Messrs. WM. ARTINDALE & SON,

Nether Green Nursery, Sheffield.

THE FIRST AND ONLY PURE WHITE DELPHINIUM.

TWO STARTLING NOVELTIES.

THESE two new varieties, which are now offered for the first time. Both grow 5—6ft. high, and produce enormous flower stems with large flowers, and the branches, which are produced in enormous quantity at the base of the central spike, are longer than of any other variety, several measuring over 2½ft. This makes both these varieties the best for cutting purposes, as they flower from June till late in summer.

DELPHINIUM HYBR. MOERHEIMI, has large flowers of the purest white, and not the slightest shade of creamy, bluish or greenish, like the so-called "white" Delphiniums, which have been introduced the last few years, and to which it cannot be compared. **It is doubtless the best hardy perennial introduced in the last ten years.** Award of Merit R.H.S. July, 1909. **10/6** each. (Only a limited quantity will be sold and orders are requested at once.)

DELPHINIUM HYBR. CAPRI, of quite the same growth as "Moerheimi," being a counterpiece of same it much resembles in colour to "Persimmon," but is in every respect an improvement of this variety; the flowers are larger and the spikes longer and of a more branching habit. We consider it as the **best sky blue single Delphinium** in commerce **10/6** each.

Our Catalogue of 200 pages will be posted free on application

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

◆

Exhibition and Garden Dahlias.

Although a frost experienced quite early in the month did sufficient damage to the dahlias in some gardens to prevent their owners contributing the products of their skill to the exhibition held by the National Dahlia Society, the present season has in its relation to these attractive flowers been highly satisfactory. There has for some time past been an abundance of blooms of much excellence in those gardens in which care has been taken to differentiate between garden and exhibition culture, and the displays of colour have been, and, indeed, still are of the most attractive character. The exhibitions have been on the whole remarkably good. The National Dahlia Society has held larger exhibitions than that which filled the central transept of the Crystal Palace on the 8th and 9th inst., but we are unable to call to mind any exhibition held by the society during the last decade that has been so remarkable for high quality. There have also been magnificent displays of dahlias at the fortnightly meetings at the Horticultural Hall, and at the exhibition of the Royal Caledonian Horticultural Society these flowers were so largely shown in the competitive and miscellaneous classes as to form one of the most important of the floral features of this great gathering. In other directions there have been conclusive proofs of the high degree of popularity the dahlia enjoys at the present time among all classes of the flower-loving public. At the exhibitions held by the National Dahlia Society and other bodies the cactus varieties of the type that finds favour with the florists have greatly predominated, and arranged, as they have been, in a tasteful manner have proved immensely attractive to the visitors. From the spectacular point of view these elegantly formed and attractively coloured flowers have fully justified the favour with which they are regarded by exhibitors and also by those who take advantage of the opportunities the exhibitions afford for seeing dahlias in their highest state of development. Were we to regard cactus dahlias wholly from the exhibition standpoint it would be necessary to refer to them in highly eulogistic terms; but we have to take into consideration their position in the garden. This is not so satisfactory as one could wish, for hitherto raisers have devoted a much larger share of their attention to the development of the points of perfection in the individual blooms than to the improvement in the habit of the plant. There is no occasion for surprise that they should have proceeded on the lines that have been followed. In the past it has been the practice of societies that make awards to new dahlias to take into consideration the size, form, and colour of the individual blooms only in estimating the merits of varieties submitted to them, and as the awards made add considerably to their commercial value, the raisers have endeavoured to create varieties bearing blooms of high quality, and their accomplishments in this direction are beyond praise. Happily a change has been made this season in the method of making awards, both by the Royal Horticultural Society and the National Dahlia Society, and from this we anticipate results of far-reaching importance. Two classes of cactus dahlias are now recognised by both societies, one to comprise those having blooms of exhibition form and the other varieties that are suitable for the production of colour effects in the garden. With regard to the second of the two classes it is regarded as essential that the varieties to which awards are made shall have stiff stems of sufficient length to carry the blooms well above the growth. When some three years ago we directed special attention to this matter many growers were doubtful as to the possibility of raising cactus dahlias possessing this important quality, but the results have shown that there was no occasion for doubt. A considerable number have been exhibited this season, and half a dozen or more have received awards from the committees of the two last-named societies. Two decorative varieties that have received awards this season would probably have failed to obtain recognition had it not been for the stiff stems that carried their blooms well above the foliage. We trust this important change in the making of awards to dahlias will induce raisers to give attention to the improvement of the habit of the pæony-flowered varieties. A considerable proportion of those in cultivation are remarkable for their freedom of flowering and for their distinct and attractive shades of colour; but they are for the most part too robust in growth for gardens other than those of large size, and in the case of a considerable proportion the stems are not sufficiently rigid to hold their flowers up. It is, therefore, most desirable an endeavour should be made to reduce their vigour and increase the

MR. A. R. SEARLE.

rigidity of the flower stems. Not less desirable is a reduction in the number of varieties by the elimination of those possessing but little merit—a matter difficult of accomplishment without submitting all the known varieties to a carefully conducted trial. One could wish that the single varieties were regarded with more favour both for garden decoration and exhibition. All the finest varieties are of moderate growth, elegant in habit, and profuse in flowering, and from quite early in the season until the growth is cut down by the frost there is a continuous succession of flowers. The colours are varied and include a considerable number of exquisitely beautiful shades that readily lend themselves to artistic treatment in a cut state. The varieties with large, rough flowers have long since disappeared, and the improvement of habit and bloom have been effected simultaneously, with the result that with few exceptions the finest varieties for exhibition are the best for garden decoration. The show varieties that represent many years' unremitting labour on the part of past generations of dahlia fanciers, continue to be regarded with but little favour, although most attractive in the garden when grown in soil that has not been very liberally enriched with manure. They have also much value for bold decorations, and some day, when classes are provided at the exhibitions for blooms staged in vases without the aid of supports, we shall have ample proof of this. At present they are regarded as quite unsuitable for any form of decoration, exactly in the same way as the incurved chrysanthemums were considered quite unfit for any other purpose than to be dumped down on a sloping board until the National Chrysanthemum Society gave their members an opportunity of demonstrating their usefulness for decorative effect.

Mr. A. R. Searle, who has during the past eight years occupied the position of head gardener at Castle Ashby, the seat of the Marquess of Northampton, has in various ways given ample proof of his great cultural skill and administrative ability, but the strongest testimony to his possession of these important qualities is the high condition in which the historic gardens under his charge are at the present time. Mr. Searle is a native of Devonshire, and had the advantage of commencing his gardening career under his father at Tristforde, near Totnes, where he remained four years. On leaving home he served in various gardens remarkable for high management, including those of Hutton Hall, Guisboro', which were then under the charge of the late Mr. McIndoe, so well known as one of the most successful cultivators and exhibitors of fruit. It will be of interest to mention that during the period in which Mr. Searle was engaged in the acquisition of the knowledge essential to his taking a high position in his profession, he made a point of staying two years only in a garden, and he is fully convinced that the course taken was a good one, inasmuch as it gave him a more varied experience than would otherwise have been possible for him to obtain. On attaining the position of foreman at Goodwood, it was not considered necessary to further adhere to the rule, and he remained in these well-known gardens four years. Subsequently he was appointed to the position he now holds. By those best acquainted with his work Mr. Searle is considered an all-round gardener, for, with the encouragement of his noble employer, he has succeeded in maintaining every department of the great gardens under his charge in the best possible condition. During the past seven years he has given some attention to exhibiting, and has achieved much success in the competitions at such important gatherings as those at York, Wolverhampton, Cardiff, and Shrewsbury. The principal products that are exhibited from the Castle Ashby Gardens, are cut flowers of hardy perennials, fruits, and vegetables, and with reference to the success achieved this season it may be mentioned that at Shrewsbury in August last Mr. Searle was awarded a first for a collection of vegetables, and four firsts for fruits. Two years ago he was successful in winning at Leamington the prize of £100 offered for the best onion, with a bulb it need hardly be said, of exceptional excellence, and his success in this competition is unique.

Our Bulb and Rose Number.—In view of the great interest that is now being taken in spring-flowering bulbs and roses, we shall devote our next issue (September 24) chiefly to these two important classes of flowers. The contents will be varied, and the articles have been written with special reference to matters requiring attention at the present season, and will be found distinctly helpful to cultivators of all classes. The greater proportion of the articles will be illustrated, and we shall give an illustrated report of the autumn show of the National Rose Society, and also of the second of the two exhibitions of the National Dahlia Society.

Presentation to Mr. Robert Fife.—Mr. Robert Fife, one of the partners of Messrs. Dobbie and Co., was recently the recipient of a handsome testimonial from the people of Rothesay. Mr. Fife is an ex-Bailie of Rothesay, has been treasurer of the Burgh, and convener of the Burgh Lands and Parks Committee, and has acquitted himself to the satisfaction of all concerned in connection with these public offices. He has in many other ways endeared himself to the people of Rothesay during the time he managed the Messrs. Dobbies' Nurseries there, and it was not surprising therefore that his many friends should combine to do him honour on the occasion of his departure to the firm's new headquarters at Edinburgh. At an influential gathering in the Council Chamber at Rothesay, Mr. Fife was presented with an appropriately engraved silver salver, together with a gold brooch and pendant for Mrs. Fife.

New Rose Daphne.—The Rev J. H. Pemberton writes, "Whilst thanking you for your kind notice and illustration of this new seedling, which appeared in your pages of last week (p. 705, Sept. 10), I feel it obligatory to make one correction in your description. This rose does not make growths seven to eight feet high; that is, one hopes, a thing to come. The habit, though strong, is dwarf and compact. It forms a bush about four feet high. The great point of this rose lies neither in its colour nor in its perfume, but in its perpetual flowering habit; it is always in bloom from June to late autumn. As evidence of its activity a spray was exhibited, when it obtained an award of merit of the R.H.S., showing a bunch of fruit, some just colouring; a truss in full bloom; a young shoot just forming its flower buds, all on one stem. It was raised four years ago, and, so far, has never had the slightest spot of mildew."

Botany at the British Association.—Grants of money appropriated for scientific purposes at the meeting of the British Association at Sheffield, included the following in the Botanical Section: Dr. D. H. Scott—Structure of Fossil Plants, £10; Dr. F. Darwin—Experimental Study of Heridity, £45; Prof. T. Johnson—Survey of Clare Island, £20; and Prof. F. W. Oliver—Registration of Botanical Photographs, £10.

Trial of Single Dahlias.—Two years since the National Dahlia Society decided to arrange from time to time trials of dahlias with a view to determine the relative merits of varieties for garden decoration. Last year a trial of pompons was conducted, and this proved so great a success that it was determined to have a trial of single varieties. Messrs. J. Cheal and Sons, of Crawley, kindly undertook to carry out the trial on behalf of the society, and this has proved not less successful than that of the pompons. The trial included the new varieties introduced by Messrs. Dobbie and Co., Mr. Seale, Messrs. J. Cheal and Sons, and other raisers, and all the older varieties in general cultivation. The trials were inspected on Monday last by the executive committee, and the officers, Mr. E. Mawley, V.M.H., president; Mr. Stephens, treasurer; Mr. G. Gordon, V.M.H., chairman of committee; and Mr. E. F. Hawes, the hon. secretary. The whole of the collection was in the best possible condition, and as the result of the careful examination made by the committee upwards of twenty varieties were awarded three marks (xxx) for their value for garden decoration. The names and characteristics of the varieties receiving marks will be published in the official report, but with reference to them we would mention that at least two-thirds were included in the first-prize collection shown by Messrs. J. Cheal and Sons, at the Crystal Palace, and illustrated in this issue. After the inspection the committee had a hurried run through the nurseries, and the members were much impressed by the various collections, especially the trees and shrubs that came under notice. Before leaving a hearty vote of thanks was, on the initiative of the President, accorded the firm for their hospitality, and the excellent manner in which the trial had been conducted.

A Giant Cabbage.—It is wonderful how the gigantic appeals to people. The big gooseberry and the big sunflower are ever a source of great interest, though neither may have any other merit than size. A correspondent reports a gigantic cabbage grown by Mr. J. Harmer, a printer's warehouseman at Newcastle. The cabbage had a circumference of 16ft. and measured more than five feet over.

Presentation to Mr. William Dawson, M.A., B.Sc.—Mr. Dawson, lecturer in Forestry at the University of Aberdeen, who has just concluded a most successful course of lectures to practical foresters from the leading estates in Scotland, was met the other day by his class in the Imperial Hotel, Aberdeen, and made the recipient of a very handsome dressing case. Mr. Joss, forester, Ardoe, made the presentation, and in the course of his speech testified to the large amount of information derived from the course of lectures. He came to the class in a critical mood, not having an open mind regarding class work, but was agreeably surprised to find in the lecturer, Mr. Dawson, one well acquainted with practical details in every conceivable circumstance, and ready to show where theory and practice could be reconciled. In particular Mr. Dawson's familiarity with all the different tools and appliances in use in this country and on the Continent, and his expertness in handling them, won his admiration, and when the forest demon, called "the devil," was explained he had to confess himself converted. Mr. Dawson, in reply, expressed the great pleasure he felt in having gained their confidence, and thanked most heartily his forester friends for the beautiful dressing-case they had just presented to him. In the course of his speech Mr. Dawson deprecated the want of forestry statistics in this country. In Germany the most elaborate statistics were available, some of which went back 100 years. Some of these, however, were not applicable to our insular conditions.

Accident to a Gardener at Gordon Castle.—An unfortunate accident befell Mr. William Cunnison, foreman at Gordon Castle, the Scottish seat of the Duke of Richmond and Gordon, the other day. Among his other duties he had charge of the sunshine recorder, and, as was his wont, he proceeded to change the cards in the recorder, which is placed on a high wall on the south side of the kitchen gardens. With the aid of a dim lantern light he proceeded to carry out his mission, when he lost his footing and fell over the wall from a height of twelve feet. Fortunately Mr. Cunnison was accompanied by a son of the head gardener, Mr. Webster, who at once ran for help. Mr. Cunnison was picked up in an unconscious condition, and carried to his apartments. Dr. Mann was soon in attendance, and found Mr. Cunnison's thigh dislocated and his head slightly injured. His condition was so serious that it was deemed advisable to have him removed to the Elgin Hospital. Reports concerning Mr. Cunnison's condition are as satisfactory as could be expected under the circumstances.

Dahlia Show at Regent's Park.—The second exhibition of the National Dahlia Society will be held at the Royal Botanic Gardens, Regent's Park, on Tuesday and Wednesday, September 20 and 21. If open weather continues the exhibition is sure to be a large one and the competition keen throughout. In addition to the dahlias there will be a display of fruits preserved in pure water only.

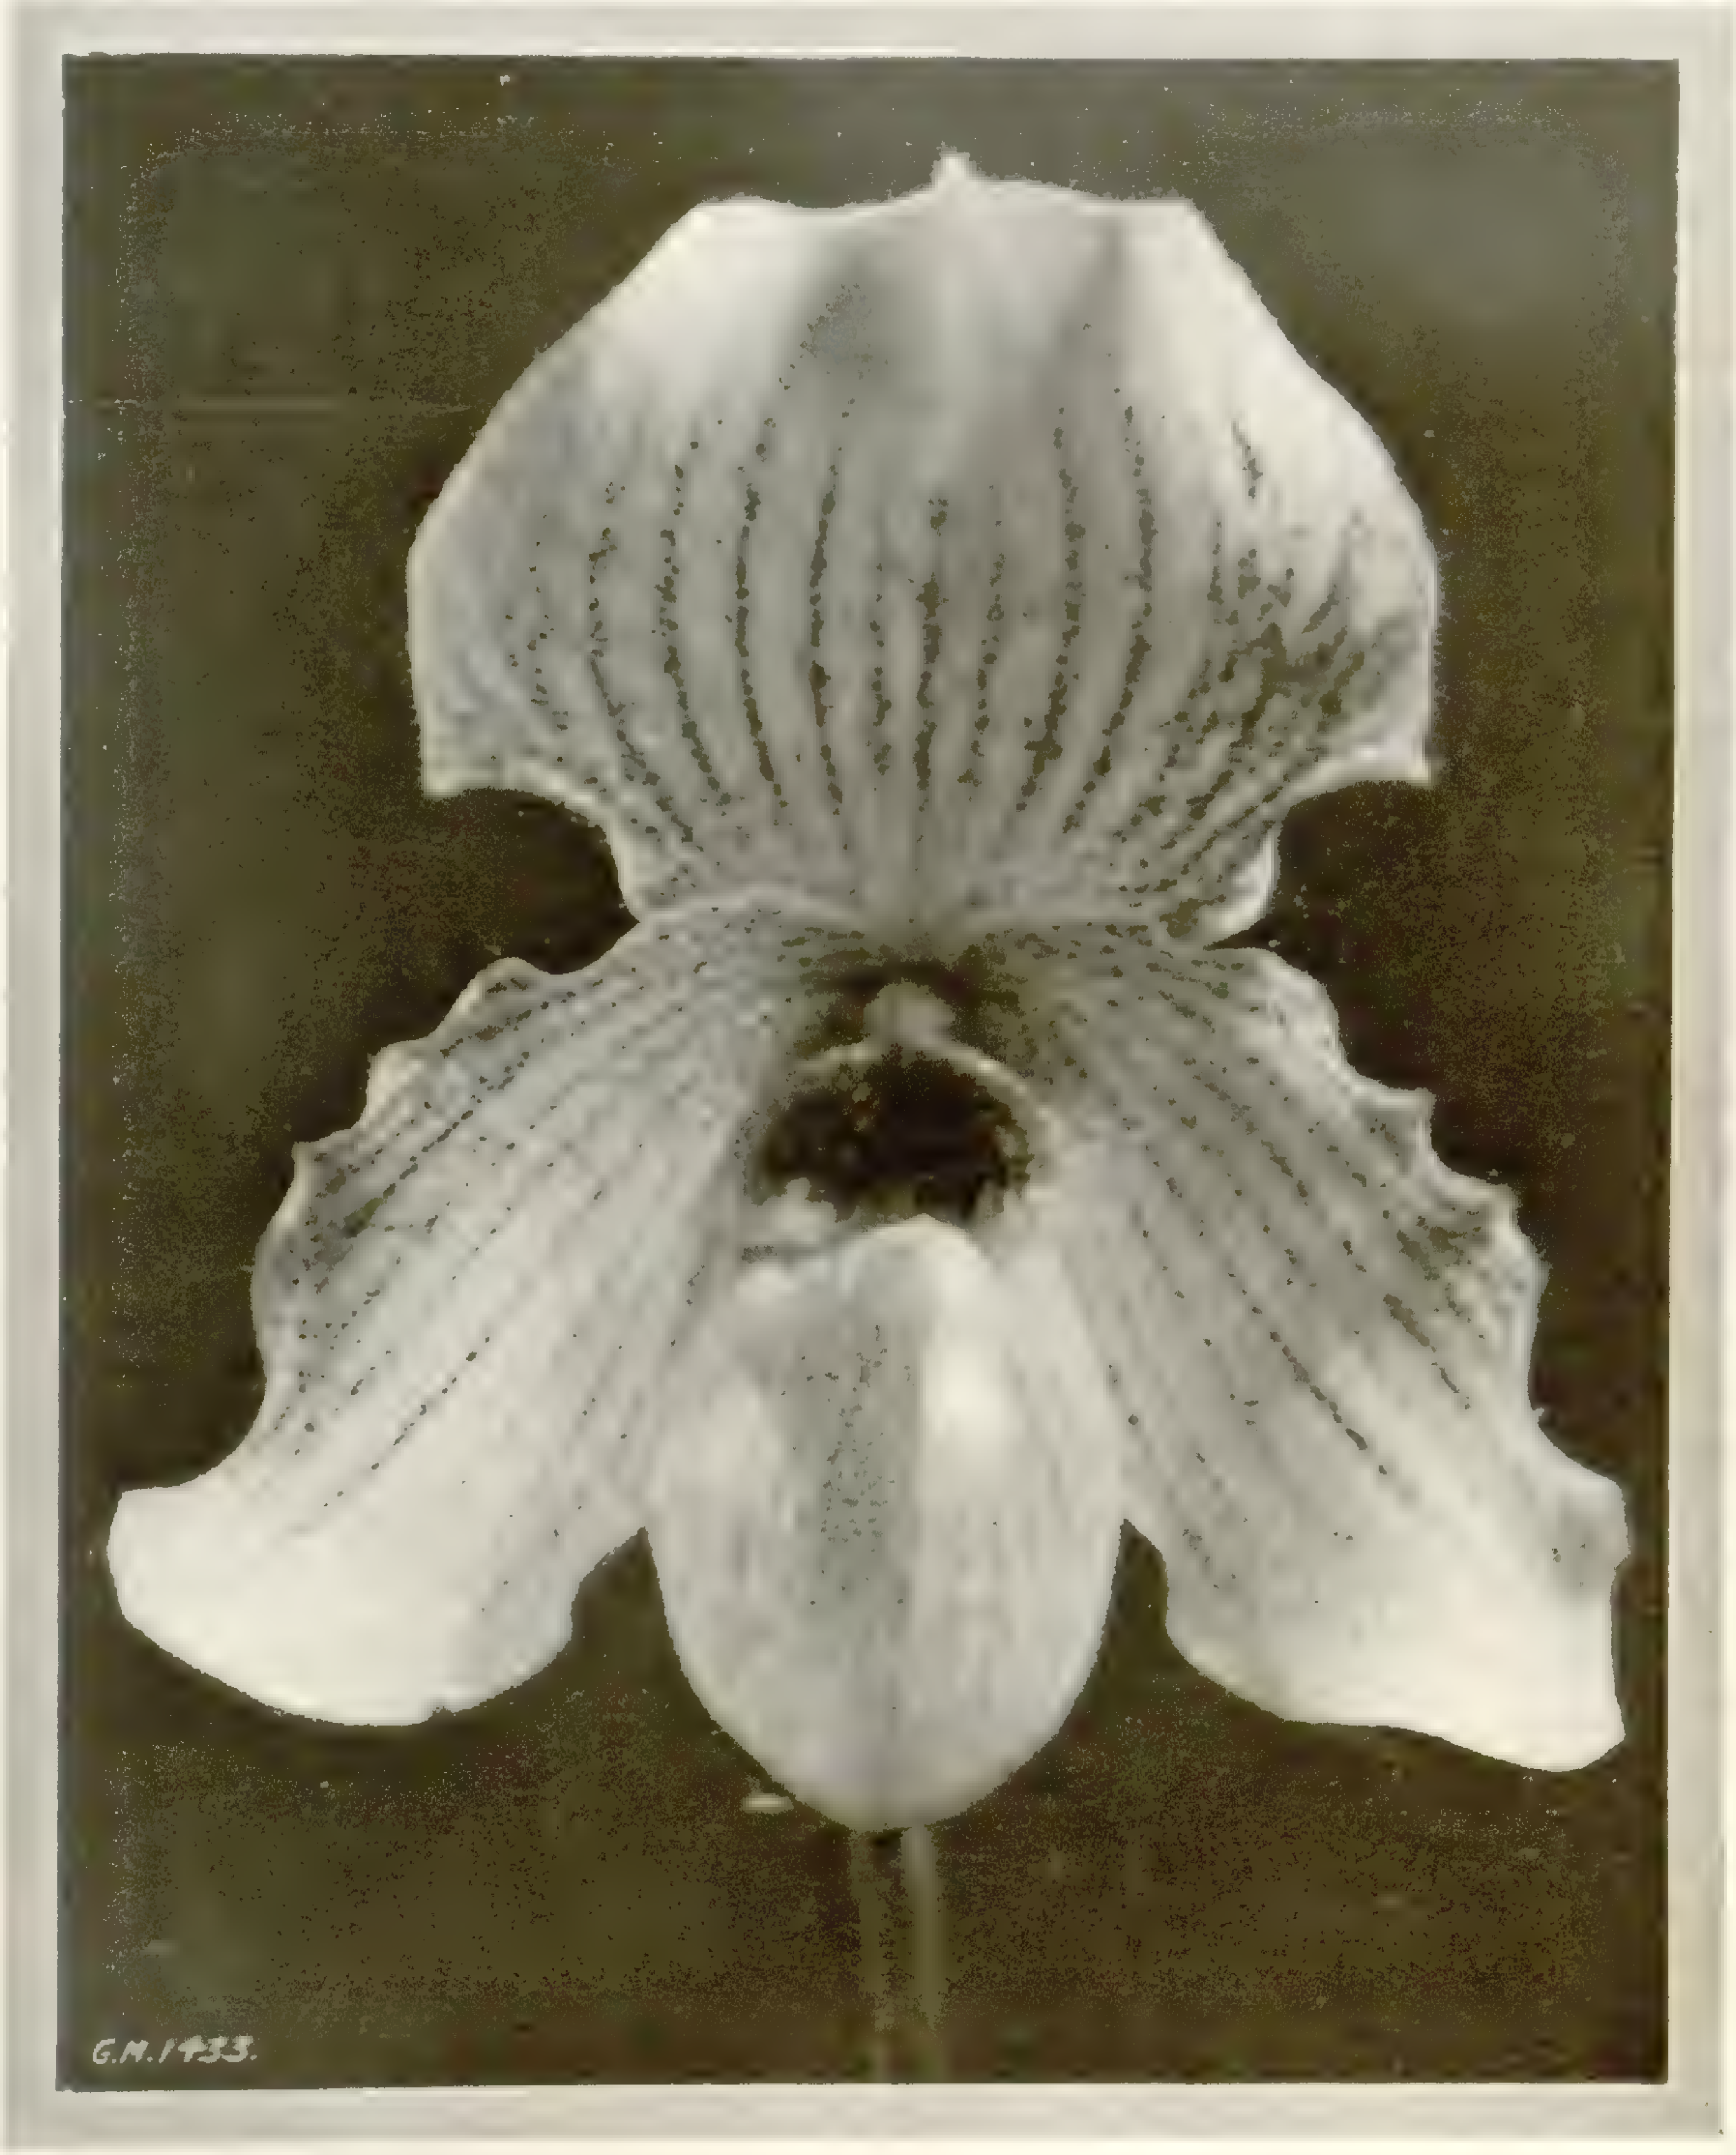
Perpetual Carnations at Edinburgh.—At the meeting of the Scottish Horticultural Association, held in the Goold Hall, Edinburgh, on September 6, Mr. W. H. Massie presided over an excellent attendance. The subject chosen for discussion was "Perpetual-flowering Carnations: their Past, Present, and Future." The address was given by Mr. J. S. Brunton, chairman of the Perpetual-flowering Carnation Society, and proved of great interest and value. Mr. Brunton and Mr. M. Todd together exhibited about fifty American and British varieties of the popular flower, and other members sent dahlias, vegetables, scabious, violas, etc.

Bulbous Plants in Moss Fibre.—We are informed that the Council of the Royal Horticultural Society have accepted prizes for bulbous plants grown in moss fibre from Mr. Robert Sydenham, for award by them at the exhibition of spring flowering bulbs to be held March 14 and 15. The prizes are for six single hyacinths, to be grown in separate vases not exceeding six inches in diameter; six vases of tulips, the vases not to exceed six inches in diameter, but no restriction as to the number of bulbs in each; and six vases of narcissi, the conditions the same as in the case of the tulips. The hyacinths, tulips, and narcissi shown in competition for these prizes have to be selected from lists of specified varieties, which can be obtained from the R.H.S. The varieties enumerated are in general cultivation, and can be obtained at the usual rates and are specially adapted for cultivation in moss fibre without drainage.

THE HEATH GARDEN.

Perhaps there is no other phase of garden art that is of greater interest than the heath garden. With its aid we are brought into touch with the charms of the breezy uplands, the purpling moors, and the delights of the native wilds. We can renew the old love of the open moorland, with its stretches of purple and mauve flowers, catch something of the glories of the latter days of summer-tide, and let the peaceful associations which they bring sink deep into mind and soul.

To my mind there are few phases of natural landscape beauty to vie with the heath-clad stretches during August days, and it is with the idea of furthering and popularising the heaths in the garden that I desire to press forward my advocacy concerning it. The whole idea is associated with a simplicity of design. Exponents of the "formal in garden design" will have none of these heath-clad slopes; but let me point out that it is the "informal in gardening" which is carrying the whole art of garden adornment to the high level and the popularity which it is achieving at the present day.



CYPRIPEDIUM ANGELA.

Flowers silvery-white, with veins and tiny dots of rose and rose-purple; a dainty flower derived from C. niveum and C. Fairrieanum. A.M., R.H.S., September 13. Mrs. Norman Cookson (gardener, Mr. H. J. Chapman), Oakwood, Wylam-on-Tyne.

The rock garden, the water garden, the wild garden, and several other phases, give ready confirmation to my statements concerning garden progress. We have tried these features, they have succeeded in the greatest measure, and I am cértain the heath garden will not show to less advantage than the foregoing. The idea is not new, if the application is. Bacon, in his quaint and readable essay "On Gardens," suggests that there should be in the garden "mounds set about with heaths and thymes, and other low-growing plants, with here and there thicket growths of sweet briar, and honeysuckles."

Now, before proceeding, let me have a word about planting. The soil can usually be arranged satisfactorily, for with the usual run of loamy soils, one can add leaf-mould, peat, and, if necessary, sand, to bring it to the required condition for successful heath culture. The question of planting time is more serious, and I am not greatly in favour of autumn planting. The greatest success follows planting done after "the turn of days," and I have recorded first-rate results from February and April plantings, and would strongly advise intending planters to choose either February, March, or April for their task, not earlier than the first month, unless one wishes to have recourse to the watering pot, which is certainly not desirable.

The surface of the ground should be

broken into slopes, ridges, and depressions to further the idea of a natural landscape, and to show the various kinds to the greatest advantage. Rocks may be used, though sparingly, just letting them show in ridgy lines and infrequent outcrops. Recollect that the area to be devoted to heaths is not a rock garden, but that the few rocks are added to give reason for the broken ridges, and sloping banks, as well as for the natural effect which a few weather-worn, moss-grown stones can give.

The little scene must embody as much as possible of the spirit of the moorland, and the pathways must represent, as much as possible, the "beaten track." Therefore, an informal track of rough-hewn stepping stones are more in keeping than formal paths. The whole must look as natural as possible, and the heath groupings must run into each other so as to do away with any definite lines of division.

The majority of the heaths, or ericas, are of comparatively easy culture. E. vagans, the Cornish heath, with its pinkish-purple blossoms, is a robust form of bushy growth, and its varieties, including alba, are equally good for massing. The Scotch Heath, E. cinerea, with its greyish leafage and reddish-purple flowers, is a low, spreading plant, and a good contrast. There are many varietal forms, including alba, pallida, rosea, and purpurea. E. ciliaris, the Dorset heath, pale red in colour, is hardy in most English districts, and covers a goodly period of blossom.

Of the common Ling, E. vulgaris, one need hardly speak, though many of its charming varieties are indeed worthy subjects. Hammondi, an erect-growing dark green form with white blossoms, is very good, while Alporti, bright crimson; Serlei, white; aurea and cuprea, the gold and bronzy varieties; pumila and pygmaea, the useful dwarfs, are among the better forms. I would advise planting the purple Corsican heath, E. stricta, with its well-defined wiry growth. E. mediterranea is charming in spring, and its varieties are very delightful.

E. Maweana, much resembling a vigorous ciliaris, should be noted, together with the rosy-purple E. australis, and the strong-growing E. lusitanica.

One must also note in passing the moisture-loving E. tetralix (the Mountain Bell), the exquisite, but none too hardy, E. arborea, the Irish St. Dabeoc's heath, usually known as E. Menziesia polifolia, and its varieties, and also the ever-charming alpine gem, E. carnea. This, and its pretty white variety, alba, are two of the earliest and are most charming, flowering in January and February with the utmost freedom. P. H.

Clematis Ville de Lyon.—This variety is, from its bright carmine-red colour, one of the most notable among the many forms in cultivation. The flowers are not so large as some of the other garden forms, but the colour is most telling, while the period of blooming extends over a considerable time. Its late flowering qualities are shown by the fact that it was given an award of merit by the Royal Horticultural Society at the end of August, 1901.—W. T.

Catalpa speciosa pulverulenta.—This distinct form of Catalpa speciosa is a counterpart of the type, except that the leaves are densely spotted and freckled with white, a style of variegation which is decidedly uncommon. Like the variegated Acer negundo, it should prove to be most useful for decorative purposes when brought on under glass, while if it can be cut down annually as the paulownia is sometimes treated, it should be useful as a permanent fine foliaged subject.—W. T.

SOILS AND MANURES IN RELATION TO PLANT GROWTH.

(Continued from page 686.)

◆

Nitrification of Soil and Manure.

The presence of bacteria in the soil is of immense importance because they are the agents which elaborate nitrate of lime, a form of food in which plants take up and assimilate nitrogen. The element nitrogen is the most expensive of plant foods; it is also essential to the existence of life. Protoplasm is the material that constitutes the living part of all plant tissues, and nitrogen is an indispensable constituent of protoplasm. If we kill protoplasm and analyse it in the form of albuminoids it will be found to contain about 16 per cent. of nitrogen.

Now the great store of soil nitrogen exists in the form of humus; and the question is, how is the nitrogen in the humus which is insoluble in water and not available for the use of plants converted into nitrate of lime? The answer is supplied by the following facts: In the soil live certain organisms, mere microscopic specks of protoplasm or living matter, they are called bacteria, and they are endowed with remarkable powers. Just as amongst civilised communities it has been found advantageous to train some men as carpenters, others as masons, others as plumbers, and so forth, so nature has found it of advantage that different sets of the bacterial workmen should be trained so that one can perform one kind of work and another another kind.

In the soil one kind of bacteria lives on humus and by the aid of oxygen—a constituent of the atmosphere—converts the nitrogen of the humus into ammonia gas, and the carbon into carbonic acid. The ammonia is then handed over to another set of bacteria, and these by the aid of oxygen and carbonate of lime (chalk), converts it into nitrite of lime; this nitrite of lime is then taken in hand by a third set of bacteria that, with the aid of oxygen, convert it into nitrate of lime, which is soluble in water, and is a form in which the plant is able to utilise nitrogenous food.

Conditions Necessary.

The foregoing facts show that oxygen and carbonate of lime must be present in the soil if the bacteria are to perform their work. A favourable temperature or degree of heat, about 98 degs. F., is the most advantageous for the development of bacteria, and the presence of moisture is also necessary. The oxygen is provided by the air admitted by the operation of tillage and drainage into the interstices of the soil; moisture is derived directly from the rainfall, or from the water reservoir in the soil; carbonate of lime is a constituent of all fertile soils and exists either as chalk or limestone rock.

It should be the object of all gardeners to produce such a condition of soil during the months of active plant growth as will secure a maximum of nitrification throughout this period when nitrogenous food is most required. It is during the months of active growth that we find it of advantage to supplement what is supplied by the soil itself by the addition of nitrogen as a top-dressing, either in the form of the readily soluble and immediately-available nitrate of soda, or in that of readily soluble and rapidly, but not immediately available sulphate of ammonia or guano. In very early spring, when nitrification is somewhat less active in the soil, it will frequently be found of advantage to supply a little stimulating manure, three to four ounces per square yard, of nitrate of soda to the young crops, especially such things as cabbage, spinach, lettuce, peas, and asparagus.

We observe that in the oxidation or decomposition of the humus matter of soils as the result of the activity of these bacteria, carbonic acid is abundantly produced, and is used up by the moisture adhering to the particles of soil; this moisture, thus impregnated with carbonic acid, acts powerfully as we have already seen, as a disintegrating agent of soil or rock particles, converting potential plant food into soluble and available plant food. Thus the activity of these nitrifying bacteria is constantly leading to the production of both nitrogenous and mineral plant food from the materials stored up in the soil.

We cannot help being struck by the fact that nature has been most economical in the arrangements for the preservation and supply of nitrogenous plant food, as is remarkably shown by the permanently unmanured plot of land in the Rothamsted experimental wheat field, to which we have already called attention. If the nitrogen of soils existed entirely as nitrate the rain would rapidly wash it all away; did it exist as ammonia, nitrification would speedily convert it into nitrate with a similar result; but existing as it does stored up in humus, an insoluble form, a form that is only converted into nitrate under conditions of warmth and moisture, which are at their best when plant growth is most active, we have the production of available nitrogen at the very time when the plants most need it.

Harpenden. J. J. Willis.

(To be continued.)

A FINE CROP OF TOMATOES.

Mr. Jones, head gardener to G. H. Rolls, Esq., J.P., Arcadia, Bournemouth, is to be congratulated on his very successful cultivation of tomatoes. Altogether there are four houses devoted to this crop, and the plants are fruiting remarkably well, but in one house—the earliest—the crop is a grand one. The structure measures about 25ft. in length and 12ft. in width, and is span-roofed. There are thirty-eight plants, which are yielding a crop of about five hundred pounds weight—more than twelve pounds per plant. The fruits are very firm, of good colour, and handsome appearance, and even in size—a little above medium. Selecting one of the largest trusses I counted thirty fruits on it. The variety is a selection of Mr. Jones's. The seeds were sown last February, and the seedlings given ordinary treatment until all danger from frost was past, then they were subjected to very cool treatment, the ventilators, both at the top and bottom of the house, being left wide open day and night, but finely perforated sheets of zinc are nailed over the openings in the front walls.

The plants are grown in shallow beds of soil—about six inches deep, on the side stages; the soil appeared to be mostly tough turves from land covered with heather and bracken fern. Of course, feeding has been resorted to, but there has not been any attempt to coddle, or unduly nurse the plants.

Geo. Garner.

THE JOBBING GARDENER.

Despite the fact that it used to be considered a very great slight on the "knights of the blue apron" to be called "Ponicas," there never was a time when the services of these very useful members of our profession were more called for than they are now. Many of the older readers of the GARDENERS' MAGAZINE will well remember why they were called "Ponicas." It arose through a party of men passing through one of the public parks, and one of the party asked a gardener what the name of a certain shrub was. The gardener in good faith told the truth, the subject being a specimen of Aucuba japonica. Naturally the visitors only partly understood japonica, and the consequence has been we have more or less been branded as "Ponicas" ever since. The term has followed gardeners to America and all over the civilised world, but it is now gradually dying out and becoming forgotten.

The jobbing gardener is a man of many parts, as his work at the various places at which he is employed is so diverse that he does not develop any stereotyped ways, as a man is likely to do when employed exclusively at one sort of work. There is another very great advantage with the jobbing gardener, as he works at so much an hour the employer is not bound to find him work in wet or unsuitable weather. All head gardeners in large establishments know from experience how difficult it is to find a large staff of outside men work under cover in bad weather, peg making, potato and onion sorting, whitewashing sheds, washing pots, etc., etc. All this is obviated with the jobbing gardener, as he is only paid for the time he can actually work. Many men, when once they have started jobbing gardening, would not again return to the monotonous routine of a "regular place." They prefer to be at what is called in this part of the country, "a loose end," i.e., not bound to any particular place at a particular time. Sometimes I think this is not to be wondered at, because in all or nearly all private gardens it is considered such an important thing for the men to keep exact and punctual time.

Of course, the jobbing gardener is most at home at purely outside work, as in places with a number of glass houses regular men in them are an indispensable condition. Indeed, the real jobbing gardener does not care for greenhouse work, as he cannot make enough seen, as watering, ventilating, damping down, syringing, etc., does not make much show; but to see him in his element watch him mowing, edging, digging, making trenches for peas, celery, etc.; he will then show you how it is done. During the last few years two of our men have left us to take up jobbing gardening and they have both done well. One especially has a penchant for laying out villa gardens, and building rockeries, a talent he possessed unknown to me, as it was dormant and not required in ordinary work in greenhouses.

The jobbing gardener naturally becomes a very intelligent man, because at most of the places he works at a different class of plants are grown, and he acquires experience which a person cannot attain who is always in one place. The winter season is the worst time of year for him, but as a set off against that he can work much longer in summer, and as he is paid by the hour he can make up for the natural shortage in winter.

From a pecuniary point of view the jobbing gardener has a great advantage over the ordinary garden labourer, whose wages vary from, we will say, 15s. to £1 per week. Whereas the jobbing gardener at 5d. or 6d. an hour, as the case may be, is far the better off.

Jobbing gardening is not a sinecure occupation, but if a man is possessed of a strong body in good health, and is active and withal intelligent, and possessing a desire to please his employers in a fairly good residential district, he is almost assured of a good living by following the honourable occupation of a jobbing gardener.

W. M.

Cheshire.

CABBAGE.

During the end of August and beginning of September preparations are made for the main plantations of cabbage. When we take into consideration their value and the length of time they can be obtained in good condition for use, which is at least from April until the end of the year, it is a question whether the cabbage has an equal amongst the Brassica family, or, in fact, amongst kitchen garden crops, for the amount of material it will produce in return for the labour expended upon it. It will amply repay thorough and liberal culture.

DOBBIE'S IMPROVED WINNINGSTADT CABBAGE.

To secure firm, tender, and crisp hearts rich, warm, and sweet soil is absolutely necessary. Ground that has been carrying crops of potatoes, peas, or onions is, as a rule, desirable, because such sites have been generally deeply dug and enriched with good manure. On light land it is best to give another good manuring before planting cabbage. Heavier soil being more retentive it will not need a heavy dressing of manure after the crops named, so long as it is known to be in good condition.

Fortunately, cabbages are not so subject to club as cauliflowers. The principal drawback to the spring cabbages in many parts of the country is the one of prematurely running to seed. It is generally found that too early sowing, and the consequent attainment of some size by the plants before winter, has much to do with this. Some varieties are more subject to "bolting" than others. Good and suitable plants for standing wind and frost can be had in most parts of the country by sowing the seed during the last week in July and the first week in August; some prefer the second week in August.

Ellam's Early, to my mind, is yet unsurpassed for its useful size and general good quality. Winningstadt is considered by many to be well worth growing for spring use, but it seems more useful for cutting during the summer months; without doubt it is a handsome cabbage, and it is often seen at exhibitions during August. The firm and weighty hearts, especially in the case of some of the better selections, have recently come under my notice. Where there is a heavy demand this cabbage is valuable in giving a large bulk of good heads, though not of the very first quality. It is an excellent plan to make a spring sowing of this variety, and to set the plants out at about two feet apart, and then heads will be produced from July till the end of the year.

C. FLACK.

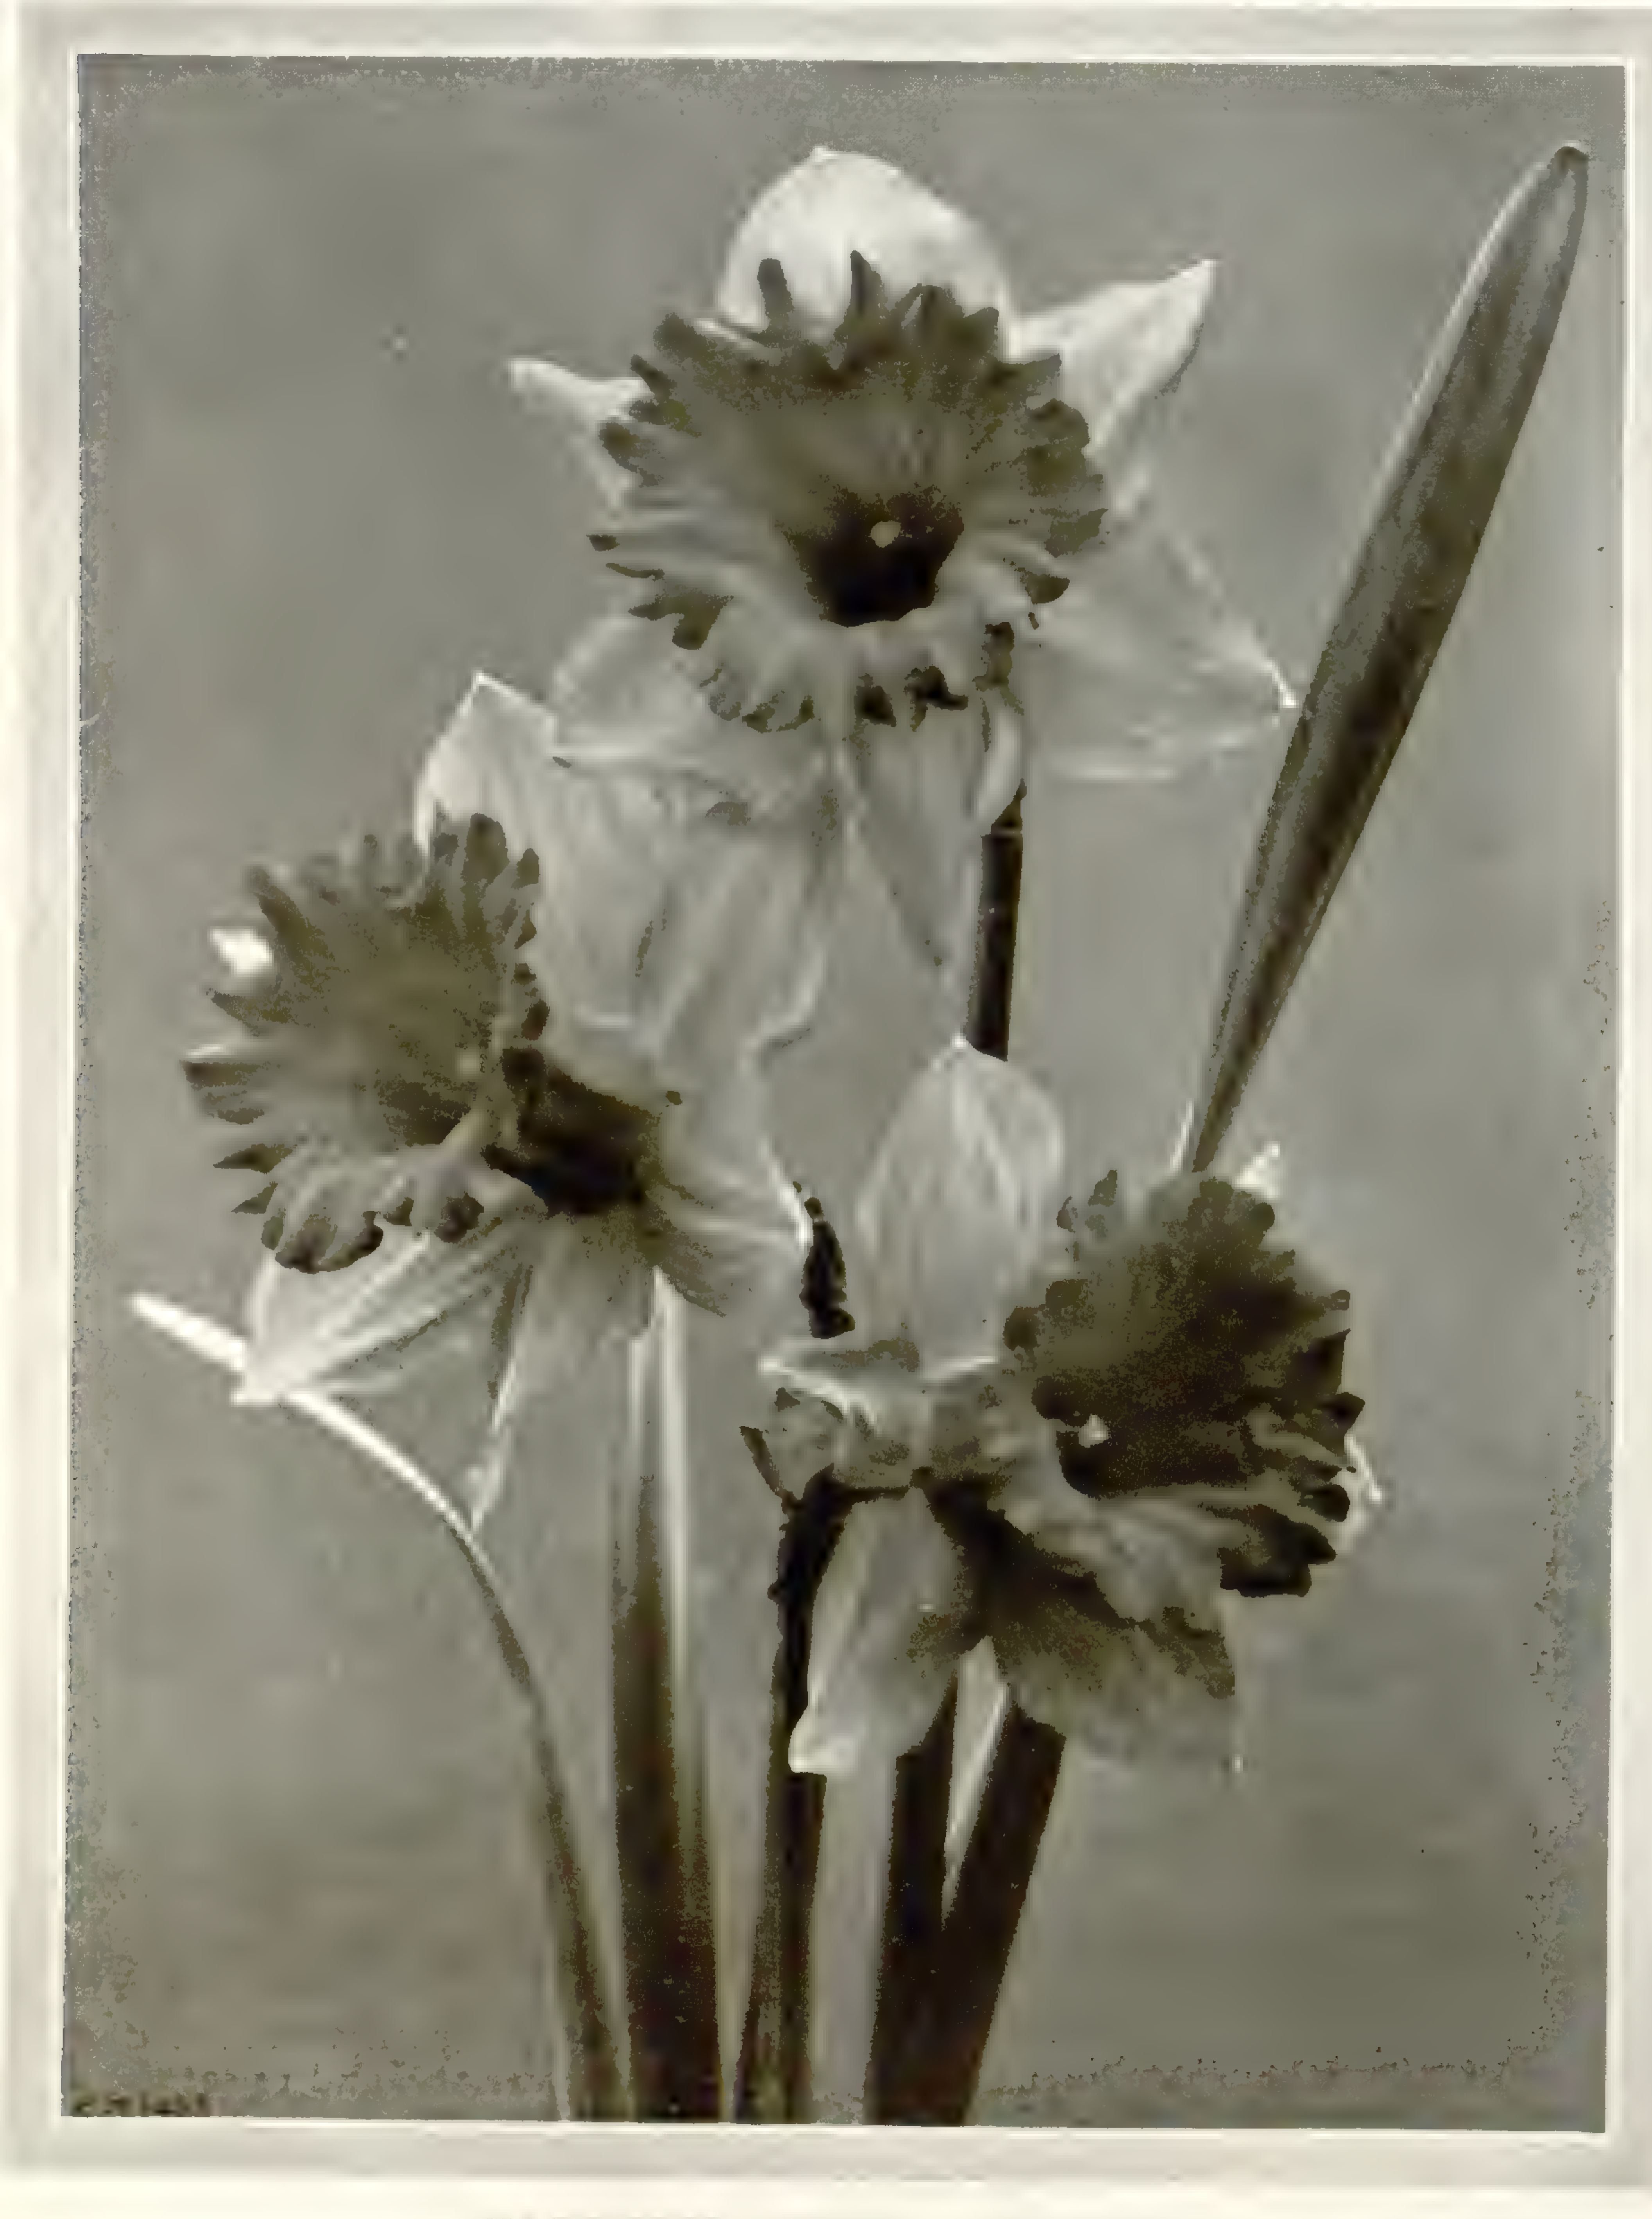
Cholmondeley Castle Gardens.

The Venetian Sumach.—There is no other hardy shrub which can for one moment be confounded with Rhus cotinus, at least during the present season of the year, when the inflorescence borne in the shape of dense wig-like masses, is at its best. In this state the upper part of the bush appears to be enveloped in a ruddy cloud, hence the popular names of Fire Bush and Smoke Bush, which have been applied to it. The comparatively small ovate leaves of this rhus stamp it as quite distinct from those species with large pinnate foliage. There is a variety (pendula) of drooping habit, and another (atropurpurea) in which the leaves are darker tinted, and the inflorescences of a deeper colour than those of the type.—W. T.

NOTES FROM KEW.

Late-flowering Clematises.

At this season of the year Clematis Jackmani, and others of the same group, assert themselves in a marked manner, not only in many large gardens, but in those attached to the humblest of cottages. It is, however, not necessary to depend upon this section, for a great number of widely diverse forms are in flower at Kew, where the practice prevails of allowing them to run over a few rough branches, under which conditions they are seen to great advantage.



NARCISSUS GENERAL GORDON.
Flowers golden-yellow, with soft yellow perianth; a fine variety for early forcing.

Clematis viticella.

Prominent among those now in flower are Clematis viticella and its numerous varieties. This species is a native of Europe, and though said to have been introduced into this country so long ago as 1569, it is questionable if its merits are even now sufficiently recognised. It is not so vigorous a climber as some of the others, but reaches a height of eight to twelve feet, and flowers continuously during the latter part of the summer and early in autumn. Of the several varieties those worthy of especial mention are alba, with whitish blossoms; flore plena, a double form of the type, which is said to have been in cultivation as long ago as Gerard's time; cærulea plena, with double blue flowers; rubro grandiflora, of a rich ruby-red; and a very distinct double-flowered form known as Lamartine. The last-named was raised and distributed some years ago, and has double flowers quite two inches across, and of a distinct lavender-mauve shade. Apart from any other consideration, the flowers are much larger than those of any other double form.

Clematis Hendersoni.

A fine mass, some four to five feet in height, of this old garden form of clematis showed it at its very best, and suggests whether in the race for novelties we are not apt to overlook the merits of old and well-tried friends. It is now well over forty years since I first became acquainted with this clematis, at which time the number of garden varieties were but few, compared with those of the present day. The origin of Clematis Hendersoni is, I believe, somewhat obscure, but it is commonly regarded as a hybrid between C. integrifolia (a herbaceous species) and C. viticella. It is said to have been raised about 1835, in the nursery of Messrs. Henderson, at St. John's Wood. Clematis Hendersoni is a non-climber, but it will reach a height of six feet to eight feet, or even more. The flowers are over a couple of inches across, and are of deep bluish-purple.

Clematis Durandi.

This is a delightful clematis, grown as it is at Kew, where it is supported by some rough branches. It possesses in a marked degree the prominent characteristics of C. integrifolia, one of its parents, the other being C. lanuginosa. By some it is classed as a variety of C. integrifolia. The flowers are somewhat of the colour of C. Jackmani, and about four inches across.

Clematis orientalis tangutica.

This is flowering close by the typical C. orientalis, and shows well that the claims which have been put forward on its behalf as the finest yellow-flowered clematis in cultivation are not exaggerated. It is a free-growing climber, and the flowers are of a decided yellow tint. They are drooping, do not open widely, and are remarkable by reason of their curiously pointed sepals. With regard to the showy nature of its blossoms this clematis cannot be compared with many others, but the uncommon tint at once arrests attention. Added to this, the heads of fruits are very attractive by reason of the long silky tail attached to each seed. As the flowering season extends over a considerable period these silvery plume-like heads may be seen interspersed with freshly-expanded blossoms.

Clematis flammula.

Everyone knows this clematis, which, though a native of Central and Southern Europe, has been in cultivation here for over 300 years. The variety, rubro-marginata, is, however, a comparatively recent form, in which the segments of the flowers are bordered with red. K.

NEW DAFFODILS.

A particularly fine new daffodil that Messrs. Barr and Sons, Covent Garden, W.C., are now offering to the public is the incomparabilis variety named Gadfly. It was shown remarkably well in their exhibits last spring, and promises in due course to be a favourite. At present its price is beyond the purse of all but the keenest of specialists, because not many are prepared to pay a dozen guineas for a bulb. Gadfly is a striking flower with a finely formed and slightly reflexed perianth of glistening whiteness shading to delicate sulphur towards the centre of the flower. The broad, flat crown or eye is dark and vivid scarlet, shading to rich old gold right in the centre. Gadfly grows about fourteen inches high and is one of the best of the flat-crowned incomparabilis varieties.

Whether the variety General Gordon is quite new or not we are not prepared to say, but it is a golden trumpet daffodil with a great future before it as a forcing variety. We first made its acquaintance last spring, when Mr. W. H. Page, Tangley Nurseries, Hampton, exhibited forced flowers. Mr. Thomas Stevenson, to whom we are indebted for the accompanying illustration of this variety, writes: "I believe General Gordon will become a very popular variety for early forcing, as under equal conditions of culture it comes into flower a week earlier than Golden Spur. It is larger than the latter variety, the trumpet being very fine and quite as deep a yellow as found in Golden Spur, but the perianth segments are a little paler, about the same shade as seen in Emperor. It seems to be a desirable variety in every way."

Full Instructions on Planting and Propagation of Hardy Plants and Flowers.

476 PAGES, AND 255 ILLUSTRATIONS OF PLANTS AND FLOWERS FROM PHOTOGRAPHS.

EASILY-GROWN HARDY PERENNIALS.

By G. H. VOS, B.A., Editorially supervised by T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

Price **5/-** net; Post Free, packed in box, **5/6**

SOME FEATURES OF THE WORK:

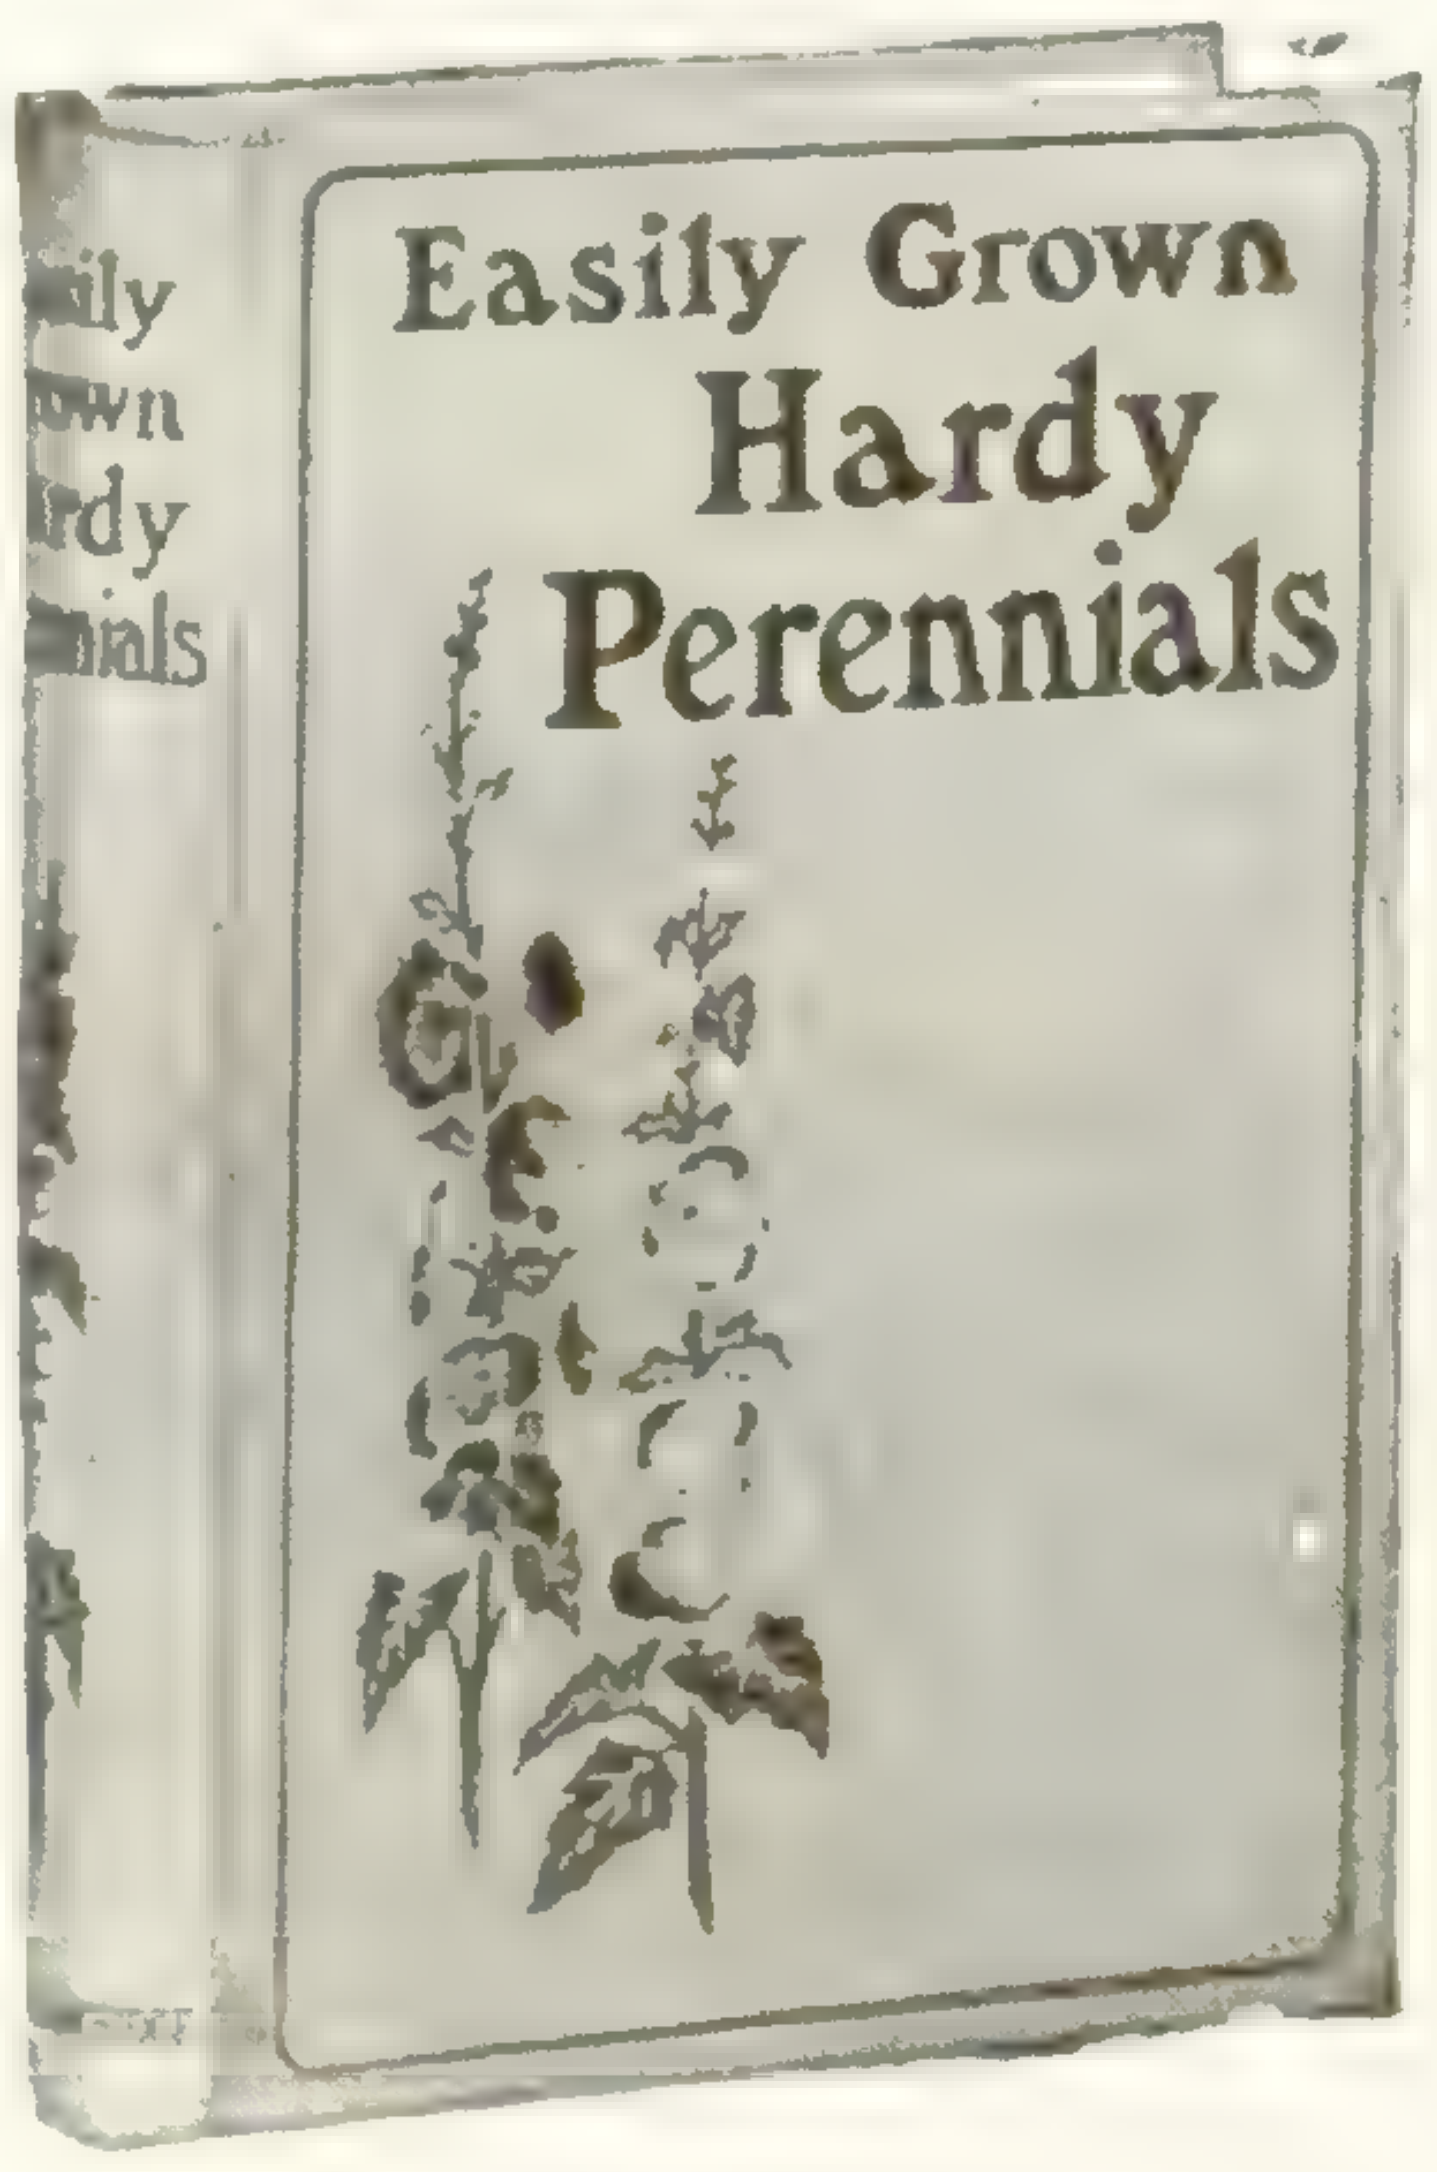
Soil and Position.—The particular soil or compost and position for each genus of plants are very fully and carefully described. Shade and sun-loving plants specially mentioned.

Planting.—The best time and method of planting are also clearly set forth

Pests.—Special mention is made of any plants likely to be attacked by insect pests, and remedies are given.

Propagation.—The best mode of increasing each family of plants described in detail—seeds, cuttings, and division.

Illustrations.—Two hundred and fifty-five of the most popular species and varieties portrayed, mostly as growing in the garden.



Botanical Name.—Gives the botanical or generic name of each genus of plant described in the book.

Common or Popular Names.—Supplies the common or popular English names of all the plants described.

Natural Order.—The botanical family to which kind belongs.

Habit and Uses.—States whether the plant is fibrous, tuberous, or bulbous rooted, and to what use it can be most effectively put in garden decoration.

Species and Varieties.—Describes the most showy varieties worthy of culture, the colour of their flowers, season of blooming, height and native country.

"The cultural details are very valuable."—*Gardeners' Chronicle.*

ORDER FORM.

HEMEROCALLIS FLAVA.

The member of this family we most commonly see growing in gardens is the copper-coloured Day Lily (H. fulva), doubtless because it is such a hardy and vigorous grower, and it must be admitted that where there is plenty of space, or in some wild garden, it may produce a good effect with its tall heads of blossom arising out of a mass of bright green foliage. H. flava is much less vigorous, though similar in character, and the flower stalks seldom exceed two feet in height. The great recommendation of the flower is its delicious scent, which has earned it the name of the Yellow Tuberose. It is hardy enough, but thrives best in light soils, succeeding even in hot dry places. Small plants are sometimes difficult to establish owing to the depredations of slugs, which attack them before they rise above the surface of the ground in the early spring. It is easily propagated by division, the early autumn being the best time, with a view to next year's flowering. All that it is necessary to do is to take up a clump and pull the fleshy roots asunder, either with the hands or by means of a couple of four-tined forks. It is best left undisturbed for several years. H. Thunbergi is very similar to the above, and is sometimes regarded as a form of H. fulva. There is also a double-flowered form. The main objection against the day lily is the fugitive character of the flowers, but they are so freely produced that we scarcely notice this defect.

Alger Petts.

STOCKS FOR ROSES.

Few points in the culture of roses have led to more discussion among rosarians than the question of suitable stocks. Unfortunately, a few growers are very dogmatic upon the subject, and almost refuse to mention some stocks, except in terms of abuse.

My own experience is that all the rose stocks are useful in some way, although I am quite willing to admit that during the last two decades the manetti has gone out of favour. Now, had it not been for this stock, its vigour, and the facility of increasing it, we should not have had roses propagated so freely and so cheaply some years back. Personally, I would not dispense with it entirely, because my own experience is it still suits some varieties best.

Then we have three distinct forms of the briar used as a stock, viz., seedlings, cuttings, and standards. The strong-growing polyantha stock is much used upon the Continent still, and this also suits some roses better than other stocks. The De la Grefferaie completes the list of those in general use, and the previous remarks apply to this as well.

But it is not so much upon the merits of various stocks that I intend to dwell, having had quite enough of that subject many years back. What we will try to look at will be the better preparation of stocks than was the case until quite recently. Here I do not think we shall be upon such dangerous ground. The subject is seasonable. To take the hedge or standard briars first. It is advisable to procure these before frosts, otherwise they become injured by laying out as procured from the hedges. I have known them lie out for more than a week, being collected as the grubber returned. I do not think any point in the rooting of these is more important than avoidance of frost and drying winds. To plant such stocks in the condition they are received is folly. By all means trim off coarse roots, and cut away any small suckers, as there will never be a better opportunity for this than the present. Do not leave any coarse knobby branches, but cut down until you have a clean stem, whatever the length may be. To commence clean in stem and root is a great feature here. Plant as soon as possible; I have begun in September, and would certainly like them finished by the end of October. Put them six inches deep, and tread firmly. When prepared and planted early most of them begin to callus, and root at once, and this is a great help to them during the trying days of winter and in early spring winds. To the amateur it might well appear hopeless to expect a properly trimmed hedge briar to root, such a mere stick does it seem.

Continuing with the briar stock, we next consider the cuttings. The cutting briar is a most useful stock, and suits any rose that needs or can be helped by foster roots. Choose growths a little more than half-ripened, and cut them into lengths of about nine inches. The most important part of preparation follows, and, I may say at once, it applies equally to the manetti and De la Grefferaie, so I can dismiss these two now. Cut out the bottom eye or eyes, only leaving two, or three if closely set, at the top of the cutting. Unless this is done there is great trouble with the stock later on. Nor do I find the cutting root usefully without it, because if the bottom eyes are left on the cutting they throw a sucker at once, the barrel of the cutting often dies, and we have an almost useless stock. When planting stocks made from cuttings, the roots which will probably have sprung from the stem must be removed. The stocks are fit to plant out the winter after the cuttings were set in, but that is a subject for another note in due season. The cuttings may be set in sandy loam, sufficiently deep so that only an inch or so remains above the newly-moved soil, which will sink a little as it settles under rain and atmospheric pressure. Two and a-half inches is far enough apart for the cuttings in the row, and fifteen inches from row to row. This allows the hoe to be brought into frequent use during the early part of the year.

Seedling briars are best purchased the same autumn one proposes to plant them, and may be the size of a wheat straw at their base. Much larger stocks are apt to swell too much as they grow during the budding season. They will soon be as large as an ordinary cedar wood pencil, and be quite ready by the time buds can be procured.

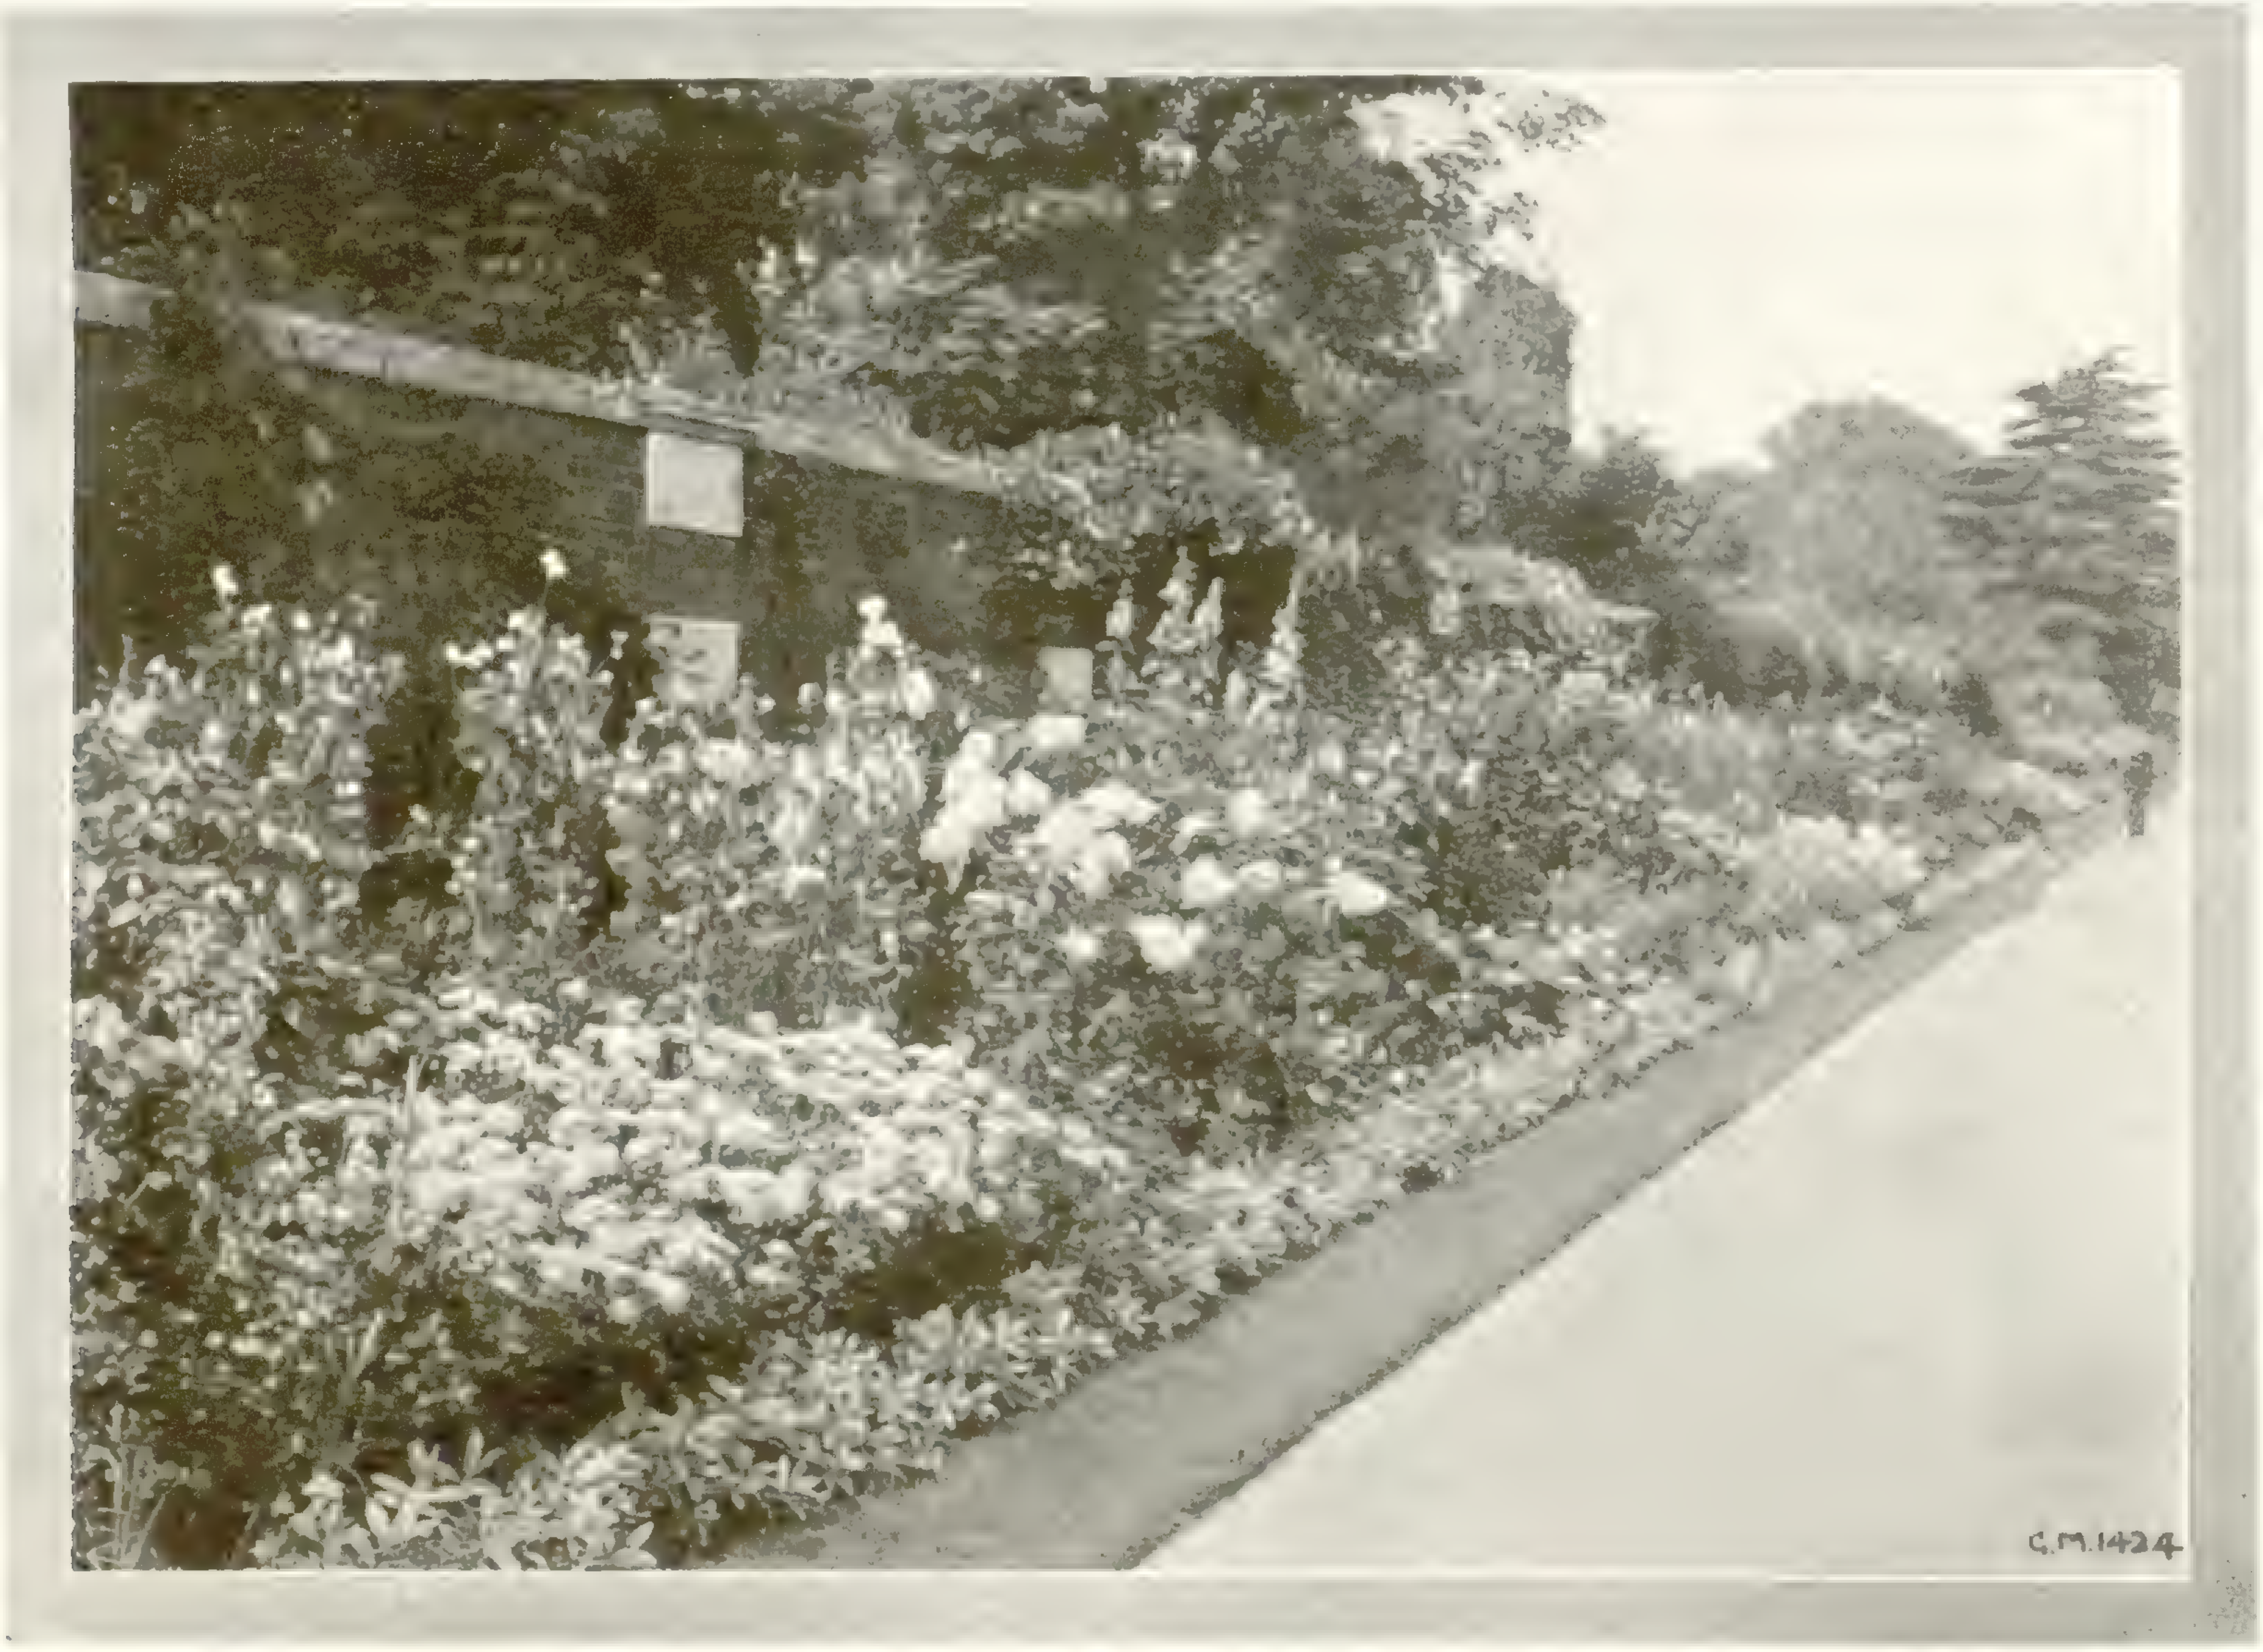
NEW NARCISSUS GADFLY.

Perianth, white and pale sulphur-yellow; crown deep scarlet and old gold.
Introduced by Messrs. Barr and Sons.

FLOWERS AT HAMPTON COURT.

The fame which the gardens that form so admirable a setting to Hampton Court have for a long period enjoyed for the great excellence of their annual displays of summer flowers have been fully maintained this season, and visitors have had good cause to be well satisfied with the floral feast provided for their entertainment. Much was heard during the past summer about the unfavourable character of the weather experienced, and the complaints of the additional difficulties it placed in the way of cultivators have had ample justification. These added difficulties have had to be contended with in the flower garden, as in other departments, and, considering the great deficiency in bright sunlight, and the relative low temperature that has been experienced, it is surprising that the more tender kinds should have made so satisfactory a contribution to the beauty of the flower garden as they, generally speaking, have done.



AN EFFECTIVELY ARRANGED BORDER OF MIXED FLOWERS AT HAMPTON COURT.

At Hampton Court the visitor has had less evidence of unfavourable climatic conditions than in the majority of gardens, public or otherwise. The whole of the plants appear to have grown freely from the first, and these remarkable for the beauty of their flowers have produced them in abundance, and are still bearing them freely. The Thames Valley, in which Wolsey's stately edifice is situated, has not enjoyed a higher temperature or a greater amount of sunlight than have other districts in the home counties, but the gardens of Hampton Court have the advantage of the shelter of the magnificent avenue of limes that forms so fine a feature on the east side, and they are sheltered also from the north and north-west by trees in the Wilderness and elsewhere. In addition to the advantage of shelter, the soil is naturally light and warm. The shelter from cold winds, and the warmth of the soil have undoubtedly proved factors of importance in a cold sunless summer, such as that through which we have just passed. They, however, are not the only factors that should be mentioned in a reference to the splendid development of the various subjects that have been used. Strong, well-hardened plants, and good cultivation subsequent to the beds being filled, count for much, and the importance of these two essentials evidently obtain full recognition at Hampton Court.

Beds and borders are equally well furnished, and immensely attractive, and the result of an attempt to determine their relative merits would not have any great practical value, because in a matter of this kind so much depends upon the personal element. The borders contain a great diversity of plants, so arranged as to produce rich and harmonious colour effects, while the majority of the beds are furnished with two or three classes of subjects. The borders of mixed plants alongside the magnificent promenade that extends from the river to the Kingston Road is divided by the Palace into two portions, each being many hundred yards in length. The south-east section is devoted almost exclusively to hardy plants, and Mr. Marlow, whose management of the gardens is so successful as to merit the highest praise, has planted the border with a view to the display of flowers being at its best during July, August, and the greater part of September, when the gardens are the most largely visited. What Mr. Marlow has accomplished would serve as an excellent model for gardens of country seats at which the owners are not in residence until after the close of the London season. The whole of the subjects are arranged in masses of some size, and with due regard to colour harmony, and the result is an effect at once rich and tasteful. Herbaceous phloxes are used with remarkable success, and the rich masses of colour produced by their splendidly developed spikes of flowers prove to demonstration the great value of these beautiful plants for contributing to the attraction of borders of hardy perennials late in summer. They indicate also that their cultural requirements are fully understood, for on light soil such as that in the Hampton Court district it is not possible to have herbaceous phloxes in a high state of development without making ample provision for their food requirements, and replanting at rather frequent intervals. Conspicuous also in the border are such subjects as Aster acris and A. corymboides, Helianthus Miss Mellish, and other of the perennial sunflowers, Artemisia lactiflora, one of the most elegant of the hardy plants flowering at the end of the summer, the flowers being creamy-white and produced in large feathery spikes; Rudbeckia speciosa in variety, Helenium grandicephalum, Eupatorium ageratoides, Veronica subsessilis, and Chrysanthemum King Edward, one of the boldest of the forms of C. maximum.

The border to the north-west of the Palace, and herewith illustrated, contains both hardy and tender plants, which, as in the other border, are arranged in bold groups. Here we find Lilium speciosum, Chrysanthemum Polly, one of the most effective of the early-flowering varieties, with rich golden flowers, varieties of Chrysanthemum maximum, hollyhocks in variety, Calceolaria Burbidgei, Hydrangea paniculata grandiflora, Salvia splendens Glory of Zurich, a fine variety for bedding, the flowers being of the same colour as those of the species but produced far more profusely, the plant being dwarf and compact; sweet peas, Heliotropium President Garfield, herbaceous phloxes, Gnaphalium microphyllum, a slender-growing species with silvery leaves, and many attractive subjects.

The beds on the fine breadths of turf to the right and left of the fountain have been wondrously beautiful, and are still very attractive. They evince a remarkable diversity in their arrangement, and it is evident that Mr. Marlow endeavoured to have them as varied as possible, but without any deviation from the canons of good taste. To give a detailed description of any considerable number would require far more space than is available at the present time, and a brief reference to a few of the more noteworthy will serve our present purpose. Specimen Calceolaria Burbidgei, ivy-leaved pelargoniums, heliotropiums, lantanas, Streptosolen Jamesoni, and a few other subjects are used freely, and with surprisingly good effect. In some cases they are used in groups of one kind, and in others two or three are in association. The specimens range from four to five feet high, and the bed of Ivy-leaf Pelargonium Galilée, herewith illustrated, will afford an excellent idea of the charming effect produced. This is perhaps the best of the pink varieties in its section, for while strong enough in growth to form good specimens within a comparatively short period, it is not unduly luxuriant, and it has the merit of blooming with great freedom. The heliotropium chiefly used in specimen form is President Garfield, a variety in which vigour of growth and freedom of flowering are happily combined. In one bed it is associated with the white-flowered swainsonia, and in another with Streptosolen Jamesoni; in both cases the combination is satisfactory, but the deep blue flowers of the heliotropium form the most pleasing contrast to those of the swainsonia. Foliage plants four or five feet in height are also rather freely employed, and a bed furnished with the rich crimson Iresine Lindeni and the silvery variegated form of Veronica Andersoni was made note of as being very attractive.

A highly effective bed on the main walk to the south-east of the Palace is that planted with Glory of Zurich salvia, and having bushy examples of the silvery Leucophytum Browni as dot plants, the contrast of white and scarlet being particularly pleasing. The last-named has also been used as dot plants in two circular beds filled with a pink-flowered tuberous begonia, with much success. The begonia is Major Hope, a dwarf-growing variety, with medium-sized flowers that are borne on stiff, erect stems. These beds are near the entrance to the Wilderness. There are numerous beds of roses, in which violas are used as a carpet, and there are several long beds of sweet peas that have been particularly good and now afford a fine display of flowers.

Visitors to Hampton Court, when they have exhausted the charms of the many flower beds on the wide-spreading lawns, should not fail to have a peep at the sunk garden at the southern end of the Palace, and on the south side of the walk leading to the structure containing the famous old grape vine. It is not possible to walk round this old garden under the shade of a pleached alley, as in the case of the new sunk garden at Kensington Palace, but a good view of its occupants is obtained from the north end, whence also a good idea may be formed of the characteristic features of a style of garden design that belongs to the Tudor period.

A CHARMING LAWN GROUP OF IVY-LEAVED PELARGONIUM GALILEE AT HAMPTON COURT.

FERN DANGER SIGNALS.

To speak of a danger signal in connection with ferns, or to imagine their power to hoist one in case of need, strikes one as absurd, but, as we shall see, it is practically done, though doubtless generally ignored. In innumerable cases we have noticed that the fronds of ferns attacked by weevils or even caterpillars change their colour to a very pale green, sometimes almost white, and the curious part of it is that it is not merely such fronds as may have been bitten, but the whole plant which displays this change, and even merely associated ones in the same pans of seedlings where such are concerned may be affected. So marked, indeed, is this change of colour that we accept it as an infallible indication of the enemy's presence, and invariably succeed by plunging the pot under water in forcing the pest out of its hiding place and despatching it

That the change of colour is due to some subtle influence on the chlorophyll is proved by the fact that a few hours after the removal of the vermin the fronds resume their normal green colour entirely. Unfortunately our collection under glass suffers so much from weevils and caterpillars, despite the most persistent hunting, that practical proofs of our statement are continually being afforded, the foe invariably being found to be present when the danger signal is shown. When, however, we mention the facts to friends, they invariably impute the idea that ferns can turn pale when danger threatens them to the imagination of a "crank," and we should, therefore, be greatly obliged if any fern lovers would make a note of these remarks and report pro or con, as the case may be, in connection with their own experiences.

In pans of seedlings which have reached the stage where pricking out is essential, a more or less dense bush resulting, both weevils and caterpillars, too, often find congenial harbourage, almost defying detection by simple search, and it is among such that, in addition to gnawed fronds, the discolouration or bleaching is invariably displayed. Our plan is to fill a small bath with sufficient water to nearly submerge the fronds. In a minute or two, rarely exceeding five, all the weevils and caterpillars present will make their way up the fronds until they reach the air, when, of course, they are easily seen. A ten-minute submersion may be safely relied upon to bring all to view, the pan being then lifted out and allowed to drain; by the next day, at latest, the normal green colour will reassert itself and healthy growth be resumed. Where trouble of this kind is frequent it is well to recognise the traces of the various kinds of pests at as early a stage as possible. Caterpillars may be traced by their droppings, even in their very young and most insidious stage, and before they have begun to travel far, and when these are noted it is the searcher's own fault if the depredators be not secured. The deposits of the weevil are found on the fronds as small brownish wet blobs, and the culprit is then never far away, since as a rule it stays near its larder. By noticing these indications it is often possible to prevent considerable damage, since a very small damage to a young, rising frond means a big gap in the full grown one.

Chas. T. Druery, V.M.H.

Rhododendron Maddeni magnificum.—The typical Rhododendron Maddeni has been long known as one of the latest of the tender Himalayan rhododendrons, as its long-tubed white flowers are often borne well on into July. The variety magnificum has flowers which are larger than the ordinary kind, and are also tinged with rose.—W. T.

AMONG THE ALPINE FLOWERS.

> "Wisdom and sadness are as near, blithe youth,
> As sun and shade. Would it were otherwise!
> Experience, feeding upon all life's sweets,
> Itself turns sour."
> —ALFRED AUSTIN ("Savonarola").

We have not been feeding upon "life's sweets" in the alpine garden for some time. The weather has frowned for long, and only on a chance day now and again has the sun smiled upon us. Nature has been frowning and weeping upon us, and now we can only find a comparatively few things to cheer us when September dawns. Yet the rock garden is not barren, though driving rains, cheerless skies, and low temperatures have checked the appearance of the autumn flowers, and have driven too quickly away the blossoms of the earlier plants. We have had to feed too much upon the sours of life, and we welcome a brighter day when it comes, thinking, happily, it may be the precursor of blither times for the gardener and the husbandman. As this is being written fields are saturated and many flooded. The floods are out and sheaves stand in water; lakes appear where no lakes should be, all dotted with little islets of trees, or lined with hedgerows deep in water And the garden is less bright than usual, so that our gleanings will be few and duller than is their wont. But we shall see what we can glean from among the scattered flowers, remembering all the time that this is not the season for the alpine, which, as a rule delights in the wakening spring or the long summer day, and bids us farewell when autumn yields her golden freight to the reaper.

Androsace lanuginosa.

Wonderfully bright for some time has been the Silky Rock Jasmine, one of the beauties of the alpine flowers of the time. It has a long season, coming in summer and ofttimes lingering until its white, soft, silky leaves are made still more silvery by the touch of the hoar frost; even then its flowers may yet be in bloom, the neat heads of blossom being bright with their soft rose, yellow-eyed colouring. A handsome plant of this is really charming as we see it trailing over the rockeries, nigh as beautiful in leaf as in flower. But it is not everywhere that one meets with it in large plants. I once had a photograph of a very fine plant of this androsace sent me from Totley Hall, and very beautiful it was in the representation. But only those of us who know this rock jasmine could imagine the beauty of the original, and realise how great a delight such a fine plant would be to its owner. It is not easy to grow this androsace to such dimensions, and it requires care and consideration, not only in the planting but in the after-cultivation. Not that the androsace is unusually exacting in its requirements. It is apparently quite oblivious to extreme cold—at least any cold we have in these islands. But it cannot stand much winter rain, and, in consequence, it craves for shelter from the rainfall, the sleet, and the frosts of winter, when accompanied with much moisture. A sheet of glass, raised overhead and fixed by means of one of Wood's plant protectors or a like contrivance, will preserve it, and even a slate or a box lid, raised in like manner about six inches above it, so as to ward off the rain, will be a shelter appreciated by this androsace, and will enable it to stand for many years and to increase in size and in beauty. A soil of loam, grit, and a little sand and leaf-soil will grow it well. It is best trailing over a stone and in a sunny position, although it does not object to half-shade. So now we enjoy the pretty leaves and flowers of Androsace lanuginosa, with all their charms heightened by the absence of its rivals of the earlier time.

A Graceful Heath.

Delightful things in the garden are the autumn heaths, though we cannot hope to rival in our rock gardens the effect of the many acres of the wild heath which empurples long miles of our mountains and hills. But the rock garden is the place for the choice varieties of these heaths, and also for those species which are not to be found within easy reach of our homes. Because Calluna vulgaris, one of our commonest heaths, is plentiful, and many acres of this lovely flower are to be found near by, we need not despise its allies in our gardens. Then one soon learns that everybody who visits one's garden admires these heaths, and that a sprig of any one of them is welcomed for the gown or the buttonhole. More appreciated, however, than the coloured heaths are the white varieties, the "Lucky White Heathers" of the market and the nursery. Not many, even among those fond of flowers, are acquainted with any number of these white heathers, and among those which are little known is a pretty variety of Calluna vulgaris, the true ling, called by the long name of Calluna, or Erica vulgaris alba gracilis. The varietal name of gracilis is aptly bestowed, because of the graceful habit of this variety. In this it is a real alpine, lacking the stiff, erect habit of so many of our heaths, and yielding in graceful sprays of foliage and white flowers. I find it a little later here than some of the other white varieties, but this may be partly due to its position. It is a good plant to grow, and as it is naturally inclined to root as it droops to the ground, it is easy to increase by layering. It was sent out, if I remember aright, a few years ago from a North of England nursery. It will grow in loam, as many of the heaths will, so that peat is not needed for this lovely "lucky white heather."

The Silky Cinquefoil.

Looking through the rock garden one comes upon the lovely Potentilla lanuginosa, a little-known shrub, in flower. Very beautiful is this plant, although the flowers are being hindered by the absence of sun and the dull skies which are saturated with moisture. It has been a satisfactory little shrub with me for a goodly number of years, and it never fails to give its yellow flowers every year in late summer and autumn. Bright and pretty are these, on bushes now some two feet high, although it has taken them long to attain this height. Potentilla lanuginosa, for such is its name, was only some six inches high at first. Its attractions do not consist solely in the yellow flowers about an inch across, beautiful as these are. They lie as much in the dainty, silvery, silky leaves all prettily notched, which make a grey mass on a tangle of thin wiry branches. As a plant for the rock garden this alpine, silky cinquefoil is a gem, and few there are who see it who do not wish to adorn their gardens with Potentilla lanuginosa. It is superior in every way to P. Fredreichseni, or any variety of P. fruticosa. Like many good garden flowers of its class, it is a native of the Caucasus, and it appears to have as much a liking for our northern clime as the majority of flowers which we owe to that cradle of the Caucasian race.

Other Flowers.

But these do not exhaust our delights, dull as is the time. There are other heaths than that spoken of. White and purple, and crimson, and almost lilac are their little bells. Then we have violas, tunicas, silenes, campanulas, meadow saffrons, dwarf starworts, betonicas, linarias, alliums, geraniums, geums, and many little flowers, which, as we look upon them seem to say: "Why write so dolefully? The garden has much to cheer you. The skies may frown but we don't. Come among us and have your heart lightened by our brightness and our beauty."

S. ARNOTT.

TRAINING FRUIT TREES.

Those who, like myself, have had the opportunity of seeing the gardens at Frogmore, now so thoroughly altered during recent years, cannot but admire the skill and care exercised in the training of the fruit trees, on the walls especially.

In many good gardens where culture is a point evident in the matter of production in fruit, flowers, and vegetables, do we find ill-trained fruit trees. Gardeners there seem to think that no matter how the branches are secured to the wall, crooked or crossing each other, the result will be the same. Well, this is not so, as apart from the appearance of the trees, which, to a person who has had a practical training in hardy fruit culture, is most unsatisfactory, the manner in which some are trained influences their productiveness.

When a plum tree, for example, has its main branches radiating away from a centre at a reasonable distance apart, increasing in width the further they get away from the base of the tree, there is surely more space for leaf maturity and branch development, and thus the tree is in a much more satisfactory condition for the production of a fruit crop. Some seem to think if the branches are made fast to the wall that is all that is required, not giving a thought to the appearance of the tree. Surely such training is bad for their juniors. What is worse than an ill-shapen peach tree? The peach, of all trees, is the easiest to manage, and one of the earliest to exhibit the ill-effects of bad management.

At Frogmore the wall trees are models of what trained trees should be, and they are not a few. A recently established plum wall, mainly of the gage type, affords an example of how trees should be handled. It matters not upon what aspect the trees are growing, or what they are, plums, cherries, pears, or peaches, the result is satisfactory. I have been much interested in the huge peach wall from which one thousand dozen fruit have been gathered in one season.

There is too much excuse made nowadays by those who fail to grow satisfactory peaches on walls, and they say the English climate has so changed that peaches cannot now be grown! Those who see examples like the one quoted smile at such an excuse. This systematic training of fruit trees at Frogmore is not alone confined to wall trees, but extends to the bush apple trees growing in the open. Where could a finer set of trees of Cox's Orange apple be found than are growing in front of this same peach wall? The trees are uniform in height—eight to ten feet—with branches thinly disposed, not one crossing its neighbour, as is too frequently the case.

E. M.

USEFUL GUIDE TO GARDEN WORK.—A handy all-round guide to work in the garden month by month is the GARDENING YEAR BOOK, by George Gordon, V.M.H., price 1s. net from booksellers, or by post 1s. 3d., from W. H. and L. Collingridge, 148 Aldersgate Street, London. The book is freely illustrated and the cultural details thoroughly practical and up to date.

TREES AND SHRUBS FOR COLOUR EFFECT.

Ornamental trees and shrubs are probably seen at their best at the present season of year, and it is a good time to note some of the more beautiful kinds for planting at the proper season. When tastefully grouped and arranged few things are more effective, and, with the numerous kinds to choose from, there need be no lack of variety in the garden. When planting all evidence of formality must be avoided or the pleasing and natural effect which is so marked in these gardens would be lost. Undulating ground lends itself to the most effective arrangement, but in all districts much can be done to improve the general effect by forming mounds here and there, and thus creating an undulating surface, which gives a more pleasing effect.

The magnolias are very showy, and of these Magnolia stellata, with its scented star-like flowers, is well adapted for small groups in the shrubbery or rock garden. M. Soulangeana, with purple tinted flowers; M. grandiflora, an evergreen species, with sweet white blooms produced in September; and M. conspicua, are highly meritorious. The Guelder Rose (Viburnum opulus sterile) and V. plicatum are both attractive, while V. macrocephalum has very large heads of white flowers. Ceanothus azureus is a charming shrub, which displays a mass of pale blue flowers during the summer, and C. Veitchianus is a lovely variety of a much darker shade, flowering in June. The common Mock Orange (Philadelphus coronarius) is a lovely object when in bloom; while P. microphyllus is a charming species from Colorado, which flowers rather later. Many of the berberis are exceedingly showy during the spring, and of these a more graceful object than Berberis stenophylla, with its numerous bright yellow flowers, could hardly be imagined. B. Darwini, B. vulgaris, B. diaphana, B. buxifolia, B. japonica, and B. aquifolium are all worthy of attention. In the autumn the crimson foliage of Cotoneaster Thunbergi is very showy.

When given a sheltered situation Choisya ternata flowers very freely, and presents a charming appearance in the rock garden. Pyrus japonica, P. floribunda, and P. Maulei are delightful shrubs when in blossom during the spring. The Flowering Currants, Ribes sanguineum and R. speciosum, from California, are very beautiful, but unfortunately the last-named is not so hardy. Some of the lilacs are very showy, and of these Charles X. and Madame Lemoine, a double white variety, are two of the best. Prunus triloba is lovely during March and April, with its double rosy-pink blossoms. The Japanese maples are probably the most handsome trees in the arboretum, and of these Acer palmatum sanguineum, A. palmatum dissectum, and A. purpureum are especially good. Acer negundo variegatum is also very attractive. Some of the hollies make ornamental specimens for the lawn. Ilex argentea marginata, I. ferox argentea, I. aureo marginata, and I. aureo regina are all handsome. There are several varieties of oaks which make handsome trees, notably Quercus coccinea, with its large scarlet leaves, and Q. concordia, with soft yellow-tinted foliage, are exceedingly fine. Prunus Pissardi, Fagus sylvatica purpurea, and F. cuprea are very attractive, and are very effective in a large clump associated with Populus canadensis nova aurea and Ligustrum ovalifolium aureum.

Cornus sanguinea and Salix canadensis are very effective when planted in masses, especially in close proximity to ornamental water; their coloured stems form beautiful objects during autumn and winter. Rosa rubrifolia, Sambucus aurea laciniata, Rubus fruticosus, and R. odoratus are effective for massing in beds. Vitis vinifera purpurea and V. Coignetiæ are quick-growing climbers, with richly coloured leafage. The latter is especially ornamental when seen scrambling over the tops of large trees. Liquidamber styraciflua, the sweet gum of the United States, is very effective in autumn on account of its bright scarlet foliage. It succeeds best in a moist loamy soil and sheltered situation. Forsythia suspensa is a lovely shrub that should not be omitted. Its bright yellow blossoms are produced in profusion during March and April on the wood of the previous season's growth. Amongst the conifers, Abies pungens glauca, Cedrus atlantica glauca, Cedrus deodora alba spica, Retinospora filifera, R. squarrosa, Juniperus chinensis, Cupressus Lawsoniana, and C. erecta viridis are all handsome, and effective additions to the grounds.

THE ORCHID HOUSES.

DENDROBIUM PHALÆNOPSIS.—There is no orchid more deserving of attention in private gardens that D. phalænopsis. In most establishments there is a demand for cut flowers during the months of October and November to break the monotony of the ever-abundant chrysanthemum, and where the plants are grown in quantity there is an extensive variety of colours among them, and this, combining with the long-stemmed graceful racemes of flowers, renders them suitable subjects for superior floral decorations. It does not seem many years ago since the only plant in cultivation was in the writer's charge, but thanks to the energies of David Burke, and collectors of more recent date, this dendrobium has been placed within the reach of the most humble of amateur gardeners, as the extensive annual importations have resulted in their being sold for fewer pence than they brought pounds a few years ago. This dendrobium is by no means difficult to cultivate. I find that the plants do better grown in shallow pans or baskets, and suspended in the plant stove, than they do when grown with the other dendrobiums. I recently saw a large fig house, with the second crop of fruits ripening, and here, suspended from the wires to which the branches of the fig tree were secured were some 250 plants of D. phalænopsis that had been in cultivation for some years, and the plants appeared to have lost none of their native vitality, the quantity of flower spikes displayed indicating a generous display in a few weeks. There is one item that appears to me to be essential in the successful culture of D. phalænopsis, and that is it should not be permitted to suffer from want of root moisture at any season of the year. If grown in the stove, where the atmosphere is more or less charged with moisture at all seasons, very little moisture at the roots is necessary to keep the plants healthy.

D. FORMOSUM GIGANTEUM is another useful dendrobium blooming in September and October, and its white flowers are acceptable at this season in most country gardens. This species is often written about as quickly losing its native vigour, and gradually diminishing both in stature and constitution under cultivation; this, I am certain, is the result of unsuitable conditions. The prolonged dry, cool rest which is so frequently given this species is perhaps more detrimental than anything else to the well-being of the plants. They should be placed in the stove, with ample moisture when growing, and when dormant sufficient root moisture should be afforded to keep the pseudo-bulbs and leaves fresh and plump.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

BOUVARDIAS. — Where these have been planted out during the summer, the plants should be prepared for potting up by cutting round the roots with a sharp spade a few days previous to lifting. After such treatment the plants will not suffer so severe a check. When they have been potted keep them in a shaded frame in a temperature of 50 to 55 deg., and syringe them freely until they have become re-established in the new soil.

HERBACEOUS CALCEOLARIAS.—Seedlings in small pots should be potted directly the roots touch the sides of the pots, so that they may not experience any check; it is important that calceolarias should continue to grow steadily at all times, as insect pests are always ready to attack those that fall into a poor condition.

CHRYSANTHEMUMS. — Plants being grown for the production of large or decorative blooms, should be given top-dressings for the purpose of increasing root action, and stimulants should be applied afterwards. For top-dressing purposes two parts loam to one part of animal manure is a safe mixture. If clear soot water be applied twice a week, it will improve the colour of the foliage, while an occasional syringing with soot water will keep down red-spider.

MALMAISON CARNATIONS. — Shoots that were layered some time ago will now be fairly well rooted, and should be severed from the parent plant with a sharp knife. Pot them into three-inch pots, using a compost of good fibrous loam mixed with leaf-soil, lime rubble, wood ashes, and sand. Use clean pots, and provide plenty of drainage. Pot fairly firm, especially round the "collar," and so that an excess of water may not be given, fill the pots almost up to the rim. Place the newly-potted plants in a cool frame, which should be kept close for a few days, and if the weather is bright syringe them once each day. When they have recovered from the check caused by potting, ventilate the frame freely, and allow the plants a maximum amount of light; they are best raised close to the glass, facing south, and stood on ashes. They may remain in this structure and position until frost makes its appearance, when they must be transferred to warmer quarters. Plants that have not been layered should be potted immediately.

BULBS.—To obtain a succession of bulbous flowers after Roman hyacinths and polyanthus narcissus, various tulips, such as Duc Van Thol, Belle Alliance, Cottage Maid, La Reine, and Vermilion Brilliant, with crocus in different shades, should be potted without delay. The compost should consist of equal parts of loam and leaf-soil, with plenty of sand added. As in the case of bulbs already potted, they should be placed on ashes in the open, and covered with the same material. Until about an inch of growth has been made, batches should be potted every week for a succession of bloom.

SALVIAS, intended for blooming early under glass, and which have been growing out of doors, should be taken inside. Care should be taken that they never become dry, otherwise all the bottom leaves will drop; stimulants twice weekly will help to develop the flower spikes.—W. Staward, Belford Hall Gardens.

THE FLOWER GARDEN.

PROPAGATION OF BEDDING PLANTS by cuttings should now be completed, or where this is not so, the work should be hurried forward with all possible speed. One of the greatest drawbacks connected with the usual style of bedding out is, that no sooner are the beds fully furnished, and giving a display of colour, than cutting them about begins for the next season's supply of plants. Small wonder is it that bedding-out with hardy and half-hardy plants is fast superseding the old style, and in some instances bedding pelargoniums are being discarded altogether. Where these, however, are considered to be indispensable, mutilation of the beds at this season of the year might be avoided altogether by lifting and potting up a number of plants from the beds, and propagating from these as early as possible the following spring.

AURICULAS, PRIMROSES, AND POLYANTHUSES, growing in beds or borders, are now generally strong and healthy. These, however, must be kept free from weeds, and the soil around constantly stirred to enable the crowns to thoroughly mature, and so assist in mitigating the injurious effects of the past wet summer, or a meagre display of flowers will result next spring.

BULBS that may be required for the flower, alpine, or wild garden should be ordered—if not already done—forthwith, nothing is gained, except confusion, by delaying their purchase. Consequently, as soon as the arrangements for next spring's display are completed, the bulb order should be put in hand.

WINTER ACONITES should be planted as soon as possible. These, unlike some others, will grow and thrive where grass refuses to grow, especially under large chestnuts and similar trees, where ordinary undergrowth is an impossibility; groups of daffodils dotted about these make an effective and pleasing display long after the aconites have ceased flowering. Both these subjects are unsurpassed for early spring effect in the wild garden or shrubbery borders.

PLANTING EVERGREENS.—Seldom has the ground been in better condition for the removal of, or the early autumn planting of, evergreen shrubs. Where this kind of work has been decided upon, all needed preliminary arrangements should be put in hand forthwith, so that by the end of the present month the work may begin in earnest. During a season like the present, early autumn lifting is decidedly beneficial, rather than otherwise. The effect of the root disturbance will result in arresting and hardening the growth, even during an ordinary season. Early lifting might be recommended, providing it is possible to well soak the soil around the roots of the trees before spade-work commences. Few shrubs suffer if treated in this way, but, on the contrary, are greatly benefited, and become semi-established in their new quarters before the advent of wintry weather.

THE GENERAL WORK of the flower garden must on no account be neglected because of the advance of the season, or the expectation of early frosts in exposed positions; on the contrary, protection should be forthcoming should the nights prove frosty, for frosts seldom come upon us for any length of time before the end of October. All edgings should now have their final clipping, and the walks kept clear of weeds; these should entail no further trouble in this respect until next spring. Keep all beds and borders in as neat a condition as possible by the persistent removal of all seed pods, or partly-decayed flowers. The ripened growths of all herbaceous plants might be removed, and those requiring additional ties by way of support should be duly attended to; in a word, neatness should be the order of the day until the general break up by frost begins. — W. Hedley Warren, Aston Clinton Gardens, Tring.

HARDY FRUITS.

PREPARATIONS FOR PLANTING.—Where the planting of new fruit trees has to be conducted a short time hence, the work of preparing the ground for this operation should, if possible, be taken in hand at once. The ground should be trenched at least two feet deep, and if the soil is of a poor character, a good dressing of decayed farmyard manure should be added as the work of trenching proceeds. Where stone fruits are to be planted plenty of road scrapings and old mortar rubbish should be worked into the soil, in addition to the manure. If, on the other hand, the soil is in good condition, and plenty of humus is present, the farmyard manure should be dispensed with, or otherwise the soil will be too rich in nitrogenous matter, and, consequently, this will induce the young trees to grow strongly, and little or no fruit will be the result. The planter should push forward the work of preparing the ground, otherwise confusion and poor results will follow, the trees often being planted in soil that is entirely uncongenial to their roots and future welfare.

VARIETIES.—At the present time careful note should be made of the varieties which one intends to plant, and the orders should be placed with some reliable nurseryman, so that the trees may be lifted, and delivered at the proper time, directly their leaves have fallen, towards the end of October and the beginning of November. This may seem a comparatively small item to some planters, but it certainly has the advantage of securing good, well-grown trees, and the requisite number of varieties are obtainable, as no disappointment is experienced, because certain sorts are "sold out." If there are any undesirable varieties that are being grown at the present time—and it is not intended to head them back and regraft them in the spring months—the trees should, when the fruit has been gathered, be grubbed out, and the soil be well trenched and manured, when it will be quite possible to plant suitable varieties upon the same site.

GATHERING APPLES AND PEARS.—This will entail a good deal of pleasant work and careful observation for some weeks. Varieties will have to be carefully watched and gathered, when it has been ascertained beyond doubt that they are fully matured. The fruits should be carefully gathered and put into shallow boxes, with a little hay or soft packing material placed in the bottom; careful handling of the fruit should be exercised at all times, so as not to bruise any of the specimens. We find it a great advantage here to use shallow boxes, which can be placed upon the hand barrow, and safely transferred to the fruit-room. Here they are again carefully examined, and all damaged fruits are placed in baskets for immediate use; the remainder are graded into two sizes, the large and medium being kept separate, and these are immediately placed carefully away upon the shelves in the fruit-room, in a single or double layer as space permits.—Henry R. Farmer, Cardiff Castle Gardens.

CHRYSANTHEMUMS.—For full instructions on the Culture of Early-flowering Chrysanthemums in pots or borders for garden or greenhouse decoration, read the Second Edition of CHRYSANTHEMUMS FOR GARDEN AND GREENHOUSE, by D. B. Crane, price 2s. 6d. net, or by post, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

GRAPE PRINCE OF WALES.

It is a pleasure to have Mr. Coomber's experience of this grape. I had it inarched on Gros Colmar in a muscat house; it grew freely, and showed good bunches, which did not set as well as I would have liked, even with artificial aid; the berries that did swell were large, inclined to be red, and the flesh too solid and flavourless. I had another vine of the Black Hamburgh, which did no better. I fruited both vines two years, and then rooted them out, and consigned them to the rubbish heap. Our old tried sorts are difficult to beat, never failing to do well when treated in a proper manner.

When writing about grapes, I would just like to mention some of the newer varieties tried here during the last few years. Diamond Jubilee is a handsome grape to look at, easily grown, with large berries, and fine finish, but the principle quality, flavour, is very poor indeed.

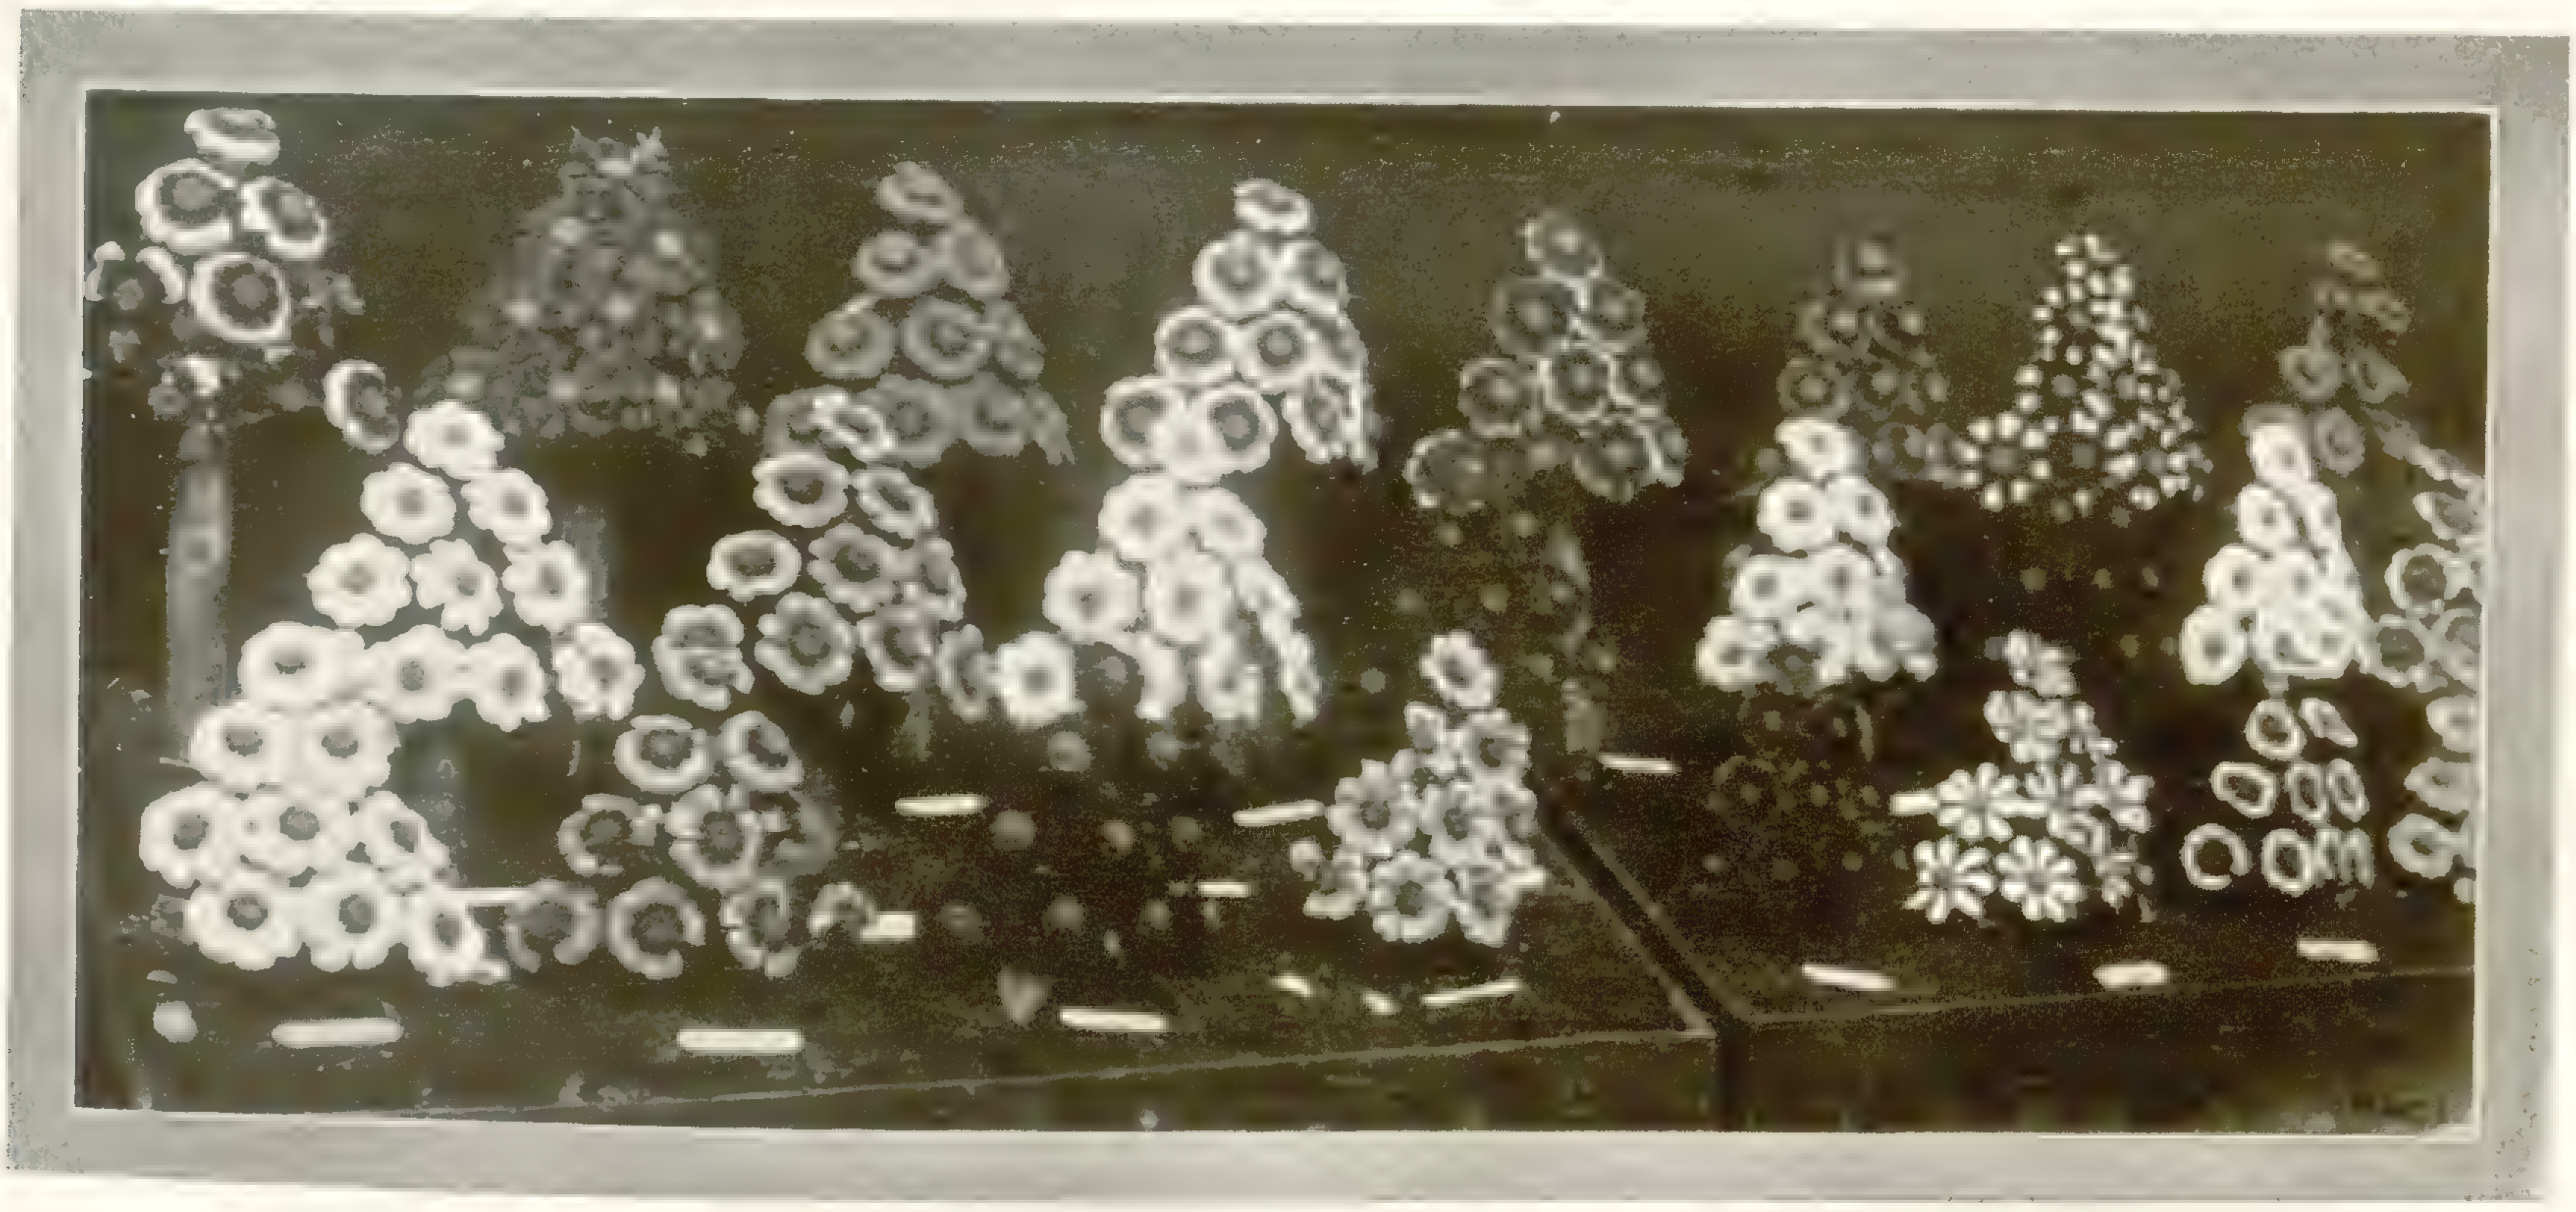
Lady Hastings, I consider too like Muscat Hamburgh. With me it had a stunted growth, often found in Cannon Hall Muscat. The wood was strong, and bore bunches freely, but the fruit did not colour well, and the flavour was too much like the Sweetwaters.

Melton Constable (if I have the right variety) I have in a Muscat house and Colmar house, and in both it seems the same as Gros Colmar; perhaps the raiser or some grower who has found it an improvement on Colmar, would give their experience, through your columns. Lady Hutt, grown in a Muscat house, colours well, and the flavour is thereby improved.

Appley Towers is an acquisition to the late varieties; it grows strong, fruits freely, and finishes well, keeping longer plump than Alicante.

W. G. PIRIE.

Dalhousie Castle Gardens, Mid Lothian.



FIRST PRIZE COLLECTION OF TWENTY-FOUR VARIETIES OF SINGLE DAHLIAS.

Exhibited by Messrs. J. Cheal and Sons at the National Dahlia Society's Show.

The notes by Mr. Coomber on Prince of Wales grape are of much interest to grape-growers generally, and I agree with him that it would prove of much value to grape growers, if those who have grown the variety would give a short account of their experience with it. I have grown this grape during the past six or seven years with results that may, perhaps, be described as very good. With me, as with Mr. Coomber, the greatest difficulty has been to induce the flowers to throw off the cap, and so expose the pistil, and thus enable the pollen grains to reach it and ensure fertilisation. This has been the worst year in this respect since I commenced growing the variety. I tried rubbing my hand over the bunches, but the caps would not move. I had quite made up my mind to use the syringe another year during the flowering period. As regards scalding, I find that with very light shading there is not much damage done.

I inarched the Prince of Wales on Gros Colmar, but, although it has made a strong growth, it has failed to set a single berry. I have had this grape to set well, and with one exception, to finish well. I exhibited it at the Royal Horticultural Society's Fruit Show, held on October 15, 1908, and, although not quite so well finished as I could have wished, the bunches were perfect in setting, as can be seen by referring to the GARDENERS' MAGAZINE of October 31, 1908, where they are illustrated. In the previous year I exhibited this grape in competition, where, in addition to the first prize, I was awarded the silver medal offered for the best exhibit in the show.

About three years ago I planted a cane of Prince of Wales in a corner of an early vinery, from which we cut our first grapes at the end of May. Now this vine has flowered satisfactorily, and set very well, and from it I showed bunches in June last at the exhibition of the Richmond Horticultural Society, and at a later show, and at both they secured the premier award, and were described in the reports in the gardening press as good examples. If I were going to plant an early vinery, I should not hesitate to include Prince of Wales in the selection. It forces well, and if it can be induced to set well it is, in my opinion, one of the very finest grapes grown; any information on this point will be most useful. With this note, I am sending for your inspection a small bunch from the early vinery which ripened about the middle of June, and I think you will admit that it is a good keeping grape.

W. LINTOTT.

Marden Park Gardens, Woldingham.

[The bunch of Prince of Wales grape that Mr. Lintott has sent for our inspection is perfect in setting, the berries are large and finely-coloured, and the flavour is rich with the characteristic muscat flavour well developed. The bunch has the appearance of having only just reached maturity. The fact that the vine in the early vinery has set its fruit satisfactorily, and the vines in the other houses have not this year set so well as usual, suggests that possibly a comparatively high temperature is favourable to the berries setting freely. What is the opinion of Mr. Lintott, and other cultivators upon this point?—ED.]

Mr. Coomber's note on this grape will interest many, those who are successful in the culture of it, and those who are not so. That it is a grape worth growing those who are successful with it will admit. It was well shown several years ago from Warren House, Stanmore, and also last autumn by Mr. Heron, from Capenod. This season I have seen some failures in the "setting" of this variety, and I have also seen some good examples of it where it has been treated as an early grape, and also where it will be in good condition later.

There appears to be at times some difficulty in its "setting" properly, through the "cap" not falling off freely, as is the case with most varieties, and I think if Mr. Coomber applies the syringe to the bunches just as they begin to flower, he will have no difficulty in obtaining a "set," as this use of the syringe is practised by some growers. Knowing the assistance this grape requires at the flowering stage, I should not consider Alnwick Seedling a good stock for inarching it on, but if I was going to inarch it, would prefer Alicante as a stock, or Lady Downes for later keeping. The scalding of the foliage which Mr. Coomber mentions I have not seen when the grape has been growing on its own roots, and it may be the Alnwick that is responsible for that. My experience of grape Prince of Wales is that it is a promising late variety, with good sized berries, nice shaped bunches, and of distinct muscat flavour. I believe I am correct in describing it as a sport from Mrs. Pince—I am writing from memory—it closely resembles Mrs. Pince in foliage and flavour, but finishes better and with finer berries.

It is a strong grower on its own roots, and so grown I should restrict the rooting space in the early establishing of this variety, while I should not give it too much manure until it had good crops to carry.

Other growers of this grape will no doubt give their opinions. I hope, however, to yet see Mr. Coomber show this grape in as good condition as he has staged other fruits at various times.

T. H. SLADE.

Ipomæa rubro-cærulea.—A few years ago we heard a great deal of the beauty of this ipomæa, and it was frequently met with, both out of doors and under glass. Without protection it often proved to be a failure, and that is no doubt why it declined in popularity. In the greenhouse, however, it is delightful, the large convolvulus-like blossoms, in colour a charming light-blue with a reddish sheen, being totally unlike any other occupants of the structure. It needs to be sown in heat in the spring, and grown on freely afterwards.—W. T.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

National Dahlia Society.

Although the exhibition held at the Crystal Palace on September 8 and 9 was not one of the largest held by the society, it was one of the best in point of quality. We should like to see a keener competition in some of the classes, and also the presence of more new growers, both trade and amateur.

SHOW AND FANCY DAHLIAS.

In the leading class for forty-eight show varieties, open to nurserymen, Mr. John Walker, Thame, secured the premier award with a clean set of fine flowers, some of which were scarcely yet at their best; some of the finest were Majestic, Rev. Gooday, Mr. Chamberlain, J. Hickling, R. T. Rawlings, D. Cornish, Blush Gem, Chieftain, and Ethel Britton; Mr. S. Mortimer, Rowledge, Farnham, came second, and most of his blooms needed more sunshine; Mr. W. Treseder, Cardiff, third. Mr. M. V. Seale, Sevenoaks, had the best set of twenty-four show and fancy dahlias, and he showed J. Rawlings, D. Cornish, Buffalo Bill, Chieftain, and Bacchus in good form; Messrs. Keynes, Williams, and Co., Salisbury, came second. For eighteen fancy dahlias Mr. J. Walker scored with a set that contained good representations of M. Campbell, Rev. J. B. Camm, Duchess of Albany, Mrs. Saunders, and Emin Pasha; Mr. W. Treseder came second, and Mr. S. Mortimer had to be content with third place. For a dozen blooms of these effective fancy varieties Messrs. Keynes, Williams, and Co. scored over Mr. M. V. Seale, these being the only competitors.

For a dozen blooms, show and fancy varieties mixed, Messrs. J. Cheal and Sons led, followed by Messrs. W. Pemberton and Son, Bloxwich, Walsall, both showing well.

NURSERYMEN'S CACTUS DAHLIAS.

The silver challenge cup, value fifteen guineas, offered as the first prize for a collection of eighteen bunches of cactus dahlias, distinct, six blooms in a bunch, was won by Messrs. Jas. Stredwick and Son, St. Leonards, who had a beautiful set composed of Crystal, Albatross, Indomitable, Irresistible, Wm. Marshall, H. H. Thomas, Rev. A. Bridge, Dr. R. Appleton, Viscount, H. L. Brousson, Satisfaction, Mrs. Douglas Fleming, Red Admiral, Golden Eagle, C. E. Wilkins, Arrow, Tokio, and Snowflake; Messrs. J. Burrell and Co., Howe House Nurseries, Cambridge, was second, and the dark variety named The Imp was a feature of their stand; Messrs. J. Cheal and Sons, Crawley, third.

There were four competitors in the class for a dozen bunches of cactus dahlias, distinct, six blooms in each bunch, and here Mr. J. Walker was an easy first with fine flowers of Snowstorm, Clincher, Mercia, Dr. G. G. Grey, Prima Donna, Mr. T. W. Willis, Ivernia, W. T. Rogers, Brutus, Mrs. A. Dyer, Red Admiral, and C. E. Wilkins; Mr. M. V. Seale second; and Messrs. Keynes, Williams, and Co., third. For forty-eight cactus blooms, on boards, Messrs. J. Stredwick and Son, St. Leonards, were to the front with a goodly set, that included Golden Eagle, Glory of Wilts, Tokio, H. H. Thomas, Ruby Grinstead, Razorbill, Viscount, and New York; Messrs. J. Burrell and Co., Cambridge, second; and Messrs. Keynes, Williams, and Co., Salisbury, third.

In the class for two dozen cactus dahlia blooms, on boards, Mr. W. Treseder scored with a set that contained fine flowers of Mrs. J. J. Crowe, Stormer, Harold Peerman, Mrs. F. G. Treseder, Conquest, and Evening Star; Mr. John Walker came second; and Messrs. W. Pemberton and Son, third.

POMPON AND SINGLE VARIETIES.

Premier place for two dozen bunches of pompon varieties, distinct, ten flowers in a bunch, was won by Mr. Chas. Turner, Slough, with a beautifully fresh and neat set of Bacchus, Ganymede, Jessica, Adelaide, Adela, Montague Wootton, Cyril, Little Mary, Nerissa, Ideal, Hecla, Mariette, Phyllis, Zerlina, Sylvia, Annie Doncaster, Mary, Wilfrid, Douglas, Portia, Mignon, Guinevere, Queen of Whites, and Darkest of All; Messrs. J. Cheal and Sons, Crawley, were a close second; and Mr. M. V. Seale took third prize.

For a dozen bunches, ten blooms each, of pompon varieties, Messrs. J. Burrell and Co. scored with a bright set of Phyllis, Annie Doncaster, Bacchus, Girlie, Nellie Broomhead, Mariette, Queen of Whites, Tommy Keith, Darkest of All, Ideal, Lassie, and Aurelia; Messrs. Keynes, Williams, and Co. second, and Mr. J. Walker third.

A very beautiful set of two dozen bunches of single dahlias won for Messrs. J. Cheal and Sons the premier award and silver medal. The blooms were unusually good, and of fine colour. The varieties were Lady Bountiful, Kitty, Alma, Sunray, Alice Castle, Miss Morland, Brilliant, Flora, Snowdrop, Peggy, Leslie Seale, Hector, Serita, Owen Thomas, Miss Roberts, Victoria, Rosemary Bridge, Betty, Winona, Stromboli, Elaine, Miss Miller, Columbine, and Royal Sovereign. Mr. M. V. Seale, the only other competitor, gained second prize. Mr. J. Walker appeared to be the only exhibitor of a dozen bunches of single dahlias, and he deservedly secured the first prize.

In the class for four varieties of pæony-flowered dahlias, six blooms of each, there were four competitors. Mr. Charles Turner secured first prize with Geisha, Rosina, Bella Donna, and Bayard; Messrs. J. Cheal and Sons came second, and Mr. J. Walker third. By the middle of the afternoon many of the flowers were drooping badly.

AMATEURS' DAHLIAS.

In the amateurs' division Mr. S. H. Cooper, The Hamlet, Chippenham, had the best two dozen show and fancy blooms, and Mr. G. Densley, Nag's Head Hill, St. George's, Bristol, came second, with Mr. G. Boothroyd, Porthfield, Chichester, third. There were four competitors. There were nine contestants in the class for a dozen show dahlias, distinct, and here the awards went, in order of merit, to Mr. S. H. Cooper, Mr. A. Robbins, Prospect Place, Keynsham, and Mr. W. Marks, Rownhams, Southampton. There were three exhibitors of six show dahlias, and here Mr. C. Luckin, Apsley, Thakenham, Pulborough, led, followed by Mr. J. Cousins, May Cottage, Greenway Lane, Chippenham, and Mr. A. P. Ironside, Park Lane, Chippenham.

For a dozen fancy dahlias Mr. S. H. Cooper was again to the front, and Mr. G. Buss, Hailsham, was awarded a third prize, both Mr. T. Jones and Mr. Boothroyd being disqualified for not having perfectly distinct varieties. Mr. J. Cousins led for six fancy dahlias, Mr. G. Densley coming second, and Mr. A. Robbins, Prospect Place, Keynsham, third.

The best table of a dozen bunches of garden cactus dahlias, distinct, six blooms in each, came from Messrs. J. Cheal and Sons, who showed Hon. Mrs. Greville, Thomas Parkin, Snowdon, Mrs. Usmar, Gold Crest, Mrs. Freeman Thomas, Brigadier, Mrs. Alfred Dyer, Mrs. C. Foster, and Flame, associating their flowers with sprays of ornamental foliaged shrubs; Mr. M. V. Seale came second. For six vases of garden cactus dahlias the Rev. Arthur Bridge, Worth Rectory, led with a good set, well arranged with grasses and foliage; Mr. Ed. Barton, 72, Brand Street, Greenwich, second.

There were seven exhibitors of nine bunches of cactus dahlias, three blooms of each, and here the Rev. Arthur Bridge led with fine examples of Red Admiral, Satisfaction, Snowdon, C. E. Wilkins, Prima Donna, H. H. Thomas, William Marshall, and Iolanthe; Mr. F. Grinsted, Beauport Park, Battle, second, and Mr. C. Luckin third. Mr. F. H. Currey, Osborne Road, Palmer's Green, led for six bunches of cactus dahlias, followed by Mr. Edward Mawley, V.M.H., Berkhamsted, and Mr. W. Lockyer, gardener to Rev. G. Twentyman, Greenhill Park, New Barnet.

Out of ten competitors, Mr. Harold Peerman, Glencross, Nantwich, scored for twenty-four cactus varieties, staged on boards, and he had beautiful flowers; Mr. M. W. Dance, School House, Abbott's Ann, Andover, second; and Mr. J. Bryant, 5, St. Martin's Terrace, Salisbury, third. Mr. C. Luckin scored for twelve blooms, similarly staged, followed by Mr. F. Grinsted and Mr. A. F. Tofield, Homesdale, Chandler's Ford, Hants; there were eight competitors. Dr. Roy Appleton, Beverley, Yorks, had the best six cactus dahlia blooms, a fine set of Brigadier, Johannesberg, Gwendoline Tucker, Glory of Wilts, Wm. Marshall, and Marathon; Mr. E. Mawley second, and Mr. R. C. Willis, Palmer's Green, third.

Messrs. Dobbie and Co.'s Gold Badge for the best dozen bunches of pompon dahlias was won by Mr. A. P. Ironside, Chippenham, with a neat set of popular varieties; Mr. H. Brown, Havelock Road, Luton, second; and Mr. W. C. Pagram, New Road, Weybridge, third. For six bunches Mr. S. H. Cooper led, with Mr. A. Robbins second, and Mr. G. Stevenson, Chadworth Cottage, Esher, third. The Rev. Arthur Bridge secured first prize in the class for a dozen bunches of single dahlias, and he had Eclipse, Snowdrop, Brilliant, Betty, and Stromboli. He was the only exhibitor, and Mr. E. Mawley was the only exhibitor in the class for six bunches of single varieties, and in the one for four bunches of twelve blooms each of single varieties.

In the maiden classes Mr. W. Marks and Mr. A. Langridge, Dalston, were the leading prizewinners.

OPEN CLASSES.

In the open classes Messrs. J. Burrell and Co. won first prize for a dozen bunches of pompon cactus dahlias with very pretty flowers of Nain, Little Ned, Martha, Mary, Argus, Lena, Minima, Nora, Wm. Marshall, Sweet, Coronation, and Titus; Messrs. J. Cheal and Sons, second; and Mr. M. V. Seale third. For six blooms of one cactus variety Mr. S. Mortimer led with C. E. Wilkins; Mr. F. H. Currey, second with Harold Peerman; and Messrs. Keynes, Williams, and Co., third with Gwendoline Tucker. Mr. Seale had the best six show blooms, Arthur Rawlings; Mr. Treseder, second; and Mr. Mortimer third.

Messrs. J. Cheal and Sons scored for six bunches of single fancy dahlias; Mr. Seale coming second. Messrs. Stredwick and Son led for six bunches of fancy cactus dahlias, winning with Humming Bird, Mercury, Jupiter, Orion, Magpie, and Sirius; Messrs. J. Burrell and Co., second; and Mr. M. V. Seale third.

DECORATIVE CLASSES.

Mr. W. Treseder was easily first for a shower bouquet of cactus dahlias with a beautiful effort; Mr. M. V. Seale second. Mr. Seale was first, however, for a basket of dahlia blooms and appropriate foliage grasses and berries, with a fine design of yellow and orange flowers; Mr. W. Treseder, second. Mr. Pagram again had the best vase of pompon dahlias, and he was followed by Mr. M. V. Seale.

In the amateurs' section Mr. Ed. E. Barton, Brand Street, Greenwich, led for a basket of dahlias with a bold but not particularly elegant design; Miss C. A. Gladstone, Hampton Hill, Bishop's Waltham, Hants, second. Mr. T. Jones, Ruabon, led for three vases of cactus dahlias, arranged with variegated foliage and berries; Mr. Jas. Bryant, Salisbury, second; and Miss C. A. Gladstone, third. Five competitors.

TRADE DISPLAYS.

Mr. Chas. Turner, Slough, made a display of pæony-flowered dahlias, showing a large variety of both single and semi-double varieties. Messrs. Hobbies, Lim., Dereham, displayed roses in great quantity, and set up tall stands of pæony-flowered and cactus dahlias, associating these with foliage and plants. Mr. J. T. West contributed a large variety of pompon, cactus, and pompon cactus dahlias, and made up a very interesting display. Mr. J. E. Knight, Wolverhampton, put up a very bright exhibit of cactus dahlias with a few early chrysanthemums. Messrs. H. Cannell and Sons, Swanley, had a very large exhibit, chiefly of cactus dahlias, set up in bunches of about nine blooms of a variety. There was a wide range of colours and varieties, and the exhibit was thus of great value to those wishing to make selections. Mr. F. Brazier, Caterham, submitted an exhibit of phloxes, pentstemons, and Michaelmas daisies. Messrs. T. S. Ware, Lim., Feltham, were represented by a display of popular cactus dahlias, and a number of fine new pæony-flowered varieties, several of their own raising. Mr. Williams, of Ealing, showed a table decoration of dahlias.

MEDALS.

Gold.—Messrs. H. Cannell and Sons, Swanley; Messrs. T. S. Ware, Lim., Feltham; Mr. J. T. West, Brentwood; and Messrs. Hobbies, Lim., Dereham.

Silver-Gilt.—Mr. F. Brazier, Caterham Valley; Mr. Chas. Turner, Slough; Mr. J. E. Knight, Wolverhampton.

Royal Horticultural Society.

There was a full meeting on September 13, and a fair attendance. Dahlias, chrysanthemums, orchids, and fruits were the leading subjects on view.

FLORAL COMMITTEE.

Very bright were the single dahlias displayed by Messrs. J. Cheal and Sons, Crawley, especially Columbine, Miss Macfarland, Kitty, and Miss Roberts; the firm also sent a few of the newer cactus varieties. Mr. J. T. West, Brentwood, put up a large collection of cactus, pompon, and pompon cactus varieties, as well as a small collection of his new and gorgeous pæony-flowered varieties. Mr. West had a splendid new garden variety, with large double flowers, belonging to the decorative class; the blooms were eight inches across, on long stiff stems, and of a rich yellow colour, and the name of this fine thing is Brentwood Yellow. Messrs. Carter Page and Co., London Wall, filled the whole of the end of the hall with a gorgeous exhibit of dahlias. In the middle there was a bank of pæony-flowered varieties, and this was flanked with large baskets of blooms, each basket filled with eighteen or twenty beautiful flowers of one cactus variety, and there were about three dozen of those baskets, as well as scores of vases and tall stands of beautiful flowers. At one extreme end there was a collection of pompon varieties, and at the other end a showy group of single varieties, the whole making up a wonderful display of fine quality and brilliant colour. A large, fragrant and charming exhibit of roses from Messrs. Wm. Paul and Son, Waltham Cross, amply demonstrated the value of so many of the hybrid tea varieties for autumn flowering, especially well represented by vases or baskets of bloom were Lyon Rose, Earl of Warwick, White Maman Cochet, Caroline Testout, Mdme. Leon Pain, Dean Hole, Mdme. Ravary, Mdme. Abel Chatenay, Prince de Bulgarie, and Le Progres. Messrs. Jas. Veitch and Sons, Chelsea, displayed Nerine Fothergilli major, in fine form, together with a selection of choice greenhouse rhododendrons, new cannas, and pelargoniums, and some standards of Plumbago capensis. The clematises in small pots, freely-flowered, exhibited by Mr. L. R. Russell, Richmond, made up a bright and attractive group; the variety Nelly Moser was especially good.

A fine exhibit of phloxes, tritomas, liliums, Michaelmas daisies, sedums, montbretias, gladioli, Aconitum Fischeri, Artemisia lactiflora, Eupatorium purpurea, etc., was staged by Mr. Jas. Box, Lindfield. Messrs. W. Wells and Co., Merstham, put up a bright display of early-flowering chrysanthemums, including grand sheaves of Roi des Blancs, Hector, Perle Chatillonaise, Leslie, Golden Glow, and Normandie. Messrs. J. Stredwick and Son, St. Leonard's, had a few beautiful new dahlias, cactus varieties, notably H. L. Brousson (A.M.), and Sweetbriar (A.M.) Mr. W. R. Hammond, Burgess Hill, Sussex, contributed about three dozen vases of sweet peas, showing popular varieties, well grown, but the flowers were not well set up.

Mr. Frank Brazier, Caterham, set up a big exhibit of pentstemons, early chrysanthemums, and Michaelmas daisies. Mr. G. Reuthe, Keston, showed some interesting tritomas, crinums, Escallonia oregana, Berberidopsis corallina, Eucryphia pinnatifida, and other rare things. Pentstemons were bravely shown by Messrs. J. Forbes, Lim., Hawick, and such varieties as Crown Princess, John Michie, Peach, Garth, Jessie Forbes, J. Lamont were conspicuous. There was also a collection of useful bedding varieties, chiefly descended from crosses with Newbury Gem. Messrs. S. Low and Co., Enfield, had an exhibit of perpetual carnations, including the new Mrs. M. T. Cook, Roseate Dawn, Lady Dainty, and other good things. The Guildford Hardy Plant Company staged a collection of hardy flowers, and Messrs. R. H. Bath, Lim., contributed a collection of good varieties of early chrysanthemums, phloxes, and other useful autumn flowers.

A great blaze of pæony-flowered dahlias, set up to make a brilliant bank of colour, came from Messrs. Bakers, Wolverhampton, Hon. Mrs. Walter Forbes, Mr. W. E. Whineray, Countess of Lonsdale, Mrs. A. Worsley, Hyde Park Gem, Lady Muriel Paget, and Ryton Roy, were the pick of a big collection.

Mr. Maurice Prichard, Christchurch, brought up Crinum Powelli, and a fine lot of tritomas and montbretias. Messrs. Barr and Sons' exhibit was chiefly notable for its colchicums, Crinum Powelli, gandavensis varieties of gladioli, the climbing Aconitum volubile, and new heleniums.

A large exhibit of Colchicum speciosum album and C. speciosum, was a lovely one from Messrs. Jas. Backhouse and Sons, York. Senecio tangutica, and Aconitum Wilsoni were also shown by the York firm. Some wonderfully fine African and French marigolds were submitted by Messrs. Dobbie and Co., Edinburgh. The blooms of Prince of Orange and Lemon Queen varieties of African marigolds were of immense size and grand colour. The same firm had on view their new cosmos, and a selection of quilled asters. Messrs. W. Cutbush and Son, Highgate, had a display of Coleus Cordelia, and the new Dracæna Bruanti variegata. Messrs. H. B. May and Sons, Edmonton, were represented by a collection of crotons and ferns.

Messrs. Whitelegge and Page, Chislehurst, were also among the dahlia exhibitors, and secured an A.M. for Princess Juliana, a creamy white, stiff-stemmed decorative variety; the same firm had a pretty blush aster, named M. Nicholls. Mr. Amos Perry, Enfield, had some very interesting hardy flowers, such as Sarracenia purpurea, Artemisia lactiflora, Sedum spectabile atropurpureum, Spiræa filipendula, and Colchicum speciosum. Early chrysanthemums in great variety were put up rather solidly by Mr. H. F. Robson, Alexandra Nursery, Ham.

Messrs. T. S. Ware, Lim., Feltham, had a rare display of dahlias, and they staged popular decorative cactus and pæony-flowered varieties in their usual excellent style. Mr. H. J. Jones, Lewisham, made a charming exhibit of Michaelmas daisies, and put up delightful bunches of Beauty of Colwall, Mrs. S. T. Wright, Finchley White, Miss Parish, Mrs. Andrews, Ryecroft Pink, R. C. Pulling, Mrs. J. G. Day, and other beautiful varieties.

Mr. Gwillim, New Eltham, had a large exhibit of cut begonias, but the flowers lost much of their beauty by being staged on flat boards. Mr. Lewis Smith, gardener to R. Fellows, Esq., Shotesham Park, Norwich, contributed several dozen bunches of well-grown sweet peas, his Earl Spencer, Rosie Adams, St. George, and Evelyn Hemus being very good.

ORCHID COMMITTEE.

In the exhibit of orchids submitted by Messrs. Stuart Low and Co., Enfield, we noticed Oncidium tigrinum, Cattleya Parthenia Prince of Wales, C. Iris in variety, Vanda Kimballiana, Cypripedium Woottoni, etc. Messrs. Sander and Sons, St. Albans, had a lovely lot of the beautiful bright blue Vanda cærulea, some spikes carrying twenty-flowers, Cattleya Iris, Brasso-cattleya Thorntoni, Lælio-cattleya Berthe Fournier, Cattleya Wavriniana, the fine Cattleya Pittiana, and Cœlogyne pandurata. Messrs. Charlesworth and Co., Haywards Heath, brought up an interesting group of orchids, which contained Lælio-cattleya callistoglossa, Brasso-cattleya Moneta, Cattleya Iris, C. Warscewiczi, Acineta chrysantha, Cypripedium Baron Schroder, etc.

Mr. J. M. Black, gardener to R. G. Thwaites, Esq., Streatham, contributed a beautiful set of orchids, largely home-raised hybrids. These were Brasso-cattleya Leemaniæ, Odontioda Thwaitesi, Cattleya Adula Thwaites var. (A.M.), Odontioda Cecilia (A.M.), a new cross between Cochlioda Noetzliana, and Odontoglossum Wiganianum; Cattleya Iris in variety, and Odontioda Charlesworthi. The pretty Neobenthamia gracilis was shown by Messrs. Jas. Veitch and Sons, Chelsea, together with Lælio-cattleya Pluto, and Cattleya Iris aurifera. In the group staged by Mr. Edward V. Low, Vale Bridge, Haywards Heath, there were excellent plants of Cattleya Adula, C. Iris, and Cypripedium James H. Veitch.

From Sir Jeremiah Colman's collection at Gatton Park, Mr. Collier brought Eria stellata, Cattleya Gaskelliana cærulescens, and Bulbophyllum lemniscatoides. Very beautiful was Dendrobium Hookeri, with panicles of fringed golden-yellow flowers (Cultural Commendation), brought up by Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking; Stanhopea Rodigasiana was also well shown. Messrs. Stanley and Co., Southgate, brought up some excellent forms of Cattleya Iridescens, C. Gaskelliana alba, and a large plant of Cypripedium A. de Lairesse. Mr. Alexander, orchid grower to Lieut.-Colonel Sir G. Holford, Westonbirt, Gloucester, staged the lovely Lælio-cattleya Golden Fleece (L.-c. Golden Gem x C. aurea), but notwithstanding its great beauty and freedom, it failed to secure an award; and Lælio-cattleya Berthe Fournier magnifica (F.C.C.), a lovely flower with rich rose-red colouring. Messrs. Wm. Bull and Sons, Chelsea, presented a good form of Odontioda Charlesworthi, and the handsome Cattleya Maroni aurea.

Cypripedium Angela (C. niveum x C. Fairrieanum), A.M., from Mr. H. J. Chapman, gardener to Mrs. Norman Cookson, Oakwood, Wylam-on-Tyne, was a very dainty new hybrid; with this came C. Sibyl and C. Chapmaniæ, both Fairrieanum crosses. Mr. W. Miller, Clarkson Nurseries, Wisbech, showed a few cattleyas and cypripediums.

Mr. G. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, displayed Cattleya Iris King Edward VII. (F.C.C.), Oncidium Lanceanum, Cattleya Mrs. J. Whiteley, C. aurea, Sophro-cattleya Nestor, Lælio-cattleya Bletchleyensis, and many other good things. From Messrs. Mansell and Hatcher, Rawdon, Leeds, came Odontoglossum grande, the quaint Gomeya planifolia, Cattleya Atalanta, C. Adula, C. Iris, Brasso-cattleya Digbyano-Mendeli, Dendrobium Sanderæ, and a number of other beautiful orchids.

FRUIT COMMITTEE.

A grand lot of picked fruit from Messrs. T. Rivers and Son, Sawbridgeworth, included magnificent Cox's Orange Pippin, Peasgood's Nonsuch, and Ribston Pippin apples. Reine Claude de Bavay, Golden Transparent, Decaisne, Grand Duke, Admiral, Late Orange, Monarch, and President plums. Celery from Messrs. Clibrans, Altrincham, who displayed fine heads of Early Market White, Sulham Prize Pink, Wright's Grove Pink, Prizetaker, Aldenham Pink, Jersey Lily, Standard Bearer, Clibran's Red, etc.

A very extensive exhibit of pot-grown fruit trees was staged by Messrs. G. Bunyard and Co., Maidstone, who showed apples, pears, peaches, nectarines, grapes, and figs in fine style, all the trees, eighty in number, carrying excellent crops, and attracting a great deal of attention. In addition to this fine demonstration of orchard house culture, there were several dozen dishes of splendid picked fruits of choice pears and apples—Marguerite Marillat, Uvedale's St. Germain, Beurre Diel, and Durondeau pears were superb.

Messrs. J. Veitch and Sons, Chelsea, showed two of their new apples, i.e., Rev. W. Wilks and St. Everard; the former is a splendid cooker, and gained a F.C.C., having previously gained an A.M.; St. Everard is a highly-flavoured dessert variety, obtained by crossing Cox's Orange Pippin with Margil. Messrs. Wm. Paul and Son, Waltham Cross, filled one corner of the hall with about two dozen pear trees in pots, beautifully grown, and carrying splendid crops of fine fruit; Marie Louise, Marguerite Marillat, and Beurre Diel were wonderfully well fruited. Mr. W. Poulton, gardener to C. F. Cayley, Esq., Huntley, Tunbridge Wells, showed good bunches of Gros Maroc, Black Hamburgh, and other grapes.

CERTIFICATES AND AWARDS.

First-Class Certificate.—To Cattleya Iris King Edward VII., from H. S. Goodson, Esq., Putney; to Lælio-cattleya Berthe Fournier magnifica, from Lieut.-Colonel Sir G. Holford, Westonbirt, Tetbury, Gloucester; to apple Miller's Red Victoria, from Mr. W. Miller, Clarkson's Nursery, Wisbech.

Award of Merit. — To Cattleya Adula Thwaites' var., from R. G. Thwaites, Esq., Streatham; to Cypripedium Angela, from Mrs. Norman Cookson, Oakwood, Wylam-on-Tyne; to Odontioda Cecilia, from R. G. Thwaites, Esq., Streatham; to Gladiolus Rathline, from Mr. Bull, Ramsgate; to Chrysanthemum Hollicot Yellow and Hollicot White, from Mr. W. Roots, Cranford; to Single Dahlias Cardinal and Mrs. Joynson Hicks, from Messrs. J. Cheal and Sons, Crawley; to garden cactus dahlias Mrs. Landale and Hon. Mrs. Greville, from Messrs. J. Cheal and Sons; to decorative dahlia Princess Juliana, from Messrs. Whitelegge and Page, Chislehurst; to garden cactus dahlia Minerva, and decorative dahlia Loveliness, from Mr. Charles Turner, Slough; to garden cactus dahlia Sweet Briar and cactus dahlia H. L. Brousson, from Messrs. J. Stredwick and Son, St. Leonards; to single dahlias Ouida and Loveliness, from Mr. M. V. Seale, Sevenoaks.

MEDALS.

Gold.—To Messrs. George Bunyard and Co., Maidstone, for fruit, and fruit trees in pots; to Messrs. Carter Page and Co., London Wall, for dahlias.

Silver-Gilt Flora.—To Messrs. Sander and Sons, St. Albans, for orchids.

Silver-Gilt Knightian. — To Messrs. T. Rivers and Sons, Sawbridgeworth, Herts, for choice fruit.

Silver-Gilt Banksian.—To Mr. F. Brazier, Caterham, for hardy flowers.

Silver Flora.—To Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Mansell and Hatcher, Rawdon, Leeds, for orchids; to H. S. Goodson, Esq., Putney, for orchids; to R. G. Thwaites, Esq., Streatham, for orchids; to Mr. Jas. Box, Lindfield, for hardy flowers; Mr. Maurice Prichard, Christchurch, for hardy flowers; to R. Fellowes, Esq., Norwich, for sweet peas; to Messrs. Wm. Paul and Son, Waltham Cross, for roses.

Silver Knightian.—To Messrs. Clibrans, Altrincham, for celery; to C. F. Cayley, Esq., Tunbridge Wells, for grapes.

Silver Banksian.—To Messrs. Bakers, Codsall, for pæony-flowered dahlias; to Messrs. Dobbie and Co., Edinburgh, for marigolds; to Messrs. John Forbes, Lim., Hawick, for pentstemons and phloxes; to Mr. H. J. Jones, Lewisham, for Michaelmas daisies; to Messrs. H. B. May and Sons, Edmonton, for crotons and ferns; to Messrs. Jas. Veitch and Sons, Chelsea, for greenhouse plants; to Mr. J. T. West, Brentwood, for dahlias; to Mr. L. R. Russell, Richmond, for clematis; to W. R. Hammond, Esq., Burgess Hill, for sweet peas; to Mr. E. V. Low, Haywards Heath, for orchids.

Bronze Flora.—To Messrs. Backhouse and Son Lim., York, for colchicums, etc.; to Mr. Gwillim, New Eltham, for begonias; to Mr. G. Reuthe, Keston, for flowers and rare shrubs; to Messrs. W. Wells and Co., Merstham, for early chrysanthemums; to Mr. Amos Perry, Enfield, for hardy flowers; to Messrs. Barr and Sons, Covent Garden, for hardy flowers.

Broughty Ferry Horticultural Association.

This annual excursion took place on the afternoon of September 3, when Pitmilly, six miles S.E. of St. Andrew's, was the rendezvous. Arriving at Boarhills Station, the party was met by Mr. Hampton, the head gardener, and, by the generosity of his employer, Duncan Mackinnon, Esq., the members were driven to the gardens where a cycle corps and a few friends from St. Andrew's joined them in an inspection of the gardens and grounds, which were looking splendid. The fruit trees, especially apples, were favourably commented upon; in many cases the crop of perfect fruits was prodigious, and an agreeable surprise for such a situation and locality, being only a mile from the wind-swept coast of the German Ocean and St. Andrew's Bay, and at an elevation of thirty-six feet above sea level. By a careful selection of varieties, and good management, Mr. Hampton has achieved these fine results.

The herbaceous borders and kitchen garden, as well as the flower garden, were features largely and favourably commented upon, while the glass department, although not extensive, was taxed to its utmost.

The historical associations of the place, the natural charm of picturesque and romantic scenery, and the old trees, appealed to everyone. The geological features, the trout stream, and, above all, the botanical interest of the place, were sources of real enjoyment, Mr. Hampton informing the company that he had gathered over 120 species of British plants one morning for an exhibit in St. Andrew's.

Thoughtful and liberal hospitality by Mr. and Mrs. Mackinnon was enjoyed after the bracing air of a lovely autumn afternoon. Thanks were extended by the President, Mr. James Bethel, and compliments were expressed by Messrs. Grant, Matthew, Robb, etc., and replied to by Mr. Hampton. Photographs were taken by Mr. Hampton's son, and then the company left for home, with pleasant recollections of a profitable excursion.

Bournemouth Gardeners' Association.

SEPTEMBER 6.

A very successful and interesting meeting was held on the above date, at which Mr. Weaver presided. "A Talk on Roses," by Mr. E. Harris, of Ensbury Park Nurseries, was much appreciated by the members present.

An exhibition of dahlias was also held, some very good collections being staged. The pompons exhibited by Mr. Nippard, head gardener to J. J. Norton, Esq., were very beautiful, and showed how useful they were for decorative purposes in a cut state. Mr. Tompkins, head gardener to Lady Miller, staged some splendid tomatoes, and a monster vegetable marrow, for which a vote of thanks was accorded. For six cactus dahlias, distinct, arranged in a vase with own foliage, Mr. Reeves was placed first; Messrs. Kennairs and Marlow being second and third respectively. Mr. Marlow had the best three vases of blooms.

In a class for six pompon varieties, distinct, arranged in a vase, Mr. Nippard scored, Mr. Marlow being second. The same competitors secured the prizes in the same order for three pompon vases, three blooms in each.

Mr. Harris, in his "Talk on Roses," said all out best hybrids and hybrid teas were best from the budded plants. He referred to the French method of budding roses, keeping them in sand under cloches until the spring, and then transplanting them in beds in April. The American method was somewhat similar, and different to our method in this country. The lecturer drew attention to the necessity for protection in some parts of the country, and not to the same extent in other parts. He strongly condemned the very general practice of putting on about six inches of cold, wet manure as a top-dressing during the winter months, as it was not any protection to the roots, but kept them too cold at a season when they should be warm. He also advised cultivators to give their plants as long a season of rest as possible, and to stimulate growth about the beginning of June just when the plants require support. Good rotted manure was recommended, and bone-meal.

Mr. Harris strongly advocated the cultivation of roses separately from other kinds of plants, saying it was a big mistake to attempt to grow other kinds generally in the same beds.

Many questions were put to the lecturer, and very ably answered. He recommended the following hybrid tea roses for sandy soils, namely: Lady Ashtown, The Lyon Rose (this variety does remarkably well in the Bournemouth district), Mrs. W. J. Grant, Caroline Testout, Charles J. Grahame, Mrs. David McKee, Countess of Gosford, Dean Hole, Gustav Grunerwald, Kaiserin Augusta Victoria, Lady Battersea, and Mdme. Abel Chatenay. Mr. Harris said that rabbits would, when they had the opportunity, always eat tea roses first.

A hearty vote of thanks was accorded the lecturer, and also the chairman, at the close of the meeting.

United Horticultural Benefit and Provident Society.

The usual monthly meeting of this society was held at the Royal Horticultural Hall, Westminster, on Monday, September 12, Mr. Thomas Winter in the chair. Six new members were elected. The amount of sick pay since the last meeting was £29 14s. The whole amount paid this year is considerably less than last year up to the same date. The annual dinner will be held on October 6 at the Waldorf Hotel, Aldwych, W.C. Edward Sherwood, Esq., has kindly consented to preside on this occasion, and it is hoped that large numbers of friends will attend.

Croydon Gardeners' Association.

On Tuesday this society resumed its meetings at the Sunflower Temperance Hotel, George Street. The attendance of members was very good, and the room was resplendent with late summer flowers, while seasonable vegetables were plentiful.

The usual lecture was dispensed with on this occasion, the members joining in friendly discussion on the exhibits staged. Cultivation of the various flowers and vegetables was expounded, and in cases where insect and fungoid pests had been prevalent the methods adopted for their eradication were freely described. Discussions like this are very fruitful, for not only are they instructive, but they help to foster that good feeling one with the other by the interchange of ideas, and strengthens one of the primary objects of mutuality which this society is doing so much to bring about.

The exhibits were very varied, and reflected great credit on the cultivators. From the gardens of the President (Mr. J. J. Reid) came a collection of ten varieties of potatoes, most of them being newer kinds. Mr. F. Oxtoby, who had grown them, kindly gave a few interesting details of their qualities. Mr. A. Edwards, gardener to Mr. Pascal, staged a nice dish of runner beans and a vase of Helianthus Miss Mellish. Coombe House, the residence of Mr. Frank Lloyd, is well known in the neighbourhood for its huge collection of hardy flowers, and Mr. M. E. Mills exhibited a magnificent collection, including some very interesting varieties, also staging dishes of runner beans, peas, and onions. Two varieties of branching asters were put up by Mr. E.

Gladwell, and also a dish of runner beans. Mr. T. Brown brought two dishes of apples, and from Mr. F. Brazier, Nineham's Nurseries, Caterham, came a few choice vases of phlox, pentstemons, Michaelmas daisies, and early chrysanthemums. These were creative of great interest, all of them being good varieties and well grown.

As the gardeners had shown up in such good style, it was a pleasant feature to find two representatives in the cottagers' section, Mr. R. Cleveland staging a collection of vegetables and two vases of violas, whilst vegetables were also put up by Mr. H. Bridges. Evidently when members of a society take the trouble to exhibit in friendly rivalry without any monetary benefits held out to them, it is conclusive of the keen interest in horticulture in our midst, and long may this continue is the hope of all.

NEW BOOKS.

PROFITABLE FRUIT GROWING.

Mr. John Wright, V.M.H. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.) Price 1s.

Twenty-one years have elapsed since Mr. John Wright was presented by the Worshipful Company of Fruiterers with a prize of twenty-five guineas and a gold medal for his essay on fruit culture; and it is a matter of much interest that, as indicated by the appearance of the ninth edition, the book enjoys undiminished popularity. This success is in part explained by the fact, as stated by the adjudicators who made the award, that the "essay combines practical knowledge with literary ability," and in part by the care that has been taken in the preparation of the several editions of which the ninth is now before us. Mr. Wright had long previous to the writing of this essay made a special study of the practical aspects of fruit culture, and possessing literary ability of a high order, he was able to present to his readers a concise account of the more advanced methods, and in such manner as to at once interest and instruct them. Since the essay was written Mr. Wright has fully maintained his interest in fruit culture, and has embodied his more recent experience in the substantial additions that have been made in the preparation of the successive editions. The more important of these are the chapters on "Cottage Fruit Gardens," "Improving Old Fruit Trees," "Pruning, Manuring, and Cleansing Old Trees," "Branch and Root Pruning," "Pinching and Pruning," "Exact Knowledge," and "Fruit Growing in Ireland." With reference to what has been accomplished in the improvement of fruit production in Ireland, the author writes, "The most extended and thorough investigation of the condition of hardy fruit culture in Ireland that has been planned up to the present time was, however, that undertaken by Mr. George Gordon, the present editor of the GARDENERS' MAGAZINE, and Mr. R. Lewis Castle (for some years manager of the Duke of Bedford's Experimental Fruit Farm). In this tour, which extended over nine hundred miles of country, namely, from Portrush and Coleraine in the north to Killarney and Cork in the south, all the principal districts were visited where fruit growing had been tried or where well organised attempts were likely to give good results." Mr. Wright also refers to the report that was read by Mr. Gordon at the Fruit Conference held at the Crystal Palace, and states that "the conclusions fairly represent the conditions, prospects, and requirements of successful fruit culture in Ireland." We may add here that, as stated by one of the leading authorities in Ireland, the scheme adopted by the Irish Government for bringing about an improvement in fruit production was based on the report. While avowedly written for the guidance of the owners of small gardens, "Profitable Fruit Growing" contains much that is well deserving the careful attention of those in charge of gardens of large size.

THE GARDENER AND POULTRY KEEPER'S GUIDE AND
Illustrated Catalogue of Goods Manufactured and Supplied
By WILLIAM COOPER.

THE GARDENER AND POULTRY KEEPERS GUIDE 2/6

640 Pages. 1,000 Illustrations. Bound in Cloth.

The most Complete Work on Gardening and Poultry-Keeping, Dogs, Rabbits, Pigeons, &c., ever written. No matter what you require to know about any one of these subjects, you will find the information in this book written in plain, non-technical language, there being 640 pages telling and illustrating everything on the above subjects. The result is

The Greatest Book Ever Published on Gardening and Poultry-Keeping.

100,000 BOOKS TO BE DISTRIBUTED FREE.

From the opening to the last line it is interestingly written. The price of the Book is **2/6**, but the Author has decided to give away **100,000 COPIES FREE**, one to each applicant who writes for a copy.

COST of PRODUCTION and DISTRIBUTION OVER £7,500.

The distribution and production of this Book will cost over £7,500, but a Free Copy will be sent, post free, on receipt of sixpence, P.O. or stamps (simply for postage and package). As the distribution of every one of these Books is an initial loss to the Author, he asks that each recipient, after reading it, if having no further use for same, will favour him by kindly lending it or giving it for perusal to some friend or relative interested in the above-mentioned matters.

SEND FOR YOUR COPY TO-DAY. What You will Receive.

Send Sixpence P.O. or stamps and you will receive, Post Free by return, the New Book for Gardeners and Poultry-Keepers, consisting of 640 pages, Fully Illustrated and Bound in Cloth. A Help, Guide, and a Necessity to every Amateur.

Span-Roof Forcing House. No. 16.

Indispensable to every grower of Cucumbers, Melons, etc., where a succession of crops is required in all seasons. Soundly built, and will repay its cost in a season.

SPECIFICATION.—Built for brickwork, 3ft. high; framework throughout 3in. by 2in. well-seasoned red deal; door complete with lock and brass furniture at one end; roof ventilation according to size, necessary ironwork for opening same, and good 21oz. glass throughout. Painted one coat, and put on rail at our works.

Partitions with extra door, 9ft., 30s.; 12ft., 35s.; 14ft., 40s. each. Ventilating boxes for side walle, 3s. 9d. each extra. If made with strong wood base instead of for brickwork, add 20 per cent.

"Invincible" Hot Water Apparatus. No. 308.

COOPER

Most efficient and cheapest in existence. Will last all night without attention. Anyone can fix it. Success guaranteed.

To heat house 7ft. by 5ft., £2 12s. 6d.; 9ft. by 6ft., £2 17s. 6d.; 10ft. by 7ft., £3; 12ft. by 8ft., £3 2s. 6d.; 15ft. by 9ft., £3 17s. 6d.; 20ft. by 10ft., £4 17s. 6d.; 25ft. by 10ft., £5 12s. 6d. Estimates for large quantities free on application. Every make of boiler supplied.

Cucumber Frames. No. 44.

Made in 1¼in. well seasoned tongued and grooved boards, with 2in. lights, painted and glazed 21oz. glass. One-light Frames, 4ft. by 3ft., 16s.; 6ft. by 4ft., 24s.; two-light Frames, 6ft. by 4ft., 26s.; 8ft. by 6ft., 42s.

The "Favourite" Poultry House. No. 71.

Made in sections, simply screwed together. A raised floor, about 2ft. from ground, forms a dry run underneath nest. Perch, ladder, nest boxes, etc., and painted with our patent rot-proof composition outside, complete, 3ft. by 2ft. 6in., 17s. 6d.; 4ft. by 4ft., 24s.; 5ft. by 4ft., 27s. 6d.; 6ft. by 4ft., 32s.; 7ft. by 5ft., 40s.; 8ft. by 6ft., 47s. 6d. For numerous other designs and everything required by the poultry-keeper, see List.

Lean-to Conservatory. No. 31.

This elegant Conservatory is designed for the side of a modern residence. Entrance can be had either from the garden or the house. The upper lights over the door, as shown in the illustration represent tinted glass.

SPECIFICATION.—Constructed of the very best materials, all woodwork consisting of well-seasoned red deal. Ventilators at top and front, with necessary ironwork for opening same; 21oz. glass throughout; stages along front and ends; footpath the entire length; half-glass door, complete with lock, brass fittings, and key; gutters and down pipe. All woodwork painted two coats. Carefully put on rail at our works (marked for fixing).

Garden Lights. No. 43.

Well-seasoned stiles, 2in. by 2in., mortised and pinned to tenoned rails, properly rabbeted for the glass, and fitted with 2in. sash-bars. Unglazed, 6ft. by 4ft., 3s.; 5ft. by 3ft. 6in., 2s. 9d.; 4ft. by 3ft., 2s. 6d.; 3ft. by 2ft., 1s. 8d. Glazed, 21oz., 6ft. by 4ft., 9s.; 5ft. by 3ft. 6in., 7s. 6d.; 4ft. by 3ft., 6s.

Portable Iron Cottage. No. 632.

Containing two Bedrooms, 9ft. by 7ft.; Sitting-room, 13ft. by 11ft.; and Kitchen 12ft. by 7ft. Put free on rail or wharf £45. Iron Buildings from £5. See catalogue for numerous other designs.

ESTIMATES for Every Description of Wood and Iron Buildings, Heating Apparatus and Poultry Appliances, FREE.

SURVEYS BY APPOINTMENT.—When required, we shall be pleased for one of our representatives to wait upon ladies or gentlemen at their residences in any part of the country to take all necessary particulars, give advice, etc., and submit Plans and Estimates in accordance with his report. We also undertake repairs and alterations of or additions to existing houses or heating apparatus.

ORDINARY ILLUSTRATED CATALOGUE POST FREE.

W. COOPER, Ltd., 761, Old Kent Road, LONDON, S.E.

Business Hours from 9 a.m. to 6 p.m. Saturdays included. Trams from all the Bridges Pass the Door.

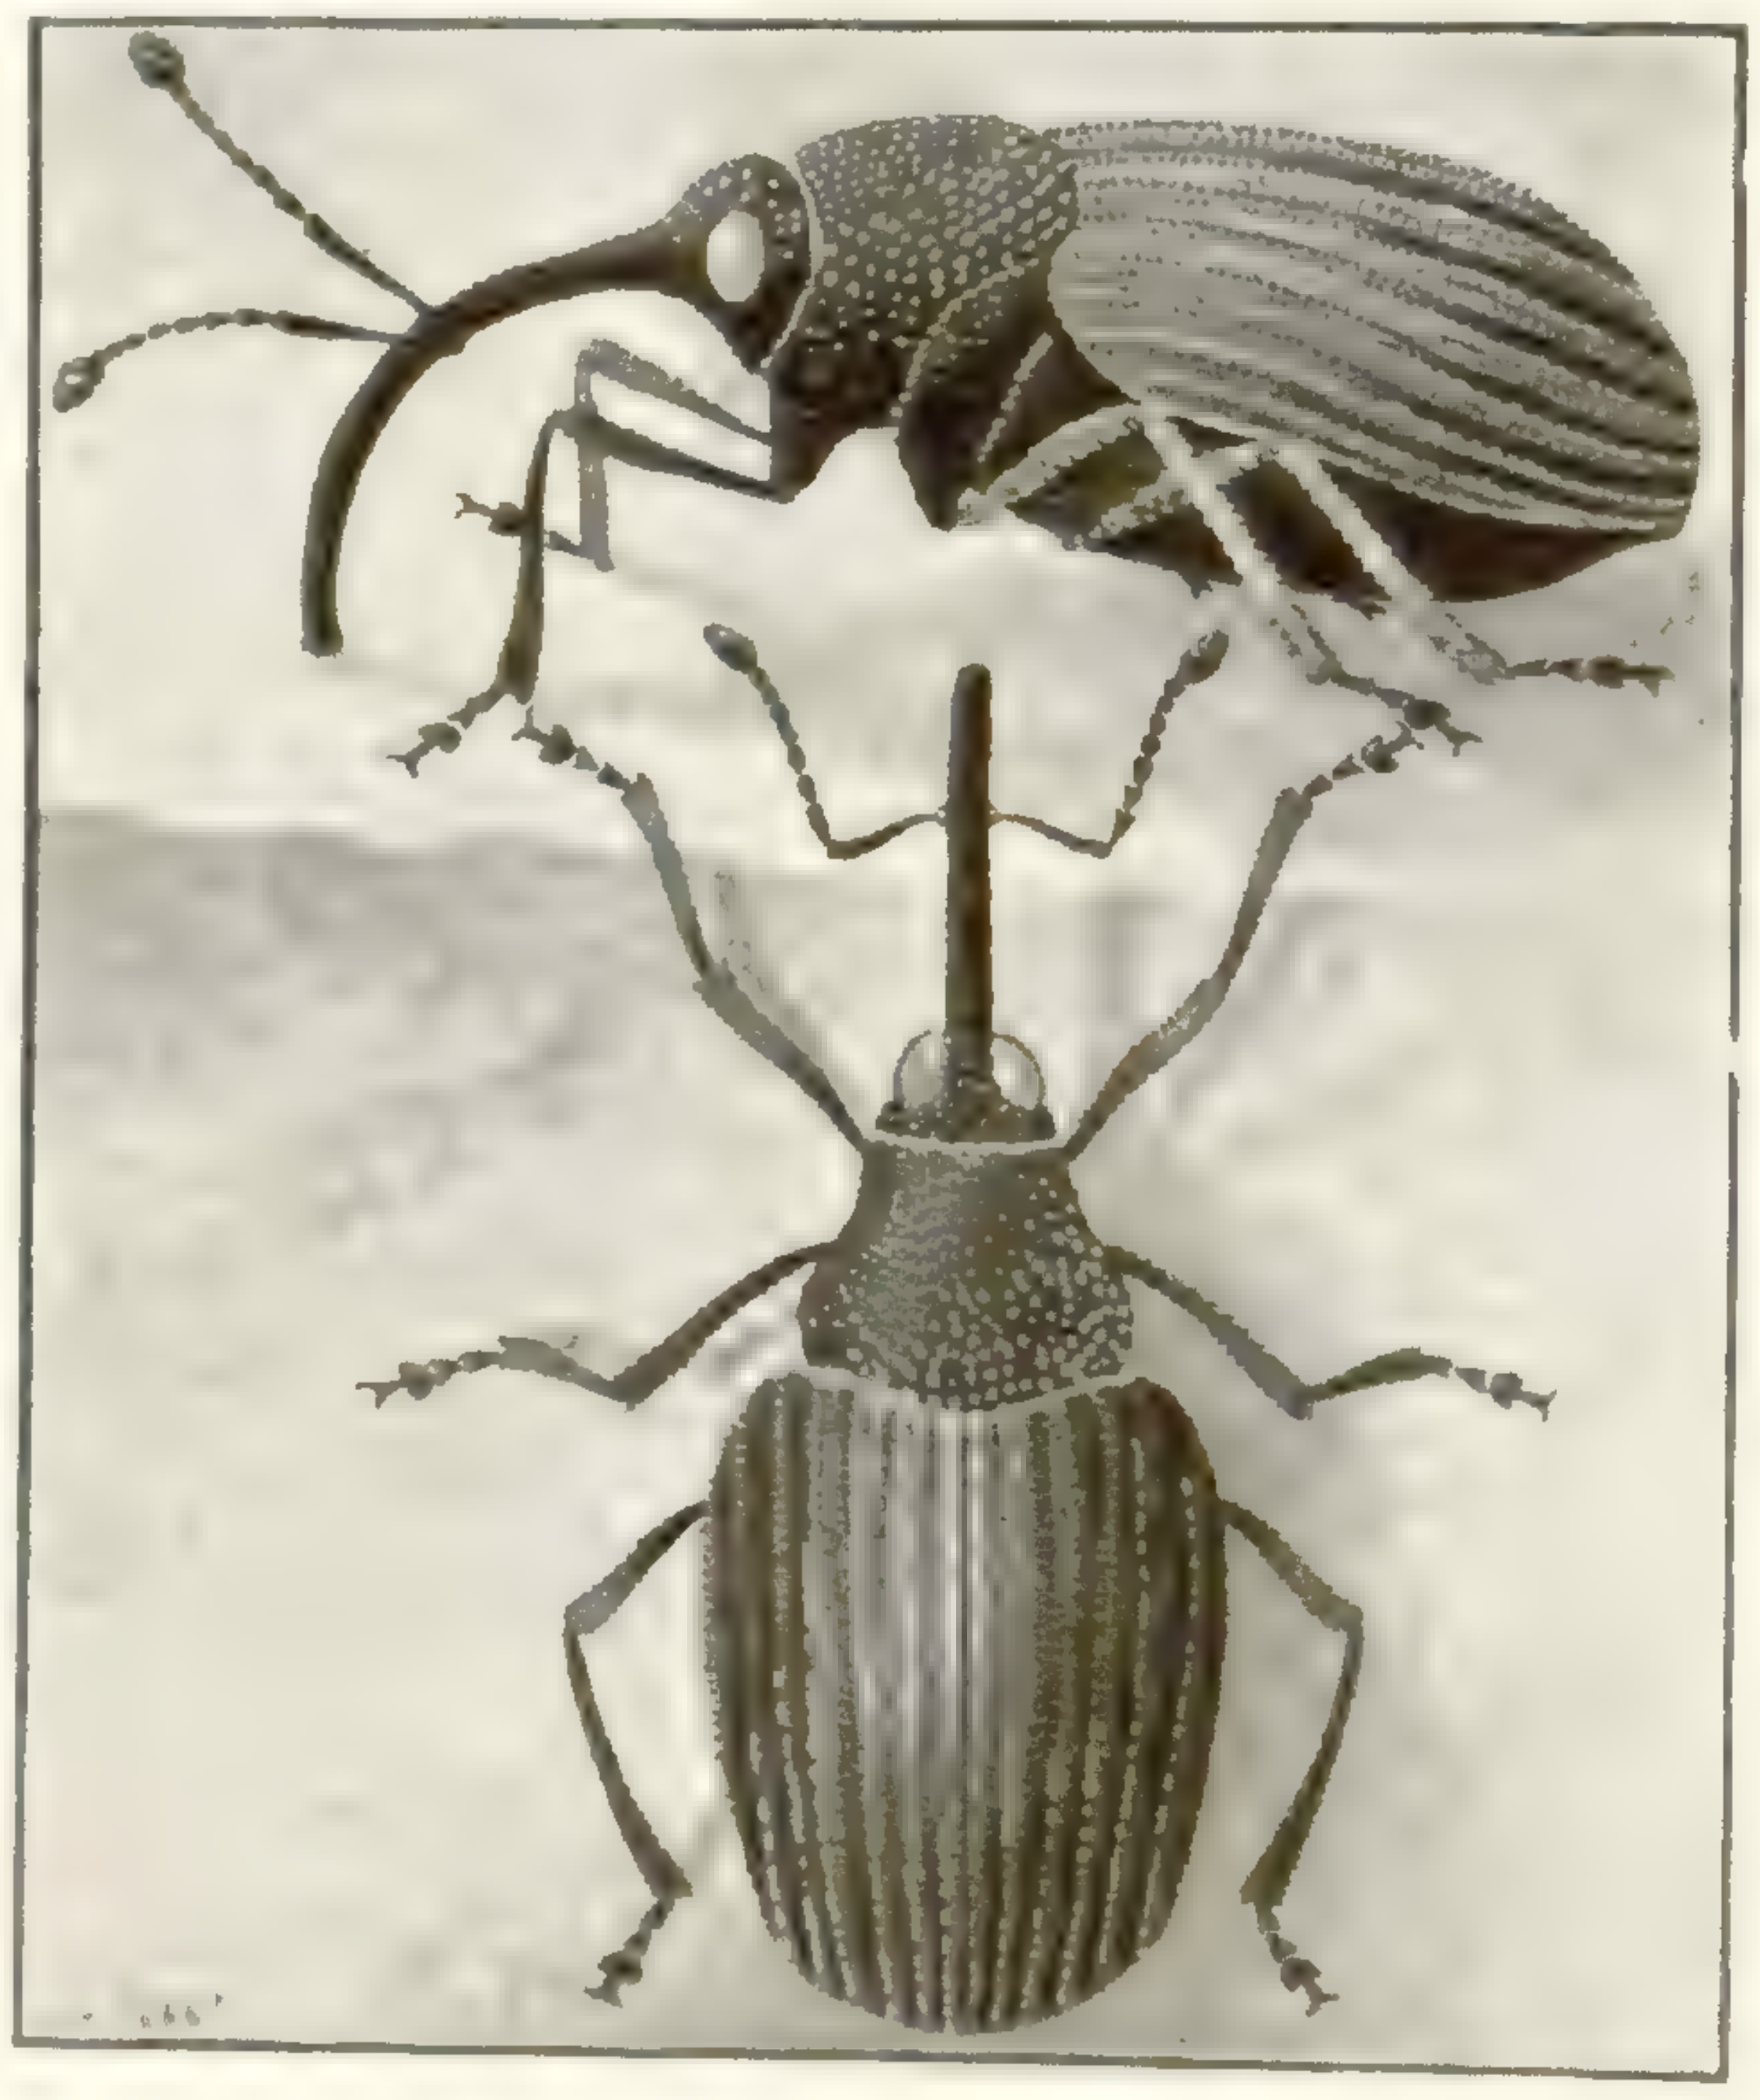
ANSWERS TO CORRESPONDENTS.

COLOUR CHART.—W. B., Swindon: There is no colour chart of any real service to florists and others, other than the "Repertoire de Couleurs," obtainable from the Royal Horticultural Society for 15s. We hear, however, that the French authorities, who so successfully produced this fine work, have under consideration a small pocket edition, in which the commoner shades of colour will be presented in such a form that one may carry the chart in the pocket ready for use as opportunity serves.

GOOD PEACHES AND NECTARINES.—C. P. O., Conway: This matter is dealt with from time to time in our columns, and details and management appear under the heading of "Work for the Week." In brief, these luscious fruits should, when in the open, be planted against a wall with a south or west aspect, and have a border that is moderately rich, contains calcareous matter, and is well drained and decidedly firm. Fan-trained trees should be selected, and planted about 15 feet apart, the roots that are injured being carefully cut away. At the winter pruning shorten the shoots to about two-thirds of their length, and subsequently train the shoots just far enough apart for the full development of the foliage. Protect from spring frosts with canvas or fish net; commence to disbud early, and proceed gradually with the work. When growth commences in spring the branches are studded with new shoots, and if the tree is well furnished with wood the proper course will be to remove or pinch back all the shoots except those at the base and upper end, first removing those growing between the branch and the wall, or at right angles from it. Some of the best peaches are: Bellegarde, Duchess of Cornwall, Duke of York, Hale's Early, Early Grosse Mignonne, Goshawk, Late Devonian, Peregrine, Royal George, Sea Eagle, Thomas Rivers, and Violette Hâtive. These are equally suitable for open walls and culture under glass. The best nectarines include Cardinal, Early Rivers, Elruge Humboldt, Lord Napier, Précoce de Croncels, Spenser, and Victoria.

BULB CULTURE IN FIBRE.—G. A. B., Middlesborough: For the culture of bulbs in fancy receptacles, without drainage, and in fibre, the cocoanut-fibre refuse should be well separated, and have ground shell mixed with it at the rate of one part of shell to four parts of fibre. Put a small handful of pieces of charcoal about the size of a filbert in each vase, then place a layer of the mixture over the charcoal, this layer to be of sufficient thickness for the necks of the bulbs to be just below the upper edge of the vase. The material should be well shaken down, but not pressed, but in filling in the spaces about the bulbs it must be moderately pressed down between them and round the sides also, to prevent there being any vacant spaces. Well moisten the material before it is used, and then no watering will be required for a fortnight or three weeks. The watering, if less troublesome than in the case of bulbs grown in ordinary flower pots with soil, requires care. An endeavour should be made to maintain the material moderately moist, and thus avoid extremes. If the material is allowed to become quite dry at the bottom of the vase, even for a short time, considerable damage will be done. On the other hand, if the water is applied so freely that it stands in the bottom of the vase, the roots will be injured, and the growth checked. It is a good plan to make a point of examining the vases once a week, and to make the examinations on the same day each week. It can be seen without any great difficulty when the moisture has been absorbed, because the material becomes dry at the top first; when it is seen to be dry, apply water moderately, sufficient, in fact, to well moisten the material. If there is a fear of too much water having been given, or it is found that water has accumulated in the vase, lay the vase on its side with the bottom tilted sufficiently to enable the surplus water to drain away. It is not necessary to put them in a cupboard or dark room, or to put them out of doors covered over; nor, indeed, is it desirable. They may be put in a light and airy spare room, where, after growth commences, they can be placed near the window. The vases may, indeed, be put in a light outhouse or shed until they commence new growth, and if a frame or greenhouse is available, it should be taken advantage of, as it is most important the plants should be fully exposed to the light during the development of the leaves and flower stems to ensure these being dwarf, and with sufficient substance to stand erect without supports.

GALLS ON CABBAGE ROOTS.—T. C. T., Southport: The swollen condition of the roots is due to the action of the Cabbage-gall Weevil (Ceutorhynchus sulcicollis), a pest that greatly weakens any crop of the cabbage family it attacks, and is sometimes so plentiful as to kill off the larger part of a plantation of cabbages or cauliflowers. The weevils lay their eggs during the summer on the roots of members of the Brassica family, and the eggs are usually hatched out in about ten days. The grubs immediately begin to feed upon the roots, and the irritation they set up causes the roots to swell up and form galls, completely enveloping the grub. Sometimes an attack of the cabbage-gall weevil is mistaken for an attack of Club-root or Finger and Toe (Plasmodiophora brassicæ), a horrid fungus pest, capable of working great destruction, but it may be readily distinguished from the latter because it does not produce the rottenness the plasmodiophora does, and, further, if the galls are cut open the weevil grub will be found, or, at any rate, evidences of its occupation. Burn all infested roots as they are pulled up, and do not plant a cabbage crop on the same plot for some time to come. During the winter deeply work the ground, manure it freely, and crop with potatoes or peas next spring.



CABBAGE GALL WEEVIL (Much Enlarged).

CLIMBING FRAU KARL DRUSCHKI ROSE.—M. R., Salford: There is a climbing variety of the popular Frau Karl Druschki rose, but we have no personal experience of its behaviour, nor have we heard it eulogised. Perhaps some of our rosarian correspondents will kindly give us their opinion of its merits. The variety was exhibited before the Royal Horticultural Society on March 20, 1906, and an Award of Merit was made in its favour. Messrs. W. Lawrensen and Son were the exhibitors.

NAMING EXHIBITS AT FLOWER SHOWS.—H. B. S., Shrewsbury: Our opinion upon this matter is well known to our regular readers, and we repeat that, educationally, there is but little advantage in exhibiting plants grown to a high degree of perfection unless visitors who are interested in plant culture have an opportunity of ascertaining the names of the specimens exhibited. Disqualification would not be too severe, and would be a just punishment for those who care a good deal for the money prize obtainable, and practically nothing for the advancement of horticulture. We discussed this matter in the issue of September 7, 1907, and in the following issues our views were supported heartily by such an able authority as Mr. William Cuthbertson, J.P.

NAMES OF PLANTS.

B. R. H., Cambridge.—1, Calceolaria Burbidgei; 2, C. amplexicaulis.

C. T. T., Reading.—1, Sarracenia flava; 2, Rudbeckia laciniata; 3, Sidalcea Listeri; 4, Hypericum calycinum.

S. J. W., Lincoln.—1, Gladiolus Brenchleyensis; 2, Isolepis gracilis; 3, Helianthus orgyalis.

S. H. J., Wallingford.—1, Cattleya Hardyana; 2, Lælia elegans; 3, Cypripedium œnanthum superbum.

H. G., Launceston.—1, Polygonum sachaliensis; 2, Pentstemon Newbury Gem; 3, Liatris spicata; 4, Artemisia lactiflora; 5, Anthemis Kelwayi.

NAMES OF FRUITS.

A. G. B., Surrey.—1, White Frontignan; 2, 3, 4, and 5, Black Hamburgh, the latter being a particularly good form; 6, Alicante; 7, Lady Downes; 8, Alicante.

NEW PLANTS, ETC.

◆

DAHLIAS.

Dr. Roy Appleton.—A fine, stiff, "spiky" cactus dahlia of excellent form; yellow, shading to pink at the tips of the florets. F.C.C., N.D.S., September 8. Messrs. J. Stredwick and Son, St. Leonards.

New York.—An effective cactus dahlia, with whorled, slightly incurving florets, making up a big bloom. The colour is bright old gold, with rosy-buff shading. F.C.C., N.D.S., September 8. Messrs. J. Stredwick and Son, St. Leonards.

Onward.—A distinct cactus dahlia with clawed florets that incurve somewhat, and intermingle in a manner suggestive of some Japanese chrysanthemums. It is a new departure that suggests future possibilities in floral development. The colour is a lovely shade of soft rosy-lilac. F.C.C., R.H.S., September 8. Messrs. J. Stredwick and Son, St. Leonards.

Sweet Briar.—A good cactus dahlia of large size, and a charming shade of soft rose or lavender. The great merit of the variety is that it carries its flowers stiffly on long, stout, rigid stems, well above the foliage, and therefore it is a garden cactus variety of merit. F.C.C., R.H.S., September 8. Messrs. J. Stredwick and Son, St. Leonards.

Glow.—A beautiful and shapely pompon dahlia of a lovely shade of rich cerise. F.C.C., N.D.S., September 8. Messrs. J. Cheal and Sons, Crawley.

Cardinal.—A splendid single dahlia of excellent form and substance. The colour is deep vivid scarlet, or cardinal shade, with a flame-yellow zone round the centre. F.C.C., N.D.S., Sptember 8. Messrs. J. Cheal and Sons, Crawley.

Mrs. Joynson Hicks.—A fine single variety, and a particularly effective one. In size and form it is excellent, and the colour is bright apricot-yellow with a maroon base to each segment. F.C.C., N.D.S., September 8. Messrs. J. Cheal and Sons, Crawley.

Minerva.—A distinct and effective variety especially adapted for garden culture. The blooms are of medium size, and the florets are straight, rather broad, and golden-yellow in centre, passing to purple-red; the blooms are carried on long, rigid stems, well above the foliage. F.C.C., N.D.S., September 8. Mr. Charles Turner, Slough.

OBITUARY.

◆

MR. THOMAS FRAZER.

It was with deep regret we learned on Tuesday last of the death, after a very brief illness, of Mr. Thomas Frazer, garden foreman at the Royal Horticultural Society's Gardens at Wisley. A quiet, unassuming man, Mr. Frazer was well liked by those who knew him best. He had a great love for hardy plants and flowers, and understood them well, and those were his chief care at Wisley. Mr. Frazer had a wide experience in this particular branch of horticulture, having been engaged some years ago at Rothesay, and subsequently at Messrs. Dobbie and Co.'s Nursery, then at Orpington. He presently took charge of the herbaceous plant department for Messrs. James Veitch and Sons, and afterwards took service with the R.H.S. at Wisley. Mr. Frazer was, we believe, only really ill for a few hours, and his sudden death has cast a gloom over the staff at Wisley, where he worked, and also resided.

HERR MAX LEICHTLIN.

The worlds of horticulture and of botany have suffered great loss by the death on September 3 of Herr Max Leichtlin, of Baden Baden. He was born at Carlsruhe in 1831, and in 1846 was apprenticed as a gardener, and subsequently worked in establishments at Frankfort, Bolweiller, and Ghent. After this he travelled about a good deal, and in 1856, returning from South America, he stayed a short time in Dublin, passing on to the Messrs. Van Houtte's nurseries at Ghent, where he stayed two years, and left to enter business with his two elder brothers. After sixteen years of close application to business, he established a private botanic garden at Baden Baden, and among other things he got together a splendid collection of liliums. In 1874 he collected Lilium Martagon in Montenegro, but, finding lilies did not succeed as he had hoped, at Baden Baden, he turned his attention to irises, nerines, aubrietias, hemerocallis, etc., and greatly improved these families; indeed, many of the finest aubrietias are due to his patience and skill. As a plant-collector he knew no fear, and to hear of a new iris was usually the signal of his departure in search of it. Eremuri, croci, arnebias, tulips, kniphofias, and calochorti all tell of his splendid efforts to enrich our gardens; indeed, it is extremely difficult just now to properly appraise the great work that Herr Max Leichtlin accomplished for horticulture in his long and busy life. He was buried at Baden Baden on September 5.

Ismene calathina.—Fine, well-ripened bulbs of Ismene calathina are sent to this country from the United States during the winter months, and with a little attention they will flower well. In a good example the green strap-like leaves are well over-topped by the flower scape, which reaches a height of 2 to 3 feet. The flowers, of which several are borne on a spike, consist of a funnel-shaped tube, and a large central cup or corona over three inches across, and fringed along the margin. The colour of the flowers is white, shaded with green, and they are very fragrant.—W. T.

Trachelium cœruleum. — This campanulaceous plant, which is a native of the Mediterranean region of Southern Europe, was first introduced over 250 years ago. The flowers are blue, and, though small, are produced in large branched heads, so that it forms a fairly decorative subject. It is in some gardens employed for the embellishment of the greenhouse during the summer. Quite a group of large specimens were shown at Holland Park—an unusual exhibit. There is a variety (alba) with whitish flowers, but it is less effective than the type.—W. T.

NOTE OF THE WEEK.

◆

Bulbous Plants in Town Gardens.

Bulbous plants that are so vigorous in growth as to admit of their being readily propagated and to produce an abundance of attractive flowers, are, as so fully recognised, of much value for beautifying gardens in country districts in which the air is of the purest; but they are especially so in town and suburban gardens, where the atmospheric conditions are not favourable to plant life. In country gardens the beauty of the flowers can be enjoyed to the full, and the plants can be grown on from year to year, and multiplied according to requirements. Consequently, in furnishing them or adding to their occupants, there is a wide range in making selections, and both bulbous and fibrous-rooted plants can be planted in accordance with the taste of the owners or those in charge, with the full assurance of obtaining successful results. On the other hand, comparatively few of the more beautiful plants can be grown on from year to year in the gardens of large towns and congested suburbs, and maintained in the state of vigour essential to abundant flower production. This necessarily excludes a very large proportion of the more beautiful of the fibrous-rooted plants, and renders it practically impossible to enjoy a really attractive and varied display of flowers at any period of the year when the selection is limited to them. It is for this reason that the best known of the spring and summer flowering bulbous plants are of such immense value for gardens in towns or within their influence. The growth of the hardy plants with fibrous roots must be made in the beds and borders where they are to bloom, because it is not until they are well established that they will yield freely of their floral beauty. Bulbous plants, on the other hand, may be cultivated elsewhere than in the gardens in which they are to produce their flowers, and of this we have ample proof on all sides. It is not even necessary in the case of some of the kinds that they should be grown within the boundaries of the United Kingdom, but happily, as the result of the enterprise of British cultivators, large proportions of the bulbs of the most valuable kinds are home grown. At the close of its season of activity the bulb contains, closely enveloped in its fleshy scales, the embryo flower or flowers, and the character of these will be largely determined by the conditions under which the bulbs were grown. If the cultural method was well devised, and the conditions otherwise favourable, the incipient flowers will be capable of attaining to a high state of development; but should the conditions, whether of soil or climate, not have been conducive to a healthy growth, they will be weak, and resulting flowers poor. This being the case, the owners of gardens in and near towns are in a position to obtain bulbs that have been grown under high cultivation, and in the open country beyond the influence of atmospheric impurities, and that will produce flowers of far higher quality than can possibly be obtained from bulbs that have had a year's stay in a crowded garden. This, briefly stated, being the case in favour of bulbous plants as aids in the adornment of the flower garden, we strongly advise those of our readers who reside in town districts to plant bulbs freely in their gardens. We need hardly suggest that the finest of the inexpensive varieties in the several classes that are known to produce effective displays of colour should be selected and planted; and when their season of flowering is past, the bulbs should be lifted and consigned to the rubbish heap as being of no further use. To some of our readers who have large gardens in country districts this may appear an extravagant method of procedure, but we suggest it as the only method of procedure, by which dwellers in towns can obtain an abundance of flowers attractive in colour and interesting by reason of their diversity of form, throughout the spring months and during the greater part of the summer. It must be remembered that the gardens under consideration are usually of small size, many indeed being so limited in their area as to render it difficult to expend a large sum in the purchase of the required number of bulbs if inexpensive varieties are purchased. If reference is made to any of the bulb catalogues of the leading firms, it will be seen that there are numbers which are cheap in the best sense of the term, inasmuch as they are low in price and of high quality for garden decoration. The narcissi should have prominence given them among the bulbous plants flowering in the spring, and Emperor, Golden Spur, Henry Irving, and P. R. Barr, of the yellow trumpets; Empress, Grandis, Mrs. Walter Ware, and Victoria, of the bicolors; Frank Miles, Nelsoni major, Sir Watkin, and Stella superba, of the incomparabilis varieties; Conspicuus and John Bain, of the Barri section; and Grandiflorus and Ornatus, of the Poeticus section, are low in price, and admirably adapted for the production of beautiful effects. In like manner the lists of early and late-flowering tulips include a considerable number of excellent varieties that are inexpensive and of high quality. Hyacinths are useful for their distinctness, and those who are satisfied with the bulbs specially offered for bedding will not find them costly. Crocuses are of much value for the rich effect they produce in advance of the early tulips and daffodils, but unfortunately the town sparrow is destructive to the flowers. The foregoing will afford a succession of

MR. HUGH PETTIGREW.

flowers over a period of nearly three months. For succeeding them there are the Spanish irises, the early-flowering and late summer gladioli, such inexpensive lilies as Lilium umbellatum and L. tigrinum, and a few other subjects that might be mentioned. These we leave to the selection of those who are specially interested in the matter, as our object is not so much to give an exhaustive list of the kinds that may be satisfactorily flowered under the conditions that obtain in towns, but to call attention to the value of bulbs for beautifying town gardens and indicating the lines on which selections should be made.

Mr. Hugh Pettigrew, whose portrait we have the pleasure of giving in this issue, is one of three brothers who, in following in the footsteps of their father, have succeeded in obtaining, while comparatively young, positions of importance in the world of horticulture. Mr. Hugh Pettigrew commenced his training in practical horticulture in the gardens of Cardiff Castle, which at that time was under the charge of his father, the late Mr. Andrew Pettigrew, who was one of the foremost gardeners of his day, and not less successful in the training of young gardeners than he was in garden management. Subsequently, Mr. Hugh Pettigrew entered the Royal Gardens, Kew, where he remained two years, and during that period was careful to take full advantage of the many opportunities the establishment affords for the acquisition of knowledge relating to botany and the practical cultivation of plants for scientific and decorative purposes. On leaving Kew Mr. Pettigrew obtained a position in the famous gardens of Ferriers, the seat of Baron Rothschild, near Paris, where he became well acquainted with Continental horticulture of the highest type. On the completion of his engagement at Ferriers, he returned to the gardens of Cardiff Castle to complete his training by filling an important position in the fruit and kitchen gardens. In stating this fact, it may be of interest to mention that the late Mr. Andrew Pettigrew regarded it as essential to success in after life that the young gardener should during the period of his training be thoroughly versed in all that belongs to the cultivation of fruits and vegetables. He also held the opinion, and gave practical expression to it, that the work in the kitchen and fruit gardens should come towards the end of the period of training, because the student is then able to fully appreciate its importance. While engaged in these departments of the gardening establishment at Cardiff Castle, Mr. Hugh Pettigrew was appointed head gardener at St. Fagan's Castle, the Welsh seat of the Earl of Plymouth. In the management of these fine gardens he has afforded conclusive evidence of his administrative ability and cultural skill, and we have ample proof of these qualities having been fully appreciated by his noble employer, for some time since the Earl of Plymouth added to his responsibilities by appointing him steward of the St. Fagan's estates, which extend over a large area, and are remarkable for their many distinctive features. Many improvements have been effected in the St. Fagan gardens within recent years, and at the present time the formation of a new kitchen garden is in progress, and when completed it will, with its ranges of glass, be one of the finest gardens of its kind in the United Kingdom.

The National Vegetable Society will hold its first exhibition at the Horticultural Hall, Vincent Square, Westminster, on Wednesday next, the 28th inst.,and it has the promise of proving eminently successful. The date arranged for closing the entries had not been reached at the time of going to press, but ten days ago applications for schedules and entry forms were coming in at the rate of about fifty per day, although 1,500 copies were, in response to applications, distributed earlier in the year. This suggests that the resources of the hall will be taxed to the utmost. We shall give an illustrated report of the exhibition in our next issue.

Poisoning by Weed Killer.—A few days since one of the employees of the Richmond Corporation lost his life through accidentally drinking weed killer instead of the beverage he had brought with him for his breakfast. Some weeks ago the man who lost his life, with another employee, brought some weed killer to Kew Green to kill the grass on the drive by the west entrance to the gardens. When they had completed their work the weed killer that remained, or a portion of it, was handed to the constable in charge of Kew Green, and placed in his shelter or box, which is unprovided with cupboards. On the day of the accident the deceased with a companion again came to Kew Green, and in accordance with the usual custom they had their breakfast in the shelter, and in the course of the meal he picked up the bottle of weed killer and drank from it instead of the bottle containing his tea. We give these particulars for the purpose of pointing out the importance of exercising the greatest possible care in handling weed killers and other poisonous preparations used in the garden. They should, in all cases, whether the gardens are public or private, be constantly kept under lock and key, and be given out as required for use by a responsible person to a responsible person, and that any remaining be at once returned to those by whom it was given out. Moreover, weed killers, when given out for use should in all cases be put into vessels that are so distinct in shape, that by no possibility can they be mistaken for bottles or other receptacles for liquids used for other purposes.

National Chrysanthemum Society.—The programme for the conference to be held on December 5, 1910, has been arranged as follows: Afternoon Session—3 p.m., paper by Mr. Norman Davis, entitled "The Culture of Japanese Chrysanthemums for Exhibition"; 4 p.m., paper by Mr. W. Higgs, entitled "The Culture of Incurved Chrysanthemums for Exhibition"; 5 p.m. to 6.30 p.m., interval for tea. Evening Session—6.30 p.m., two short papers, viz.: (a) "Methods of Exhibiting Japanese and Incurved Chrysanthemums," by Mr. H. J. Jones; (b) "The Use of Large Blooms in Floral Decoration," by Mr. R. F. Felton; 7.30 p.m., paper by Mr. Stevenson, entitled "Late-struck Japanese Chrysanthemums for Exhibition."

Fourth Conference on Genetics.—The fourth Conference on Genetics will, as decided at the Conference held in London in 1906, be held in Paris in 1911, and the dates now fixed are September 18 to September 23, 1911. The Conference will be held under the auspices of the Société Nationale d'Horticulture de France, and at its rooms. Dr. Viger is president of the Organising Committee, and M. Philippe de Vilmorin is secretary, with M. A. Meunissier as assistant secretary. The meetings of the Conference will be presided over by M. Yves Delage, Professor of the Faculty of Sciences. The programme, to be elaborated in due course, will include "not only all the problems connected with Mendelian heredity, but also all the questions of variation, mutation, and, in general, everything pertaining to the transmission of characters in living beings." All desirous of taking part in the Conference, or of obtaining further particulars concerning it, should communicate with M. Philippe de Vilmorin at 66, Rue Boissière, Paris.

Messrs. Sutton and Sons have been awarded by the jury of the Brussels International Exhibition the gold medal for the excellence of their grass seeds which have been used in the formation of the beautiful lawns that constitute a prominent feature.

National Hardy Plant Society.—Mr. Frank Bouskell, secretary of the National Hardy Plant Society, writes: "During the Royal Caledonian Horticultural Society's show at Edinburgh, a meeting of persons interested in hardy plants was held, Mr. Macself in the chair, the secretary and treasurer of the society also being present. The meeting was well attended, and a number of apologies were read from persons promising their support, who were unable to attend. The Chairman explained the objects of the society, and invited the meeting to express an opinion as to the desirability of including annuals within the scope of the society. After a most interesting discussion the meeting decided that it was not desirable to include annuals. A discussion then took place as to the amount of the annual subscription. The Chairman thanked the meeting for their expressions of opinion, which, he stated, would be of great assistance to the Provisional Committee in framing the constitution of the society. Mr. Bouskell and Mr. Brunton also addressed the meeting. The following gentlemen were elected members of the Provisional Committee to represent Scotland: Mr. M. Todd, Mr. Brydon, Dr. MacWatt, and Mr. Kidd.

Early Single Chrysanthemums.—A few days ago a party of members of the Floral Committee of the National Chrysanthemum Society paid a visit to the trials of early single chrysanthemums conducted by Messrs. W. Wells and Co., at Merstham. Marie Corelli and China were considered as too much alike, so were Charming and Esther, and Florence Gillham and Phyllis Cowley. The members then proceeded to select the best varieties in the different colours as follows: White, White City, Phyllis Cowley, and Minnie; cream, Eva Grantham and Lily Ovenden; chestnut, Donald and Chestnut; rosy-bronze, Alexandra; pink, Brazier's Beauty, Olive, and Pink Gem; amaranth, Richard and Dorothy; crimson terra-cotta, D. Ingram; rose-pink, Esther; gold edge, Gold Lace; ruby-red, Hilda's Favourite and Ruby; chestnut-crimson, Kate Westlake; yellow, Marie Corelli and Nellie King. Numerous newer varieties were voted two or three marks according to their excellence. The members also inspected the pentstemons, herbaceous flowers, early and late chrysanthemums in the nursery, and a busy, interesting, and profitable afternoon concluded with tea kindly provided by Mr. and Mrs. Wells.

Blairgowrie Raspberry Trade.—The raspberry season in the Blairgowrie district has now concluded, and, though the total crop despatched from this centre to various parts of the country fell short of the one gathered last year, it must be considered satisfactory, especially as prices have ruled high, about £18 10s. per ton being obtained during the last week, though £10 was the price earlier in the season. There has been a keen demand, and practically every berry has been marketed, whereas last year the crop in other districts was large, and prices were low. This season the output has amounted to about 3,117 tons (including packages), as compared with 3,329 tons in 1909, the fruit itself probably amounting to about 2,494 tons.

Improvement in Ulster Orchards.—Under the auspices of the Ulster Horticultural Society two silver cups—the Aberdeen and Gibson cups—are annually offered for competition among owners of apple orchards. The competition has served a most useful purpose and has resulted in a great improvement in the orchards in the Belfast district. The orchards are judged by points, and the maxima are as follows: Quality, 60; quantity, 40; skilful cultivation, 100; total, 200. The winner of the Aberdeen cup was Mr. James Bonis, of Moy, who was the cup-holder, and secured respectively 55, 37, and 85 points, making a total of 177. For the Gibson cup the competition was extremely close, the winner for the second time being Mr. J. Moffett, Portadown, who had 148 points, but Mr. J. M'Quillan, Crumlin, was second with 145 points. The judges, Messrs. J. Lynas and J. Harding, state in their report that "While some of the orchards submitted to our inspection still require a great deal of care and attention to bring them up to the high standard of the prize-winners, we were delighted to find a marvellous improvement since these competitions were inaugurated seven years ago. Instead of the miserable, starved, and moss-covered trees which we found in many of the orchards then, we now find in almost every instance clean, healthy, well-pruned trees carrying heavy crops of fine clean fruit, which will, we have no doubt, if properly graded and packed, command a good price, and amply repay the growers for the extra care and attention which they have devoted to the cultivation. We are pleased to find that spraying has now become general. Many of the growers spray two and three times, with the result that we saw very little signs of insect or fungoid pests. While the Department of Agriculture have done, and are still doing, a great deal to help and encourage the fruit-growing industry in the country, we think your society have good reason to be proud of the fact that they were the first to take it up.

AN EFFECTIVELY-ARRANGED COLLECTION OF DAHLIAS

For which Messrs. T. S. Ware, Lim., were awarded the Large Gold Medal at the exhibition of the National Dahlia Society held on September 20 and 21.

B.G.A. Visit to Wisley.—The members of the London Branch of the British Gardeners' Association propose to visit the Royal Horticultural Society's gardens at Wisley to-day (September 24), but they will be glad to have with them any members of the association who can make it convenient to attend. The train for Byfleet leaves Waterloo at 12.8 o'clock.

Monument to George Don.—George Don, a Scottish botanist, born in 1764, had a varied experience, both horticultural and botanical. In 1802 he was appointed superintendent of the Royal Botanic Gardens, Edinburgh, at a salary of £40 a year. He was a clever British botanist, but a failure as a business man, and he died in great poverty on January 15, 1814. To the memory of George Don a granite obelisk was recently erected in the parish churchyard of Forfar, and on September 8 this was unveiled by Mr. E. Claridge Druce, M.A., who, in his address, detailed Don's history.

Forestry Appointment in the Malay.—Mr. F. G. Spring, a diploma student of the Aberdeen and North of Scotland College of Agriculture, has just received a lucrative appointment in the Federated Malay States, in the shape of an assistantship to the Director of Agriculture and Superintendent of the Government plantations. The post carries with it a commencing salary of £360 per annum. A Kincardineshire man, Mr. Spring took his diploma in agriculture in 1908, after completing the stipulated college course. Since then he has undergone further training specially fitting him for such a post as he has now received, including a special course in botany at the University of Aberdeen. As may be supposed, Mr. Spring's appointment has given great pleasure to his old classmates and friends.

Supply of Botanical Material for Demonstration.—It will be within the recollection of most botanists that Messrs. James Backhouse, of York, promoted a scheme in 1899 for the supply of botanical material to colleges and schools for demonstration and research, although recognising that for some time, at any rate, the venture would not be self-supporting. Subsequently, the interests were transferred to the British Botanical Association, of which Dr. A. H. Burtt became the director. After ten years, notwithstanding the expansion of the original scheme and the increased demands due to the extension of nature study, it has become apparent, says "Nature," that the institution cannot exist as a private venture, and therefore it is proposed to enlist the help of individuals interested in the aims of the association and convert the undertaking into a public association of subscribers. This decision was formulated at a meeting of botanists and others, and an executive committee was elected to proceed with the enrolment of members and associates. As the institution exists purely for the preferment of botanical study and research, it is to be hoped that sufficient subscribers will be forthcoming to ensure its permanence.

A Good Bunch of Black Hamburgh Grape.—Mr. Isaac Read, Brunwall, has just cut a single bunch of Black Hamburgh grapes scaling $5\frac{1}{4}$lb., every berry perfectly coloured except one. How many of our readers can beat this?

NEW PLANTS, ETC.

CATTLEYA IRIS KING EDWARD VII.

Probably the best form of this hybrid that has yet been seen. It is a strong grower, and has flowers of large size and excellent form. The parents are C. Dowiana aurea and C. bicolor. The sepals and petals are yellowish-green with rosy-bronze suffusion, while the broad lip is rich red-purple. F.C.C., R.H.S., September 13. Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney.

LÆLIO-CATTLEYA BERTHE FOURNIER MAGNIFICA.

A handsome variety of the hybrid between L.-c. elegans and C. Dowiana aurea. There were six fine flowers on the spike shown, and in these the shape of the lip was very like that of Cattleya Iris, whereas in some varieties the labellum is more like that of C. Dowiana. The sepals and petals are rich rose colour, suffused with golden-bronze; the lip is bright red-purple. F.C.C., R.H.S., September 13. Mr. H. Alexander, orchid grower to Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester.

CYPRIPEDIUM ANGELA.

A charming new hybrid derived from C. Fairrieanum and C. niveum, and showing its parentage very plainly (see Fig. on p. 721). The silvery-white flowers are veined with rose and rose-purple, the veins on petals and dorsal sepal being composed of dots of colour. A.M., R.H.S., September 13. Mr. H. J. Chapman, gardener to Mrs. Norman Cookson, Oakwood, Wylam-on-Tyne.

CATTLEYA ADULA THWAITES' VAR.

A bold variety with large rosy-lilac sepals and petals, and a fine broad crimson-purple lip. A.M., R.H.S., September 13. Mr. Black, gardener to R. G. Thwaites, Esq., Streatham.

ODONTIODA CECILIA.

A new hybrid obtained by crossing Cochlioda Noetzliana with Odontoglossum Wiganianum. The flowers are of fair size and good shape, creamy-white freely marked with orange-red. A.M., R.H.S., September 13. Mr. R. G. Thwaites, Streatham.

APPLE REV. W. WILKS.

This splendid cooking apple has already had an Award of Merit. It is of large size, with light green-yellow skin, crops freely, and cooks beautifully. It also bears freely in a young state. The parents are Peasgood's Nonsuch and Ribston Pippin. F.C.C., R.H.S., September 13. Messrs. Jas. Veitch and Sons, Chelsea.

APPLE RED VICTORIA.

This variety has been exhibited each autumn for several years past. It has shapely fruits of the most brilliant crimson-scarlet colour, the colour passing into the flesh near the skin. The variety crops regularly and freely. F.C.C., R.H.S., September 13. Mr. G. W. Miller, Clarkson Nursery, Wisbech.

DAHLIAS.

Cardinal.—Described on p. 736. A.M., R.H.S., September 13. Messrs. J. Cheal and Sons, Crawley.

Mrs. Joynson Hicks.—Described on p. 736. A.M., R.H.S., September 13. Messrs. J. Cheal and Sons.

Mrs. Landale.—A pretty garden cactus variety with rosy-pink florets that are yellow at the base. A.M., R.H.S. Messrs. J. Cheal and Sons.

Hon. Mrs. Greville. A handsome garden cactus variety with fine blooms on long, stout stems. The colour is orange, with bright salmon shading. A.M., R.H.S., September 13; F.C.C., N.D.S., September 13. Messrs. J. Cheal and Sons.

Princess Juliana.—A rather solid pæony-flowered variety, more double than most of the section. The flowers are pure white. A.M., R.H.S., September 13. Messrs. Whitelegge and Page, Chislehurst.

Sweet Briar.—Described on p. 736. A.M., R.H.S., September 13. Messrs. J. Stredwick and Son, St. Leonards.

H. L. Brousson.—A cactus variety that has been well shown this year. The ground-colour is soft yellow, and this shades to salmon-rose at the tips of the florets. A.M., R.H.S., September 13. Messrs. J. Stredwick and Son.

Ouida.—A charming single variety of fine shape, salmon-rose, with crimson-red centre. A.M., R.H.S., September 13; F.C.C., N.D.S., September 13. Mr. M. V. Seale, Sevenoaks.

Loveliness.—A bright rosy-mauve coloured single variety, with crimson centre. A.M., R.H.S., September 13. Mr. M. V. Seale.

Minerva.—Described on p. 736. A.M., R.H.S., September 13. Mr. Chas. Turner, Slough.

Loveliness.—A handsome and very large-flowered decorative variety, with broad florets of rich rose-pink colour. A.M., R.H.S.; September 13. Mr. Chas. Turner, Slough.

Rosette. — A large rosy-purple cactus variety of good form. F.C.C., N.D.S., September 13. Messrs. J. Burrell and Co., Cambridge.

Clarissa.—A long-stemmed garden cactus dahlia of rich crimson-scarlet hue. F.C.C., N.D.S., September 13. Messrs. J. Burrell and Co.

Mrs. Usmar.—Another long-stemmed garden cactus variety, with rich soft scarlet colour over a glowing yellow base. F.C.C., N.D.S., September 13. Messrs. J. Cheal and Sons.

Butterfly.—A pretty single variety, pure white with bright yellow centre. F.C.C., N.D.S., September 13. Messrs. J. Cheal and Sons.

The Earl. — A deep crimson-maroon coloured cactus variety, with narrow, pointed, and incurving florets. F.C.C., N.D.S., September 13. Messrs. J. Stredwick and Son.

CHRYSANTHEMUMS.

Hollicot White.—A useful early variety with bold flowers of pure white, carried on long stout stems. A.M., R.H.S., September 13. F.C.C., N.C.S., September 19. Mr. W. Roots, Cranford, Middlesex.

Hollicot Yellow. A showy variety of rich golden-yellow colour; it has drooping florets, and is of very large size. A.M., R.H.S., September 13; F.C.C., N.C.S., September 19. Mr. W. Roots, Cranford, Middlesex.

Dolores.—A splendid and graceful variety with blooms about six inches across, of Japanese shape, and lovely bronzy terra-cotta shade. F.C.C., N.C.S., September 19. Messrs. Lowe and Shawyer.

El Draco.—A lovely early outdoor Japanese chrysanthemum of graceful form, with slightly drooping florets of a charming rich amber colour. F.C.C., N.C.S., September 19. Messrs. Lowe and Shawyer, Uxbridge.

Almirante.—A brilliant variety with very long stems, and stiff and yet elegant flowers of a vivid chestnut-crimson colour, almost scarlet. The blooms are about five inches across. F.C.C., N.C.S., September 19. Messrs. Lowe and Shawyer, Uxbridge.

Pink Beauty.—A glorious variety of large size and splendid Japanese form and beautiful lilac-pink colour. It grows about 2¼ft. high. F.C.C., N.C.S., September 19. Mr. W. Roots, Holly Cottage, Cranford.

Cranford Pink.—A large, flattish flower, about seven inches across, with flat, broad florets of a rich deep mauve-pink colour. N.C.S., September 19. Mr. W. Roots.

Wills' Bronze Pearl.—A rounded flower of medium size, and borne erect. Colour soft bronze, a sport from Pearl Rose. Commendation, N.C.S., September 19. Mr. W. R. Wills, Cheshunt, Herts.

Verona.—An attractive early variety of fine habit for the border, producing an abundance of neat rich bronze flowers about three inches across. Commended, September 19. Messrs. W. Wells and Co., Merstham.

Richard. — A new and distinct early single variety of fine habit, and one that promises to be a fine bedding variety. Colour deep rosy amaranth all through. F.C.C., N.C.S., September 19. Messrs. W. Wells and Co., Merstham.

W. A. Cull.—A handsome and brilliant single variety, of a rich golden chestnut shade, the bases of the florets being golden-yellow. F.C.C., N.C.S., September 19. Messrs. W. Wells and Co., Merstham.

John Woolman.—A large early single variety; rich rose-pink with small white zone round the deep yellow eye. Commendation N.C.S., September 19. Mr. H. Woolman, Shirley, Birmingham.

HYACINTHS FOR EXHIBITION AND GENERAL USE.

During the past few years valuable prizes have been offered at the Royal Horticultural Hall for the hyacinths, and in most cases the competition has been very keen, and has done much to retrieve the lack of interest in their cultivation.

The hyacinth is certainly one of the most useful of bulbs for forcing purposes, as it is easily cultivated, and with judicious care the flowering season can be extended over a very long period. Hyacinths are suitable alike for the conservatory or the embellishment of the dwelling house, either in pots or in a cut state. Well-ripened bulbs should be obtained as early in September as possible from a reliable source and potted immediately—this is a most important item in their successful culture.

The compost should be prepared a week or two previously, be thoroughly mixed, and used in a moist condition, and yet not so much so that when pressed down it becomes caked or pasty. The following will be found a suitable mixture—three parts good fibrous loam, one part well decayed cow manure, which should be passed through a quarter-inch mesh sieve, with sufficient coarse road or river sand to keep it open and porous. As to the size of pots to use, there is much difference of opinion, but I consider those generally known as 48's are the best and most convenient. These should be thoroughly cleansed and well drained, and on the crocks should be placed sufficient fibre (taken from the loam) to prevent the compost becoming mixed with them. Pot moderately firm and allow the crown of the bulb to remain about one inch above the level of the soil. Each pot should be correctly labelled, and after a thorough watering, be placed in a cold frame and covered with finely sifted cinder ashes to the depth of four inches.

The stock should be examined after about five or six weeks, and when the growths are about two inches in length they should be taken out and placed in another frame near the glass. Give air moderately at first and shade for a few days should the weather be bright. It will be found that some varieties take much longer to start into growth than others, but in no case should these be taken out of the ashes until active growth is evident. From this period hyacinths must not be allowed to suffer for want of water, and when watering the pots should be filled up at least three times to ensure every particle of the soil becoming moistened.

The plants so treated may then be introduced to heat as required, and weak liquid manure be given at alternate waterings, but when the spike commences to show colour this may be increased.

An ideal place for the full development of the spikes is a shelf near the glass, where air can be given freely when necessary. Each spike will require to be neatly staked and shaded very lightly from bright sunshine.

E. Beckett.

Aldenham Gardens.

RAMBLING ROSES.

For a considerable period after rambling roses obtained prominence as aids in beautifying the garden and enhancing its interest, there was a strong tendency to place a rather severe limit upon their usefulness, with the result that in many gardens they were not planted in sufficient numbers to contribute so liberally to their attractions as they should have done. As the result, however, of experience in their cultivation a much broader view is taken of their suitability for garden decoration, and they are grown in a much greater diversity of forms They are, indeed, recognised not only as suitable for clothing pergolas and trailing over arches, but of much value for running riot up the trunks and lower branches of trees that are not in a robust state of health, for clambering up poles, and for spreading freely over rustic and other trellises. In addition, their great value for cultivation in standard form has been proved to demonstration; and when grown under conditions favourable to their full development, they are objects of great beauty. We have evidence of this in the charming gardens of Foxhill, Reading, the residence of Sir Rufus and Lady Isaacs, and if the readers of these brief notes turn to the illustration that is given herewith, they will see that standards with stems of various heights are used with much success. It can be seen that the specimens with stems that have a height of about five feet are surprisingly beautiful, and it will not be found difficult to imagine that those some two or three feet taller will be still more effective when they have had time to develop large heads, with the long slender branches sweeping the ground. To fully enjoy these graceful and attractively-coloured roses it is necessary to grow them in as many of the suitable forms as space will allow, and to so arrange them that each form occupies a position wherein its distinctive characteristics are seen to the best advantage.

One of the most important points in the cultivation of rambling roses is the selection of varieties. In many gardens the selection is limited to two or three varieties that have become popular owing to their freedom of flowering, but from lack of variety, they lose much interest. In others the varieties are too numerous to produce really satisfactory colour effects, and when the numbers are large there is a difficulty in excluding some that are somewhat below the standard in quality. The proper course is to select a sufficient number to include the various types of bloom and shades of colour, and no more; and, it may be added, to ensure a display of bloom extending over as long a period as possible. The following will form a suitable selection from the Wichuraianas: Alberic Barbier, white, shaded yellow, early. Debutante, soft pink, sweet scented, and very free, late. Dorothy Perkins, rich pink, flowers borne in large clusters, sweet scented, late. Evangeline, flowers single and rather large, white with pink tips, sweet, late. Hiawatha, single, crimson with white centre, flowers borne in large clusters, late. Leontine Gervais, salmon-rose shaded yellow, early. Réné André, orange-yellow, early. White Dorothy, pure white, free, late. From the polyanthas and other ramblers not included in the Wichuraianas may be selected as the most desirable: Blush Rambler, single, blush, wonderfully free. Claire Jacquier, soft yellow, very free. Crimson Rambler, still one of the best in its colour, taking its many good points into consideration; late. Euphrosyne, rose-pink; early. Flower of Fairfield, crimson, hardly so bright as Crimson Rambler, but it has the advantage of being perpetual in flowering. Goldfinch, pale lemon, deep golden yellow in the bud state. Kathleen, rich carmine, with white centre. Lyon Rambler, rich carmine-pink. Mrs. F. W. Flight, bright rose-pink, very free, early. Tausendschon, flowers large, rich rose-carmine, sweet scented. Waltham Bride, white, single, very free.

AN EXCELLENT EXAMPLE OF THE USE OF RAMBLING ROSES
In the gardens of Foxhill, Reading, the residence of Sir Rufus and Lady Isaacs.

As in the case of other roses the ramblers appreciate a deep and rather rich soil, and previous to planting the soil should have a dressing of well-decayed manure, such as that from an old hotbed, and be broken up to a depth of about two feet, and the manure be well mixed with it. The end of October or the beginning of November is the best time to plant, and precautions to ensure an even distribution of the roots and a firm soil should be taken. In the case of those to be trained to pergolas, arches, etc., the growths should be loosely secured to the supports to prevent injury from the wind, and they should remain undisturbed until early in the spring. If the plants are extra strong, and an immediate effect is desired, cut the shoots back to where the wood is well ripened, and then bend them down in a horizontal direction, and make them secure by means of a stout peg or a short stake and a piece of bast or string. In due course, growths will be produced throughout their whole length, and when these are two or three inches in length train them to the posts or trellis against which they are to be grown. The best course is to wait for flowers until the second year, and at the spring pruning to cut the shoots back to the second or third bud above the surface. By this means a strong, vigorous growth is obtained from the base and a good foundation thereby laid. In the planting of standards the greatest possible care should be taken in planting to avoid injury to the roots, and to have the soil thoroughly firm. Immediately the planting is completed a strong stake of a suitable length should be fixed in position, and the stem be made secure to it.

Rosarian.

LATE TULIPS.

Among the most familiar and beautiful of our hardy bulbous flowers the tulip, and especially the late-flowering varieties, stand pre-eminent as useful subjects for the decoration of the flower garden or the home. Their brilliancy of colour and effectiveness when grown in masses in the wild garden is seldom, if ever, surpassed by other spring-flowering bulbous plants. Most of the late-flowering section have sprung from Tulipa Gesneriana, and are usually designated as "May-flowering tulips," and as such they are most acceptable and useful as cut flowers, coming into bloom at a time when few herbaceous plants are yet in flower, and when the majority of the daffodils are over.

LATE TULIP INGLESCOMBE YELLOW.
Flowers large, the colour rich yellow. From blooms supplied by Messrs. Barr and Sons.

Of the late-flowering section one might almost say (beautiful as the earlier flowering varieties are), they possess a form and general stateliness of character not seen among the other sections of the tulip family, certainly they exercise a fascination of their own, which is clearly shown by their increased popularity in recent years. The Parrot section is highly valued by some, their serrated petals and curious markings are certainly highly attractive, but for fine shades of colour these are surpassed by the "Darwins," whose symmetrical and cup-like shape of bloom places them at once in a regal position amongst their fellows. With a good selection of these—and nowadays they are numerous—charming arrangements might be made, either in the house or garden, and so cheaply can these be purchased now, that none need reject them on the score of expense or difficulty in management.

The Cottage Garden tulips, which were so named, it is said, because they have from time to time been collected from the old cottage gardens of England, had become almost forgotten, but some very beautiful varieties have been obtained, and these, like the "Darwins," are becoming increasingly popular, for, being perfectly hardy, they are excellent subjects for the permanent borders, or for naturalising in grass, while as subjects for the herbaceous border they are unrivalled, their naturally graceful habit and length of stem adds much to their artistic value, either when growing, or as cut flowers. These are now frequently seen in old-fashioned country gardens, where they are allowed to remain undisturbed from year to year—a clear proof that they are easily grown in rich soil that has long been under cultivation. For the successful cultivation of this class of tulip the soil must be deep, rich, and well prepared.

The bulbs may be planted any time from September to the middle of November, and unless the natural soil is porous it is advisable to place a little sand at the base of each bulb when planting. After planting a mulching of leaf-soil may be given to assist in keeping extreme frost from the bulbs, this, however, is not absolutely essential. After flowering, and when the old stems are turning yellow the bulbs may be lifted and dried, and kept out of the ground until planting time, or if more convenient they may at once be replanted, as nothing is really gained by keeping them out of the ground.

Where these tulips can be planted in quantity, or in broad masses of any one colour, the effect produced is exquisite and not soon forgotten, especially where the ground is carpeted with dwarfer-growing plants affording a suitable contrast of colour, either in flowers or foliage. So numerous are the varieties and shades of colour now obtainable from any reliable nurseryman, that to give a list of varieties is unnecessary in an article of this kind, for there are more than enough to meet the requirements and taste of each individual grower, amateur or professional alike, and details of height and descriptions may be found in the bulb catalogues issued by reliable firms.

W. Hedley Warren.
Aston Clinton Gardens.

SOME DOUBLE PERENNIAL SUNFLOWERS.

Sunflowers are not so much in vogue as they were at one time, but they will always find a good place in the garden where hardy autumn flowers are appreciated.

Among them are some which are too aggressive in their growth to enjoy the favour they otherwise deserve, and those which have more of the "stay at home" habit deserve fully more consideration, inasmuch as they are not so likely to encroach upon the domains of their neighbours, and so to injure their welfare.

The double varieties here named are al worthy of notice, and are all useful flowers, either in the border or for cutting, although they have not the "æsthetic" effect which was sought after and found in the huge annual sunflowers so popular some years ago. They are very beautiful, however, and good plants, some five or six feet high, are fine things in their season. Those now named are all varieties of Helianthus multiflorus, and, as the name would suggest, give a number of blooms.

Bouquet d'Or is one of the finest of these, the flowers being prettily quilled, and reminding one of a huge yellow anemone-flowered pyrethrum, or a chrysanthemum of the same type.

The older H. multiflorus plenus has also good double flowers of the character of an anemone-flowered pyrethrum or chrysanthemum, and is a good variety, not to be despised because older than the foregoing. Soleil d'Or is a very beautiful double form, after the style of plenus, but with lighter-coloured flowers. Another of the anemone section is Metéore, or Queen Victoria, which is not only one of the best, but has about it more of the merit of novelty. The blooms are both large and of a good colour.

These handsome double sunflowers are perennial, and in a fairly sheltered place are certain to give satisfaction. They like a good and rich soil, well drained, but with a fair amount of moisture in it in summer. They are real sun lovers, and are at their finest when seen in the warm sunlight of a glorious autumn day.

They can be planted in spring or in autumn, preferably in March or April.

Messrs. WM. ARTINDALE & SON,

Nether Green Nursery, Sheffield.

THE FIRST AND ONLY PURE WHITE DELPHINIUM.

TWO STARTLING NOVELTIES.

THESE two new varieties, which are now offered for the first time. Both grow 5—6ft. high, and produce enormous flower stems with large flowers, and the branches which are produced in enormous quantity at the base of the central spike, are longer than of any other variety, several measuring over 2½ft. This makes both these varieties the best for cutting purposes, as they flower from June till late in summer.

DELPHINIUM HYBR. MOERHEIMI, has large flowers of the purest white, and not the slightest shade of creamy, bluish or greenish, like the so-called "white" Delphiniums, which have been introduced the last few years, and to which it cannot be compared. **It is doubtless the best hardy perennial introduced in the last ten years.** Award of Merit R.H.S. July, 1909. **10/6** each. (Only a limited quantity will be sold and orders are requested at once.)

DELPHINIUM HYBR. CAPRI, of quite the same growth as "Moerheimi," being a counterpiece of same it much resembles in colour to "Persimmon," but is in every respect an improvement of this variety; the flowers are larger and the spikes longer and of a more branching habit. We consider it as the **best sky blue single Delphinium** in commerce **10/6** each.

Our Catalogue of 200 pages will be posted free on application

LILIES IN BEDS.

The culture of lilies has of late years received a considerable stimulus, and they are now grown far more extensively than was at one time the case. This is not at all surprising, for many lilies are entitled to rank among the grandest of herbaceous subjects, and though some of them are decidedly capricious in their behaviour, they cannot, from their noble appearance, be omitted.

Lilies of different kinds are now frequently associated with rhododendrons, or with other dwarf shrubs that thrive under much the same conditions, that is to say where the soil is cool and moist, yet effectually drained, and contains a considerable amount of vegetable matter, preferably sandy peat. By so planting them the roots can freely penetrate into a cool medium that does not get unduly dry (a most important point in lily culture), while the neighbouring shrubs serve to protect the young and tender shoots from late frosts and harsh, cutting winds, often experienced about the time that they first make their appearance above ground. Furthermore, the protection afforded by neighbouring shrubs is of considerable value later on, as they shade the ground and the lower portion of the stems. This is of great importance, especially in the case of those species that make a considerable number of stem roots, as they develop rapidly in partial shade and play a prominent part in supplying nourishment to the blossoms.

LILIUM TIGRINUM FORTUNEI.

As grown in association with Helenium pumilum in Hyde Park.

Yet another reason exists for the association of lilies and rhododendrons, and that is these last named will have practically finished flowering before the lily blossoms open, and thus by planting the two together a floral display is maintained from spring till autumn.

Where the lilies, planted in beds, are intended to form the predominant feature, the ground may be carpeted with hardy heaths, andromedas, and similar subjects, if it is desired to be permanent, but for a summer display alone other plants may be used. This season I saw a grand bed of Lilium longiflorum (the superior Japanese variety that used to be known as Wilsoni), springing from a groundwork of a deep purple viola, which viola was also used as a carpeting to both the white and pink forms of L. speciosum, in all three cases with the happiest results. The following lilies are all well proved kinds for planting in beds associated with rhododendrons or other shrubs of this class, and what is more the bulbs can, during the season, be purchased at a moderate rate:

L. auratum, of which beside the ordinary form the strong-growing variety, platyphyllum, the white-flowered virginale or Wittei, and the high-coloured rubro-vittatum are all desirable. L. Browni, somewhat like L. longiflorum, but the ivory-white trumpet-shaped flowers are tinged with chocolate on the exterior. L. canadense, which, like the other kinds with rhizomatous bulbs, needs the moist spots. L. Henryi, a Chinese species of comparatively recent introduction, which has become thoroughly established here. L. longiflorum, an exceedingly popular lily, of which enormous quantities of bulbs are sent over annually from Japan. L. Martagon and its dark and white varieties, all of which will also thrive in a loamy compost. L. pardalinum (Panther Lily), whose creeping roots mark it, like L. canadense, as a moisture lover. L. speciosum, known also as L. lancifolium, which, given a fine autumn, is a delightful lily. The bulbs sent from Japan represent as a rule very superior forms, but the Dutch-grown ones will flower out of doors two or three weeks earlier, which in northern districts at least may be an important consideration.

There yet remains a second group of lilies, including some of the finest garden forms, the members of which, as a rule, thrive better in a good loamy soil than in a lighter medium. Instances may occur of some of them doing well under the conditions specified for the first-named group, but as a rule a deep and fairly open loam will suit them best. Those referred to are

L. candidum, the Madonna lily, than which there is no more beautiful flower in the whole genus, and a bed of it when at its best forms a most entrancing feature. Failures with this lily are frequent, a fungoid disease in some districts giving a great deal of trouble, but much of the non-success is caused by the bulbs being kept out of the ground too long, or lifted too late. Essentially an evergreen, L. candidum should be planted permanently during the last two weeks in August, or very soon after. When thriving it should not, if possible, be disturbed at the roots. The advantage of leaving this lily alone may be seen in cottage gardens where magnificent clumps that have not been moved for years may be often met with. L. chalcedonicum is another lily to which the same remarks apply. It is known as the Scarlet Martagon, and though at its best somewhat later than L. candidum, yet many flowers will be open at the same time, and then the contrast between the bright sealing-wax red of L. chalcedonicum and the spotless purity of the other is most marked. The bulbs of L. chalcedonicum produce but a few thick, fleshy roots which are of a deep, descending nature. From this circumstance a considerable check is inflicted on the bulb when moved, and, consequently it, as a rule, flowers weakly, if at all, the first season after transplanting.

L. croceum (the Orange lily is a representative of a group characterised by the flowers being upright, or nearly so, instead of drooping as in most lilies. In L. croceum the flower heads are composed of a number of blossoms of a warm reddish orange tint. This may often be seen thriving in the herbaceous border while it is also a favourite with cottagers. Associated with blue delphiniums, which bloom at about the same time, it forms a handsome bed.

L. dauricum or dahuricum, somewhat like the last named, but not so tall a grower, has flowers redder, but they do not retain their freshness as long as those of L. croceum. Several garden forms, known usually as L. umbellatum, are cheap, grow readily, and make a good display.

L. elegans, also known as L. Thunbergianum, is the most variable of all lilies, the flowers differing in colour from pale yellow to deep crimson. Nearly all the forms are exceedingly dwarf, and are on that account valuable as an edging to the taller kinds. The flowers are comparatively large. A few good varieties are atrosanguineum, deep red; alutaceum, buff; bicolor, yellow and red; Orange Queen, bright orange; Van Houttei, bright crimson; and venustum, orange-red. These upright-flowered lilies bloom well the first season. L. monadelphum, when established, is a tall, stately lily whose prettily reflexed flowers are of a varying shade of yellow, more or less spotted with brownish purple. It rarely shows much above ground the first year after planting, but, favourably situated, it improves year by year.

L. pyrenaicum is a free-growing border lily and the first of all to flower. It grows from two to three feet high, and bears a great profusion of small prettily reflexed yellow flowers, which, however, have a heavy unpleasant scent. L. testaceum is quite distinct from all others by reason of the nankeen tint of the blossoms. It is supposed to be a hybrid between L. candidum and L. chalcedonicum, but its early history seems to be obscure. At all events it must be given a place among the best of garden lilies, however rigid a selection is made, as grown in a mass or bed the drooping flowers of such a distinct tint, with their bright red anthers, form a delightful feature. While this is quite at home in a good open loam, it may sometimes be seen in a flourishing state associated with rhododendrons.

L. tigrinum, the Tiger lily, is an old and well-known kind, whose orange-red flowers, copiously spotted with blackish purple, are seen in August. There are several varieties, the best being splendens or Leopoldi, in which the stem is smooth and almost black, while the flowers are larger and brighter in colour than those of the type. The spots, too, are fewer in number but larger. This is one of the earliest to flower, while another superior variety namely Fortunei, is the latest. This is a very vigorous grower with immense heads of rather pale-coloured blossoms. Of the two varieties splendens or Leopoldi is largely grown by the Dutch, while Fortunei is principally sent from Japan. A bed of Fortunei has been of late very effective in Hyde Park, while one of the type has been a feature in the Royal Gardens, Kew.

NARCISSUS WHITE SLAVE.

Flowers pure white with citron cup. From blooms supplied by Messrs. Barr and Sons.

CHOICE DAFFODILS.

Of roses and of sweet peas there are comprehensive lists of varieties, indeed these lists are as nearly perfect as it is possible to attain in the case of florists' flowers. But the official list of sweet peas, issued by the National Sweet Pea Society, is a fleabite as compared with the big list of roses issued not long ago by one of the Continental authorities. And, again, this rose list promises to be a small affair when compared with a complete list of daffodils, provided the output of new varieties continues at the present rate for a few years. Hosts of varieties are hopelessly out of the running as valuable garden sorts, while a hundred or two are so costly that they, too, are in a class by themselves.

Between the old and obsolete varieties and the superfine and rare ones there is a wide range, and no matter at what price per bulb one draws the line the difficulty of making a selection is immense. Those who have a great love for daffodils, and are willing to gratify their own taste, will not mind paying between ten and twenty shillings per bulb for choice varieties, though they call a halt long before Challenger at £35, Bedouin at £21, Furnace at £15 15s., Masterpiece at £21, Jasper at £25, Michael at £25, Sir Galahad at £18 18s., Uncle Robert at £18 18s., C. H. Curtis at £10 10s., or even Peter Barr at £8 8s. are reached.

Visitors to spring flower shows, and those who carefully study the reports of daffodil shows, come to be conversant with a large number of daffodil names, and also with the general appearance of the varieties they represent, but unless they are buyers, or study the autumn catalogues, they often have a very remote idea of the value placed on the bulbs of the fine varieties they see or read about.

Taking the minimum price as 10s., and the maximum as 20s., there are some wonderfully beautiful varieties to be obtained by those who desire to extend their culture beyond the large number of varieties that are eminently suitable for the garden, the conservatory, or the park and meadow—and there are large numbers of such people nowadays. Among yellow trumpet varieties we have Lord Roberts, coming within the limits, but there are very few others remarkable for refinement and brilliance that do so, though there are excellent varieties, like Outpost, King Alfred, Alma, and Admiral Togo, that are somewhat less than 10s. per bulb. Alice Knights and Lady Audrey are in the white trumpet class, and the former is a charming flower. Bicolor trumpet daffodils open to our selection are Hulda, Pyramus, and Sabrina, while Glory of Noordwijk, and Weardale Perfection are below the mark. The incomparabilis section provides plenty of choice material, and here we may select Chancellor, Lady Margaret Boscawen, a very bold variety with white perianth and golden crown; Nestor, Pilgrim, very handsome; Homespun, a shapely yellow beauty; and Whitewell, ivory-white, with yellow cup, and thus become possessed of a fine half-dozen.

In the Barri group there are the brilliant Cœur de Lion, Emerald, with its green and white crown; Circlet, yellow and orange; Finella, lemon and white; Fire Queen, Incognita, very fine, and with richly-coloured crown; Margot, Royal Star, the vivid Scarletta, the dainty Sceptre, Sunrise, and Zenith, white, yellow, and scarlet. Passing to the Leedsi section, with its galaxy of silvery-white varieties, we find the fine Eoster, that was so great an attraction at Birmingham in 1906; Evangeline, a fine grower; Janet Image, a giant variety; Penguin, with its creamy-yellow cup; Undine, a campanulate flower; White Queen, a refined white Sir Watkin; and White Slave, a beautiful shapely variety, three inches and a-half across, snow white, with citron cup. Few of the newer dainty and elegant triandrus hybrids are obtainable at the price fixed, but Anne Holloway and J. T. Bennett Poë are both within the mark, and each is very lovely.

The poeticus family is the next for consideration, and a good pair we may select are Harold Finn, very large, with dark crimson-red eye, and Ibis, with dark scarlet eye. In the other sections choice new varieties are few in number, but the above selection will be found an excellent one for those who desire to pass quietly and with no extravagant outlay from the garden varieties into the daffodil realm peopled with the achievements of our most skilful and successful raisers.

C. H. CURTIS.

THE FRAGRANCE OF THE ROSE.

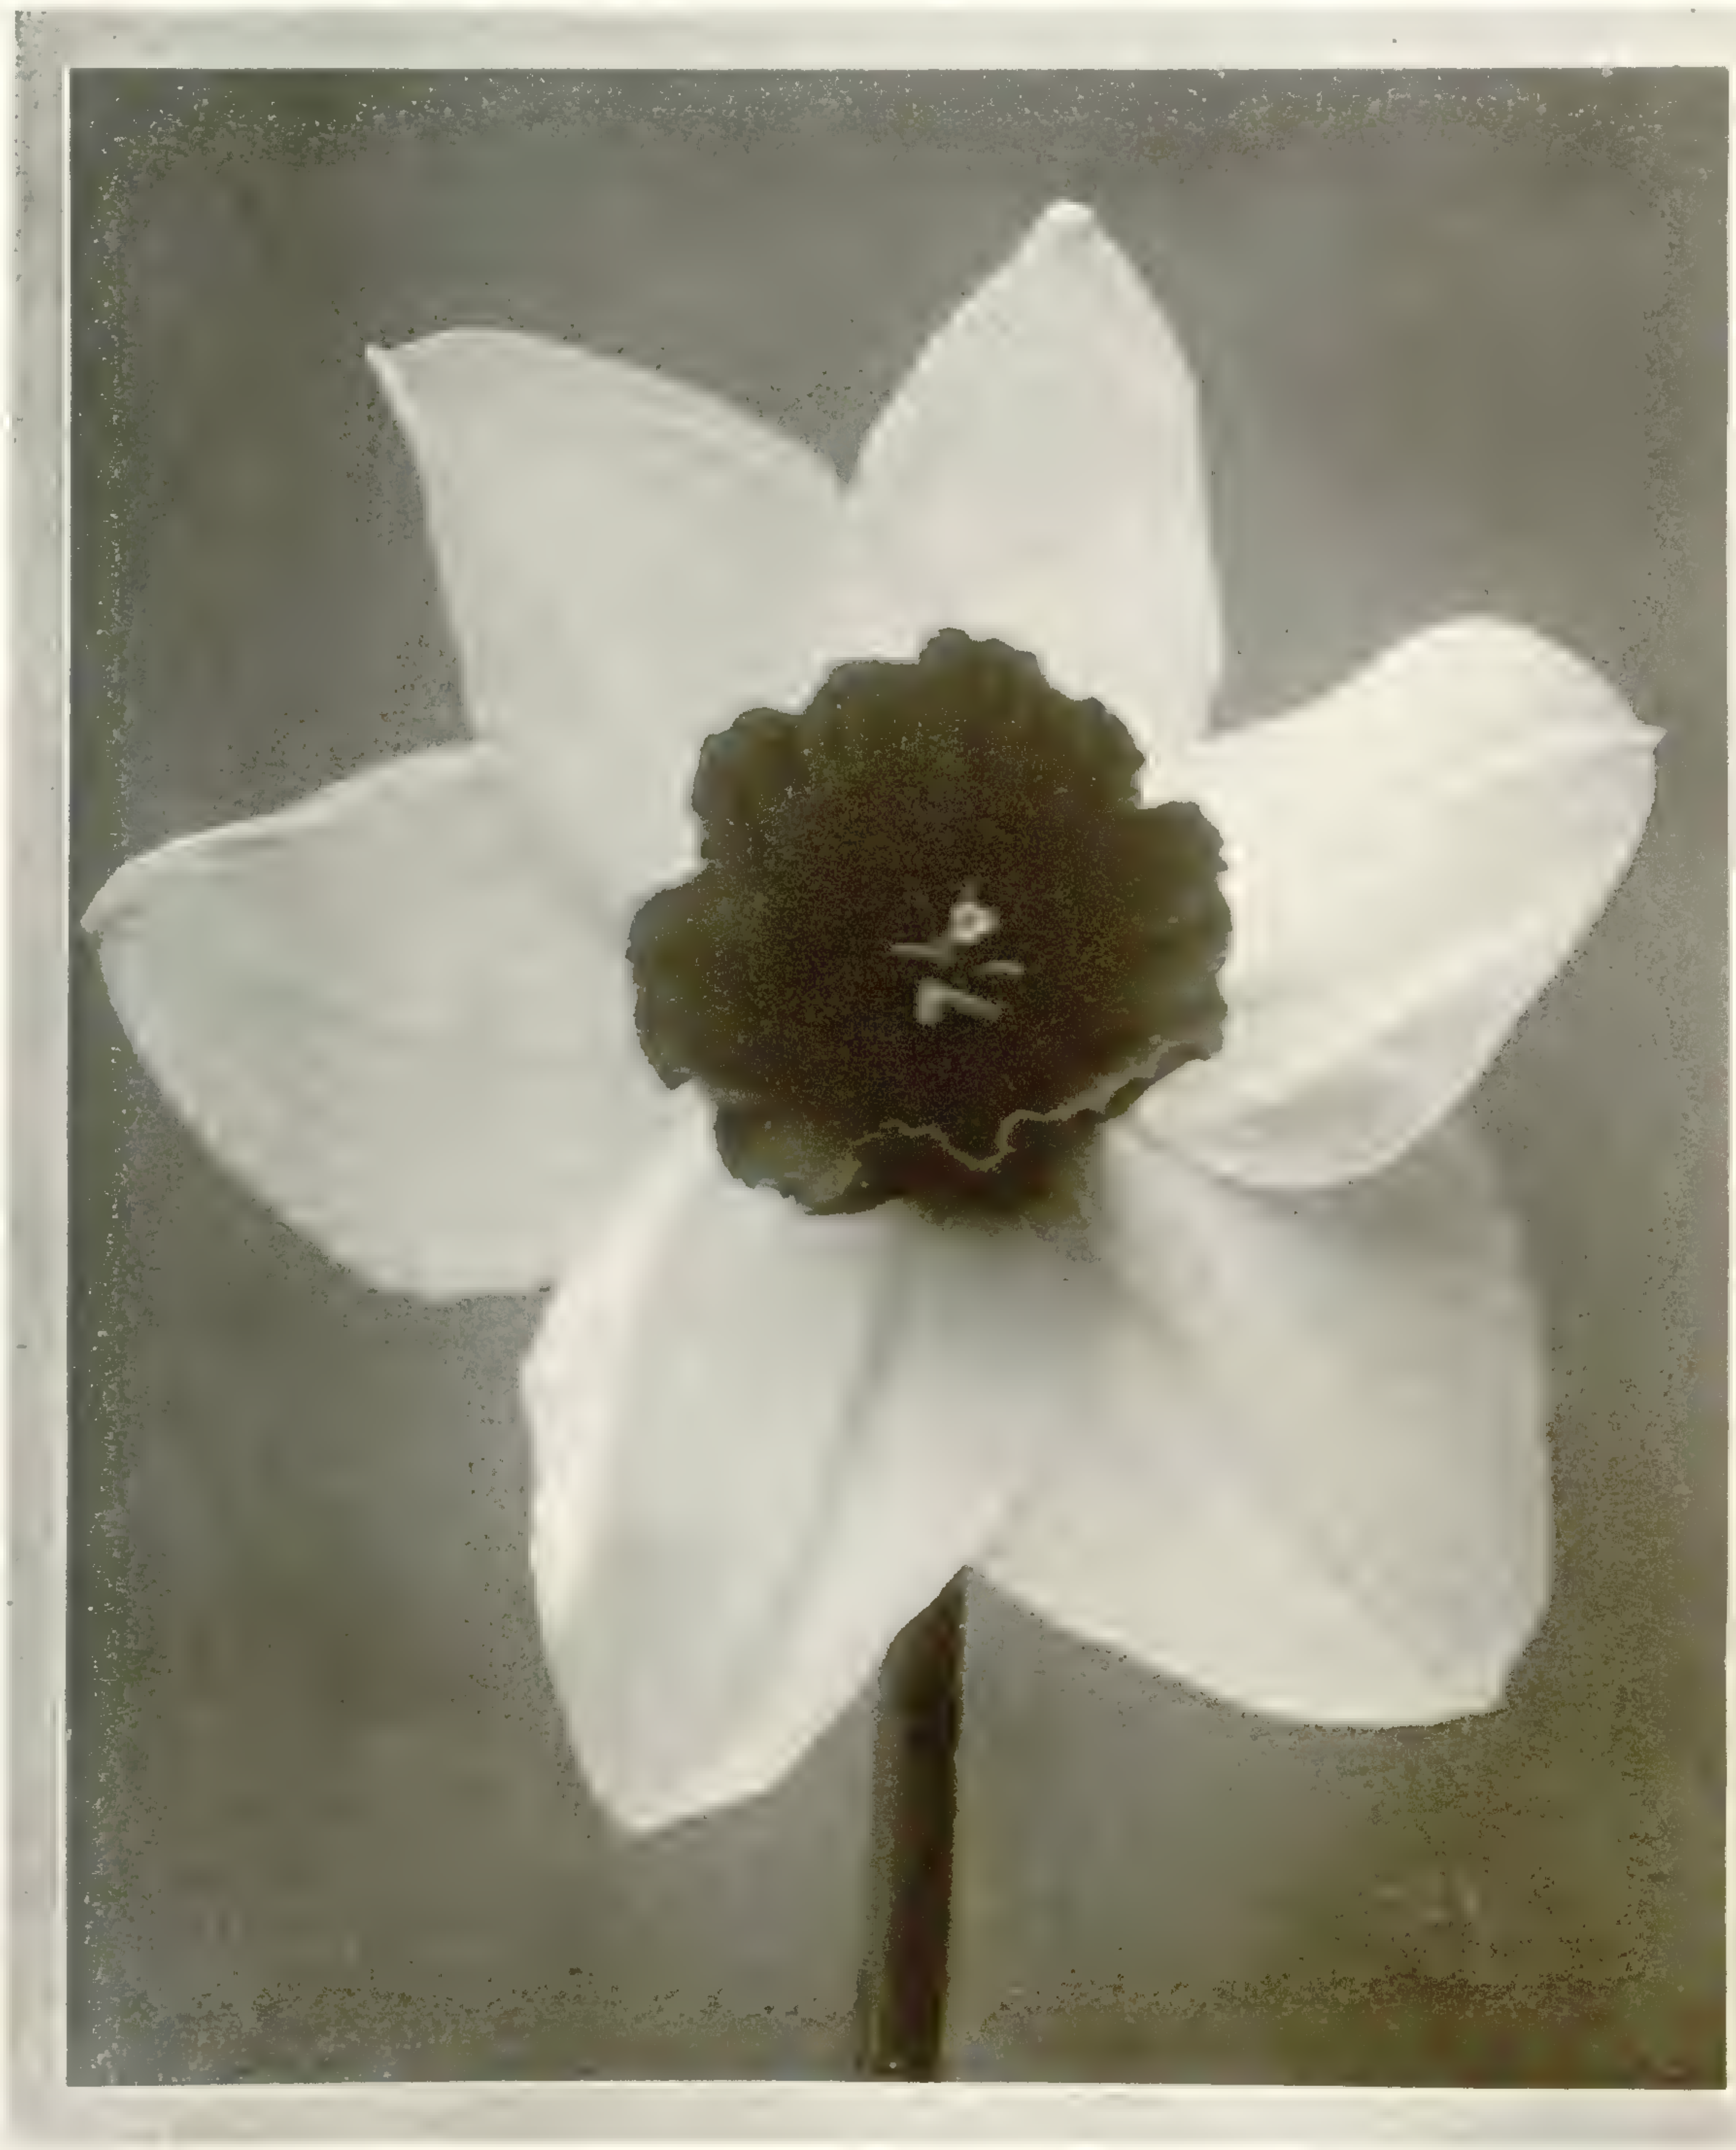
On a Tuesday afternoon in August I met someone coming from a meeting of the Floral Committee of the Royal Horticultural Society. "My friend," he said, "they have given your rose an Award of Merit, but, to tell you the truth, I don't think much of it; it's got no smell." We had on more than one occasion discussed the subject of perfume in roses, and I replied, "You are a chap, you seem to expect the damask in everything." "Yes," was the rejoinder, "even in clean linen."

I went on my way thinking. My friend's opinion is shared by many; they look for the damask perfume in all roses, regardless of the fact that unless a variety has Rosa damascena for one of its progenitors, or is in some way related to it, how can it possess the damask perfume? An ancestor of Daphne, the seedling in question, is related to Rosa maschata.

The damask perfume is not only one of the most delicious of odours in the world of flowers—they realised that, and acted upon it years ago—but it is also the most dominant in the rose family. I am conscious that a smoker is considerably handicapped in detecting perfume in flowers, and my friend indulges in a fragrant cigar.

We should bear in mind that the rose family is a large and varied one, each branch of the family possessing its own characteristic, not only in habit, but also in perfume. All species have a fragrance more or less apparent, a fragrance, in most cases, peculiar to each. The best-known perfumes are those of the Damask, the Tea, and the Musk. Probably the best-known examples of these three distinct perfumes to be found in modern roses are Marie Baumann and General Jacqueminot for the damask, Madame Bravy for the tea, and Lamarque and The Garland for the musk. The strongest perfume in modern roses is derived from the damask and centifolia roses, which, although distinct in some respects, are, as regards perfume, almost identical, and the hybrid perpetual is the offspring of the damask and centifolia. Now note what follows.

In the official catalogue of roses issued by the National Rose Society there appears a list of "the best eighteen fragrant roses," and out of these eighteen we find twelve are hybrid perpetuals, three are summer-flowering roses of the damask and centifolia class, the remaining varieties being two hybrid teas and one Bourbon. Not a single Tea or Musk rose amongst them! Were the compilers of this list oblivious to the sweet fragrance of the Tea rose or the delicate aroma of the Moschata? Surely the accurate heading of this should run "the best eighteen roses of damask perfume."



NARCISSUS LADY MARGARET BOSCAWEN.

Flowers large, perianth snow white, crown golden yellow. From a flower supplied by Messrs. Hogg and Robertson.

Why do many people dab their noses into a rose which they admire? Why not into the dahlia and chrysanthemum? It is because they expect to find in it that which has made the rose the most popular of all flowers, fragrance. But in searching for fragrance we must not limit ourselves to the damask. Our fathers and grandfathers made a great mistake when they expelled from their gardens every rose that was not a hybrid perpetual, or such as Gloire de Dijon, Aimée Vibert, Lamarque, and a few others. Do not let us imitate them in our quest of fragrance. Do not let us forget the claims of the Tea-scented and the Musk, the Austrian Briar and its progeny, Rosa pernetiana. We do not desire to always dine off roast beef and Yorkshire pudding, nor should we restrict our favours to the damask perfume.

I yield to none in my desire for perfume in the rose, for a scentless rose is a disappointment. You cut a long-stemmed Frau Karl Druschki and present it to a visitor, who has just admired those great balls of snow poised on shoots eight or nine feet high. She takes it, and immediately smells it. Alas! what a disenchantment is hers! Size, form, purity are all there, but one thing it lacks, fragrance. Now experience has proved that in this particular, rose, strange as it may seem, there is a strong element of the multiflora, and the perfume of Multiflora simplex, always faint and evanescent, has been lost in the crossing that produced Frau Karl Druschki.

One word with reference to the perfume of the Musk rose. If you have not yet appreciated it, I bid you go into the garden one early morning in summer, and smell R. moschata. Then and there you will find a fragrance which baffles description. Watch your bees, they know where the most fragrant roses grow, and I venture to say you will find more bees on R. moschata and its hybrids than on any other rose in the garden.

JOSEPH H. PEMBERTON.

Havering.

GREENHOUSE MANAGEMENT.—THE AMATEUR'S GREENHOUSE, the popular book by T. W. Sanders, not only treats of the selection and cultivation of greenhouse plants and flowers, but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the management of the plants and flowers grown in it. The price of this book of 416 pages is 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

AUTUMN ROSES.

The recent fine and seasonable weather has been very favourable to an autumn display of roses, and it is long since we had them in better condition, for the beds are as full and gay as at any time of the year. With such a choice before one it is difficult to select the best, but a few that never fail us late in the season may be noted, and I will try and give as good a selection of varying colours as possible.

NEW HYBRID TEA ROSE MRS. CHARLES E. ALLAN.
Flowers silvery-pink suffused with rose. Raised by Mr. Hugh Dickson, and awarded a Silver-Gilt Medal at the National Rose Society's Autumn Show.

Victor Hugo is our best deep velvety crimson this autumn. This is one of the most reliable hybrid perpetuals, and seems exempt from red rust. Always a glowing crimson, shaded with velvety maroon, that sometimes has a distinct tinge of purple; not the dead and dull shade of purple found in aged blossoms, but a clear, almost bluish shade, that changes as the flower is looked at in different lights. One seldom finds Victor Hugo with flowerless growths, almost every branch carries blooms as freely as most of the teas and their hybrids. Another good late dark rose is General MacArthur. This is brighter than Victor Hugo, and minus the deep velvety colouring. A stronger grower, and one that may be depended upon all through the season. Richmond always satisfies me in the autumn, when the cooler weather helps our rather thin-petalled roses. At the time of writing (September 12) Richmond is one mass of crimson, and has been so upon three or four occasions during the present season. It does much better here than Liberty, keeping a good and even height, that is so valuable when used in beds or masses.

Among white roses Frau Karl Druschki is undoubtedly champion, and never fails. This rose is so well known that little more can be said about it. It is reputed to be a cross between Merveille de Lyon and Caroline Testout, but it resembles neither of those varieties in any single way that I can note. Frau Karl Druschki will grow anywhere, and in any position, and I know of no other white flower that retains its purity so well, and is unaffected by bad weather.

A sport from Georges Naboonnand (itself one of our best autumnals), named Peace, is another good light rose. This is not a pure white, and I would describe it as pale lemon-yellow when quite young, getting lighter with age. Peace throws large spreading trusses, each flower carried well away from the rest, and frequently upon branching stems upwards of a foot in length. It makes a long, pointed bud, opening into a flower that lasts longer than most of the few petalled varieties.

In Madame Antoine Mari we have one of the most charming coat flower roses imaginable; always of good form, and lasting well. It is even prettier than ever this autumn, and the sun has brought out its carmine tints on the margin of the petals so finely as to remind one of the colourings sometimes found on Marie Van Houtte in the autumn. Madame Antoine Mari is an excellent grower, and almost evergreen. It is a useful rose all through the season, but is certainly seen to most advantage during autumn, when it is a difficult matter to select any other in front of it. A soft creamy-blush, edged with carmine, it is always of good form, and a capital grower. Perle von Godesberg is very good just now, with its lemon-white blossoms. A grand rose this, and perhaps the best sport from another good variety, viz., Kaiserin Augusta Victoria. It does better here than the last-named, both in growth and flower. It is also a good rose to stand; some flowers have remained fresh and good for the past ten days.

I do not think we can select a better orange-yellow rose than Madame Ravary, which is also one of the sweetest scented roses grown, and is quite faultless. This is very pretty in its younger stages, and always opens well. As a decorative rose it is in the first rank, and if it has rather few petals, these are large, and make a good showy flower. We have few better growers than this, and none with more handsome foliage. Le Progres is a much purer yellow, and a larger and heavier flower. Not quite so strong and free a grower as Madame Ravary, but one of our most certain bloomers, and sweet scented. This is a heavy flower, and as it has a slight tendency to droop it is seen to the best advantage when grown in standard form. A rose that is very pleasing this autumn is La Tosca, a variety that I may perhaps describe as an upright form of Viscountess Folkestone, but I do not find the sweet perfume of the latter in La Tosca. This is an erect grower, producing large trusses of spreading flowers that do not droop like Viscountess Folkestone.

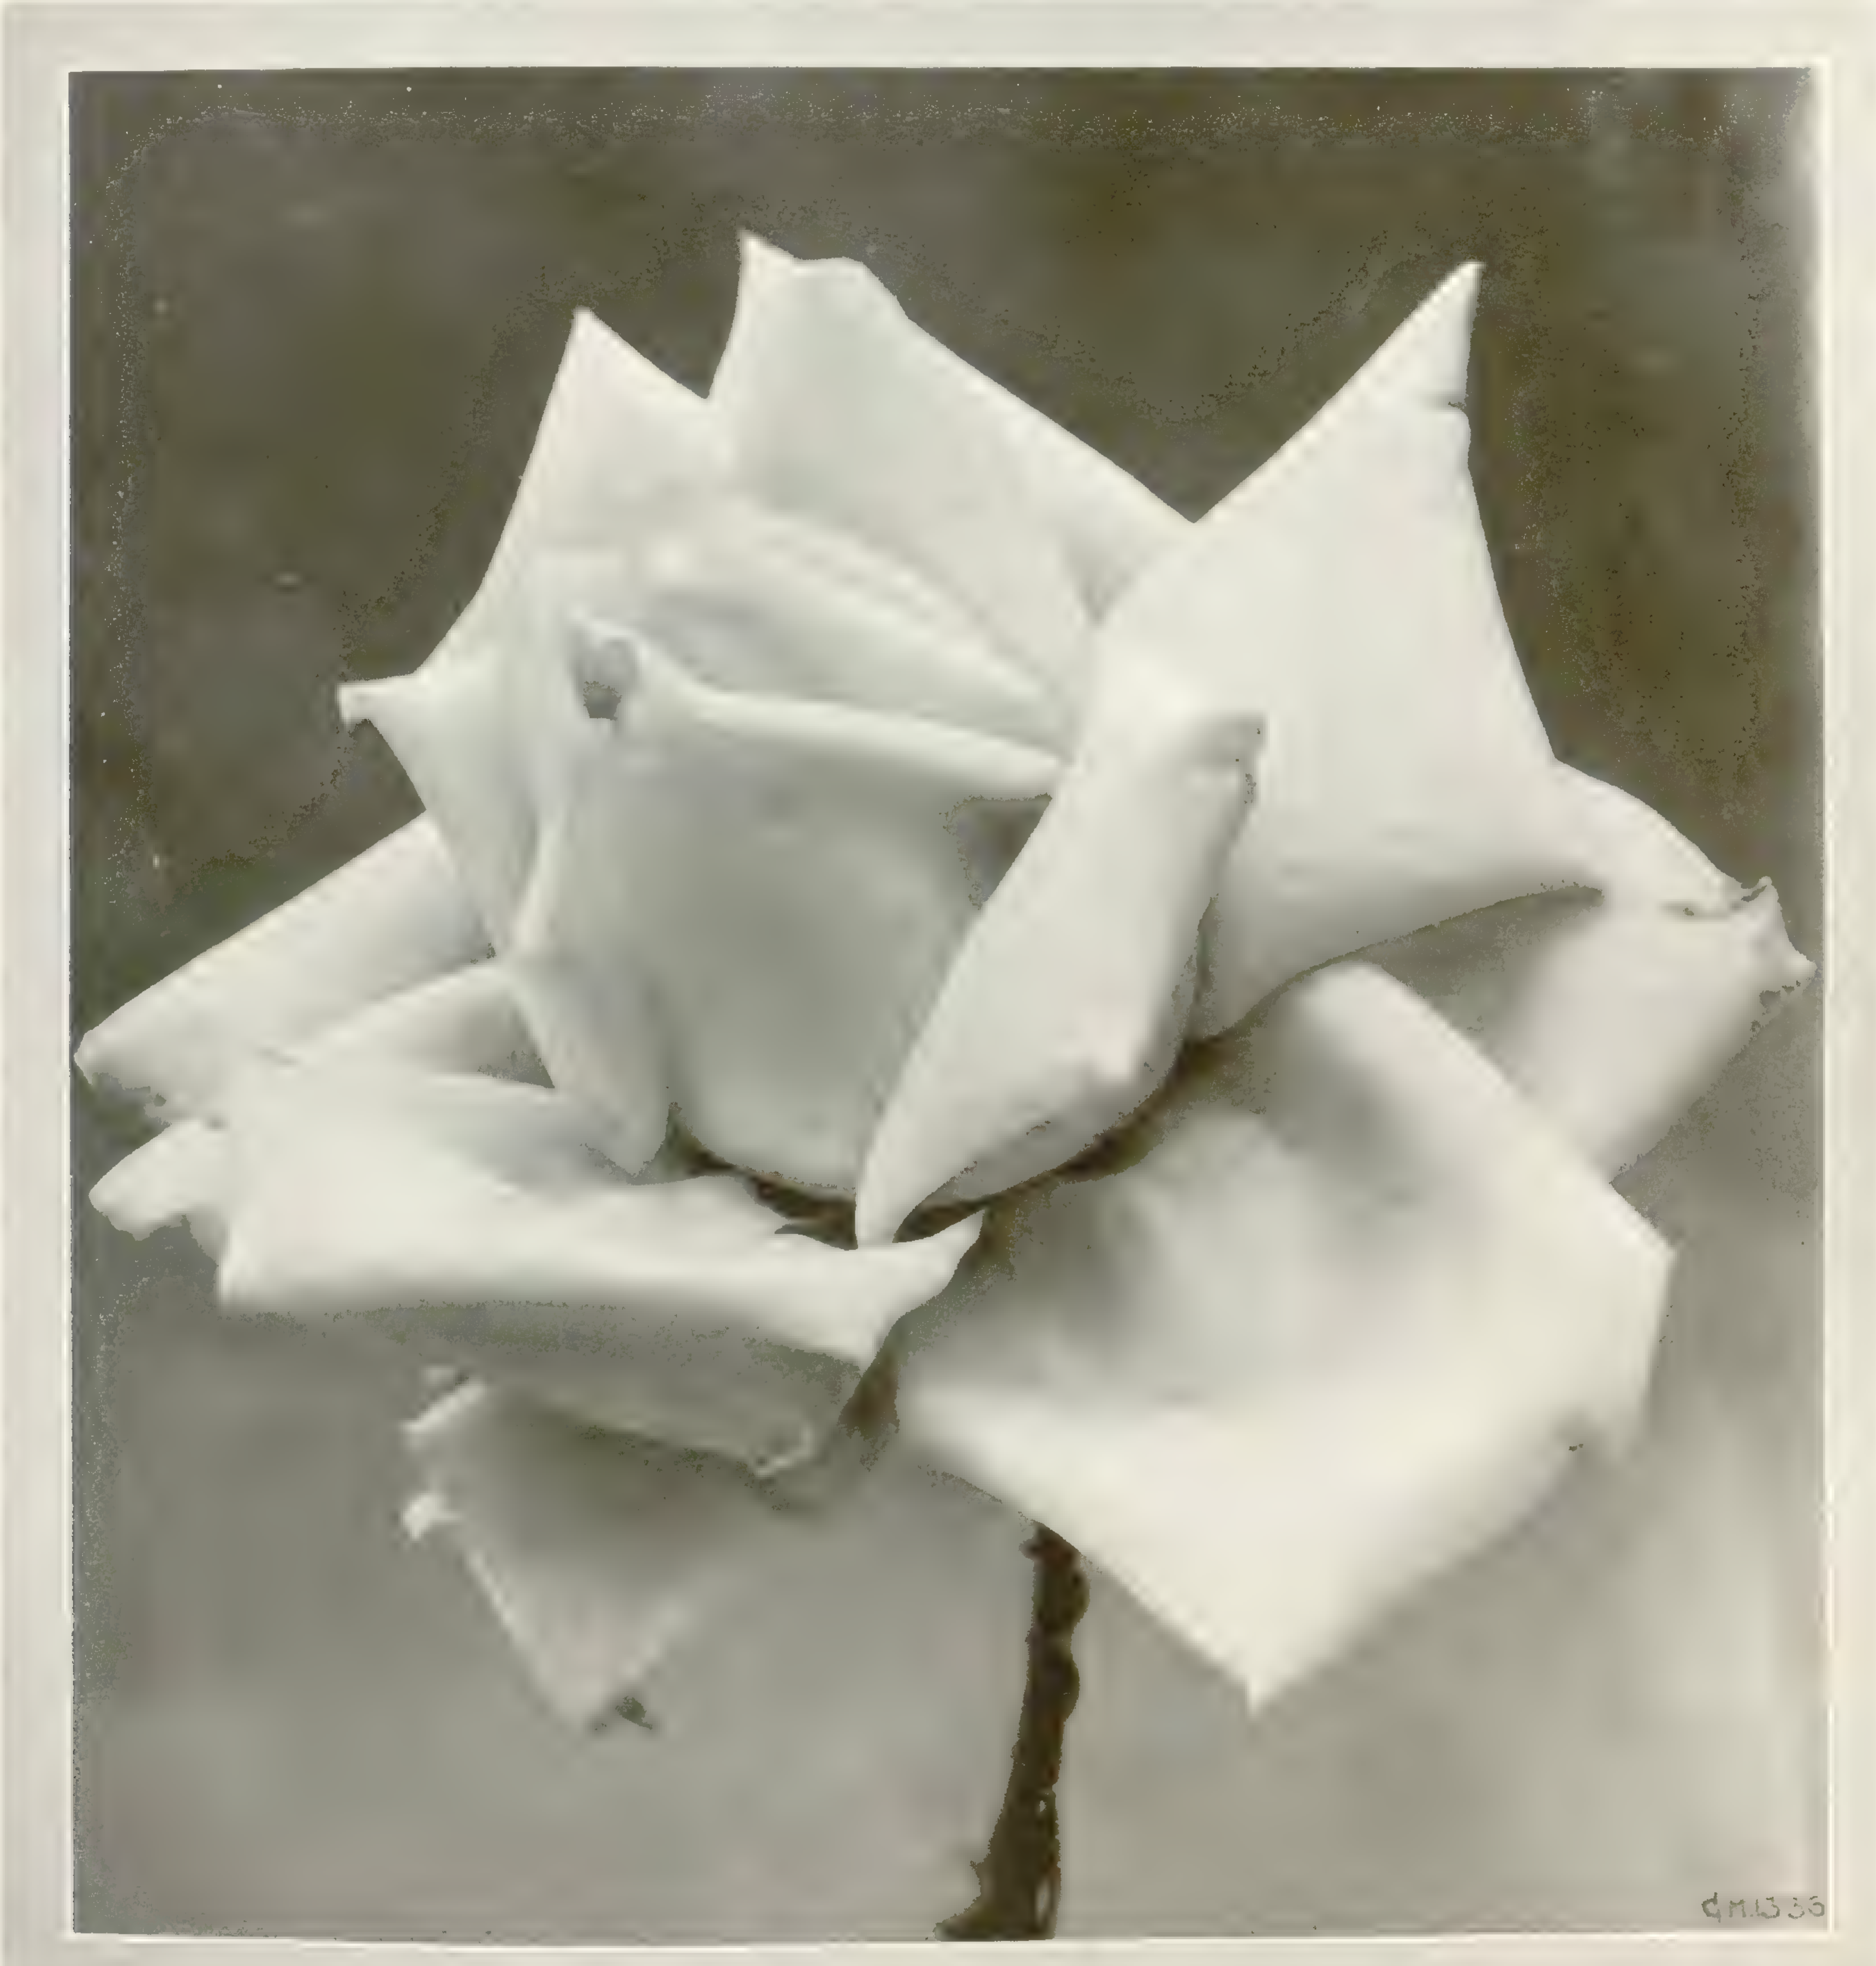
No list of late-flowering roses can be complete without Madame Abel Chatenay, which is one of the best roses we have. Not only is this an excellent late bloomer, but it is equally good all through the season, and deserves a place in every collection. I could write much in favour of this rose, but nothing against it, and it is one of the most reliable, no matter what the season may be, nor are there many with sweeter perfume. This and Caroline Testout are our two best salmon-pinks at present, and are very full of blossom. Caroline Testout is well known, and if sometimes inclined to hesitate in opening during wet weather, because of its globular form, it is certain to please during the best part of the season. It is a good variety for town culture, and one of the hardiest. It cannot well be put to the wrong purpose, and, with the climbing form for pillars, is one of the most serviceable roses we have. But to name, or even select, a few of the best late bloomers is not an easy task, for as we wander among the plants we are constantly coming upon another as good, if not better, than the last, and the present autumn has been exceptionally favourable to late roses.

Good as the above are, they do not surpass the dwarf polyanthas, which are carrying enormous trusses of flower. A small bed of Phyllis is one of the showiest features we have, and shows up well against a batch of Schneewittchen, with its large trusses of creamy-white blooms. Mrs. W. H. Cutbush is another that increases in favour. There is not the same demand now for Madame Norbert Levavasseur as formerly, its place being taken by others that do not possess its dull crimson shade that never looks clear. A variety named Orleans Rose is an immense improvement upon Madame Norbert Levavasseur, and in every direction. Aennchen Muller is a deep and clear rose colour, and one that retains its fresh appearance up to the time its petals fall. The petals are curled up very much in the form of a cactus dahlia. Not only is this a good late rose, but it is one of the first to open, and does not cease throughout the year. Of course, there are short periods when the flowers are not so plentiful, but it is always carrying them more or less.

Perle d'Or is pretty, but apt to throw a few strong side shoots, while the rest of the plant keeps close and compact. This does not make it such an ideal bedder as the majority of the dwarf polyanthas. Etoile d'Or is smaller, and only a pale lemon-yellow. Aschenbrodel is one of the most perpetual among the polyanthas, and has immense trusses of peach and orange-red flowers about the size of a shilling piece, and each little flower is of perfect rosette form. The best white here is undoubtedly White Pet.

There are not many late-blooming climbers among roses, but two need a few words. In Ards Rover we have a good dark crimson that is very useful just now. The blooms are large and well formed, carried nicely upright on stiff stems, very sweet scented, and always with handsome foliage. I think it the best red climber we have. Madame Alfred Carrière affords a good creamy-white, with a suspicion of yellow at the base of its petals. This is a rose that will grow anywhere, and is as generally useful as our old favourite Gloire de Dijon; very hardy, smooth-wooded, and almost evergreen.

These are only a few of the great number of roses now available for autumn display: indeed, I think that if we except a few of the hybrid perpetuals, and those that only flower once in the summer, we find almost all roses very pleasing during such a favourable autumn as we are now enjoying, but those mentioned in these notes are invariably good. A. PIPER.



TEA-SCENTED ROSE, MRS. FOLEY HOBBS.
Flowers bright cream colour, deeper in centre. Raised by Messrs. Alex. Dickson and Sons, Lim., and awarded a Gold Medal at the National Rose Society's Autumn Show.

DWARF POLYANTHA ROSES.

Among the many species and varieties of roses cultivated in our gardens at the present time none are more useful or easy of management than those of the dwarf polyantha or multiflora group, and where a good mass of bloom is required over as long a season as possible there is certainly nothing among roses to equal them. They are quite as floriferous as their more robust growing confreres, the climbing polyanthas, producing a good show of bloom quite early in the season, this, in many instances, continuing till well on to the autumn. From this it will be seen that they are particularly well suited for bedding purposes, either by themselves or as a groundwork or edgings to larger beds of standards, etc., and I doubt if there are a pair of more beautiful roses for buttonholes and sprays than Cecile Brunner and Perle d'Or. Though quite miniature flowers, they are as perfect in form as the best H.P. or H.T. one can name.

For exhibition purposes many of them are also useful, as they make up very fine bunches or vases for showing in the garden rose classes, and here again the two previous mentioned varieties, Cecile Brunner and Perle d'Or, stand out quite by themselves, as they make most exquisite bunches, and if a fair number of plants are grown there will be hardly a week from mid June to October when bunches may not be cut from them. This almost equally applies to quite a number of varieties, such as Etoile de Mai, Gloire des Polyanthes, Mrs. W. H. Cutbush, Perle des Rouges, White Pet, Marie Pavie, Mignonette, Orleans Rose, and several others.

Generally speaking, the colours of these dwarf polyanthas are light, ranging from white to deep pink, and from pale yellow to salmon, only three varieties that I know being fairly deep in colour, these being Madame N. Levavasseur, Orleans Rose, and Perle des Rouges; the latter is not one of the strongest of growers, but certainly the brightest of all the polyantha roses, and it makes a wonderfully bright bunch for exhibitions.

FIRST PRIZE TWELVE VASES OF EXHIBITION ROSES.
Exhibited by Messrs. J. Cocker and Sons, at the National Rose Society's Autumn Show.

The cultivation of this class of roses need not vary from that of any other group, though it may not be necessary to give them such rich soil as one would naturally give the hybrid perpetuals, neither is it necessary, when planting beds, to make them up with loam, as they will do wonderfully well in light soil with moderate manuring. If strong shoots are wanted fairly liberal treatment must be given, but they seem to flower best when only growing moderately strong. Pruning is not a serious operation, as, flowering so freely, they make very little wood growth, and all one can do is to cut back the strongest of the shoots to just below where the first lot of flowers appeared, thinning out all the small and useless shoots, as well as cutting very hard back the strong sappy growths that are frequently made quite late in the autumn, and, if left, often die back after pruning, or even just after growth commences.

As mentioned before, many of the varieties make good bedders, and the following varieties I can strongly recommend for this purpose: Gloire des Polyanthes, bright pink, one of the freest bloomers, the plants keeping of quite a uniform height. Etoile de Mai, opening yellow, and paling off to white with age; rather a large flower for a polyantha, very early and free. Marie Pavie, another good white, with pink or rose centre, very free and good. Maman Levavasseur, very pretty pink, much in the way of a small Dorothy Perkins. Madame N. Levavasseur, commonly called the Dwarf Crimson Rambler, and it certainly resembles it in colour, but is not quite so bright; very free blooming, and a much stronger grower than either of the others. Mrs. W. H. Cutbush, a prettier shade of colour than the preceding, and not quite so robust. Perle des Rouges, a velvety crimson, free, and very dwarf. White Pet, white, as its name implies, rather smaller in flower than the others mentioned, but very pretty and free. Perle d'Or, yellow, with orange centre, a perfect flower, and very continuous bloomer. Cecile Brunner, similar in form to the above, but of a different colour, it being pale pink, or rose, with a much deeper centre.

One or two other varieties which I have noted as being good, but have not seen growing in quantity, are: Orleans Rose, scarlet, shading to pink in the centre of the flower. Aschenbrodel, a very pretty deep shade of blush, but not deep enough to describe as pink, with a touch of yellow in centre. Aennchen Muller, bright rose-pink, with moderately large flowers, good as a bunch for exhibition. Phyllis, bright rose, with good trusses of bloom; and Katherine Zeimet, small white flowers, which look very pleasing in the bunch.

As decorative subjects in small pots these dwarf polyanthas are hard to beat, and are much more easily grown than either teas, hybrid teas, or hybrid perpetuals, and are very much more lasting when in bloom than either of these classes. They may also be relied upon to last in the dwelling house at least a fortnight, providing they have not been pushed along in too much heat before being taken in. In a fairly light conservatory or winter garden they will last quite a month or six weeks. For pots they may be potted up in the autumn from the open ground, and plunged in ashes or short litter, when they will soon make root. Even better are the young plants that have been grafted in pots the previous spring, and if these are shifted on into 32's they make really fine plants for flowering in the spring or early summer, and even the first year, say four months after working, they make first-class decorative plants in 54's or 48's.

For early flowering they should be put indoors as soon as the major portion of the leaves have dropped, and after being kept dry for a few days they may be pruned, giving them a slight damping overhead to induce them to break. Nothing in the way of hard forcing should be tried, or weak attenuated growth will result, and the flowers naturally be soft, and of poor colour, but if brought along steadily, giving them a temperature of about 50 degrees at night, after they are nicely in growth, they should make good plants by the end of April or early in May. They should be kept in as small pots as possible, being much more useful thus than when larger. Feed either with a little liquid or artificial manure as soon as they begin to show flower. The favourite varieties for pots are Mrs. W. H. Cutbush, White Pet, and Maman Levavasseur, and if well managed after flowering thus early in the season they will give quite a good display again a month or six weeks afterwards.

Thomas Stevenson.

NATIONAL ROSE SOCIETY'S AUTUMN SHOW.

Although there was not such a big show of roses at the Royal Horticultural Hall on Thursday last as on the occasion of the Autumn Rose Show of 1909, there was a very fine display, especially when it is remembered that a very heavy storm passed over a greater part of the country on the Wednesday. So delightful were the displays of roses made by the traders, and the little groups of vases of roses set up by the amateurs, that the question arises, Might not boxes for roses be dispensed with altogether at the autumn show? This would come hard upon some few growers, but, unquestionably, the great interest of the autumn show lies in the displays.

DISPLAYS OF ROSES.

Last year there was a grand bank of blooms in the class for three dozen vases of garden roses, but this year, while the flowers were charming, there were but two competitors. Mr. John Mattock, Headington, led the way with a beautiful exhibit of fine bunches of beautiful flowers, the leading varieties being Lyon Rose, Corallina, Mdme. Antoine Mari, White Maman Cochet, Mdme. Constance Soupert, Mdme. Melanie Soupert, Ben Cant, Gottfried Keller, Marie Van Houtte, and the inevitable Frau Karl Druschki. Messrs. Frank Cant and Co., Braiswick, Colchester, were a capital second.

In the class for a representative group of roses (150 square feet), foliage plants allowed, and either pot plants or cut flowers, or both, there were but two competitors, and they filled the two upper corners of the hall. Messrs. Hobbies, Lim., Dereham, secured the gold medal and first prize with a novel and artistic arrangement, the features of which were two miniature pergolas, wreathed with rose growth, and freely studded with blooms. Both these led to the centre of the group, and underneath them, on a carpet of ferns, were specimen blooms of Frau Karl Druschki. At the back were three tall standards, and if the higher and central one had been furnished with a quantiy of flowers of some striking colour it would have materially improved the exhibit. In the front centre were baskets and vases of Kaiserin Augusta Victoria, Lyon Rose, Betty, Mdme. Melanie Soupert, Sunset, Mdme. Ravary, etc., and towards the sides were vases of popular H.P. and H.T. varieties, the margin of the display being filled in with yellow and white tea roses amid ferns. Dorothy Perkins and Hiawatha were the rambling varieties most in evidence. Second prize fell to Messrs. Paul and Son, Cheshunt, who had a rather flat exhibit of cut flowers in low vases, bowls and vase, backed by a few pot roses and palms. Irish Elegance, Mdme. Melanie Soupert, General McArthur, Mrs. W. J. Grant, Joseph Hill, Harry Kirk, Caroline Testout, Lyon Rose, La Tosca, and Frau Karl Druschki were the leading varieties displayed.

The great feature of the show was provided by the class for a representative group of cut roses, arranged effectively on a space 18ft. by 6ft., show boxes not allowed. There were six competitors, and these filled the whole side of the hall opposite the entrance, and made a rare and fragrant display that was worth going a long way to see, and that was a striking testimony to the freedom with which so many roses bloom in the autumn, for there were many thousands of blooms here arranged. The gold medal and premier award was assigned to Mr. George Prince, Longworth, Berks, for a grand lot of beautiful roses, set up in tall pillar-like stands, sheaf-like arrangements, low bowls, and also hanging baskets. Varieties that were very freely shown were Frau Karl Druschki, Mdme. Abel Chatenay, Harry Kirk, K. A. Victoria, Lyon Rose, Pharisaer, Irish Elegance, Auguste Comte, and Gottfried Keller. The front was edged with sprays of rambling rose growths. Second prize fell to Messrs. Gunn and Sons, Olton, who had a stone-coloured latticework background with arches of Dorothy Perkins and other rambling varieties, with a few baskets of bloom suspended from the latticework. In the centre were pillars of blooms of Lyon Rose, Mdme. Abel Chatenay, Killarney, Frau Karl Druschki, Dr. Felix Guyon, Souv. de Pres. Carnot, and Mdme. Ravary, while in the front were baskets of Harry Kirk, Mrs. David McKee, Lyon Rose, Souv. de Catherine Guillot, Maharajah, and other good things. Third prize fell to Messrs. W. and J. Brown, Peterborough, and an extra prize went to Messrs. J. Jefferies and Son, Cirencester.

There were two displays in the class for a representative display of cut roses, arranged effectively on a table space of 60 sq. ft. These were at the top end of the hall, and both were good. The premier group was from Mr. F. M. Bradley, Church Street, Peterborough, who had a very high background of bamboo rods filled with splendid flowers of Frau Karl Druschki and J. B. Clark varieties. The rest of the exhibit was notable for fine stands of beautiful fresh and bright blooms of J. B. Clark, the single white Simplicity, Lyon Rose, Harry Kirk, Mrs. J. Laing, Madame Abel Chatenay, and Charles J. Grahame. Second prize was awarded to Messrs. G. Jackman and Son, Woking, who used the sprays of Rosa rubrifolia too freely among their blooms, and the colour of stems and foliage detracted greatly from the effectiveness of Lyon Rose, Madame Jean Dupuy, and Caroline Testout. Pharisaer and Edu Meyer were very good here.

NURSERYMEN.

First prize for thirty-six varieties, distinct, was won by Messrs. J. Cocker and Sons, Aberdeen, who had a box of beautiful blooms, in which the leading varieties were Gladys Harkness, F. K. Druschki, Mrs. J. Laing, Helen Keller, White Lady, S. M. Rodocanachi, Hugh Dickson, Madame Melanie Soupert, Gustave Piganeau, Betty, and Caroline Testout. This is the sixth year in succession that the Messrs. Cocker have secured this prize at the autumn show. Hugh Dickson (H.P.) and Gladys Harkness (H.T.) were silver medal roses in this stand. Messrs. Adam and Craigmile, Rubislaw, Aberdeen, came second; and Mr. W. Ferguson, Dunfermline, third; seven competitors.

Six competitors staged in the class for eighteen distinct tea or noisette roses, and here Mr. G. Prince scored with some good blooms of Mrs. E. Mawley (silver medal T.), Muriel Grahame, Medea, Golden Gate, Madame H. Berger, and White Maman Cochet; Mr. Henry Drew, second, and Messrs. Adam and Craigmile third. For twelve vases of roses, distinct, seven blooms in each, Messrs. James Cocker and Son led with bright fresh specimens of Hugh Dickson, Gustave Grunerwald, Mrs. D. McKee, Alfred Colomb, Mrs. J. Laing, Lyon Rose, Captain Hayward, Caroline Testout, Madame M. Soupert, Mrs. W. J. Grant, Auguste Rigotard, and F. K. Druschki. Mr. Hugh Dickson, Belfast, second; and Mr. Ferguson, Dunfermline, third.

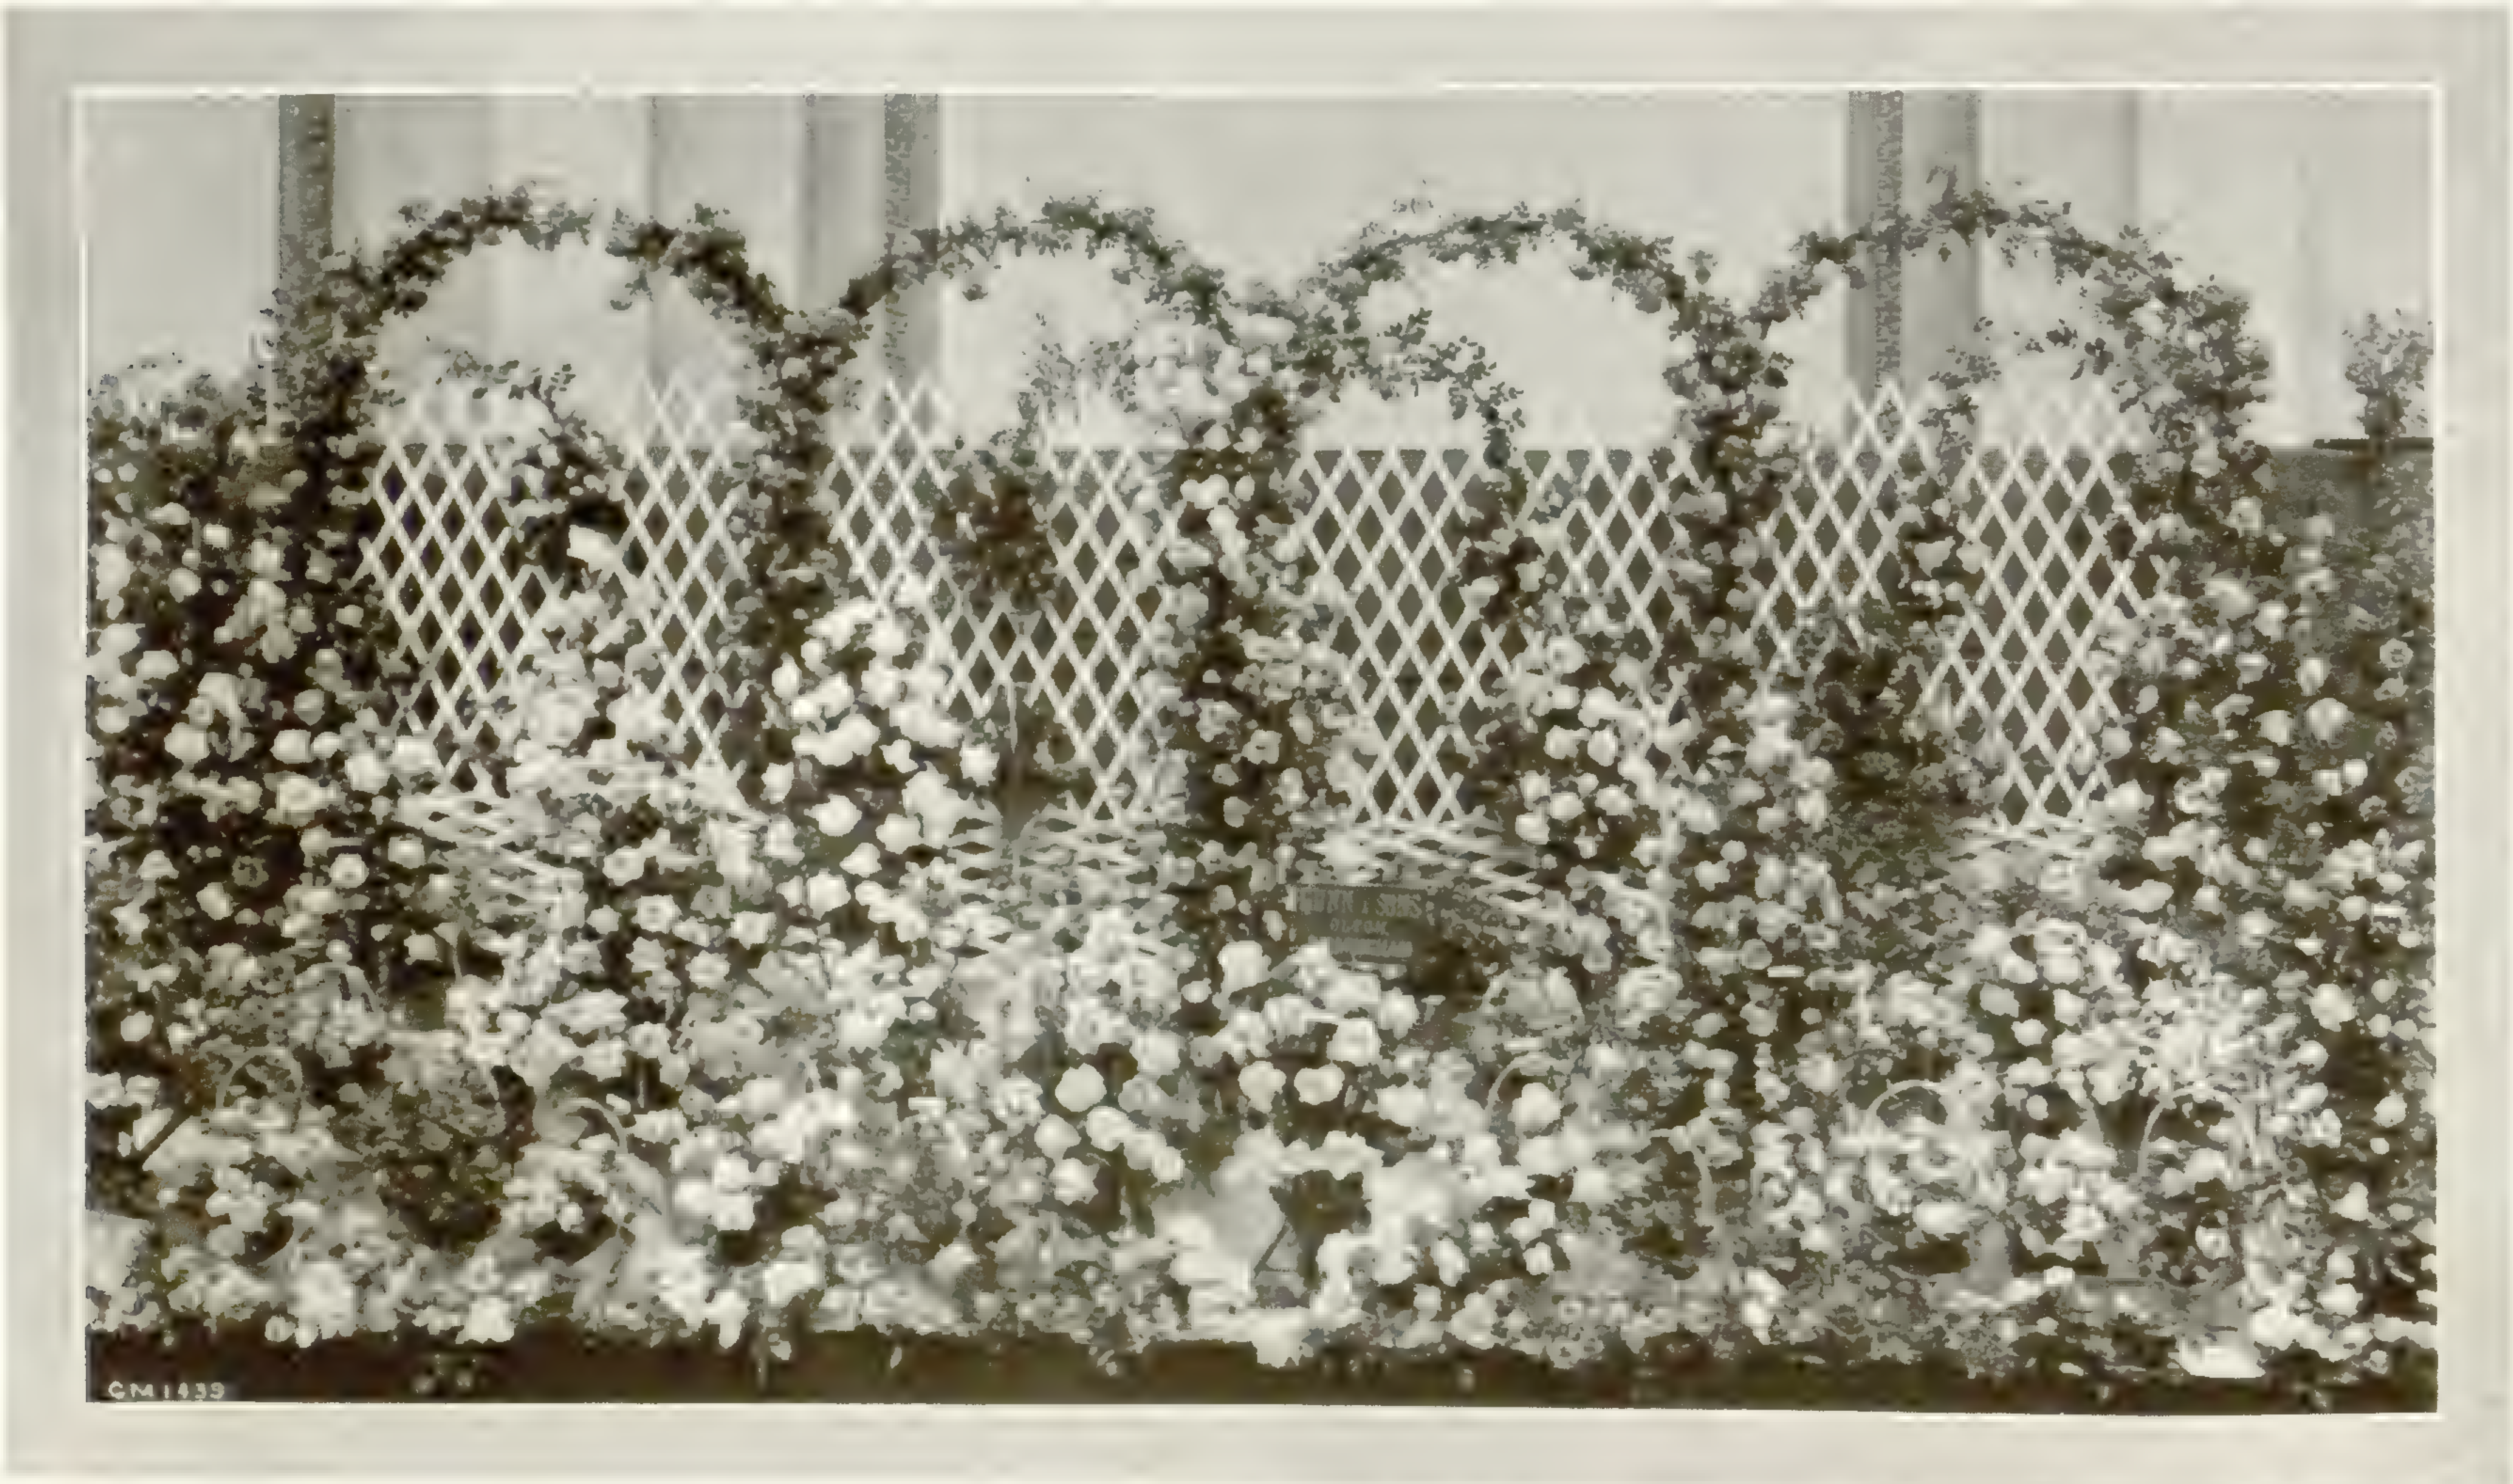
The best dozen blooms of any one rose, in a vase, were examples of Mrs. J. Laing, exhibited by Mr. W. Ferguson, Dunfermline; Messrs. Bide and Sons, Farnham, second with

TEA-SCENTED ROSE, MRS. HERBERT STEVENS.

Flowers white with pale lemon tint in the centre. Raised by Messrs. S. McGredy and Son, and awarded a Gold Medal at the National Rose Society's Autumn Show.

Frau Karl Druschki; and Messrs S. McGredy and Son, Portadown, third, with Lyon Rose. The best twenty-four bunches of decorative roses was the set from Mr. J. Mattock, Headington, Oxford, whose Marie Van Houtte, Dorothy Page Roberts, Teresa Bevan, Liberty, Gottfried Keller, and Edu Meyer were beautiful; Messrs. Paul and Son, Cheshunt, came second; and Messrs. G. Cooling and Sons, Bath, third.

There were four sets of twelve vases of decorative roses, the premier award being won by Mr. Charles Turner, Slough, whose Aennchen Muller, Souv. de C. Guillot, Marie Van Houtte, and Madame Pol Varin-Bernaix, were finely developed and most attractive; Mr. J. Crossling, Penarth, second; and Mr. G. Prince, third. Three competitors came forward in the class for a dozen varieties of roses, each variety staged in a large bamboo stand. First prize fell to Mr. J. Mattock, New Headington, who had two or three dozen flowers each of Madame Abel Chatenay, Marie Van Houtte, Prince de Bulgarie, Betty, La Tosca, Edu Meyer, Trier, etc.; Mr. Henry Drew, Longworth, second; and Mr. W. Bentley, Leicester, third.



A NOVEL AND EFFECTIVE DISPLAY OF ROSES.
Exhibited by Messrs. Gunn and Sons at the National Rose Society's Autumn Show.

Twelve distinct varieties of polyantha roses proved an interesting class, and there were five competitors, Mr. J. Mattock scoring with Eugene Lamesch, Phyllis, Canarienvogel, Aennchen Muller, Marie Pavie, Mrs. W. H. Cutbush, Perle des Rouges, Schneewitchen, Perle d'Or, and Leonie Lamesch; Messrs. Frank Cant and Co. second, and Mr. G. Prince third. Messrs. Paul and Son, Cheshunt, contributed the premier collection of nine varieties of rose hips, and their best bunches were of R. rubrifolia, R. rugosa, R. rugosa alba, R. pimpinellifolia, and R. pisocarpa. There were six competitors, and Messrs. J. Cooling and Son, Bath, came second, and Mr. G. Prince third.

AMATEURS.

Mr. G. A. Hammond, Cambrian House, Burgess Hill, annexed the premier award for eighteen roses, distinct, in the open amateurs' class, and he had fine flowers of Lady Ursula, Madame Melanie Soupert, Madame Eugene Verdier, Yvonne Vacherot, and Molly Sharman Crawford; Mr. E. M. Eversfield, Horsham, second; and Rev. T. G. Henslow, Stanton St. Quinton, third; seven competitors. Mr. R. Barrowman, Rosebank Cottage, Bargeddie, N.B., led for a dozen blooms, and had the silver medal H.P. in his Hugh Dickson; Mrs. B. Fortescue second, and Mr. Whittle third.

Mr. W. Upton, Claremont Street, Leicester, scored for nine roses, distinct; Mr. G. Moules, Hitchin, coming second, and Mr. Morris, Uckfield, third, the latter gaining a silver medal for his H.T. Mrs. W. J. Grant. Mr. H. W. Richards, Westridge, Ryde, led for six blooms in a very keen competition; Mr. P. G. Davis, North Warners, Burgess Hill, second; and Mr. A. E. Brown, Brokes Lodge, Reigate, third.

The Rev. J. H. Pemberton, Havering, had the best twelve bunches of roses, and was followed in order by Mr. F. Denison, Cranford, Leamington, and Mr. H. R. Darlington, Park House, Potters Bar. Viscountess Enfield, Dancers Hill House, was first for a dozen bunches of decorative roses, with Miss Ethel Wightman, Bengeo, Herts, second; and Mr. Conway Jones, Hucclecote, Gloucester, third. Mr. Page, gardener to Mrs. B. Fortescue, Dropmore, Maidenhead, led for a dozen tea or noisette roses, scoring with very bright flowers, and his White Maman Cochet was the medal tea rose; Rev. T. G. Henslow, Stanton St. Quintin, Chippenham, second; and Mr. Eversfield, Denne Park, Horsham, third. For nine tea roses Mr. F. Slaughter, Steyning, was to the front, followed by Rev. J. B. Shackle, Dropmore Rectory, Maidenhead, and Mr. M. Whittle, Leicester.

Mr. W. Upton had the best six tea roses, Mr. J. M. Stuart, Broomhill, Harrow, coming second; and Dr. F. G. Hayes, Dunster, Somerset, third; fourteen entries. Mr. O. G. Orpen had the best four vases of tea roses, five flowers of each, and he scored with Lady Roberts, Madame Jules Gravereaux, White Maman Cochet, and Maman Cochet; Mr. Conway Jones, second, and Mrs. B. Fortescue third. For six vases of roses, five blooms in each, Mr. G. A. Hammond, Burgess Hill, led with Bessie Brown, Madame Melanie Soupert, Madame Wagram, William Sheen, Lady Ursula, and Frau Karl Druschki; Mr. Eversfield second, and Mr. Conway Jones third.

Mr. H. R. Darlington made a very pretty display of six bunches of decorative roses, his Trier and Sulphurea being very good; Miss H. B. Langdon, Raymead, Hendon, second; and Mr. W. Colin Romaine, The Priory, Old Windsor, third. Mr. J. W. Smith, Sparrows, Herne Hall, Bushey Heath, had the best five bamboo stands of decorative roses, and his varieties were Marie Pavie, Papillon, Gustave Regis, Madame Ravary, and Perle d'Or; Mr. Conway Jones second, and Rev. J. H. Pemberton, third.

FLORAL DECORATIONS.

There were seven bowls of China roses in open competition, but in no case was the arrangement first rate. Mr. E. J. Hicks, Twyford, Berks, came first, with Comtesse de Cayla; Mr. C. Turner, Slough, third, with the same charming variety; and Mr. J. Mattock second with Comtesse de Cayla and Queen Mab.

In the ladies' class for a bowl of roses Mrs. G. C. Sawday, Heath Road, Weybridge, scored with a grand bowl of Frau Karl Druschki; Miss Harwood, St. Peter's Street, Colchester, second, with K. A. Victoria; and Miss Langton third with Madame Melanie Soupert. For a bowl of roses, exhibition varieties excluded, Mrs J. W. Smith, Bushey Heath, led with the lovely Irish Elegance; Mrs. Hammond, Burgess Hill, second with Lady Pirrie, and Mrs. O. G. Orpen third with Irish Elegance. Mrs. Butcher, Upper Brook Street, Ipswich, scored for a basket of roses, with Miss Harwood second, and Miss J. B. Langton third.

There was one class for a table decoration of roses, arranged by lady members, and there were a dozen competitors. Mrs. O. G. Orpen led with a very pleasing design, executed wholly with the new yellow Lady Hillington rose; Miss J. B. Langton second with Irish Elegance; Mrs. Hammond third with Mrs. Alfred Tate; and Mrs. Tisdall, Trevor Road, Woodford Green, fourth, with Frau Karl Druschki and Maman Cochet.

NEW ROSES.

Gold medals to Messrs. S. McGredy and Son, Portadown, for Mrs. Herbert Stevens, a new tea variety, cream coloured, and of beautiful shape, pointed; to Messrs. Alex. Dickson and Sons, Newtownards, for Mrs. Foley Hobbs, a tea rose of great beauty, very sweet, bright cream colour, rather deeper in the centre.

148 & 149, Aldersgate Street, London, E.C.

Please send me a copy of "BULBS AND THEIR CULTIVATION," for which I enclose remittance of 2/10.

Name ____________________

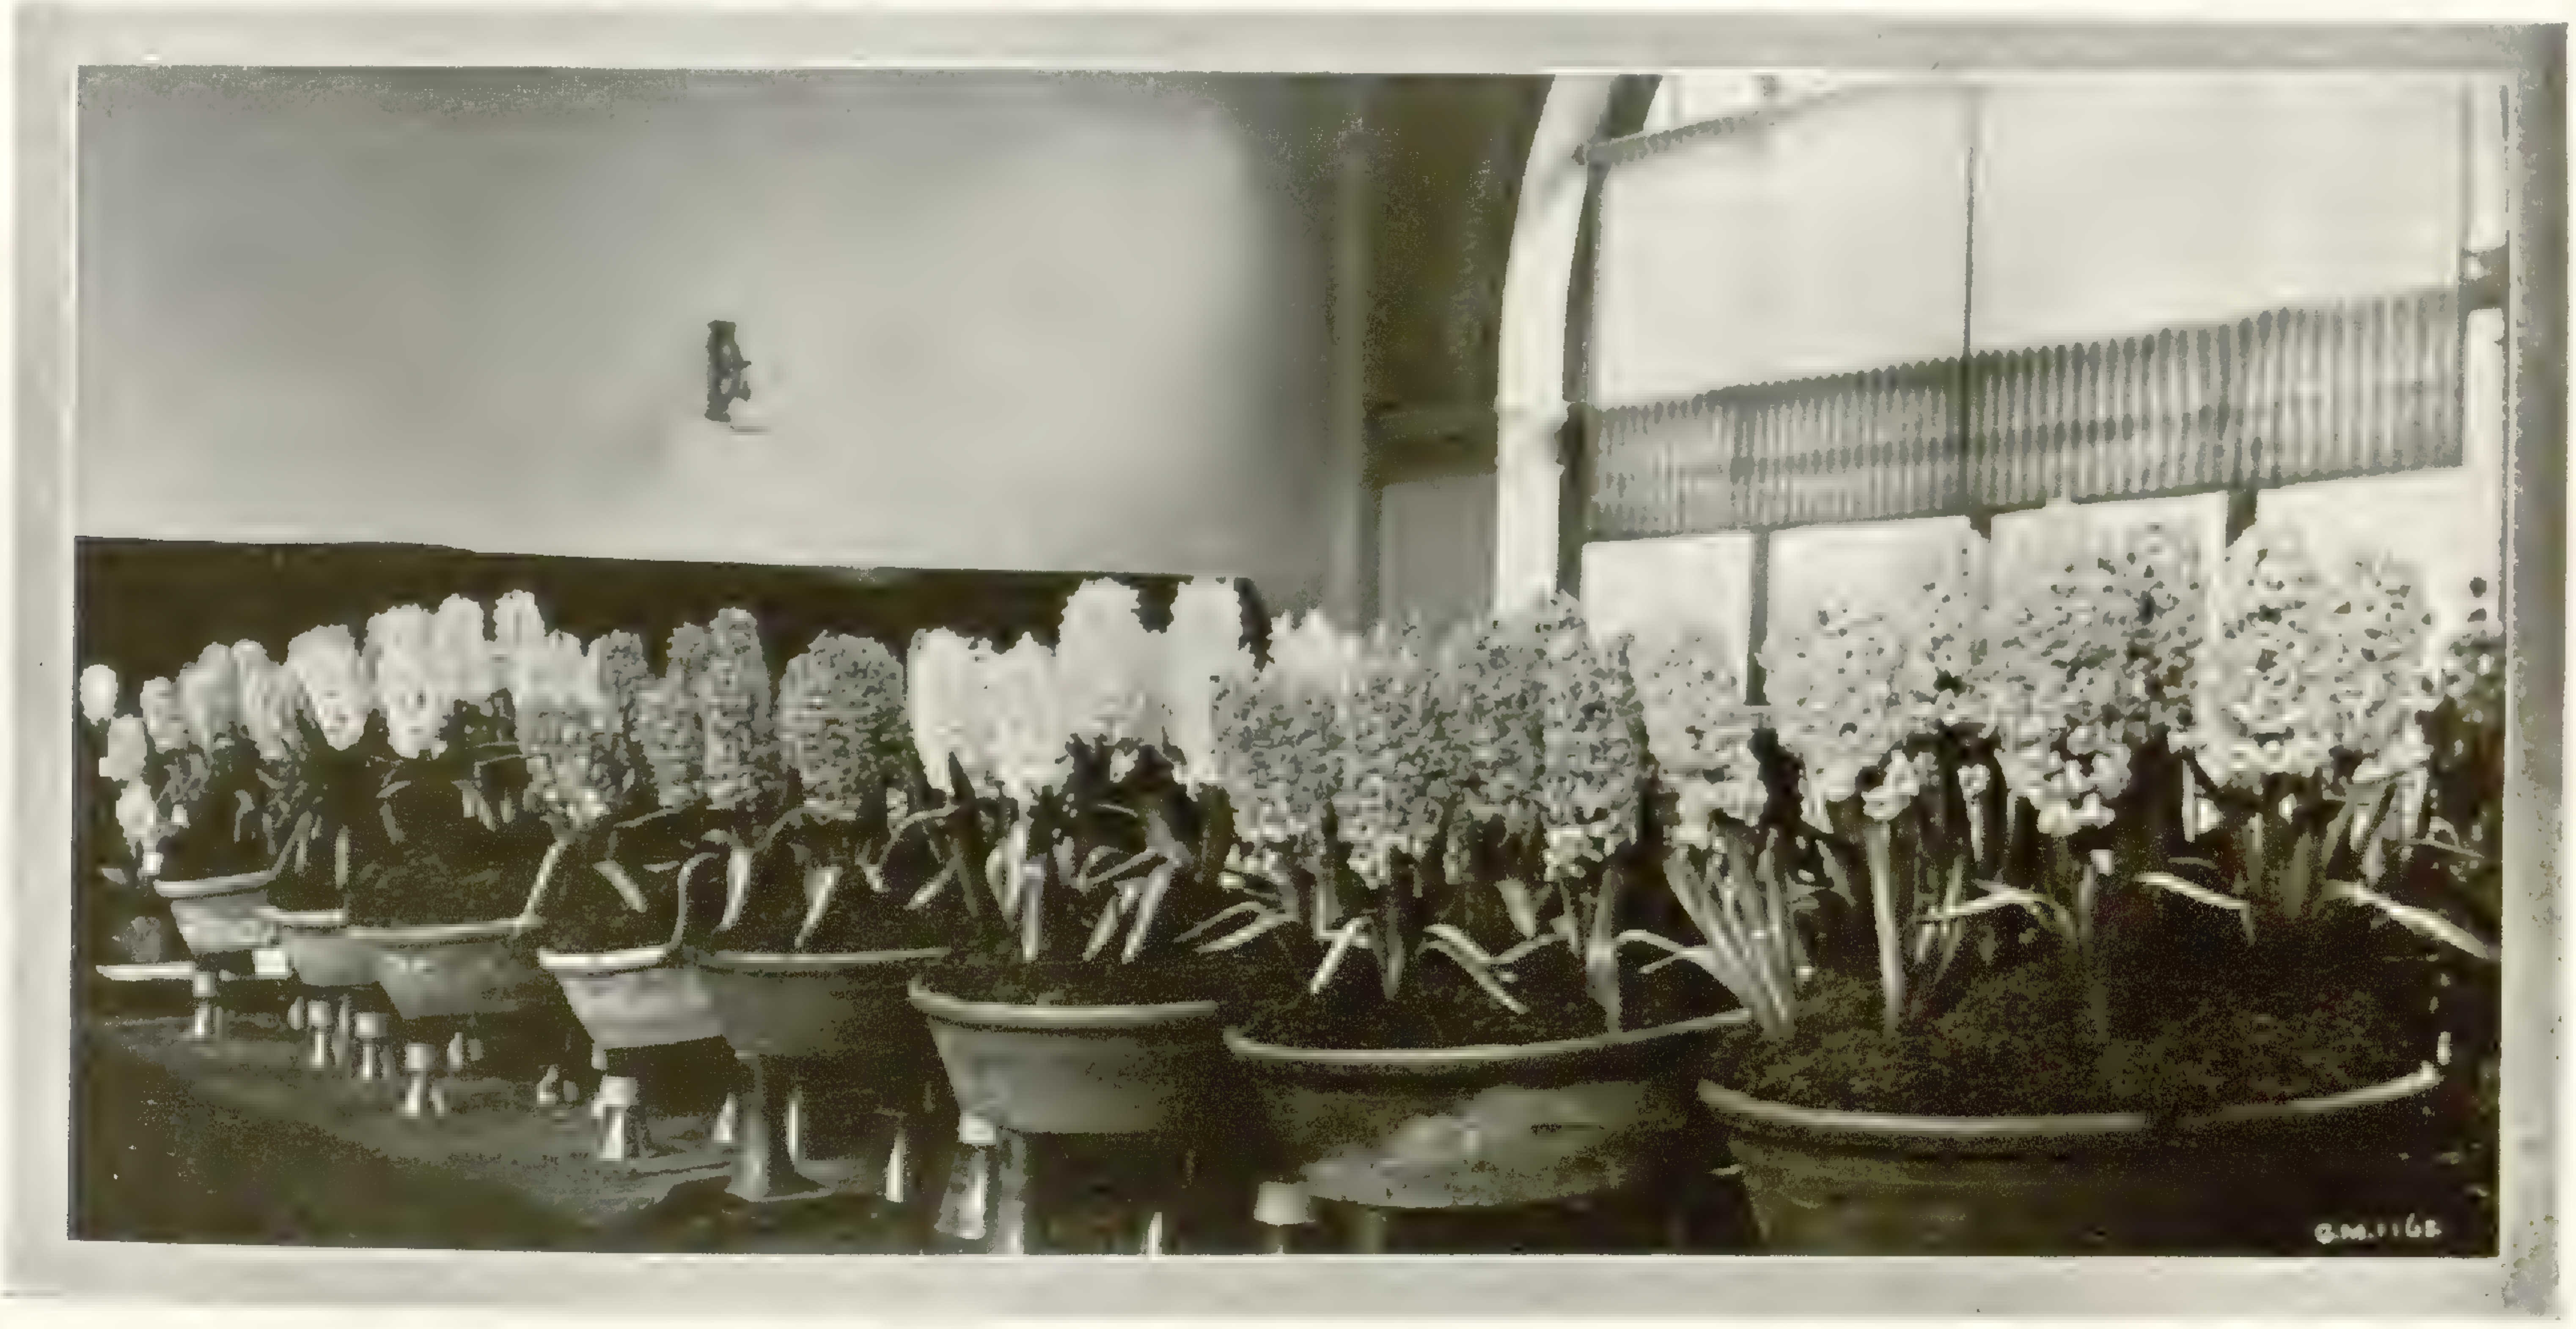
Address ____________________

Silver-gilt medals to Messrs. S. McGredy and Son for H.T. rose Dorothy Ratcliffe, a showy variety of much the same colouring, a little lighter perhaps, as the Lyon Rose; to Mr. Hugh Dickson, Belfast, for H.T. rose Marchioness of Waterford, silvery-pink, flushed with rose, a large-petalled, full bloom; and to the same firm for H.T. rose Mrs. Charles Allan, a big creamy variety, with pale fawn-pink tinting; to Mr. W. Ferguson, Dunfermline, for H.T. rose James Ferguson, a large variety, with broad silvery-pink petals, promises to be a fine exhibition variety.

Card of Commendation to Rev. J. H. Pemberton, Havering, for perpetual-flowering hybrid musk rose Daphne, already described and figured in our columns; to Messrs. S. McGredy and Son, for H.T. rose Mrs. Muir Mackean, a rosy-red variety, flushed with vivid carmine.

HYACINTHS IN PANS.

Although they have their value for conservatory decoration when grown in pots singly, hyacinths never look so well as when massed together. At the Continental bulb shows a great feature is always made of hyacinths in broad pans, one variety in a pan, and often a number of these pans are so grouped together as to present the effect of a bed of flowers. At the meeting of the Royal Horticultural Society held on March 8 and 9 last, a number of prizes were offered for bulbs, and hyacinths were especially well catered for, the prizes being provided by the Royal Dutch Bulb Growers' Society. In one class the requirements were four pans of hyacinths, ten plants in each, and as there were three competitors the display was a good one. In the accompanying illustration the four pans in the foreground are the first-prize set staged by Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, and the next set is the second-prize one, set up by Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey. Mr. Beckett's varieties were City of Haarlem, King of the Blues, La Grandesse, and La Victoire. We may at once point out that the hyacinths presented in pans in this way are not grown in them all the season, but are grown in pots and transferred to the pans as the spikes approach full development. As the time for potting-up hyacinths is now with us our readers will be glad to find that Mr. Beckett is contributing to these pages an article on the cultivation of these popular spring flowers for exhibition.



EXHIBITION HYACINTHS IN PANS.
Mr. Beckett's and Mr. Gibson's displays at the Royal Horticultural Society in March last.

THE KING'S SPEAR.

A bold and handsome plant, when well grown, the King's Spear, as Asphodelus albus is called, is one which is fated too often to be starved, owing to many thinking that it will stand any kind of neglect. It is worthy, however, of a better fate, and if it is grown in a rich soil, with plenty of moisture during the growing and flowering seasons, it will surprise all those who have only seen it before in poor and shallow soils. Its nominal height is about four feet, but it may be reduced by the starving treatment referred to just now, while, on the contrary, it will become taller, and much more ornamental, if given its desires in the way of soil and moisture. A good border, deeply dug and well manured, will enable it to show to advantage, but it is also an excellent wild garden plant when in a rather moist, but not too wet, place. There it will increase into a handsome clump, and give noble spikes of its white flowers from four to five, and even six feet high. It is truly handsome when well grown, with its branching stems and its pleasing white flowers.

A native of South Europe, this asphodel is yet quite hardy with us, and is certain to give satisfaction, either when planted in sun or in shade, but always in good soil where possible.

I have seen it doing well even by the sea, and with a north-east exposure, full in the teeth of the wind from the water, and in a place where it only received the morning sun for a brief season.

It is raised from seeds or multiplied by division, and is so hardy and enduring that it may well be planted by all who have plenty of room, and who care for early summer flowering plants of its kind.

S. ARNOTT.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

MASDEVALLIAS.—The various species and hybrids of the genus Masdevallia especially commend themselves to the attention of amateur cultivators of orchids. Those in possession of a greenhouse, or better still, a fernery, where the temperature maintained is sufficient to exclude frost, may engage in their cultivation with the assurance of success. In the majority of cases the plants are found growing wild at high altitudes, where even frosts are experienced, so that a normal winter temperature of about 45 degrees is ample. The tall growing kinds, being the most robust in constitution, and possessing free-flowering characteristics are those that may be specially recommended. They are at the present time most popular in our prominent orchid establishments, and are procurable at a moderate price. They are exceedingly useful for exhibition and decorative purposes, their varied colours being most effectively blended, and as large specimens are very effective. The most suitable kinds are M. Veitchi, M. ignea, and M. coccinea (Harryana) in variety, and the hybrids having one or both of the above-mentioned species as their parents. The species and varietal forms having thick leaves are also most attractive, and can either be grown in pots or baskets. They include M. calura, M. cornaculata, M. ephippium, M. guttulata, M. leontoglossa, M. gargantua, etc.

SMALL-GROWING MASDEVALLIAS.—The smaller growing kinds such as M. polystachya and M. racemosa, are also useful for exhibition purposes. The dwarf growing kinds succeed best when grown in shallow pans or baskets, so that they may be suspended near the roof glass during the winter months. I also consider that those included in the appended list succeed better when grown in a structure with a temperature of not less than 50 degrees during winter. If grown cooler they must be retained in a reasonably dry state during periods of unfavourable weather outside, or the leaves will damp off at the base. Although not so showy as the larger growers, they are most interesting, and the quaint characteristics of many of the kinds are remarkable. M. muscosa, M. simula, M. Estradi, M. Wagneri, M. abbreviata, M. Armeni, M. demissa, M. Shuttleworthi, and the numerous intermediate hybrids are all worthy of consideration.

REPOTTING MASDEVALLIAS.—There are differences of opinion as to the best season at which to repot masdevallias. I would advise the early spring as the best time for repotting the tall-growing kinds, but as the plants are actively rooting at the end of September, no harm can be done with careful attention by repotting at this season. The small growing kinds should be attended to for repotting at the present season. Take care to have any sphagnum moss that has overgrown the plants clipped away. I find that a compost of equal portions of fibrous peat and sphagnum moss, with sufficient sand added to render the compost porous, suits the masdevallias well.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

BEGONIA GLOIRE DE LORRAINE.—These will now be making rapid growth, and should be given as much space between them as possible, this tending to keep the growth sturdy, as well as keeping the plant in good shape. The early and very bushy plants should be staked out, especially if they are likely to be wanted for exhibition. For this purpose very light bamboo tips (painted green), should be used, keeping the tallest shoots towards the centre, and the shorter ones on the outside; should they, however, be rather uneven, they may be easily drawn down so as to give the plants a good even start. For pyramidal plants one strong stake only should be used, slinging all the shoots from this, and using small green twine; this is neater and less conspicuous than raffia. If required for November blooming, all the flowers should be allowed to come along, while for later use they may still be picked off, and as these plants are amongst the most useful for winter blooming, if they can be brought along in two or three batches so much the better. The plants for the latest batch should be kept in a rather cooler house, but 55 degrees at night is quite cool enough.

OTHER BEGONIAS.—The larger-flowered section, and the foliage begonia, such as Gloire de Sceaux, with John Heale, B. Haageana, and others, will all need to be looked over, and given a stake and tie wherever necessary; and as these are rather subject to attacks of thrips, especially just now when more fire heat is likely to be used, they should be given an occasional fumigation, but make sure the foliage is thoroughly dry first or the edges of the leaves may suffer. When well-rooted all begonias may be supplied with liquid manure, cow or sheep manure being very suitable. Generally speaking, all syringing overhead may be stopped, except on extra fine mornings, when the later plants may have a light spraying; but the dampings between the pots will be generally found quite enough for them.

TABLE PLANTS.—In many establishments table plants are used more during the autumn and winter months than during the summer, and this being so, the stock should be examined and some of the best of them be isolated; and where there is plenty of overhead room they may be suspended from the roof, taking care that they do not overhang other plants where the drip from them might be detrimental. This will economise space as well as add colour to the plants, but a sharp look-out must be kept on them, as they will dry up much quicker hanging up than when standing on the stage.

CALADIUMS.—Most of these will now be dried off, and, after seeing that the labels are secure in the pots, they may be packed away under the stage, not too far away from the hot-water pipes, and stacked in such a manner that they receive no drip from the plants above.

STOVE CLIMBERS.—Where these are planted out an effort should be made to dry them off somewhat, and as soon as the foliage shows signs of drying off a portion of the wood may be cut away, thus allowing as much light as possible to reach the plants underneath.

GENERAL REMARKS.—Syringings should now be less frequent, and the afternoon turn may be omitted, just damping beneath the pots instead of overhead. The morning syringing may be left until after breakfast. All permanent shading should be washed off the roofs of the houses, choosing a damp day, when it is much more easily removed, and arrangements may be made at any time for removing the roller blinds and storing them away for the winter, preferably in a place where they are free from dust and dirt. Closer attention must now be given to stoking, as the temperature frequently drops very quickly between 7 and 10 o'clock, and, though I do not believe in too high a night temperature, yet a sudden fall is detrimental to most stove plants. Where the boilers have not already been flushed out, the first opportunity should be taken to do this, and it is as well to have the bricklayer in to give the flues and chimneys an extra good clean through, and to do whatever pointing may be necessary. Much draught and heat are lost through these small repairs being neglected or overlooked.—THOMAS STEVENSON, Woburn Place Gardens.

FRUITS UNDER CLASS.

EARLY PERMANENT VINES.—Vines that ripened their fruits in May, and have had, as previously advised, their laterals shortened, should, if it is intended to force them early next season, be pruned, and otherwise prepared for it at the end of this month. Cut the laterals back to two plump buds, relieve the rods of all loose bark, and cleanse the woodwork, etc., of the house. Thoroughly wash the vine rods and spurs with an approved insecticide, and repeat the operation before the rods get dry if red spider or thrips have been troublesome, but in doing so be careful not to injure the vine eyes. Remove sufficient of the surface of the border (vines of this description should have their roots confined to inside borders) to bare the uppermost roots, and in its place put good loam, mixed with a suitable artificial manure, wood ashes, and soot.

POT VINES.—The canes of cut-back pot vines that are being prepared for very early forcing will be now well matured, and should have the necessary pruning, and the cuts dressed with styptic. Give them complete rest until placed in the forcing house by putting them in a cool position, and keeping the soil tolerably dry. Plants raised from eyes at the beginning of the year should, as soon as their canes are sufficiently hardened, be removed to a sunny border, have their pots stood on a bed of ashes, and their canes either secured to a wall or trained near to the ground in a horizontal position, and fastened to stakes.

LATE GRAPES.—Vines to provide winter supplies of fruit, if started into growth as was recommended in spring, and subsequently carefully attended, will have ripened their fruit by the end of this month. It is desirable that this should be so, both that the fruit may possess good flavour and keeping properties, and the vines be properly matured. In cases, however, where the fruit is later in ripening, advance its maturity by the discreet use of artificial warmth, careful ventilation, and by relieving the vines of all unnecessary sublateral growths, that may have extended. As soon as the fruit is perfectly ripe lower the temperatures, that for the night being maintained at 50 degrees by artificial aid, and accompanied by ventilation, and the avoidance of unnecessary use of water. Keep the atmosphere dry.

MELONS.—Notwithstanding the dull, wet weather experienced this summer, melons have been satisfactory, good flavour having been obtained by great care in the employment of fire heat and moisture. It will be necessary now that the days are shortening, whatever the conditions of the weather may be, to continue to give (in order to secure late crops of high quality) unremitting attention to these matters. At no time should the night temperature fall below 65 degrees, and in favourable weather give slight ventilation early in the day to plants swelling their fruit; increase the ventilation as the sun gains power, and close early to entrap sun heat. Keep the lateral growths regularly stopped, give the plants the assistance of diluted liquid manure, or light top-dressings of suitable artificial compounds, and as soon as the fruit commences to ripen keep up, even at night, circulation of warm air through the house, and lessen the supply of moisture both in the atmosphere and at the roots.—T. COOMBER, The Hendre Gardens.

THE KITCHEN GARDEN.

FRENCH BEANS that are now growing freely in frames will need care and attention. Stake them early to keep them in an upright position, and so have full advantage of the sunshine between the rows which will help them immensely. Hoe the soil weekly, and give an occasional dusting of soot around the plants, and on all favourable mornings give a good syringing. Ventilate freely during fine weather. In some localities frost may be experienced, therefore have in readiness mats or other protecting material for covering the frames.

BEETROOT.—This crop should now be ready for storing, particularly if the roots are of a good size. Nothing is gained in leaving them after this, as coarseness is sure to ensue. On the other hand, if many roots are undersized, and appear to be making healthy growth, they can be left to increase in size, simply examining the rows, and pulling very carefully those that are ready. During this process take special care not to damage the small rootlets. Carefully twist the tops off, and leave the roots on the ground for a few hours to dry. Beet can be stored under a north wall in finely sifted coal ashes or sand.

PARSLEY.—If there is any doubt about there being a good supply from the latest sowing seed should be sown in an unheated frame, and the produce will be found very useful during the winter months.

CARROTS may be treated as advised for beetroot, the difference being that all can be drawn or dug up, whichever the case may be, or many of the larger roots will crack, causing them to be of little use for keeping to store or consumption. It is a good plan to assort the roots according to their sizes. Select the best roots of a medium size for keeping, as these will be found to keep well until the spring for use then. The very small roots can be kept separately for the many uses for which they are required in the kitchen, and the larger and coarse ones should be consumed first. The late-sown carrots must be encouraged in every way, by thinning, hoeing, and regular dusting with soot and wood ashes.

TURNIPS.—Those sown recently will now be ready for thinning, and hoeing on all favourable occasions. The earlier sown ones will be large enough to lift and store.

CELERY.—The later plantings of celery will need a slight earthing up. Previous to this operation clear away the small leaves and side growths, and give a good soaking of liquid manure. If slugs are troublesome employ soot and lime, sowing these alternately. The celery required for November use should now be partially blanched. If exhibition sticks are desired the blanching should be done by means of narrow brown paper bands, applying them every ten days till the required height is obtained.—GEO. ELLWOOD, Swanmore Park Gardens.

Deutzia crenata.—Among July flowering shrubs, two varieties of this deutzia occupy a prominent position. They are candidissima, also known as Pride of Rochester, a pure white double flower; and flore plena purpurea, whose blossoms are also double, and suffused with purple on the outside of the flower. This feature is particularly noticeable when in the bud state. Being more robust than most deutzias, for it will form a dense bush from six feet to ten feet in height, Deutzia crenata is, when represented by the varieties named, well worth a place in the shrubbery border.—W. T.

NATIONAL CHRYSANTHEMUM SOCIETY.
The EXHIBITION of EARLY-FLOWERING CHRYSANTHEMUMS will be held at the CRYSTAL PALACE, on October 5th and 6th, 1910.
Entries close on Wednesday, September 28th. Schedules and all particulars relating to membership can be obtained post free, on application to the Secretary, RICHARD A. WITTY, 72, Savernake Road, Gospel Oak, London, N.W.

NATIONAL VEGETABLE SOCIETY.
Will hold their
FIRST GREAT SHOW,
at the
R.H.S. HALL, VINCENT SQUARE, WESTMINSTER, S.W.,
on
WEDNESDAY, SEPTEMBER 28th, 1910.
Doors open at One o'clock.
Admission One Shilling; after Five o'clock, Sixpence.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

National Dahlia Society.

Excellent quality in the flowers characterised the second show of this society, held on Tuesday and Wednesday, September 20 and 21, at the Royal Botanic Society's Gardens, Regent's Park. There was a large attendance of dahlia specialists, including the president, Mr. E. Mawley, V.M.H.; the chairman, Mr. G. Gordon, V.M.H.; and the secretary, Mr. E. F. Hawes, of the society. The President distributed the cups and medals at the conclusion of lunch on the opening day.

OPEN CLASSES.

The best three vases of cactus dahlias put into commerce in 1908-9 were examples of Echo, Mercia, and Mrs. A. Dyer, set up by Mr. John Walker, Thame, Oxon; Mr. M. V. Seale, second, with Ivernia, Rev. T. W. Jamieson, and C. E. Wilkins; and Messrs. Keynes, Williams, and Co., Salisbury, third. The premier set of twelve bunches of pompon cactus dahlias came from Messrs. J. Burrell and Co., Howe House Nurseries, Cambridge, who showed delightful bunches of Coronation, Flora, Argus, Nain, Titus, Cheerful, Sweet, Lena, Alwyn, Minima, William Marshall, and Martha; Messrs. J. Cheal and Son, Crawley, second; and Mr. M. V. Seale, Sevenoaks, third.

There were three competitors in the class for two dozen show dahlias, distinct, and here chief honours fell to Mr. John Walker, Thame, who had splendid flowers of William Powell, James Cocker, Duchess of York, R. T. Rawlings, Shirley Hibberd, D. Cornish, and Frank Pearce; Mr. S. Mortimer, Rowledge Nurseries, Farnham, came second; and Messrs. Keynes, Williams, and Co., third. Messrs. J. Cheal and Sons, Crawley, scored for a dozen show dahlias, their Mrs. Saunders, T. W. Girdlestone, and J. Hickling being especially good; Mr. S. H. Cooper, The Hamlet, Chippenham, second; and Mr. M. V. Seale, third.

There were three exhibitors of a dozen bunches of cactus dahlias, and the competition was close. Messrs. J. Stredwick and Sons, St. Leonards, won first place with superb bunches of Golden Eagle, Satisfaction, H. L. Brousson, Jupiter, H. H. Thomas, C. E. Wilkins, William Marshall, Mrs. Douglas Fleming, Indomitable, Red Admiral, Dr. R. Appleton, and The Earl; Messrs. J. Cheal and Sons, Crawley, secured the second award, and Messrs. J. Burrell and Sons, Cambridge, third. For two dozen cactus blooms, distinct, set out on boards, Messrs. J. Stredwick and Son were again to the front, and some of their finest flowers were Red Admiral, Ekko, Royal Scarlet, C. E. Wilkins, Arrow, Glorious, and William Marshall; Messrs. Keynes, Williams, and Co., second; and Messrs. J. Burrell and Co., Cambridge, third.

Mr. John Walker secured the chief award for three vases of cactus dahlias, each containing nine blooms associated with appropriate foliage; he showed a fine set of mixed varieties, all grand flowers; Mr. Charles Turner, Slough, second; and Mr. M. V. Seale, third; five competitors. Mr. M. V. Seale scored for a dozen cactus blooms on boards, and he had Advance, H. H. Thomas, and Sir John Sinclair, good; Messrs. J. Cheal and Sons, second; and Mr. S. Mortimer, third.

The only entry in the class for six blooms of any one cactus variety was from Mr. M. V. Seale, who was awarded the first prize for Mrs. T. W. Willis. Six competitors came forward in the class for a dozen bunches of pompon dahlias, and here Mr. Charles Turner, Slough, secured the chief award with a bright and very neat set of Bacchus, Ideal, Phyllis, Adelaide, Ganymede, Mignon, Nerissa, Mariette, Queen of Whites, Darkest of All, Mary, and Cyril; Messrs. J. Burrell and Co., second; and Messrs. J. Cheal and Sons, third.

The Dean Gold Medal and first prize for a dozen bunches of single dahlias was well won by Messrs. J. Cheal and Sons, Crawley, with a glorious set of Cardinal, Strombolı, Owen Thomas, Leslie Seale, Flora, Miss Morland, Miss Roberts, Rosemary Bridge, Snowdrop, Kitty, Lady Bountiful, and Mrs. Joynson Hicks; Mr. M. V. Seale, second, and Mr. J. Walker third. Three bunches of pæony-flowered dahlias was a class that contained four entries; Mr. C. Turner scored with Rosina, Bayard, and a seedling; Mr. J. Walker, second, and Messrs. J. Cheal and Sons, third.

Giant decorative varieties, six vases, and six flowers in a vase, resulted in a win for Mr. Charles Turner, who set up Attraction, Jean Charmet, Loveliness, Souv. de Gustave Douzon, Mrs. Seale, and Mdme. Van der Dael; Mr. Seale second. The only exhibitor of six blooms of a show or fancy seedling was Mr. S. Mortimer, who was awarded first prize for Wm. Pemberton, yellow with crimson marks.

AMATEURS.

The Rev. Arthur Bridge, Worth Rectory, Three Bridges, led in the amateurs' division for nine cactus varieties, three flowers of each, with Harold Peerman, Red Admiral, Snowdon, Rev. T. W. Jamieson, Iolanthe, H. H. Thomas, and Satisfaction; there were five competitors, and Mr. F. Grinsted, Beaufort Park, Battle, came second, and Mr. W. H. Peters, gardener to Sir J. Kennedy, Holmhurst, Baldstow, St. Leonards, third. The Rev. Arthur Bridge led for a vase of six blooms of any one cactus, and was followed by Mr. C. Luckin, Apsley, Thackenham, and Mr. E. E. Barton, Brand Street, Greenwich.

Mr. Edward Mawley, V.M.H., Rosebank, Berkhamsted, led for six varieties of cactus dahlias, three blooms of each, with very fine specimens of Beryl, Brigadier, Evening Star, Red Admiral, Harold Peerman, and Leda; Rev. Arthur Bridge second, and Mr. G. Stevenson, Chadworth Cottage, Esher, third. There were seven stands of a dozen cactus blooms, three flowers each of four varieties, and here the premier award was made in favour of Mr. F. H. Currey, Osborne Road, Palmer's Green, for Wm. Marshall, Satisfaction, Brigadier, and J. B. Riding; Mr. C. Luckin second, and Mr. R. C. Willis, Osborne Road, Palmer's Green, third.

Mr. J. Hicks, Thornton Heath; Mr. G. Davidson, Thornton Heath; and Rev. Arthur Bridge, were first, second, and third respectively for a dozen cactus blooms, distinct; while for six flowers the awards fell to Mr. Edward Mawley, Mr. Charles Luckin, and Mr. S. H. Cooper, Chippenham. Mrs. E. Mawley was placed first for a vase of twelve cactus dahlia blooms, arranged for effect, and she showed crimson flowers with sprays of Prunus Pissardi; second prize fell to Mr. J. Hicks, Thornton Heath; and third to Mr. T. H. Currey.

Mr. S. H. Cooper had the best dozen show dahlias, and Mr. A. Robbins, Prospect Place, Keynsham, came second; in each case the flowers were rather small. For six show blooms the prizes fell, in order, to Mr. Charles Luckin; Mr. A. P. Ironsides, Park Lane, Chippenham; and Rev. A. Chalmers Hunt, Williaa Rectory, Hitchin. Mr. G. Davidson led for six bunches of pompon dahlias, followed by Mr. A. P. Ironsides and Mr. S. H. Cooper; while for single varieties Mr. Mawley was an easy first, with Rev. Arthur Bridge second, and Rev. S. S. Pearce third. Mr. E. Mawley had the best six bunches of single dahlias, and secured the Dean medal; and Mr. W. C. Pagram had the best three vases of pæony-flowered varieties.

TRADE DISPLAYS.

An extensive exhibit in the conservatory, from Messrs. Hobbies, Lim., Dereham, was a great attraction. Half the display consisted of roses, set up prettily in stands of various forms, some of them forming light screens. The varieties shown were chiefly hybrid teas—Gruss an Teplitz, Mdme. Abel Chatenay, Frau Karl Druschki, Mdme. Ravary, and Hugh Dickson were very fine. The rest of the exhibit consisted of pæony-flowered dahlias, backed by Japanese anemones and double Michaelmas daisies, with a row of the newer cactus dahlias along the front. Mr. J. B. Riding, Chingford, contributed an interesting exhibit of colarette dahlias. These were very interesting, and attracted a great deal of attention, especially such effective varieties as Maurice Rivoire, Corbeille de Feu, Johannisfeur, Souvenir de Bernadeau, Papa Charmet, Mdme. Poirier, Orphee, and Joseph Goujon.

A very big exhibit was admirably staged by Messrs. T. S. Ware, Lim., Feltham, who put up tall and large stands of pæony-flowered varieties, such as Andrew Carnegie, Duke Henry, Ruddigore, etc. In front of and between these were sets of cactus dahlias, the varieties Dreadnought, Crescent, John Peel, Rev. Jamieson, Advance, Ruby Grinstead, Echo, M. Inman, Dibs, Nellie Riding, and Evening Star being especially well shown. The whole arrangement, as well as the flowers, was good. Mr. J. E. Knight, Wolverhampton, had cactus and pæony-flowered dahlias in goodly numbers, set up on boards and in bamboo stands; a somewhat unusual effect was produced, but some of the pæony-flowered varieties showed the effects of travel. A brilliant bank of pæony-flowered dahlias set up by Messrs. Bakers, Codsall, Wolverhampton, gave a good idea of the effectiveness of this group of varieties, and the great progress made in the direction of new colours. Very striking were the vases of Germania, Lord Elphinstone, The Tatler, Mr. Joseph Chamberlain, Ryton Roy, Sunset, Codsall Gem, The Warrior, and King Leopold.

Mr. J. T. West, Tower Hill, Brentwood, had a very interesting and bright exhibit. At one end he had a set of gorgeous pæony-flowered varieties, including the brilliant crimson Holman Hunt and the effective Liberty. The big decorative Brentwood Yellow was again grand, and it is difficult to understand that the huge long-stemmed flowers are borne by 3ft. high plants. The middle of the exhibit consisted of choice cactus, neat pompon cactus, and beautiful pompon flowers, all very well set up. Mr. Williams, Oxford Road, Ealing, showed a table decoration of single and other small dahlias. Pæony-flowered and decorative dahlias, and dwarf single Tom Thumb dahlias in pots, made up a group from Messrs. Whitelegge and Page, Chislehurst; but there was need for more skill in the disposition of the flowers.

The exhibit made by Mr. Charles Turner, Slough, contained a large assortment of pæony-flowered varieties, but the predominating variety was Loveliness, of which there was a large central stand; this is a beautiful shade of pink, and is bound to be popular. Messrs. Spooner and Sons, Hounslow, submitted a fine collection of apples, pears, etc.

NEW DAHLIAS.

First-class certificates were awarded as follows: Garden cactus dahlias White Ensign and Flagstaff, and cactus varieties Mrs. Douglas Fleming and H. L. Brousson, to

Messrs. J. Stredwick and Son; to pompon variety Pink Beauty, from Messrs. J. Cheal and Sons; to garden cactus dahlia Mary Purrier, from Mr. J. T. West; and to fancy cactus dahlia American, from Messrs. Keynes, Williams, and Co.

BOTTLED FRUITS.

In connection with this show the Anglo-Belge Glass Association offered prizes for bottled fruits, and there was a fair competition in the classes arranged.

Premier award for a dozen bottles of fruits fell to Mrs. V. Banks, Park Street, Grosvenor Square, who had splendid raspberries, rhubarb, cherries, plums, and loganberries; Mrs. Birkinshaw, Bothamsall, Retford, second; and Mrs. Ayre Foothill, Doncaster, third. Mrs. E. Beckett, Aldenham House Gardens, Elstree, scored for six bottles with cherries, blackberries, and plums, in fine condition; Mrs. V. Banks came second, and Mrs. L. Birkinshaw third. For three bottles Mrs. Banks, Mrs. Foothill, and Mrs. Birkinshaw, and Mrs. E. Beckett secured the awards in order as placed.

MEDALS.

Large Gold.—Messrs. Hobbies, Lim., Dereham; Messrs. T. S. Ware, Lim., Feltham; Messrs. Bakers, Codsall, Wolverhampton; and Mr. J. T. West, Brentwood.

Gold.—Mr. J. E. Knight, Wolverhampton; Messrs. Spooner and Sons, Hounslow, for fruit.

Silver Gilt.—Mr. Charles Turner, Slough; Messrs. Whitelegge and Page, Chislehurst.

Silver.—Mr. J. B Riding, Chingford.

GENERAL VIEW OF MESSRS. DICKSON AND ROBINSON'S EXHIBITION OF VEGETABLES.

Vegetable Show at Manchester.

Encouraged by the success of their onion show of last year, Messrs. Dickson and Robinson, of Manchester, this year not only renewed the valuable cash prizes for four bulbs of the Premier onion, but added prizes for other of their vegetables. The show was held in their large farm seed warehouse, Robert Street, Cheetham, Manchester. It proved highly successful in every respect, over 400 exhibits being staged.

For the onion prizes there were 81 entries, a number slightly less than last year, but more than compensated for by the exceptional quality of the exhibits. The first prize, for four bulbs of Premier, went to Mr. Tysoe, The Lodge Gardens, Bedford, who had beautiful, finely-finished, uniform and altogether excellent bulbs; their weight was 7lb. 10oz. Mr. Hester, Inwood Gardens, Templecombe, came second with four very large bulbs, weight 9lb. ½oz. Mr. Folkes, Gaddesden Place, Hemel Hempstead, was third with a nicely-finished four; the weight being 8lb. 1½oz. Mr. Avery, Loudwater House, fourth; and Mr. Johnson, Duffield House Gardens, fifth.

Five prizes were offered for one bunch of Messrs. Dickson and Robinson's Moneymaker tomato, and there were 23 entries, the first prize going to Mr. Caterer, Dunorlan Gardens, Tunbridge Wells, with a bunch of 24 fruits, 21 of which were ripened, very uniform and good. Mr. W. Cox, Oakfield Gardens, Wembdon, was second, and Mr. Charles Parker, Waverton, third.

For twenty-five pods of Exhibition scarlet runner 34 entered, Mr. Tysoe carrying off the first prize, and Mr. W. Cox the second. There were three other awards. Most of these entries were of a high order. For six roots of Market Favourite beet there were 35 entries and five prizes. The competition was keen. Mr. Barnes, of Bearwood Gardens, was first, and Mr. W. Folkes second.

The prizes for three heads of Messrs. Dickson and Robinson's Snowdon cauliflower brought 17 entries. Mr. W. Folkes was first, and Mr. Beckett second. The exhibits were generally very good. Eighteen entered in the class for three heads of the firm's Sugar Loaf cabbage, the first of the six prizes going to Mr. Johnson, Hall Barns, and the second to Mr. Adams, Lilleshall Gardens. The class for six roots of Messrs. Dickson and Robinson's Perfection carrot contained 37 entries, and Mr. Griffiths, The Glen Gardens, Haverfordwest, was an easy first with a very refined and shapely six; Mr. Tysoe second. For six roots of Matchless carrot there were 24 entries. Mr. Tysoe was first, Mr. Parry, Wellesbourne Hall Gardens, being a close second.

In the class for three sticks of Messrs. Dickson and Robinson's Prize Pink celery 18 entered, and Mr. E. Beckett was first with three magnificent sticks; Mr. Cole, Althorp Gardens, was a good second. The contest for six plants of Exhibition leek was very keen, there being 19 entries. Mr. Tysoe was first, and Mr. Barker a very close second.

For the prizes for six roots of Selected Manchester Market turnip the entries were numerous. Mr. Cooke, Kingston Hall Gardens, was first with a beautiful six; Mr. R. Walker, second, with six bulbs inclined to be flat, but otherwise excellent. The competition in the class for six roots of the firm's Selected Hollow Crown parsnip was very spirited, there being 33 entries. Mr. Cole was first with six which, in spite of the general excellence, were markedly superior; Mr. Tysoe came second, and Mr. Parry, Wellesbourne Hall Gardens, third.

In the classes for Hercules and The Gladstone peas there were 15 and 28 entries respectively. Mr. Guy, Halsall House Gardens, was first; and Mr. Kimber, Shenley, second, for Hercules; and Mr. Cooke, Kingston Hall Gardens, easily first, and Mr. Kimber second for The Gladstone. Hercules is a distinctive and fine pea. It is well filled, of excellent flavour, a heavy cropper, and the pods contain on the average ten peas each.

Mr. Hester, Inwood Gardens, sent a bulb of Premier onion weighing 3lb. 5oz., and measuring in circumference 22in.

Messrs. Dickson and Robinson are to be congratulated on the adoption of this show as an annual event. It has advantages quite apart from demonstrating the potentialities and possibilities of their strains of vegetables. A competition that includes the principal and most skilful exhibitors in the country, and is so numerically strong, is bound to set up and maintain a very high standard for each type of vegetable. In another direction it does much to encourage allotment holders, who are not only extremely enthusiastic, but possessed of considerable knowledge and judgment. In Manchester they are in big numbers. A show such as this must prove a healthy stimulus to their cultural achievements, and induce them to become well acquainted with the finest types.

Messrs. Dickson and Robinson arranged a fine display of flowers, comprising splendid cactus, single, and pompon-cactus dahlia blooms, sweet peas, scabious, etc., all grown within ten miles of the Manchester Town Hall. One hears much of the unfavourable atmospheric and other conditions prevailing in this active Northern city, and the display was of much interest as an example of what it is possible to do even in such a district.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, September 13.

Present: Prof. G. S. Boulger, F.L.S. (in the chair), Messrs. J. T. Bennett-Poë, A. Worsley, W. Hales, and F. J. Chittenden (hon. secretary).

FRUIT OF HIPPEASTRUM CALYPTRATUM.—Mr. Worsley showed a mature fruit of Hippeastrum calyptratum, drawing attention to the membranous ring which, attached to the style and the top of the ovary, is separable at maturity intact, and to the deep lobing of the fruit at the base, which is not shown in published figures, these having apparently been prepared from immature fruits.

PLANTAGO MEDIA BRACTEATA.—Messrs. Barr sent an excellent specimen of this plant, in which the bracts are enlarged and form a dense rosette of closely-packed and evidently spirally-arranged ovate green leaves at the apex of the peduncle. The axis elongates but very slightly as it gets older.

MAIZE INFLORESCENCES.—Mr. A. Turner, of Chelmsford, sent staminate inflorescences of maize, in which some of the flowers had been replaced by pistillate ones and branching cobs, some of the branches of which bore staminate instead of pistillate flowers.

FASCIATION IN VEGETABLE MARROW.—Mr. W. H. Mastin, of Haslemere, sent a remarkable example of a fasciated stem of the vegetable marrow, about 4-5 inches broad, the whole being about 30ft. long. Fasciation is frequent in marrows, but not often so marked as in the present case.

REVERSION IN RADISHES.—The Rev. Professor Henslow, V.M.H., sent the following communication: Pliny tells us that the Greeks discovered how to turn the rape into the turnip by sowing the seed in a very heavy soil. M. Languet de Sivny found that the seeds of short-rooted carrots, when sown in the alluvial deposits in France, yielded immediately in the first generation long-rooted plants. M. Carriere found that seeds of the wild radish (Raphanus raphanistrum) gave a majority of long roots in the light soil near Paris, but turnip forms in a heavy soil of South of France. I sowed the seed of the turnip-radish in a prepared, very light soil; of 30 plants 20 were long-rooted, and ten produced the normal forms, thus corroborating M. L. de Sivny's experience. The point to notice is that as the turnip and long-rooted radish come true, as a rule, from seed, as well as the short and long carrots, etc. We have here distinct varieties with hereditary characters, originating solely from the "direct action" of stiff or light soils, illustrating Darwin's contention that varieties arise "without the aid of selection."

THE INFLUENCE OF STARVATION ON SEX.—Professor Henslow also wrote as follows: It is well known that the male flowers of monœcious trees, as oaks, are generally on the more slender shoots than the females. So, too, in diœcious herbs the females are, as a rule, on stronger plants than the males. The following experience illustrates both these facts. Finding Mercusiolis amina to be an abundant weed in the allotment grounds at Hythe, I collected some seed and sowed it very thickly in two small 3½ inch pots. In one, of a total of 25 seedlings, 16 were male and nine female. In the other there were 64 plants, of these 39 were male and ten female, the remainder were too starved to produce flowers at all. The 55 males, therefore, were 74 per cent., and the females only 26. None of the plants were above four inches in height, but the females were decidedly stouter than the more slender males.

HYBRID PRIMULA. — Messrs. James Veitch sent a plant of Primula japonica x P. Bulleyana, which they had named P. x Briscoli. The habit of the plant, which was of vigorous growth, was that of P. japonica, but the scape, etc., were pulverulent, and the flowers were in colour and form more like those of P. pulverulenta.

National Chrysanthemum Society.

At the meeting of the Floral Committee held at Essex Hall on Monday, September 19, there was a good display of early chrysanthemums, and the meeting was specially notable for the presence of numerous varieties of a quite new race of very beautiful early chrysanthemums, from Uxbridge. Every flower was of large size, approaching in beauty and richness of colouring many of the Japanese varieties seen at the November exhibitions. All had been grown out of doors, and were disbudded. Whatever their value as border plants may be we do not know; but their value as splendid cut flowers for the market was unquestionable. We understand that in some instances the name of the variety has been registered under the Trades Marks Act, for the purpose of protecting the raisers.

Messrs. W. Wells and Co. brought up an interesting lot of early chrysanthemums, and among his single varieties the best were Richard W. Newton, and W. A. Cull; of larger, double varieties, the best were Helena, Patricia, a fine silvery-pink, Border Beauty, reminiscent of Harvest Home, and Verona, light bronze. A dozen and a-half bunches of early chrysanthemums, largely single varieties, were submitted by Mr. H. Woolman, Shirley, Birmingham, among the latter we were attracted by H. W. Bills, Shirley Pride, John Woolman, Miss R. S. Shepheard, cream, pink tipped; and Shirley Pioneer, crimson and yellow.

Particularly fine were the grand flowers, six inches and more across,which were shown by Mr. W. Roots, Holly Cottage, Cranford; the varieties were Cranford Pink, Hollicot Bronze, Hollicot Yellow, Pink Beauty, and Hollicot White; these were all magnificent, especially for September flowering, and from the open ground. Equally fine were the superb flowers of Dolores, Almirante, and El Draco, shown by Messrs. Lowe and Shawyer, Uxbridge, and to each of which an F.C.C. was awarded; El Draco, rich amber, is a magnificent flower in size and form, measuring seven or eight inches across; while Almirante is a brilliant chestnut-crimson.

The Executive Committee of this society held a meeting on September 19 at Carr's Restaurant, Strand, when Mr. Thomas Bevan occupied the chair.

After the minutes and correspondence had been disposed of, the Secretary drew attention to the great Horticultural Show of 1912, and it was agreed that prizes should be offered for chrysanthemums. The interim financial statement was read by the Secretary, showing a working balance in hand. It was also announced that the Floral Committee had again elected Mr. D. B. Crane as chairman. The Brussels Exhibition scheme was then brought forward, and it appears that, owing to the unfortunate fire in the Belgian and British Sections, the building reserved for the flower shows has been put to other uses, and therefore no official autumn show will be held, and the projected display on the part of the N.C.S. must fall through.

The International Autumn Show in Paris promises to be a most attractive one, and Sir Albert Rollit and Mr. Harman Payne have been appointed members of the jury. Other members are hoping to make up a party, and the foreign secretary will be pleased to furnish details of what promises to be a very enjoyable gathering. The show and Chrysanthemum Congress will open on November 4. It was resolved that the annual dinner be held as usual at the Holborn Restaurant about November 28 or 29. The N.C.S. Conference will take place on December 5.

East Anglian Horticultural Society.

There was a good attendance at the September meeting of this society. Mr. L. Smith, Shotesham Park Gardens, was in the chair, and after some preliminary matters had been disposed of, Mr. H. Goude, lecturer to the Norfolk County Council, gave a most interesting discourse upon the subject of "Pruning." He dealt mainly with the apple, but pears, plums, peaches, and vines were included in the scope of his remarks. In his travels he had found that the subject in its proper application was very little understood. He clearly defined how best to make a tree of any trained style from a baby plant. In cutting large branches off trees the cut should be made quite close to the main trunk and tarred over to prevent the ingress of germs of fungi. Root pruning, outside a private establishment, was hardly ever carried out. When one saw trees flourishing luxuriantly, yet with no crop, it was wonderful what results root pruning had upon such trees. The main principles were always to keep the branches well open to admit air and sunlight to ripen the wood, and promote fruit buds; leave the leading growth at the summer pruning, and whenever a tree was growing too well, without fruiting, to judiciously prune the roots.

Mr. L. Smith, Mr. J. Forder, Mr. J. Powley, and others added some useful remarks during the discussion which followed. The society decided to again enter for the fruit competition at the R.H.S., which is open to affiliated societies. Mr. F. Williams, gardener to Mr. Louis Tillett, exhibited a good cypripedium in the monthly competition classes, which throughout were keenly contested and very interesting.

OBITUARY.

Mr. Thomas Milne.

There died last week, in Aberdeen, at the ripe age of 87, Mr. Thomas Milne, nurseryman and gardener, and one of Aberdeen's most esteemed citizens. Deceased was associated with the nursery business all his life, his father having been a nurseryman in the suburbs of Aberdeen. Mr. Milne at the outset of his career cultivated the lands of Glenburnie, which now form one of the best residential parts of the city, and he had also a considerable area of land in Rubislaw Den. All these lands are now occupied by houses, some of which may be considered old. Besides his activities in gardening, he also did a vast amount of forestry work. He planted the Hill of Nigg, adjacent to the City of Aberdeen, which now forms one of the most delightful scenes to be seen from the city. Mr. Milne also did extensive work of a similar kind in the Garioch District of Aberdeenshire. It was, however, as a market gardener that Mr. Milne was best known. In this line he did splendid and most commendable work. A man of the highest integrity, and conspicuous for his geniality of temperament and pleasant manners, Mr. Milne exercised a powerful influence for good in the sphere in which he moved. During his time he had through his hands a large number of lads, and these, now grown up and scattered all over the world, are the first to admit the great benefits they derived from Mr. Milne's advice and counsel, and the example of his sterling character and personal worth. The funeral took place at St. Peter's Cemetery, Aberdeen, on Friday, the 16th inst., and a large and representative attendance proved how highly respected Mr. Milne was by his friends and neighbours.

ROSES ON LONDON CLAY.

Roses, as everybody knows, delight in a strong soil of a heavy character, and herein lies the explanation of what is to many people very perplexing—namely, that roses can be grown to a high state of perfection in London, although many common garden plants refuse to grow. The soil in almost all quarters of the metropolitan area is a stiff yellow clay, and, although very difficult to work, this may be made an ideal soil for roses. The writer has this season had a remarkably fine show of roses in a garden within three miles of the General Post Office, and the whole system of cultivation has been deep digging and the incorporation of a liberal quantity of Wakeley's Hop Manure. There is nothing superior to this manure for use on heavy, unwieldy soils, and certainly roses find something in it of considerable value, judging by the vigour with which they grow after a dressing or mulching of Wakeley's. The value of this manure is by no means limited to roses as proved by the results of its use with other plants and useful crops.

A. J.

FORTHCOMING ENGAGEMENTS.

SATURDAY, September 24.—Brussels Market Garden Exhibition; four days.

TUESDAY, September 27.—Royal Horticultural Society; Committees meet at 12 o'clock; lecture at 3 p.m. on "South America in its Relation to Horticulture," by Mr. Arthur W. Hill; Scientific Committee at 4 o'clock.

WEDNESDAY, September 28.—National Vegetable Society's Exhibition at Royal Horticultural Hall.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

MANURING GROUND. — G. W. H. J., Sutton: If the ground has been well worked and manured previously, then the special manure you mention should prove both economical and useful for a dressing this autumn; but, unless the ground is in fairly good condition, a heavy dressing of light stable manure will be best.

DOUBLE RAMANAS ROSE.—A. L., Malton: There are two double, or rather, semi-double, white Ramanas or rugosa roses, and these are Blanc Double de Coubert and Mdme. Georges Bruant; both are vigorous growers and very free-flowering, but Blanc Double de Coubert is, in our opinion, the better of the two, and is probably the best of all rugosa roses. It has large, pure white, semi-double flowers. Nova Zembla, sent out in 1906, is a white sport from Conrad Ferdinand Meyer, and is well spoken of, but we have no experience of it under cultivation.

YELLOW DISEASE IN ROSES.—A well-known correspondent writes from Wiltshire, under the nom de plume of "Enquirer," as follows: I should be extremely grateful if you could tell me the cause and treatment of the following trouble in roses: I almost said it could be called the "yellow peril." Yes, it is in this particular district. At any rate, for the sake of a name I call it "the yellows." The mild form is a yellowing of the foliage (lack of chlorophyll, it looks like). In a worse form the foliage becomes quite yellow. In both these forms the plants go on growing just as if they were quite healthy, but the blooms have not their true colour. In the worst form the leaves change from yellow to white, and some of the leaves get brown (? scorched by the sun), and the plant slowly dies. It is more noticeable in the early summer, and many of the plants seem to grow out of it, more or less, the younger leaves and shoots getting greener as they grow, and sometimes the older yellow leaves improve, but, as a rule, a plant once affected never gets rid of the trouble altogether. I have marked plants, and find it recurs each year, more or less. Sometimes it affects only half the plant, perhaps only one shoot, or even one branch from a shoot, the rest of the plant being fairly healthy. In other gardens than my own I only see it bad where the subsoil is chalk like mine. However, I have always been able to find it slightly in every garden I have been into in this neighbourhood. My own rose garden has, perhaps, fifteen different kinds of soil in it. At any rate, within the last eighteen years, I must have had top spit from quite fifteen different places, and I might say it has occured in plants in all these soils. In some places the hole has been "made" to the depth of 3ft. and the bottom spit chalk removed. It occurs in beds artificially drained or not; I notice no difference. It attacks H.P.'s mostly, H.T.'s rather less, and T.'s much less. I have seen it in gardens where no manure at all has been used, and, also where plenty has been incorporated with all spits. It occurs in all situations, as to exposure to winds. Last year a well-known gardening expert said he would see if he could help me if I sent him some shoots. I did so, and he sent them on to an authority, who, in his turn, sent them on to, perhaps, the best-known living authority on plant diseases. They all three said: "Too much humic acid," and recommended ground lime, 4oz. to square yard in spring. In my own case this "seemed" quite right. I had already tried lime, but did so again this spring, and find no difference. I have been studying this disease for over ten years. I am always thinking about it, and trying to puzzle it out, but it is getting on my nerves, as it beats me. I have tried at various times as a top-dressing lime, gypsum, chalk, sulphate of iron, soot, charcoal, water in which green leaves have been boiled, copious plain warm waterings, liquid manure, artificials, mulching with manure, and renewing top soil. This season, in the holes and bed already prepared, and in all the other holes to be made, I am using "Vaporite," my last resource, I think. My own rather diffident opinion is that it is something that disagrees with the rootlets, and that is why the disease is so patchy in some plants, only the roots supplying one particular part of the plant being affected. I took about a dozen affected shoots up to the N.R.S. Show at Salisbury, and showed them to many of the most prominent exhibitors, both nurserymen and amateurs. They only laughed, and said I had given the roses something to disagree with them. They do not suffer from it evidently, or they would not treat the matter so lightly. About here it is the curse of rose-growers, and many have given up trying to grow roses to any extent on this account. Personally, I think the N.R.S. would be doing very good work, which would benefit hundreds of people, if they took the matter up, and got at the root of the complaint, and found a remedy for the same. I hope, at any rate, you will do your very best to help us in this district.

[Have any of our readers any experience of this disease? If so, we shall be glad to hear from them.—ED.]

WINTER-FLOWERING PLANTS.—C. R., Mapperley: You could take up the culture of winter-flowering begonias, and find this class of plants both interesting and beautiful. Primulas, both florist's and stellate forms, provide another useful and bright-flowering group of winter bloomers. Cypripediums, especially the varieties of C. insigne, C. Leeanum, and the hybrids descended from these and allied species are also delightful for winter-flowering, and they last a very long time. Either of these could be managed in your structure. We are not very clear as to your needs; please write us again.

DISEASED CELERY.—W., Devon: The celery sent shows a very bad infection of Cercospora apii, a fungus pest that sometimes spoils whole crops of celery. Pull up and burn all infected plants, as every piece of diseased leaf allowed to remain may propagate the disease next season. Prevention of attack is secured by spraying the young plants with ammoniacal carbonate of copper solution in their earlier stages of growth, following this up at intervals with the same solution or, at a later stage, with sulphide of potassium. It is practically impossible to do anything at this date in the way of spraying.

WHITE MARKS ON VIOLET LEAVES.—J. H. W., Kilmarnock: The violet leaves are small, and the plants seem to have suffered a severe check of some kind, and this has rendered them open to the attack of a fungus named Cercospora violæ, a pest that often attacks violets, especially those grown under glass. Spray the plants with weak Bordeaux mixture.

PRIMULA OBCONICA.—J. H. W., Kilmarnock: We find no traces of disease or insect pests on the foliage submitted. The trouble is due to some accidental error in culture, and is possibly the result of over-fumigation.

NAMES OF PLANTS.

B. S., Weybridge.—Aconitum volubile.

M. G., Tunbridge Wells.—Silene armeria.

S. R., Swindon.—Flower much bleached in the wet moss; probably Dendrobium dixanthum.

N. B. J., Warwick. — 1, Odontoglossum ardentissimum; 2, Pentstemon Hartwegi; 3, Tiarella cordifolia; 4, Senecio Jacobæa; 5, probably Ligustrum chinensis.

W. P. W., Galway.—1, Coleus, variety not recognised; 2, Sibthorpea europæa; 3, probably Davallia canariensis; 4, Veronica spicata; 5, Sidalcea rosea; 6, Helenium striatum.

MARKETS.

COVENT GARDEN.

Flowers.

Chrysanthemums, carnations, liliums, and dahlias are plentiful and meet a steady demand.

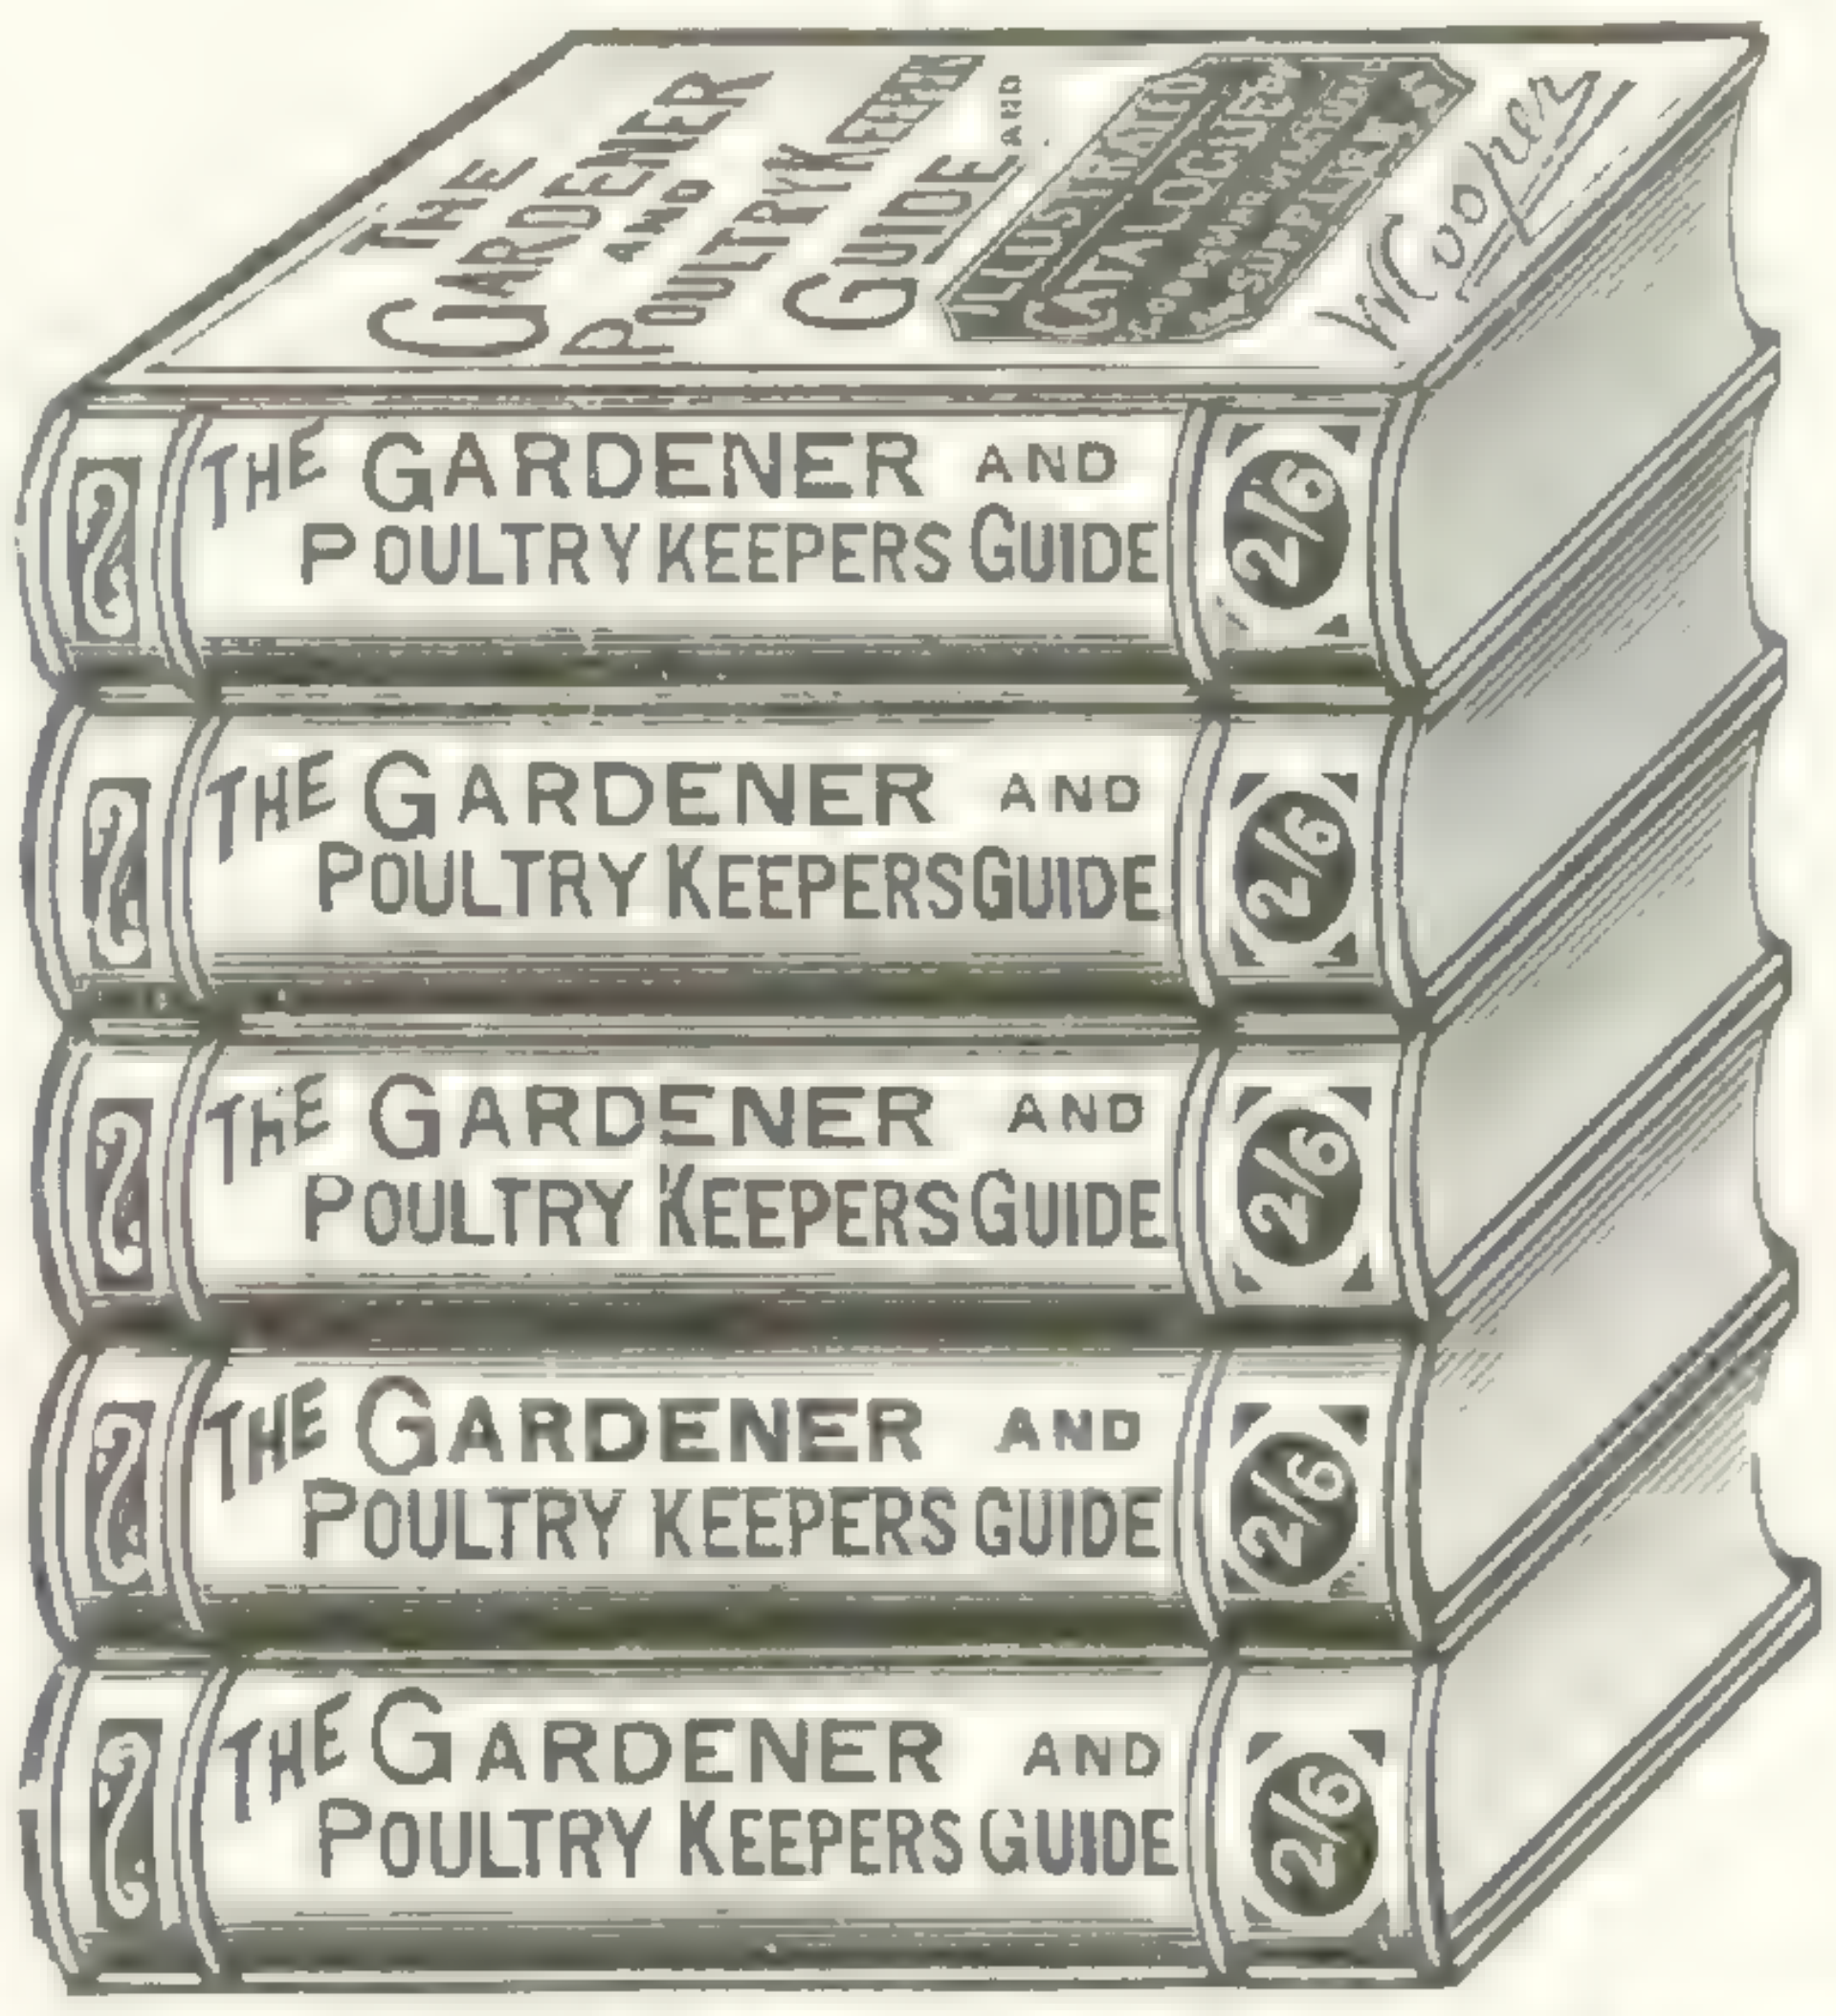
THE GARDENER AND POULTRY KEEPER'S GUIDE AND

Illustrated Catalogue of Goods Manufactured and Supplied

By WILLIAM COOPER.



THE GARDENER AND POULTRY KEEPERS GUIDE
2/6
W. Cooper

640 Pages. 1,000 Illustrations. Bound in Cloth.

The most Complete Work on Gardening and Poultry-Keeping, Dogs Rabbits, Pigeons, &c., ever written. No matter what you require to know about any one of these subjects, you will find the information in this book written in plain, non-technical language, there being 640 pages telling and illustrating everything on the above subjects. The result is

The Greatest Book Ever Published on Gardening and Poultry-Keeping.

100,000 BOOKS TO BE DISTRIBUTED FREE.

From the opening to the last line it is interestingly written. The price of the Book is **2/6**, but the Author has decided to give away **100,000 COPIES FREE**, one to each applicant who writes for a copy.

COST of PRODUCTION and DISTRIBUTION OVER £7,500.

The distribution and production of this Book will cost over £7,500, but a Free Copy will be sent, post free, on receipt of 6d. P.O. or Stamps (simply for postage and package). As the distribution of every one of these books is an initial loss to the Author, he asks that each recipient, after reading it, if having no further use for same, will favour him by kindly lending it or giving it for perusal to some friend or relative interested in the above-mentioned matters.

SEND FOR YOUR COPY TO-DAY.

WHAT YOU WILL RECEIVE.

Send 6d. P.O. or stamps and you will receive, post free, by return, the New Book for Gardeners and Poultry Keepers, consisting of 640 pages, fully illustrated and bound in cloth. A Help, Guide, and a Necessity to every Amateur.

SURVEYS BY APPOINTMENT.—When required, we shall be pleased for one of our representatives to wait upon ladies or gentlemen at their residences in any part of the country to take all necessary particulars, give advice, etc., and submit Plans and Estimates in accordance with his report. We also undertake repairs and alterations of or additions to existing houses or heating apparatus.

WAKELEY'S *celebrated* HOP MANURE

THE MOST PERFECT FERTILIZER FOR GARDENS, GREENHOUSES, LAWNS, Etc.

PATENTED

THE ONLY RELIABLE AND COMPLETE SUBSTITUTE FOR STABLE MANURE

in the form of a leaf mould, ready for use at any time in the same way, and for all purposes that stable manure is put. Goes further (1 cwt. equalling 15 cwts.), gives better results, is clean to handle, sweet smelling, and free from weeds, worms, etc.

READ WHAT USERS SAY:

FOR ROSES AND SWEET PEAS.

Dear Sirs — Bradwell-on-Sea, Essex. I used Wakeley's "Hop Manure" this year, especially for **Roses** and **Sweet Peas**. The season has been a trying one, but I never before had such good results.
(Signed) W. HOATHER.

AS SUBSTITUTE FOR STABLE MANURE

Dear Sirs, Blackhall, Midlothian. The Wakeley's "Hop Manure" does **all the good of horse manure, without** any of the latter's **drawbacks**. The **Roses** are splendid this season.
(Signed) THOS. W. DALGLEISH.

FOR VEGETABLES AND POT PLANTS.

The Gardens, Lilley Brook, Charlton Kings.
Gentlemen,—I consider Wakeley's "Hop Manure" the finest thing for **Vegetables**: it is splendid to mix with the soil for **Pot Plants**, and is a good **top dressing** for **Chrysanthemums** after the buds are set.
(Signed) FRANK MAY.

SPECIMEN LETTERS RECEIVED

VOL. LIII.—No. 2,970. SATURDAY, OCTOBER 1, 1910.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

The National Vegetable Show.

Within the past three or four decades there has been a marked change in opinion with regard to the position vegetables should occupy in the economy of the garden, at the public exhibitions, and in the dietary of the community; and, happily, the change has been in a direction that should afford much gratification to those who are interested in horticulture. Some thirty or forty years ago, when plants from tropical regions were in the ascendant, and an immense amount of attention was devoted to tender summer bedders, many young gardeners regarded the acquisition in the course of their training of a knowledge of vegetables and their cultivation as a quite secondary matter. Some of these made strenuous endeavour to make good their deficiencies when they assumed the charge of gardens, and found how essential it was that they should be able to maintain liberal supplies of vegetables of high quality throughout the year, and usually succeeded. Others less able to quickly recognise the weak points in their training, and, it may be, less energetic, remained satisfied with the scant knowledge they possessed, and in many instances failed to attain to such a high position as they would otherwise have done. This having been the case, it is not surprising that vegetables should have been assigned an inferior position at the public exhibitions. At the great metropolitan exhibitions they were practically, if not wholly, unrepresented, and at the provincial shows, where encouragement was given them, they were usually presented in a manner that could certainly not be considered satisfactory. The tent set apart for vegetables was regarded by the general body of visitors as a place to be shunned, and the competitors had abundant opportunities for discussing the relative merits of varieties and points of practice, and it may be indulging in a criticism of the judging, without being jostled by visitors desirous of making a thorough inspection of the products in competition. Now, as indeed for some years past, very different views are held with regard to this all-important subject. The importance of a thorough acquaintance with all that relates to the kitchen garden and its management is fully recognised, and coincident with the improvement that has been effected in cultural methods has come a desire to present vegetables to public notice in the most tasteful manner, and in giving practical effect to this desire exhibitors have succeeded in making the vegetable tent one of the most attractive features of the exhibitions. No longer is it avoided by visitors, but it usually has its full quota, and we could mention a considerable number of exhibitions where, as at Leicester, for example, the tent is so crowded during the greater part of the day as to render it difficult to obtain a close view of the produce in competition. This largely increased interest in vegetables has given rise to a strong desire that they should have a society wholly devoted to them, and that the society should, in addition to carrying out such other work as might appear desirable, hold an annual exhibition of a truly national character. To found a society capable of successfully accomplishing such work, and place it in a sound position, is a very different matter to expressing a wish that it should be formed; and, having regard to the large amount of work it entails, there is no occasion for surprise that a society really national in its aims should not have been formed at an earlier date. It is always well there should be no undue haste in a matter of this kind, especially as unless there is a complete unanimity among the promoters on the main point a successful issue is highly problematical. It is most essential they should have a strong faith in the cause, for invariably when the preliminary steps have been taken in forming a society, whatever may be its object, there are not wanting those who are ready to express their opinion that the whole project is doomed to failure. They have not been wanting in this case, but the members of the executive being all of one mind as to the desirability of a national organisation, and possessing the courage of their opinions, they did not allow any discouragement they may have received to divert them from the course they had marked out. The course taken has been fully justified by events. The executive, with commendable prudence proceeded cautiously, and, instead of holding an exhibition last year, before their plans were fully matured, it commenced a series of trials that were likely to prove useful to the general body of cultivators, and these, as shown by the reports that we have published, were most successful. By this means the executive not only placed at the disposal of cultivators much valuable information on the selection of cabbages for spring supplies and onions for sowing in the autumn, but it made the society and the proposed scope of its work generally known. It is evident that the distinct and vigorous policy of the society has met with general approval, for the appeal made to the members of the seed trade for support in carrying out the exhibition met with a generous response, and members have been enrolled in large numbers. Not less satisfactory is the fact that cultivators contributed so freely of the products of their skill to the exhibition which was held at the Horticultural Hall on Wednesday, as to tax to the utmost capacity the build-

MR. GEORGE ELLWOOD.

ing and to form the largest and most important display of vegetables that has yet been produced in this or any other country. Our report deals so fully with the exhibition that there is no occasion for us to refer to it further than to say that the committee, of which Mr. A. Dean, V.M.H., is the chairman, may be heartily congratulated on the success achieved. The future of the society will of necessity be largely determined by those actively interested in vegetables, but as the committee consists of practical men, who fully appreciate their responsibilities, and have but one object in view, and that the encouragement of the extension and advancement of vegetable culture, there can be no doubt as to their receiving the heartiest support in carrying out the vigorous policy that has been so successfully initiated.

Mr. George Ellwood, whose portrait we have the pleasure of giving in this issue, may perhaps be best described as an "all-round" gardener, for the high condition in which all departments of the extensive gardens of Swanmore Park are maintained amply testify to his being fully acquainted with all branches of the gardening art. His great successes have been in the culture of the products of the kitchen garden, and his interest in them and his success as a cultivator he attributes in a large measure to the influence of Mr. E. Beckett, under whom he had the good fortune to serve in the various departments of the Aldenham House gardens. From Aldenham Mr. Ellwood went to Lockinge Park, and there also he had for his chief a past master in the art of fruit and vegetable culture. Here Mr. Ellwood remained five years, three as general foreman, and evidently took full advantage of the exceptional opportunities he had for the acquisition of knowledge. Mr. Ellwood left Lockinge Park to take charge of the gardens of Enbridge Lodge, Woolton Hill, Newbury, the residence of C. R. de la Salle, Esq., where orchids received special attention, seedlings of cypripediums, lælio-cattleyas, etc., being raised in large numbers, and considerable success achieved in the exhibition of groups of plants, vegetables, and other things. After a stay of four years, Mr. Ellwood was appointed to the charge of the gardens of Swanmore Park, the residence of W. H. Myers, Esq., who takes a keen interest in all that relates to his fine gardens, which for a period extending over nearly thirty years have enjoyed so high a degree of fame as to have become a household word throughout the United Kingdom. Stimulated by the encouragement of his generous employer, Mr. Ellwood has given increased attention to the exhibition of fruits and vegetables, and during the past eight years he has taken a large number of prizes at important exhibitions, such as those of Southampton, Portsmouth, Bournemouth, Winchester, and Reading.

Electricity and Plant Growth.—Sir Oliver Lodge, in discussing the effect of electricity on plants and crops, said he had been carrying out experiments in this connection, and had found that in bright weather it was not necessary to apply any electricity to the soil, but in dull weather, when positive electricity was applied, the experiment showed an increase in output of the soil of 30 per cent. It seemed to him the plants themselves had terminals which discharged electricity in bright sunshine, and it had been suggested that perhaps in applying electricity to the soil they were doing artificially what the sunshine was doing directly. Apparently there were elaborate chemical changes going on in the leaves themselves, but no doubt great assistance was being afforded to growth by the application of static electrification.

The Gardeners' Magazine Autumn Number.—We propose to devote the greater part of the space in our issue for October 22 to the discussion of matters of special import to those who contemplate planting hardy trees and shrubs either for floral or foliage effects, select fruit trees, small fruits, and choice subjects for the embellishment of the herbaceous border and other parts of the flower garden. The articles will be by recognised authorities on the several subjects, and the issue will be freely illustrated.

Study of the British Flora.—In reviewing the existing provisions for the study of the flora of the British Islands, Professor James W. H. Trail directed attention to the great need for a work on the British flora that would be worthy of the subject and the country. He also urged the importance of giving greater prominence to the study of plants in the field. He said that for a time the knowledge of plants was too much confined to the ability to name them according to the system in vogue and to a knowledge of their uses, real or imagined. The undue importance attached to this side of the study, even by so great a leader as Linnæus, naturally led to a reaction as the value of other aspects of botany came to be realised, and as improvements in the instruments and methods of research opened up new fields of study. The science had gained much by the reaction; but there was danger of swinging to the other extreme and of failing to recognise the need to become well acquainted with plants in their natural surroundings. The opportunities for study in the laboratory were so great and so much more under control, and the materials were so abundant and of so much interest, that there was for many botanists a temptation to regard work in the field as of little value. It was scarcely necessary to point out that each side was insufficient alone. The study of plants in the field was of much importance, and there were few paths more likely to prove attractive to most students. The study of the plants in their natural environments would lead to an understanding of their nature as living beings, of their relations to one another and to other environments, of the stimuli to which they responded, and of the struggle for existence that resulted in the survival of certain forms and the disappearance of others.

United Horticultural Benefit and Provident Society.—The annual dinner of this excellent friendly society will be held at the Waldorf Hotel, Aldwych, W.C., on Thursday, October 6, at 6 for 6.30 p.m. Mr. Edward Sherwood will preside, and he has very kindly undertaken the musical arrangements for the evening. It is hoped there will be a large attendance; the tickets are 5s. each, and may be had from the secretary, Mr. W. Collins, 9, Martindale Road, Balham.

Honey Harvest in Scotland.—The results this year from our busy little friends are not to be so good as the earlier summer months promised they would be. It is an old adage with bee-keepers that two bad seasons never follow in succession, but now they have had three bad seasons (1907 being disastrous) all following each other. The supply of clover honey this year has been fairly good, but very little was got from the fruit blossom. It is the heather season, however, concerning which fears are entertained. So far it has not been very productive, owing to the unfavourable weather experienced. The blossom is fully as rich as usual, but on some moors it is somewhat deficient, probably owing to the intense frosts experienced last winter. The tempestuous weather of the closing days of last month considerably damaged the heather bloom, and little can now be expected from it, while, should a nip of frost come, that would entirely shut off the flow of nectar. On Deeside the harvest is very fair. The same, however, cannot be said of the later and less congenial districts. The honey already harvested is of fairly good quality, and prices are ruling much about the same as those prevailing last year at this time.

Bees in Relation to Fruit Culture.—Canon Rawnsley, in the course of the proceedings in connection with the opening of the honey exhibition at Carlisle, referred to the importance of bees as aids in fruit production. He stated that the results of the experiments made in different parts of Cumberland by experts this year proved conclusively the vital necessity and usefulness of bees to farmers and fruit-growers. In orchards not bearing well hives were introduced, and certain trees were covered with muslin during the period of flowering. The results were that the trees to which bees had free access bore more fruit, while the trees from which the bees had been excluded were found to be wholly unproductive.

National Chrysanthemum Society.—The exhibitions of this society will be held respectively on October 5 and 6, and November 2, 3, and 4, at the Crystal Palace. There will be a conference on chrysanthemum culture at Essex Hall on December 5. The Floral Committee meetings are as follows: At the Crystal Palace on October 5 and November 2, and at Essex Hall, Strand, on October 24, November 21, December 5, and December 19.

Wild Flowers in London.—The Selborne Society has been investigating the flora of a building site in Farringdon Street, scarcely removed from the heart of the City. Although this plot has only been cleared for about two years, 28 species of flowering plants and ferns have established themselves upon it. Mosses, liverworts, and others of the more simple plants are also represented. Mr. J. C. Shenstone, F.L.S., is preparing a detailed list which will be published in the October number of the "Selborne Magazine." In a preliminary report he says that one would expect "wind distributed plants" to figure largely in this garden, but not bracken, which is a difficult fern to transplant. There is thus provided a problem for nature students to solve.

Apple and Plum Crop Around Wisbech.—In an interesting contribution to the journal of the Board of Agriculture on the fruit crop in the district of which Wisbech is the centre, Mr. H. Amos states that, in consequence of the shortage in the supplies of apples, the available produce is making a very high price; as an example, Bramley's Seedling commands £15, Lord Derby £14, Grenadier, Lane's Prince Albert, and Lord Suffield, £12, Emneth Earlier and Grosvenor, £10 per ton. Amongst the dessert apples, Beauty of Bath realised £16, Worcester Pearmain £18, and Gladstone £14 per ton. Plums also were a very short crop, and Early Rivers commenced and finished at not less than £15 per ton. Czars were firm at £15 per ton. Victorias were thin crops, and readily bought up at £18 per ton. Belle de Louvain and Ponds' Seedling sold at £16 and £18 per ton. Plums were a poor crop, but realised more than they would have done had there been a full crop.

EXHIBITIONS AND MEETINGS.

◆

National Vegetable Society.

The long-expected and much-talked of vegetable show was held at the Royal Horticultural Hall, Westminster, on Wednesday, September 28, and was a splendid success. There were many who doubted whether an exhibition of vegetables would be a success, but these who had faith worked hard and won the success they desired. Never before has such a wonderful collection of finely-grown vegetables been brought together; the competition was keen, and most of the leading growers competed. The great bulk of the work this big display entailed was borne by Mr. Alex Dean, V.M.H., Mr. Quick, and Mr. G. Wythes, V.M.H., respectively chairman, secretary, and treasurer of the society; while Mr. C. Fester, assisted by Mr. Harvey and others, superintended the show arrangements. There were fifty-nine classes, and the entries totalled 1,100, there being no fewer than 600 entries in the set of classes provided by Messrs. Dobbie and Co. There were altogether 240 different exhibitors, and these hailed from all countries in the United Kingdom, and from practically all the counties of England. There was room for some improvement both in the schedule and arrangements, but these are matters that experience will put right for another season; enough for the present that the National Vegetable Society has more than justified its existence both in the matter of trials and exhibition.

At the lunch given to judges, pressmen, and officers, at the Hotel Windsor, Mr. George Monro presided, and at its conclusion thanks were accorded the judges, the donors of special prizes, the conductors of the Society's trials, the Press, the officers of the Society, and the Chairman, the speakers being Messrs. G. Monro, V.M.H., A. Dean, V.M.H., Owen Thomas, V.M.H., N. F. Barnes, Milne, G. Gordon, V.M.H., R. Sydenham, E. Beckett, V.M.H., C. Fester, G. Wythes, V.M.H., J. H. Dick, and W. Poupart.

COLLECTIONS.

The premier class was one for a dozen kinds of vegetables, and here the first prize of ten guineas was given by the Duke of Portland, president, and the second prize of seven guineas by Lord Howard de Walden, vice-president. The schedule did not state the amount of the third prize. There were four competitors, and the chief award fell to Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop, who set up grand, clean specimens of Superb Pink celery, Autumn Mammoth cauliflowers, Prizetaker leeks, Tender and True parsnips, Ailsa Craig onions, Duke of Albany peas, Best of All Runner beans, Dwarf Gem Brussels sprouts, Perfection tomatoes, Sutton's Black beet, a magnificent dish of Superlative potatoes, and as fine a set of New Red Intermediate carrots as was ever staged. Second prize fell to Mr. James Hudson, Gimson Road, Leicester, whose chief dishes were of Giant White celery, Prizewinner runner beans, Ailsa Craig onions, Prizetaker leeks, A1 tomatoes, and Autumn Mammoth cauliflowers; third prize went to Mr. W. G. Lobjoit, Heston Farm, Hounslow, who had fair average produce, but not well set up.

The class for nine dishes, distinct, was open to all except those competing in the premier class. The leading award of £5 fell to Mr. W. Gaiger, gardener to H. T. Tatham, Esq., Kendall Hall, Elstree, for a splendid set of Autumn Mammoth cauliflowers, Perfection leeks, Solid Pink celery, Up-to-Date potatoes, Ailsa Craig onions, Gladstone peas, Best of All runner beans, Barr's Thick-fleshed tomatoes, and New Red Intermediate carrots; Mr. S. Cole, gardener to Earl Spencer, Althorpe Park, Northampton, second; and Mr. Avery, gardener to J. Kew, Esq., Loudwater, Rickmansworth, third; six entries.

For the purpose of bringing before the public those vegetables which are not well known, the proprietors of "Country Life" offered prizes for a collection of eight dishes to be selected from a given list of fourteen kinds of vegetables. This was an interesting class, and brought out four competitors. Premier award was made in favour of Mr. Edwin Beckett, who scored with Large Solid cardoon, Seakale beet, salsify, Golden Waxpod beans, Golden Ball turnips, Sugar Corn maize, celeriac, and Couve Tronchuda; Mr. W. Folkes, Ampthill, Beds, came second, and Mr. W. G. Lobjoit, Heston, Hounslow, third.

For a collection or display of vegetables, any kinds or varieties, to fill a table space 15ft. by 5ft., and to be effectively arranged, Messrs. Wood and Sons, Wood Green, offered prizes of ten and six guineas respectively. The only exhibitor was Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, who was awarded the first prize for an effective collection of splendidly-grown and varied produce. He had leeks, celery, cardoons, Chilian beet, cauliflowers, red cabbages, savoys, peas, Brussels sprouts, cucumbers, grand onions, potatoes, tomatoes, parsnips, kohl rabi, Globe artichokes, peas, radishes, beet, capsicums, mushrooms, shallots, celeriac, carrots, turnips, mustard-and-cress, lettuce, runner and French beans, Chinese artichokes, marrows, scorzonera, maize, and salsify—a grand exhibit even for Mr. Beckett.

The Messrs. Wood also contributed the prizes in a class for six dishes of vegetables exhibited from an establishment where there are not more than six gardeners engaged, including the head gardener. This was open only to Messrs. Wood and Son's customers. There were three entrants, and premier award fell to Mr. G. Holiday, Havering Road, Romford, who scored with celery, cauliflowers, onions, potatoes, carrots, and tomatoes, all excellent, but unlabelled. Mr. A. Folkes, gardener to the Right Hon. T. F. Halsey, Gaddesden Place, Hemel Hempstead, came second; and Mr. T. J. Broom,

MESSRS. SUTTON AND SONS' GOLD MEDAL DISPLAY OF VEGETABLES
At the National Vegetable Society's Exhibition.

gardener to Miss Langworthy, Gay's House, Holyport, Maidenhead, third.

In the class for a collection of twelve distinct kinds of vegetables, with prizes offered by Messrs. Robert Sydenham, Birmingham, there were four entrants, and the finest collection was the one staged by Mr. Silas Cole, Althorpe Gardens, Northampton, who led with good specimens of Autumn Giant cauliflowers, Ailsa Craig onions, Clayworth Prize celery, Hollow Crown parsnips, Up-to-Date potatoes, Pragnell's beet, Perfection tomatoes, Wroxton Brussels sprouts, and Gladstone peas; Mr. A. Basile, gardener to Rev. O. Turner, Woburn Park, Weybridge, second; Mr. W. Foulkes, third; and Mr. Bedford, gardener to R. H. Ling, Esq., The Braes, Berkhamsted, fourth.

There were twelve competitors in the society's class for six kinds of vegetables, and here Mr. H. Keep, Aldermaston, Reading, scored with leeks, onions, beans, potatoes, celery, and cauliflowers; Mr. W. Coleman, Hunter Street, Buckingham, second; and Mr. C. F. Jenden, Horsham, third.

Mr. T. Jones, Bryn-Penylan, Ruabon, North Wales, scored a first in Messrs. Sydenham's class for six kinds of vegetables. The famous sweet pea grower showed fine samples of Clayworth Prize celery, Autumn Giant cauliflowers, Ailsa Craig onions, New Scarlet Intermediate carrots, Ne Plus Ultra runner beans, and Satisfaction potatoes; Mr. E. Deakin, Hay Hall, Hay Mill, Birmingham, second.

In the class for eight varieties of vegetables, prizes provided by Messrs. J. Cheal and Sons, Crawley, there were three entries, and here Mr. G. Hobday was once more successful, winning with a remarkably fine collection of unlabelled celery, cauliflowers, leeks, carrots, onions, tomatoes, beans, and potatoes; Mr. T. Sparkes, gardener to Mrs. Von Hartmann, Wimblehurst, Horsham, second; and Mr. Davey, gardener to Allan Scott, Esq., Holbrook Park, Horsham, third.

In the Messrs. Barr and Sons' class for seven dishes of vegetables, Mr. W. Gaiger and Mr. G. Hobday were the only exhibitors, and the former secured the chief award with Dwarf Purple curled kale, Little Queen cabbage, Stump-rooted carrots, Golden Prolific runner beans, Red Globe beet, Crimson Globe onions, and Best of All cauliflowers; Mr. G. Hobday second.

In the society's class for three kinds of vegetables, Mr. Thos. Jones, Ruabon, scored with Ailsa Craig onions, a seedling potato, and Autumn Giant cauliflowers. There were nine competitors, and Mr. W. G. Worth, Stratfield Road, Summertown, Oxford, was second; and Mr. J. Smith, Northolt Road, Harrow, third.

FIRST PRIZE COLLECTION OF TWELVE KINDS OF VEGETABLES.
Shown in the Premier Class by Mr. J. Gibson, Welbeck Gardens, at the National Vegetable Society's Exhibition.

Four competitors entered for Mr. G. Monro's prizes for six dishes of tomatoes, and Mr. A. G. Nicholls, gardener to the Duke of Wellington, Strathfieldsaye, led with beautifully even fruits of Princess of Wales, Satisfaction, A1, Eclipse, Magnum Bonum, and Winter Beauty; Mr. J. Hudson, Leicester, second; and Mr. E. Beckett, third. First prize for six dishes of potatoes, prizes provided by Messrs. Clay and Son, Stratford, was won by Mr. J. Gibson with beautiful even and clear tubers of Windsor Castle, King Edward VII., Superlative, Supreme, White City, and Ideal: sixteen entries. Mr. J. Hudson came second, and Mr. Silas Cole third.

FIRST PRIZE COLLECTION OF VEGETABLES, EFFECTIVELY DISPLAYED.
Shown by Mr. E. Beckett, V.M.H., Aldenham House Gardens, at the National Vegetable Society's Exhibition.

SMALL CLASSES.

Messrs. Dobbie and Co., Edinburgh, provided the prizes in a number of classes, and paid all entrance fees. There were fifty-one entrants in the class for two dishes of potatoes, and these produced a wonderful display; first prize fell to Mr. C. Hudson, Leicester, for splendid tubers of Provost and The Admiral; Mr. H. Wells, Mint Street, Lincoln, second, with The Factor and The Provost; and Mr. Gentle, gardener to Mrs. Denison, Little Gaddesdon, Berkhamsted, third. In the single-dish classes provided by the Edinburgh firm, Mr. Gentle led for beet with Dobbie's New Purple, out of sixty-eight competitors; Mr. R. H. Thompson, Little Hayward, Staffs, second. For Golden Globe onions, Mr. A. G. Gentle was first out of twenty-four competitors; for Selected parsnips Mr. Gentle was again first, this time from forty competitors, nearly all of whom showed splendidly; of Golden Ball turnips there were forty-seven dishes, and the first set was from Mr. T. Antony, Lea Rig, Broxham (a working collier), who had perfect specimens of beautiful colour; there were fifty-one dishes of Model White turnips, Mr. T. Antony scoring with another beautiful set; first prize for six International Prize leeks was won by Mr. T. Hetherington, Newbrough, Fourstones, Northumberland, who led from among forty-two competitors, many of whom ran him closely.

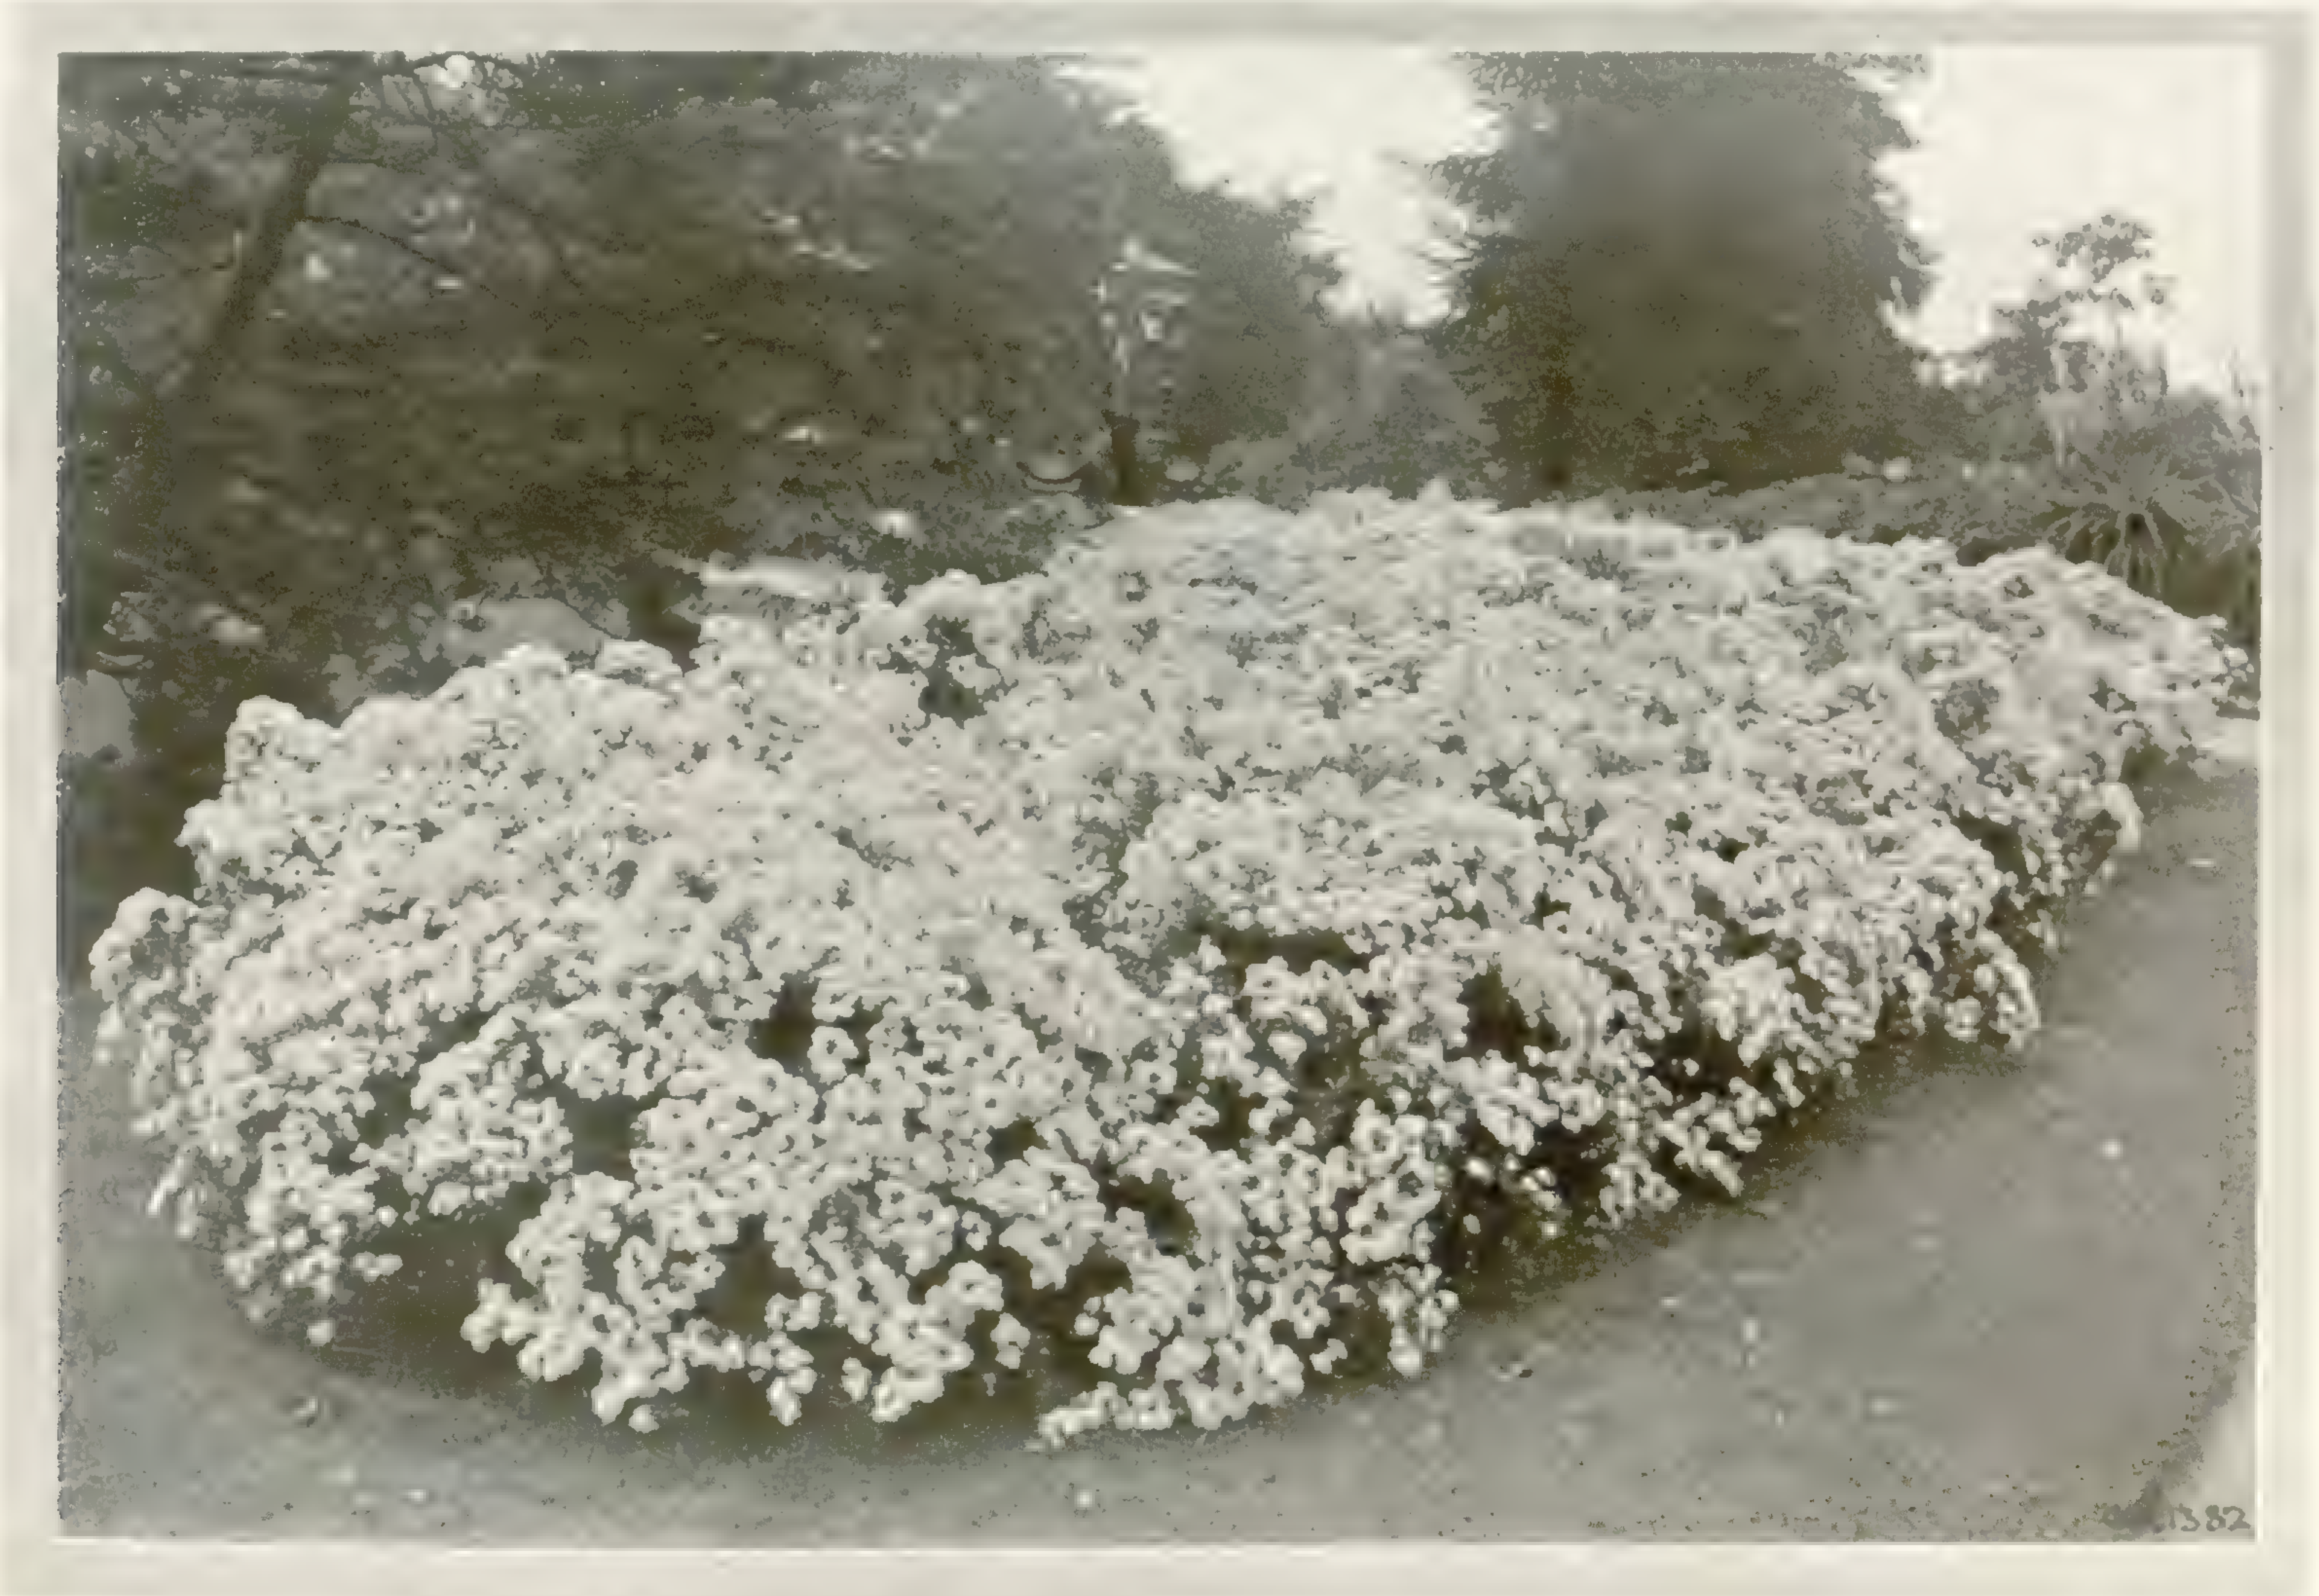
Messrs. Dickson and Robinson, Cathedral Street, Manchester, gave the prizes for a number of their specialities, and the chief prize-winners were as follows: Selected parsnips, Mr. F. West, gardener to the Right Hon. Lord Curzon, Hackwood Park, Basingstoke; six Sugar-loaf cabbages (five entries), Mr. W. Folkes, Ampthill; Manchester Market turnip (sixteen entries), Mr. R. H. Comyns, Heath Farm House, Watford; Snowdon cauliflower (eleven entries), Mr. A. Grubb, gardener to C. F. Raphael, Esq., Shenley Park; six Staghorn lettuces (seven entries), Mr. T. Jones, Ruabon; six Market Favourite beet (eleven entries), Mr. W. Waterton, Heath Farm Gardens, Watford; Perfection carrots (ten entries), Mr. Barker, gardener to the Duke of Newcastle, Clumber, Worksop; Prize Pink Celery (six entries), Mr.

(Continued on page 775.)

THE OLEARIAS.

The genus Olearia is included in the order Compositæ, an order which, considering its large number of genera and species, contains but a small number of shrubby plants. The genus under notice is composed of a considerable number of evergreen shrubs, many of which possess the further recommendation of being excellent flowering plants. Unfortunately, the majority are not sufficiently hardy to admit of their general outdoor culture in the British Isles, though most of them may be grown in Devonshire, Cornwall, and other places where the climatic conditions are similar in character. The subject of the illustration, O. Haasti, is, however, much hardier than the majority of the species, and will stand uninjured through any ordinary winter in most parts of the country. The genus is peculiar to Australia and New Zealand, and is allied to senecio and eurybia.

The various species show a great diversity of habit, some being quite low bushes, with thin, wiry branches and tiny leaves, and others good-sized shrubs with large leathery foliage; whilst one or two assume almost tree-like proportions in their native country. O. argophylla, for instance, forms a trunk a foot or more in diameter. Many of the species have the young shoots and the undersurfaces of the leaves coated with a dense greyish, brown, or silvery felty pubescence, which adds appreciably to the general effect of the bushes. In one or two instances the foliage is musk scented, whilst the wood of O. argophylla also possesses that peculiarity.



A LAWN GROUP OF OLEARIA HAASTI AT KEW.
A distinct hardy shrub, native of New Zealand, and bearing in July a profusion of white flowers.

Providing the climatic conditions are satisfactory, the majority of the species thrive in ordinary garden soil, whilst, given a cool greenhouse, all the species may be cultivated in pots. One or two species appear to prefer a mixture of light loam and sandy peat, and those are alluded to later; else, for general purposes, a light loamy soil is all that is required. Many of the kinds may be increased by means of cuttings of young shoots inserted in sandy soil in a close propagating case, whilst cuttings of O. Haasti root quite well in a cold frame. A few species are difficult to increase from cuttings, and in these instances seeds have to be relied on.

In the following notes no attempt is made to mention all the introduced species, but a sufficient number of distinct kinds is included to add interest to any garden.

O. Haasti is undoubtedly the most useful member of the genus for the British Isles, in addition to being one of our most attractive flowering evergreens. It thrives satisfactorily in inland gardens, whilst it is an excellent seaside shrub. An instance of its suitability for exposed positions near the sea is seen in the Marine Park at Southport. In this place it is planted largely, and though the town is exposed to the full force of the winds from the Atlantic, it looks just as well as we are used to seeing it in sheltered inland gardens. It is a New Zealand species, and was introduced about 1858 by Messrs. Veitch, of Exeter. Its headquarters is said to be the mountain ranges of the Middle Island, where it is met with at an altitude of 4,000 to 5,000 feet. Here we are familiar with it as a shapely bush three to four and a-half feet high, with small, leathery, broadly ovate leaves, and heads of white flowers, which are borne in great profusion in July. It is available for a variety of purposes, such as specimen bushes, beds, hedges, etc. Should it become overgrown, it may be pruned hard back, for it recovers well from severe pruning. By removing the points of young plants occasionally shapely bushes are soon formed.

O. insignis.—This, like the celmesias, may be looked on as one of the aristocrats of the New Zealand flora, for its handsome foliage and large flower heads give it a distinct appearance which readily separates it from other plants. It is figured in the "Botanical Magazine," t. 7,034, and is there stated to occur along the rocky banks of rivers in the north part of the Middle Island. It was discovered in the Province of Nelson by Captain D. Rough about 1850, and was noticed from sea level to an altitude of 5,000 feet. A peculiarity of the shrub is its stout branchlets, which are comparatively few in number. These are clothed with large leathery leaves, almost elliptical in outline, and often six inches or more long. When they first develop they are covered with wool on both surfaces. This, however, soon falls from the upper side, leaving a dark green surface. The stems and undersides of the leaves are throughout life, however, coated with a dense whitish felt. The flower heads are often two to three inches in diameter, and are borne on stout stalks four to six inches long. The ray florets are white, and the disc yellow. This species is difficult to propagate, and likes a peaty soil.

O. Solandri.—It would be difficult to imagine two species of a genus more generally unlike than this and the one immediately preceding. In place of a few specially strong branchlets we find a multitude of thin elegant growths, and tiny linear leaves, scarcely more than a quarter of an inch long, in place of imposing foliage. It is a native of the same country, and forms a pretty, elegant bush, suitable for greenhouse decoration in most parts of the country, and the outdoor border in the south. The brownish stems are coated with hairs, and the undersurface of the leaves is silvery. The flower heads are small, star-like, and white, whilst they appear in great profusion.

O. dentata is an Australian shrub, found about the east coast from Port Jackson to the Blue Mountains, according to the "Botanical Magazine" description. The branches and undersides of the leaves are covered with a brownish felt, which is somewhat conspicuous. The leaves range from one and a-half to two and a-half inches in length, and they are more or less ovate in shape. A difference occurs in the colour of the flowers from those of other species, for in this case the ray florets are tinged with rose. Sir Joseph Hooker gave the name of O. dentata to the plant which is now called O. macrodonta, hence a certain amount of confusion sometimes occurs.

O. macrodonta may be said to be the second hardiest species, for in certain parts of the country it thrives where many other kinds will not succeed. Curiously, at Kew it will not grow in an open border, whilst good bushes exist in some parts of Shropshire and Cheshire. One was noted recently in the gardens at Ince Hall in the latter county. In New Zealand it is said to attain a height of twenty feet, but bushes eight or nine feet high, and as far through, are considered of remarkable size in English gardens. The leaves are three to four inches long and an inch wide, dark green above, with deeply sunken nerves and deeply toothed margins. The undersurface is silvery. The flower heads are borne in large corymbs, often more than six inches across.

O. stellulata is an Australian species which has come prominently to the front in recent years. It forms a moderate-sized bush, with greyish stems and leaves. The latter vary considerably in size, and may be but half an inch long or nearly two inches. The surface is wrinkled, and the margins deeply dented. As in most other cases, the flowers are white, but in this case single flower heads are borne on long stalks from the leaf axils near the points of the branches. In sheltered places it succeeds out of doors further north than some of the other kinds.

O. nummularia.—This is a very distinct shrub, with rather stiff branches, clothed with small roundish leaves with reflexed margins. The leaves are scarcely more than a quarter of an inch across, and are somewhat viscid. When young the bark is golden in colour. The flowers are white.

O. argophylla is known as the Muskwood, on account of the odour of the wood resembling musk. It forms a good-sized tree, with a trunk of considerable size. The leaves are up to six inches long, with serrate margins, the undersurface and the bark of the young wood being silvery. For Cornish gardens it is an excellent shrub. Flowers are borne somewhat less freely than in the case of other species.

O. nitida is another New Zealand species. It is of strong habit, with handsome ovate long-pointed leaves with dentate margins. The upper surface is deep green, the underside silvery, and the young branches reddish. Frequent stopping is required to ensure a bushy habit.

O. furfuracea.—This forms a good-sized bush, with thick, broadly ovate leathery leaves three to four inches long, with a few very minute teeth on the margins. As is the case with so many species, the undersurface of the leaves is silvery. When grown in pots a certain amount of peat should be included in the compost.

O. myrsinoides is a rather loose-habited shrub from New Zealand, with small deep green leaves, which have wrinkled margins, and in some respects resemble miniature leaves of O. macrodonta. A peculiarity of the species is noticeable in the reddish hue of the young shoots. The flower heads are less showy than those of many other species.

For gardens in Cornwall, Devonshire, and similar localities, there are many other plants from the same countries that offer great possibilities, and it is a pity that we do not see better use made of public parks and gardens in these counties for the establishment of collections of rare and somewhat tender shrubs. W. D.

STANDARD ROSES ON LAWNS.

If there are few more showy and pleasing objects upon a well-kept lawn than a healthy - growing standard rose, few will deny but that a scrubby and half-dead specimen is an eye-sore. There is no excuse for the latter provided we use a little care in the selection of varieties and in planting. Very often standard roses are planted too deeply; partly to aid in keeping the plant upright, but more often through ignorance of the nature of the stock they are worked upon. Deep planting is fatal; and even where they have not been put in deep enough for this result, it encourages such a host of suckers that little can be done. Seeing that in any case it is necessary to afford some support to the stems, why not let this be effectual from the first, and put our plants in at a more reasonable depth? The briar stock prefers a rather stiff soil, and if such is not provided, naturally we must help a little in that direction.

To expect weak growers to draw up their nourishment through several feet of foster stock, while all the time the latter is naturally doing its best to make suckers, is, to say the least, unreasonable. Unless the top grows well, the briar stem deteriorates, and the only hope of the roots is to form suckers. Given a strong-growing rose, much of this would seem to be avoided. We too often find an attempt made to grow upon three and a-half feet stems such weak habited varieties as can scarcely exist as dwarfs, and this is more often than not the chief cause of failure among standard roses. But when we ask such to take the place of specimens upon the lawn the result is ludicrous.

I have seen quite a mound of soil piled around stems of standards on the theory that they had suffered from being too wet at the root; and have also noticed the soil pitched towards the stem because the roses were thought to need more than the usual amount of moisture. Do not plant too deeply, see that roses have a rich and fairly stiff soil, select strong growers, and there are few more pleasing features upon a lawn than standard roses.

Should a plant show signs of failing, lift it the following autumn, and add a little fresh compost. This affords a capital opportunity to remove suckers, while the shifting often improves the plant very much. Naturally there must be some losses, the same as with dwarfs, and I noticed some years back a batch of standards growing in pots ready to take the place of failures early in the spring, just the same as is practised with dwarfs for filling up gaps. A few standards in fair-sized pots, plunged upon a north border, is what a good many neglect to have in hand.

Now that we have such grand weeping and strong-growing roses, instead of standards going out of fashion, I feel we really have a better chance than before of securing such a handsome feature for our lawns.

A. P.

AUTUMN - FLOWERING HEATHS.

It cannot be said that the species of hardy heaths which produce their flowers in autumn are to be compared, as regards beauty and stature, with those that brighten the landscape from February to June. At the same time they are indispensable, and being usually found in the shape of large colonies are exceedingly attractive. It is hardly necessary to point out that the majority of the autumn bloomers are natives of our shores, being more or less abundant on moorlands, etc. As seen growing in their hundreds of thousands on the famous Dartmoor they form a glorious feature, and visitors may be noted culling huge sheaves in all directions. The same applies to many parts of the sister county, Cornwall, the Scotch moors, and many other districts, and it is gratifying to know that they are now allocated prominent positions in many private gardens and parks. In some instances they are so concentrated as to form a heath garden, while in others they are arranged in large and informal masses in the wilder portions of the garden, or to act as a wide belt to shrubberies, etc.

Few plants are more accommodating, and, given soil free from lime, with a little rough peat added, they luxuriate and grow with great freedom. Further, they call for but little attention after they become established, and beyond an annual top-dressing, which is distinctly advantageous, the removal of old flower heads in early spring, together with the cutting back of such growths that exhibit a tendency to become leggy, they are capable of looking after themselves. Early in spring is certainly the best time to plant these subjects, and, should drought prevail, artificial watering must be resorted to. The Cornish heath, Erica vagans, is altogether one of the finest in this section, attains to a height ranging from two to three feet, and becomes literally a mass of delicate pink florescence in its season. Of a much darker hue are the flowers found in its varieties rubra and grandiflora, while E. v. alba has white flowers. Other comparatively large growing kinds are named E. stricta with red flowers, and E. multiflora, both of which are very floriferous. E. ciliaris is characterised by its loose and thin habit of growth, and the flowers are as brightly coloured as any I can call to mind. Very distinct, also, is E. tetralix, popularly known as the cross-leaved heath, and it stands alone as far as the peculiar arrangement of the foliage is concerned. The normal height of E. cinerea is ten inches, but in common with other species and varieties considerable diversity is seen, both as regards stature and colouring in different parts of the country. We find some very desirable forms in its varieties, whose colourings range from purple to white, and bear the names of rosea, alba, atrosanguinea, atropurpurea, and coccinea. E. Mackayi is perhaps the least desirable, at the same time its pink flowers are attractive and add variety. Few, indeed, are the gardens where a suitable spot cannot be found to cultivate a fully representative collection of these plants, which possess a charm quite their own.

WALTER H. AGGETT.

Everyone interested in a garden should obtain a copy of the ALPHABET OF GARDENING, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc. with explanatory diagrams. Price, bound in cloth 1s. 6d. net, post 1s. 9d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

ARTISTIC HERBACEOUS BORDERS

GARDENS BEAUTIFUL

KELWAY & SON have again received recognition in the award of the **Grand Prix** of the **Japan-British Exhibition** for an Exhibit of Kelway Hardy Border Plants (Pæonies, Delphiniums, etc.), and Gladioli, planted in the Grounds. This makes the fifth of these high awards received by Kelway's during 1910. In all the firm have been awarded **220 Grand Prizes and Gold and Silver Medals** at Exhibitions all over the world.

Full particulars of Kelway's Specialities on application.

AUTUMN PLANTING SEASON

In spite of an unfavourable season, we have had a splendid fruit crop, and invite intending planters to inspect our great stock of

FRUIT TREES

which is in grand condition, hardy, healthy, and fertile.

We shall be glad to quote for small quantities for private growers and large quantities for market growers.

Roses, Hardy Perennials, Ornamental Trees and Shrubs, Bulbs, of the highest quality at reasonable prices.

Special Autumn Offer and Descriptive Catalogue — free. —

THE BARNHAM NURSERIES, LTD.,
BARNHAM, SUSSEX.

C. HIGHT, Cranleigh, Surrey, has Millions of Autumn-sown Cabbage Plants now ready. [illegible], First and Best, Wheeler's Imperial, [illegible], Flower of Spring, Meins No. 1, [illegible] 1000; or 10,000 25s., on rail; any above 1s. 100 [illegible] free.

Messrs. WM. ARTINDALE & SON,
Nether Green Nursery, Sheffield.

THE FIRST AND ONLY PURE WHITE DELPHINIUM.
Two Startling Novelties.

THESE two new varieties, which are now offered for the first time. Both grow 5—6ft. high, and produce enormous flower stems with large flowers, and the branches, which are produced in enormous quantity at the base of the central spike, are longer than of any other variety, several measuring over 2½ft. This makes both these varieties the best for cutting purposes, as they flower from June till late in summer.

DELPHINIUM HYBR. MOERHEIMI, has large flowers of the purest white, and not the slightest shade of creamy, bluish or greenish, like the so-called "white" Delphiniums, which have been introduced the last few years, and to which it cannot be compared. **It is doubtless the best hardy perennial introduced in the last ten years.** Award of Merit R.H.S. July, 1909. **10/6 each.** (Only a limited quantity will be sold and orders are requested at once.)

DELPHINIUM HYBR. CAPRI, of quite the same growth as "Moerheimi," being a counterpiece of same it much resembles in colour to "Persimmon," but is in every respect an improvement of this variety; the flowers are larger and the spikes longer and of a more branching habit. We consider it as the **best sky blue single Delphinium** in commerce. **10/6** each.

SOILS AND MANURES IN RELATION TO PLANT GROWTH.

(Continued from page 722.)

◆

Farmyard Manure.

Farmyard manure is a mixture of animal urine and decomposing vegetable matter, such as litter and the undigested remains of food. If kept moist and well aerated, and supplied with a sufficiency, but not an excess of earth, in which chalk is a constituent, we have all the conditions for active nitrification—that is, for the conversion of the nitrogen of the vegetable matter and urine into ammonia and into nitrate of lime, for the multiplication of the bacteria, and for the elaboration of the potential plant food in the added earth.

When treated in this way the farmyard or stable manure heap becomes not only a factory of ammonia salts and nitrate of lime, but also a nursery for the raising of multitudes of bacteria. The precautions to be observed in the management of this heap are, first, to avoid too high a temperature, which may expel and cause the loss of ammonia formed by the fermentation of the urine and of the vegetable matter; the heat produced can be kept under control by watering the heap when necessary, and in preference by water from a liquid manure tank.

The second precaution is to build the heap in a covered or sheltered place, so that it is not exposed to the rain, which, in washing through, would carry away soluble salts of nitrogen and potash. There is no doubt, by the judicious use of soil and water, that all the valuable constituents of farmyard manure can be retained in the manure, and nitrifying bacteria multiplied, and such farmyard manure will not only render ground fertile in consequence of the available plant food that it brings, but will supply bacteria to land deficient in these agents of nitrification.

Soil may be infertile from many causes. Want of drainage or tillage, the presence of injurious substances, such as excess of iron, the absence of a sufficient supply of one element of plant food, may any of these reduce an otherwise highly fertile soil to infertility; and to all these may be added a further cause of infertility, and that is the absence of the bacteria of nitrification.

Denitrification.

Among the communities of bacteria that have their dwelling in the soil is one whose members are able to produce a change very different from those we have just studied. They are called denitrifying bacteria because they take nitrates and ammonia salts and set free the nitrogen, rendering it useless as plant food. These denitrifying bacteria only work in the absence of oxygen (air)—a condition existing in water-logged soils—in soils rich in humus but not aerated by tillage, or in soils where the decaying vegetable matter rapidly uses up the oxygen.

Instances have been observed where a smaller crop has been obtained on soils receiving farmyard manure than on soils which have been left without manure, because the farmyard manure, ill-rotted, and infested with these denitrifying bacteria, caused the destruction of the nitrates formed by nitrification in the soil. And again, there is always a danger that the application of nitrate of soda and sulphate of ammonia on the top of freshly-dunged soils may be wasted owing to denitrification. The addition of phosphates and potash increase the activity of denitrifying bacteria in farmyard manure because they supply food to the bacteria. Artificial manures should therefore not be applied at the same time or too soon after the application of farmyard manure.

The Supply of Humus.

We have seen that humus is being constantly used up in the process of nitrification. This consumption of humus is an essential part of the activity of soils, and is a necessary accompaniment of fertility. There is thus a constant loss of humus going on in all cultivated soils.

A due proportion of humus, however, is absolutely essential if our garden soils are to remain in good heart; it is necessary for its valuable properties in relation to the movements and conservation of moisture, it is necessary for its retention of ammonia, it is necessary in nitrificaton.

Since in cultivated soils humus is being constantly consumed, how is it to be replaced?

The answer is, by the application of farm yard and stable manure, by the digging into the soil of green crops, plant roots, and compost consisting of leaves, tree cuttings, and other organic waste materials usually to be found in a garden. In order to prevent the soil from becoming sour by the incorporation of so much decaying organic manure, apply a dressing of quicklime, 10 cwt. per acre, or a dressing of basic slag 5 or 6 cwts. per acre.

Harpenden. J. J. Willis.

(To be continued.)

EXHIBITING ANNUALS.

The mixing of colours in exhibiting annuals, as alluded to by "H.," page 666, is a common occurrence at ordinary flower shows, and though I do not recollect having previously heard of a case where it was objected to, I am not surprised that it happened, for there is a class of exhibitors who do not scruple to adopt every available means in their power, however dishonourable or dishonest they may be, to take, as it were, a few shillings from another's pocket, and place it in their own. If your correspondent was one of the judges in question, he doubtless settled the matter to his satisfaction, but, as he asked for other's views, I give mine for what they are worth.

The schedule, it appears, asked for a collection of annuals, "twelve varieties"; well, for example, we will take the sweet pea as a variety of annual, and, in my opinion, an exhibitor would be justified in staging a mixed-coloured bunch of it as one of his twelve varieties, though I don't think he would gain anything, but might in some cases lose by doing so. Had the schedule asked for twelve distinct varieties, and the sweet pea made one of them, it should, I consider, be staged in one colour only; at any rate, by so doing, one might, in close competition, avoid giving the judges a reason for passing over an exhibit; and judges, it should be remembered, are at times placed in very close corners. In trivial cases of this description, when the wording of the schedule is not definite, the judges, when dealing with exhibits staged in good faith, and with no intention of gaining an advantage (in the case referred to it is questionable if the exhibitor gained anything by mixing colours of the varieties he staged) should be given the power to act in a common sense manner, and make the awards accordingly. M.

[Our correspondent is under a misapprehension in his reference to sweet peas. Assuming there is a class for a collection of annuals, in twelve varieties, and twelve distinct bunches are shown with sweet peas as one, the exhibitor who mixes his sweet peas should be disqualified. Every distinct colour in sweet peas represents a distinct variety, and if there is more than one colour the stipulated number of varieties will be exceeded.—Ed.]

THE APENNINE WINDFLOWER.

Windflowers are among the most admired of all our garden flowers, whether they come to us in the guise of humble-growing plants like our lovely Wood Anemone of our native land, or in the shape of the taller and more majestic Anemone japonica, one of the prides of our autumn gardens. Much has been written as to the origin of the name, but much of it is purely conjectural and of little consequence, save in the eyes of philologists and searchers after the out-of-the-way points in connection with their flowers.

In the lovely little Apennine windflower we have a species which is more nearly akin, in point of stature, at least, to our anemone of the woods than to the more stately Japan anemone. When it does well, however, it is taller and more tufted in its growth than our Wood anemone, forming a tufted mass of beautiful finely-cut leaves, and surmounting these, in due time, the charming starry flowers of clear, intense sky-blue. As has been well said, the blue is not that of our own skies, but that of the heavens above the Apennines. Such, at least, we may say of the type, but, like many other flowers, it has broken from its original colouring, and we have also varieties yielding us double, white, purple, and rosy coloured flowers as well. Yet none are so beautiful as the blue, whose beauties are unspeakably superior, though the taste for something less common leads some to seek after the plants with white or rosy flowers. It usually grows about six inches high, but much depends upon the nature of the soil and whether it is cultivated under trees or in the open. When under trees it is drawn up to a greater height.

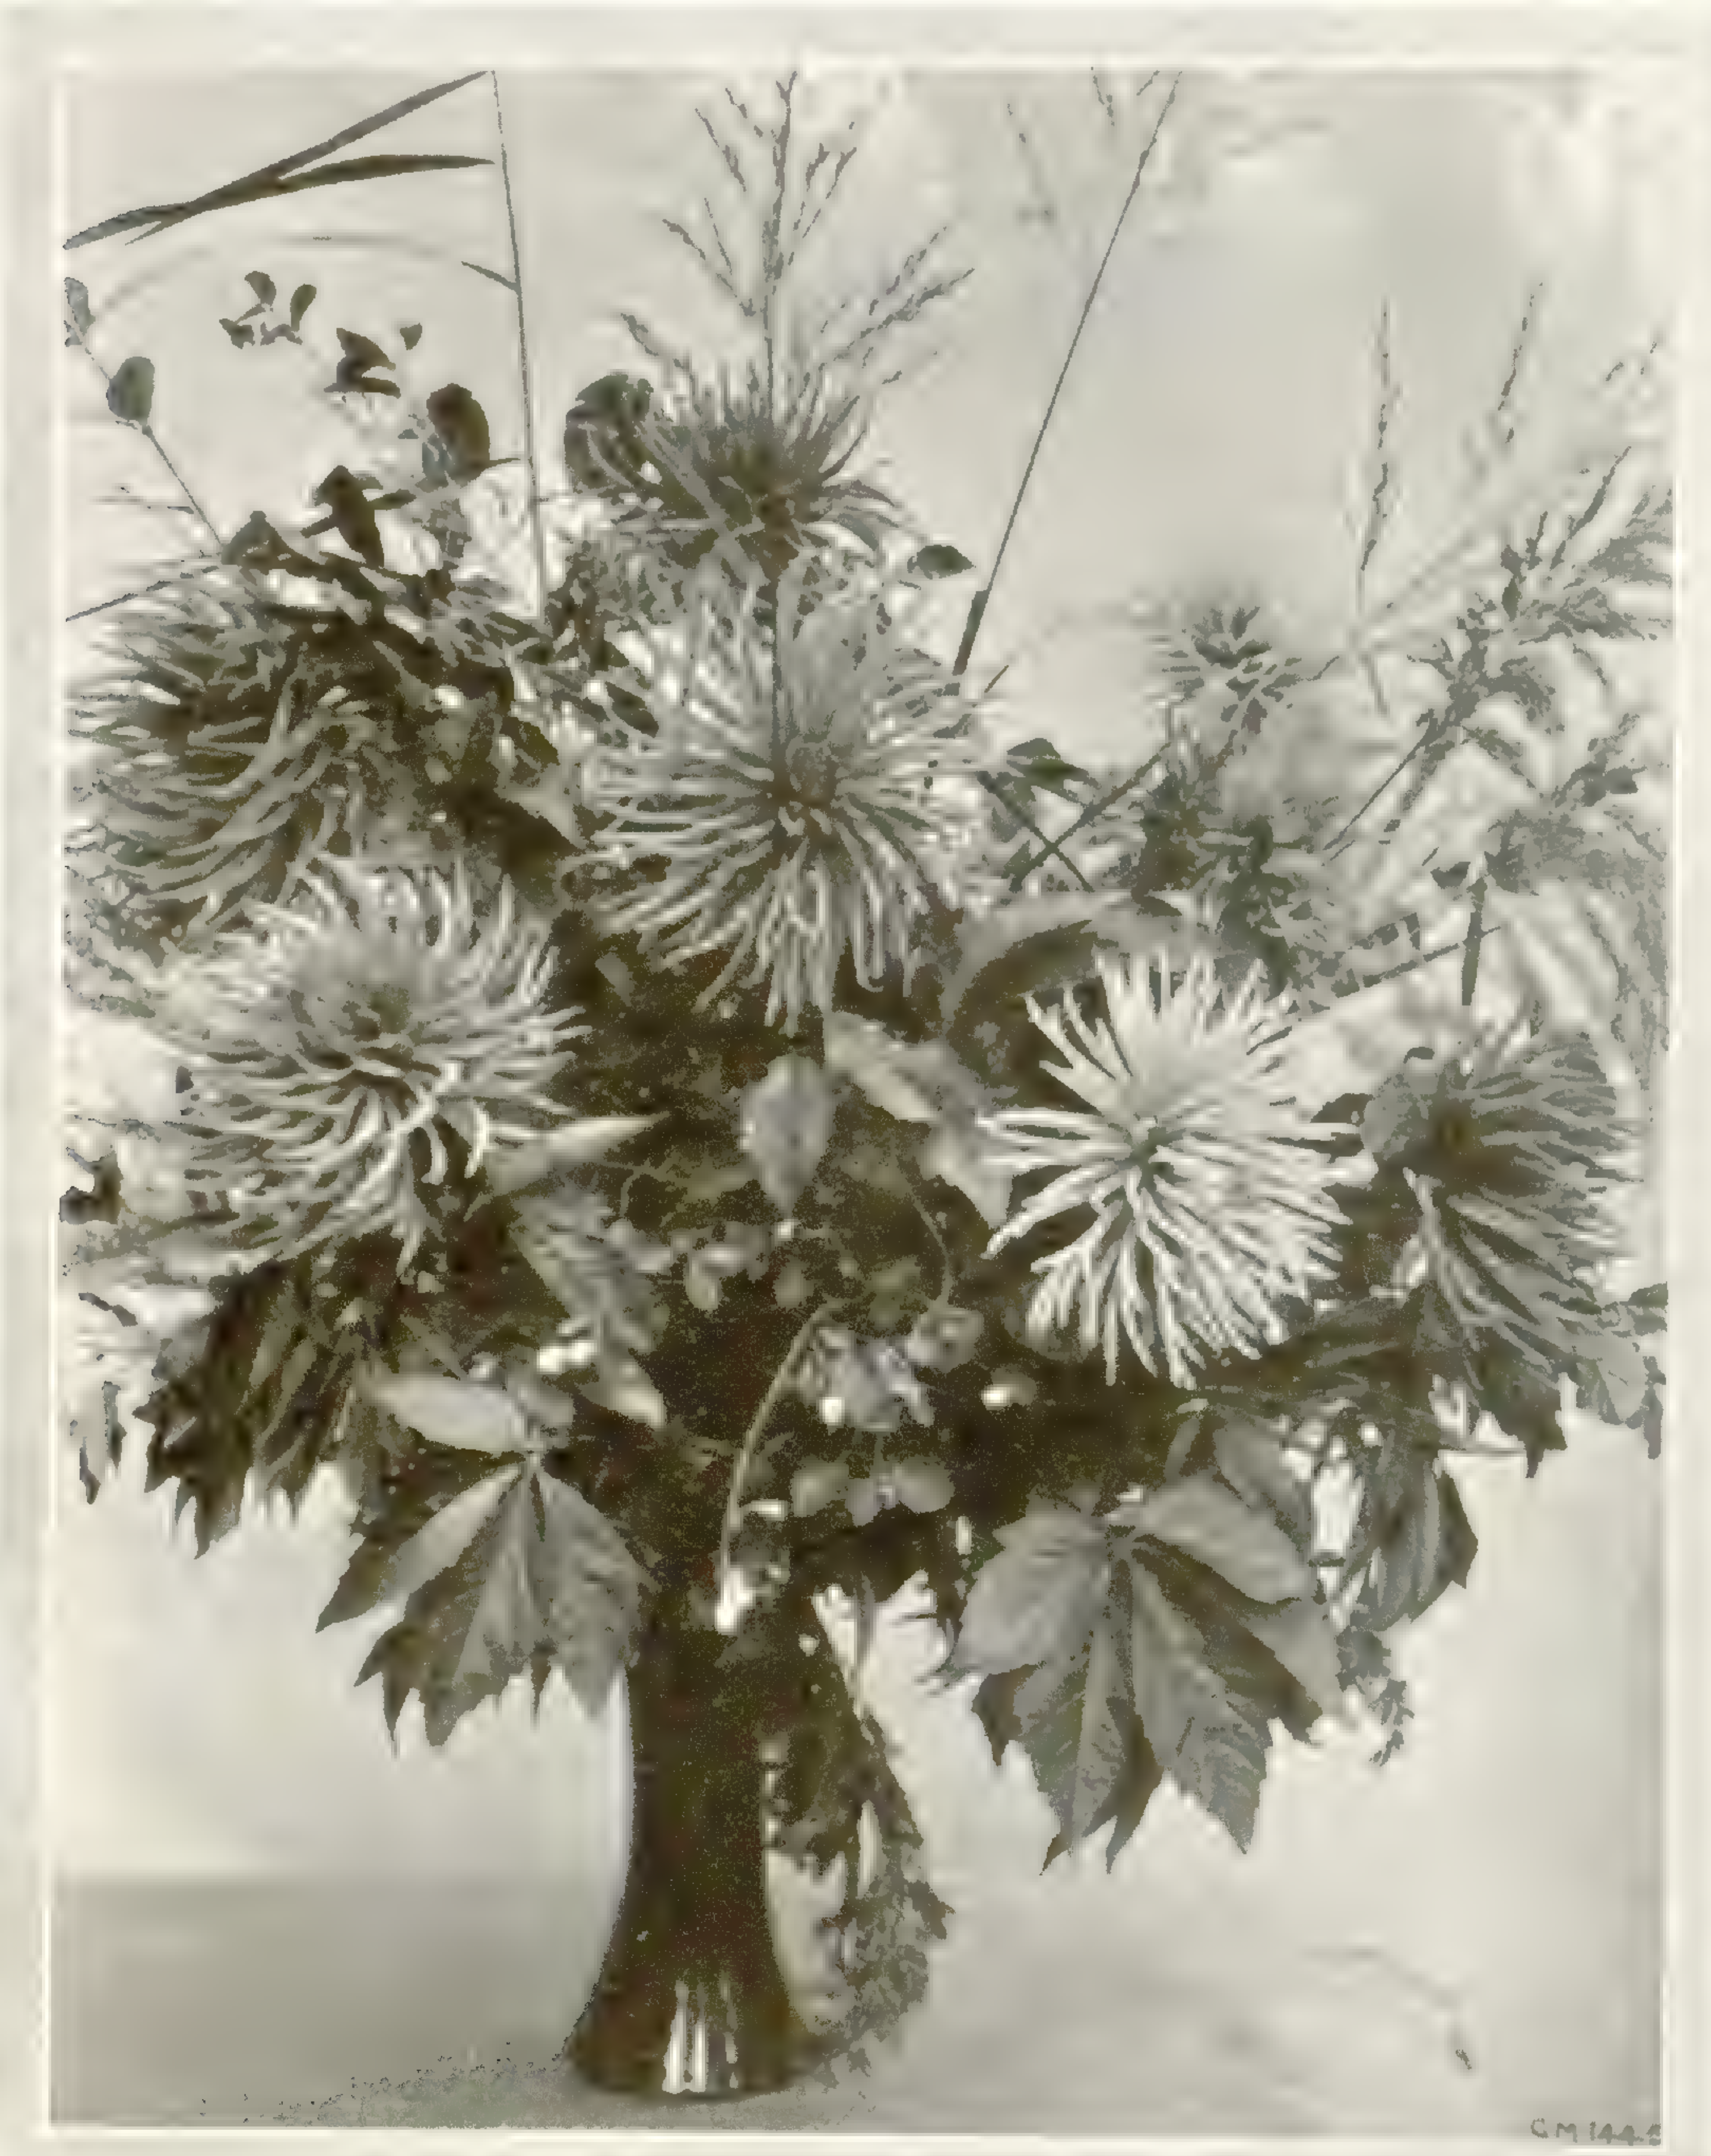
This anemone has, like our Wood anemone, a liking for partial shade. It thrives perfectly under trees, and is a charming thing for carpeting the soil in open woods or in orchards where the soil is covered with grass or other low herbage. It grows splendidly among grass, provided, of course, that this is not too early cut. As a plant for naturalising in woods and in wooded glens it is one of the most charming imaginable. The writer knows a wooded glen in a noble domain where there are millions of the Apennine anemones, presenting a truly lovely sight in April and May, and an orchard in another demesne where there are as many carpeting the ground beneath the trees. When the sunbeams come through the branches and persuade the anemones to open their starry flowers of blue it seems a veritable fairy land.

To look at the rough little tubers one would consider it incredible that such gnarled little things should be the source of so much beauty, for no one can call them attractive in themselves. Yet from these black, rough little tubers there spring the pretty green leaves and the exquisite blossoms of this windflower. As for its hardiness there is no room for doubt, seeing that it has become so naturalised in a few places that some have accounted it a native, though this idea has no real warrant. It may be said to be hardy from Land's End to John O'Groats. Planting should be done as early in autumn as possible, but it may be deferred until spring in the case of necessity, but not otherwise. From two to three inches of soil above the crowns of the tubers is a sufficient depth, but it is not at all particular in this respect. It increases readily by division of the tubers and also by means of seeds.

S. Arnott.

BULBS FOR BANKS AND SLOPES.

Take a stiff plant such as the hyacinth, set it closely all over level ground, and it is bound to have a stiff effect; set it, on the contrary, upon sloping land, and all its inelegance is hidden and only its exquisite colour and fragrance remains. Although bush roses are not ungraceful it has been truly said that for obtaining the most artistic effects with them they must be planted upon slopes, so that the lower stems of half are hidden by the blossoming tops of the others; this is the same principle that can be observed with regard to bulbous plants of innumerable species.



ONE OF THE FIRST PRIZE SET OF THREE VASES OF DAHLIAS.
Shown by Mr. J. Walker, Thame, at the National Dahlia Society's Exhibition on Sept. 20 and 21.

A grand example of bold landscape gardening is witnessed when the steep sides of a large dell are covered by Crown Imperials in spring and Hyacinthus candicans in summer, yet the bulbs only require to be alternated, then left alone for years, and both kinds are inexpensive by the hundred. A smaller dell of nodding montbretias has a marvellously lovely appearance, and there is no reason why Spanish iris should not have flowered earlier, in groups, in the same place. By trying a few of a great many species of bulbous flowers in our gardens, we often prevent our enjoying any species in perfection, since massing is undoubtedly the only style that displays the plants adequately. Natural beauties are due to the lavish representation of bluebells, primroses, daffodils, etc.; where only a few specimens are to be found we do not call the spot a notable one for charm.

If tall growers are handsome when used as a ground covering on a slope, dwarf but brilliant subjects yield more vivid sheets of colour; the ordinary crocus will so cover a bank round two sides of a tennis-court that the place in spring is a blaze of orange-gold visible across several meadows. The rich violet-purple, or china-blue of other crocuses give equally attractive, if less prominent, results, the former imparting a warmth to any garden in which it luxuriates. Crocuses, too, are charming in mixture, but, if purple and mauve are used with gold and white, no blue should be added, indeed, a more satisfactory display results from using only purple, gold, and mauve in one place, and reserving white to go with blue elsewhere.

Large yellow daffodils are admirable for clothing terrace slopes, or those of undulating lawns; instead of planting them closely in terrace borders, however, a better appearance is gained by making groups of three or four at intervals of a foot, then carpeting the earth with variegated arabis; this permits the elegance of daffodil growth to be observed as it could not be if they formed a solid field. In turf, groups or single plants are, of course, always used. The Poet's narcissus is one of the loveliest hardy bulbous plants with which to clothe abrupt slopes; it can be employed advantageously in semi-wild gardening, up and down cliff-like sides of gravel pits, or deep dells in woodlands or meadows, for example, it will flourish as though a native, and perfume the whole neighbourhood.

Bulb-planting on so large a scale is not within the power of us all; it is well to remember, therefore, that small slopes, such as those against front-garden verandahs, are exquisite when closely massed with crocuses, the scarlet Anemone fulgens, the rich blue grape hyacinth, or azure Scilla sibirica, the small single daffodil, or Van Thol tulips. Miniature or Dutch hyacinths are far too little used for such situations; their delicate colours, earliness, and perfume entitle them to attention, and they are over, and ready for removal when the first bedding plants can be located.

Few gardeners ever cover sloping borders or banks with a mixture of Allium neapolitanum and deep rose hyacinths, but these two bulbs are excellent companions. Mixed Caen anemones require a sunny position, but if shrubs do not afford too much shade a blank summit is the ideal position for them. Noted bulb-merchants, if appealed to, will supply a mixture that does not include scarlet, or else one that has scarlet but does not include pink and magenta; this is an immense gain from the artistic point of view, as, though all the colours are fair, they are sadly inharmonious together.

Exquisite effects are to be obtained by cultivating some of the bulbous plants that need lifting and storing each year; the ranunculus is one of the fairest flowers we possess, for example, whether of scarlet, crimson, gold, or white, and in foliage and habit of growth leaves little to be desired. A front garden bank, running from gate to door, and holding up a smooth green lawn, can be planted all over with mixed Turban ranunculuses, and just a few groups of tall tulips to blossom first; the cost will be trifling, the appearance in June will be glorious, after the tulip colour has departed. This species of ranunculus generally thrives when autumn-planted upon a sunny slope anywhere in England; the soil should not be new; if the bank has been recently formed a quantity of vegetable ashes and leaf-mould should be incorporated. Early gladioli give a fairy-like forest of white and rosy spires in a similar position, and planting them somewhat liberally can be strongly recommended, especially as they have the advantage of being inexpensive.

M. H.

DAHLIAS IN DECORATIONS.

In skilful hands dahlias are admirable decorative subjects in a cut state, and it is therefore very desirable that the value of the flowers in floral arrangements should be demonstrated at the leading exhibitions. Few flowers are more magnificent for large designs in harvest festivals and similar gatherings than the big, brilliant, long-stemmed pæony-flowered and decorative varieties, while the best of the cactus, as well as the pompon varieties are serviceable for smaller arrangements. Some good examples of vases of cactus dahlias were to be seen at the exhibition of the National Dahlia Society, held at the Royal Botanic Gardens, Regent's Park, on September 20 and 21. Mr. J. Walker, Thame, who secured first prize for three vases of cactus dahlia blooms, showed his flowers off to great advantage with sprays of coloured foliage, and one of his vases is figured herewith. In the amateurs' section Mrs. E. Mawley, Rosebank, Berkhamsted, was awarded first prize for a vase of handsome blooms of the crimson Dr. G. Gray cactus variety associated with sprays of the purple-leaved plum.

HORTICULTURE AND CHARITY.

A Flower Show Without Prizes.

Is it possible to run a flower show without giving prizes? Perhaps some will answer no, but I am about to point out that such a thing is not impossible, and, of course, much depends on the object of the show, its organisation, and the spirit of the exhibitors. But there, I am not here to moralise, only to describe a flower show at which no prize money is given, and in doing so I may perhaps be allowed to get away a little from the orthodox reporting style.

The time is an August morning, the place is Alveston, a little village close to Thornbury, in Gloucestershire, which is noted for its castle, which never was finished, its cattle market that is held in the street, and the fact that it is the birthplace of the Grand Old Man of cricket, "W. G.," and his hardly less famous brother, the veteran "E. M." There is evidently something going on, for there is a stir opposite to the old Ship Inn, and rattling up the road, one after another, come farmers' spring carts and milk floats laden with horticultural produce of every description. They pass into a field where two big tents are erected, and there are the usual side shows in the way of merry-go-rounds, swingboats, and the rest of the paraphernalia. There is no lack of helpers, one after another the conveyances are emptied, and by midday the two marquees are so full of produce that it cannot all be accommodated on the tables, and a good deal of it has to be "staged" on the ground underneath. We glance at the schedule, which contains classes for fruit, flowers, and vegetables open to cottagers and amateurs, as well as butter, cheese, poultry, bread, eggs, and, we know not what else besides, but not a penny is given in prize money, and now is the time to explain.

No, the show is not a novelty, for twenty-two years ago it occurred to a few people that it might be possible to hit two birds with one stone, by encouraging horticulture, and at the same time assist the medical charities of Bristol and district. The beginning was small, but the twenty-first balance-sheet shows that this worthy horticultural society has since it was established paid £638 to the Bristol Royal Infirmary, £273 3s. to the Bristol Eye Hospital, £208 to the Bristol Hospital for Women and Children, £42 10s. to the Bristol General Hospital, and £58 10s. to the Almondsbury Hospital, making a grand total of £1,220 3s. Not a bad record for a village society, which does not trouble about keeping balances in hand, for last year, after beginning with a balance of £1 3s., and paying £110 to the above medical charities, the sum of 8s. only was kept in hand.

How is it done? Well, in the first place, the affairs of the society have been managed from the first by its two excellent secretaries, Messrs. T. Croome and G. H. Riddiford, helped by a good working committee. Secondly, the local gentry and others subscribe liberally to the funds, and the people round about send the best they have got to make up the show. No money prizes are offered, only certificates of merit, and, with the exception of pot plants, everything is given, and at the close of the show is sold for the benefit of the charities mentioned.

Not until the day of the show do the secretaries know what they will get, but the farmers and others lend their conveyances, the stuff comes rolling in, more every year, and by midday all is ready for the judges. Is there much competition? Well, I should say so, when there are twenty exhibits in a class for kidney potatoes, as many for rounds, marrows by the dozen, big piles of cabbages, and keen competition in classes for onions, peas, beans, carrots, parsnips, beet, etc. In the fruit division it is just the same, the gentry competing with choice fruit, like grapes and peaches, and the cottagers sending their gooseberries, currants, and apples, which they save expressly for the show. While there is more of it, the stuff is just as good as that staged at neighbouring shows where prizes are given, and though they have only cards to award, the judges have no easy task in selecting the exhibits to receive them.

FIRST PRIZE VASE OF TWELVE CACTUS DAHLIAS.

Shown by Mrs. Mawley, at the National Dahlia Society's Exhibition on Sept. 20 and 21.

Turning to the miscellaneous department we see butter fresh from the dairy, cheese that won first prize in open competition a week or two before, home-made bread, dressed poultry, eggs, brown and white, by the dozen, two fine salmon fresh from the neighbouring Severn, a ham, a leg of mutton, and other things, all given, and all to be sold for the good of the cause. The sale of the produce is in the hands of the committee, most of it is disposed of by the time the show closes, and any that is left is sent to the hospitals.

One cannot help thinking that if there were more horticultural societies like Alveston medical charities would be better off than they are, and the spirit in which the whole thing is conducted is admirable. No mercenary feeling prevails, there are no bickerings and heartburnings over exhibits and prizes, yet the people of Alveston and district send the best they can grow to the show, value the certificates they may win, and give their produce, realising the good of the cause, and knowing that if sickness overtakes them, and they have need of the hospital, its doors will be open to them. There is a spirit of personal possession also prevailing, for Alveston is proud of its unique show, proud of what it has done, and anxious that it should continue its good work. Indeed, Alveston has reason to be proud of its show, which is a contradiction to any contention that exhibitors only show for the sake of prize money, and an example how horticulture can be encouraged and a noble charity be assisted at the same time.

G. H. H.

Cassia corymbosa. — Where a greenhouse has to be kept gay with flowering plants at all seasons this is of considerable merit. The dark green pinnate leaves are decidedly ornamental, and the rich golden blossoms, so freely borne throughout the summer and autumn, are particularly showy. It is, too, a plant of very easy culture, and in the summer it may be stood out of doors, but it should be removed under glass before frost comes. Naturally it forms a large bush, but it can be flowered freely in a small state, while for clothing the back wall of a greenhouse it is one of the most satisfactory plants that we have.—W. T.

SPRING BULBS IN THE BORDER.

Perhaps one of the most marked features of modern gardening is the increasing extent to which spring-flowering bulbs are employed, not only in the hardy flower borders, where they used to be regarded as a nuisance because they interfered with the annual digging—and this point of view is not yet extinct—but in all sorts of places, such as lawns, rose beds, rockeries, copses, and hedge banks, besides the beds and borders devoted to summer bedding. The variety is now so bewildering, and we all want to grow so many kinds, that it becomes an increasing problem to find room for those we want to grow. A few notes and suggestions with a view to the use of bulbs, with the minimum of untidiness in the late spring, and of inconvenience in the management of the borders, may not be out of place at this season.

When a hardy flower border is well planted with bulbs, as well as perennial plants, we are taking two crops off the ground every year, the bulbs taking out plant food and moisture from March to June, and the other plants from March to October, some in fact all the year. It is evident that if both are to be a success the borders must be not only top-dressed every year with both animal and mineral manures, but, as no annual digging in them is practicable, they must be also periodically—say quinquennially—turned out and dug to a depth of a couple of feet, with the addition of liberal quantities of animal manure, and of lasting substances like bone meal or basic slag. This seems all very laborious, but the trouble is more apparent than real, as a border needs so much less attention for the first couple of years following this treatment. It is the only way in which a border that is well filled with both plants and bulbs can be maintained in good condition, unless the soil is of an exceptionally favourable character.

Fortunately for our purpose many spring-flowering bulbs do well when grown among the roots of other plants and shrubs, in moderation, and, indeed, in a very heavy soil do better in such conditions than anywhere else, the roots amongst which they are growing not only giving the soil that openness which they love, but keeping them from excess of moisture during the winter and also during their resting season. With hyacinths, for instance, if the soil is heavy it is only under such conditions that they will last more than a couple of years. Hence there is nothing better for many bulbs than the neighbourhood of such surface and fibrous-rooting plants as tall phloxes, Michaelmas daisies, erigerons, the multiflorus type of sunflower, veronicas, heleniums, and so on, and they may be planted in clumps between these latter, so that in the spring the bulbs will have the ground pretty much to themselves, and when their foliage begins to get untidy the perennials growing up will hide it and leave no vacant spaces where we should feel obliged to plant something else. These clumps of bulbs should always be marked by short sticks standing out two or three inches to keep us from running the trowel into them when they have died down.

The removal of both bulbs and plants at the periodical renovation of a border presents a little difficulty. Narcissi, for instance, which form such a large part of the bulbs of any garden, are best taken up every three or four years, or even less in a very heavy soil, and the same applies to many if not most perennials, and though it might seem from this that bulbs and plants would agree together well in this respect, there is the fact that the best time to take up the bulbs—late June—is damaging to the perennials, the roots of which they are growing amongst, and October, the best time for removing the perennials, is not a good time to take up bulbs. But experience comes to our aid, and in practice we are able to make compromises which are fairly agreeable to all parties. The periodical digging up, or turning out, of the border, which should be done every five or six years, gets over half the difficulty, the new soil and increased root run after such an operation making up for any damage which the bulbs may sustain by being taken up in October. If the other lifting of the bulbs is midway between these periodical renovations, they will not suffer much. It is generally found, too, that individual clumps of bulbs which appear to be getting congested can be taken up when the leaves are dying down, without any serious damage to the perennials if done in damp weather, the bulbs being replanted in October, when, perhaps, there are some perennials which also need taking up and dividing, as, indeed, frequently happens.

Narcissi and tulips should be planted in groups of three or four, and smaller things, like snowdrops, grape hyacinths, crocuses, scillas, winter aconites, and chionodoxas, in patches running in and out amongst the perennials. It is not only in the front parts of the borders that these smaller bulbs may be planted but right at the back, as there will be nothing to conceal them when they are in flower. Crown Imperials may be planted amongst delphiniums, lupins, and the like, as they are the only bulbs which run up high enough, and early enough, to be above their spring growth not only during the time of flowering but for a sufficient time afterwards. They also do well amongst Japanese anemones and Chinese pæonies, but in each of these cases a timely stick is necessary to prevent the bulbs being unduly smothered. When a border is well cultivated in the way described above, not only may bulbs be planted amongst other plants, but many of the latter may have bulbs planted underneath them, as, for instance, candytuft, pinks, sweet williams, some of the dwarf campanulas, violas, geums, heucheras, and the like, over daffodils; tall tulips amongst Japanese anemones; crocuses and snowdrops under a carpet of Veronica rupestris, and so on ad infinitum. But in no case must the foliage of the bulbs be allowed to damage the plants above more than can be helped, nor must the growth of such plants as Veronica rupestris, Lysimachia nummularia (Creeping Jenny), double arabis, and the like, be allowed to become so thick as to choke the bulbs. Sometimes, where large spaces are left on borders to be filled up with plants in the early spring, bulbs may be planted in groups in the autumn, leaving the necessary spaces for various other subjects. This plan may be adopted with such plants as pentstemons, antirrhinums, gaillardias, and some autumn-sown annuals, which are kept in a frame during the winter, when, by the time the bulbs are dying down, these plants will have spread over the space. Besides this, there is, of course, always the obvious way with such places, namely, that of covering them with bulbs and a surfacing of spring-flowering plants, the whole being taken up at the end of May in time for summer plants like dahlias, petunias, verbenas, and the like, the bulbs being laid in somewhere to ripen.

ALGER PETTS.

EARLY CAULIFLOWERS.

Those who still adhere to the old method of wintering young cauliflower plants under handlights or in cold frames where protection can readily be afforded during severe weather will soon be planting the sturdy young plants where they are intended to remain till spring. With careful attention these should give heads fit for use in the first week of June, a little earlier or later according to climate.

I still follow out this practice, selecting for the purpose Sutton's Favourite, Erfurt, and Walcheren, and if not too early sown we find the plants are more reliable than if larger at the time they are transferred from the open border to the frames, but they should be strong enough to handle and be planted sufficiently early to become well established before the weather is too cold. At all times the plants should be grown along as hardily as possible, and given abundance of air, excepting during severe weather. If wintered under handlights, then put six or more plants under each, to be thinned out in March or April, leaving some to remain without disturbance. Choose a good sunny position, well sheltered from the north winds. The land must be in good heart and deeply worked. If set out in this at 18 inches apart, some capital curds will result.

I also make a sowing of that valuable little cauliflower, Dean's Snowball, in February, in heat; the plants raised are usually potted in small pots, and kept in a light position, and subsequently hardened sufficiently to be transferred to the open. If ample room is provided in the way of cold frames, this small-leafed variety can be planted 12 to 15 inches apart, and it is marvellous how quickly they turn in for use, while the size is just that required for the table. The great secret in obtaining early serviceable heads is to prevent the plants receiving a check and buttoning. To obtain good cauliflowers in the summer, especially should the weather prove dry and hot, deep cultivation is most essential.

I have grown Autumn Giant cauliflowers on deeply trenched land, also the Walcheren and Early Giant during a very dry season, and when watering has been out of the question, all three varieties have withstood the drought and turned in splendidly, while the same varieties planted on land dug in the ordinary way have proved almost a total failure. I am strongly in favour of deep cultivation, and would strongly urge at this time of the year and onwards all labour available should be devoted to deep trenching, especially on light land, and where, in summer time, both water and time to water are somewhat scarce, and the demand for vegetables is large and must be met.

H. MARKHAM.

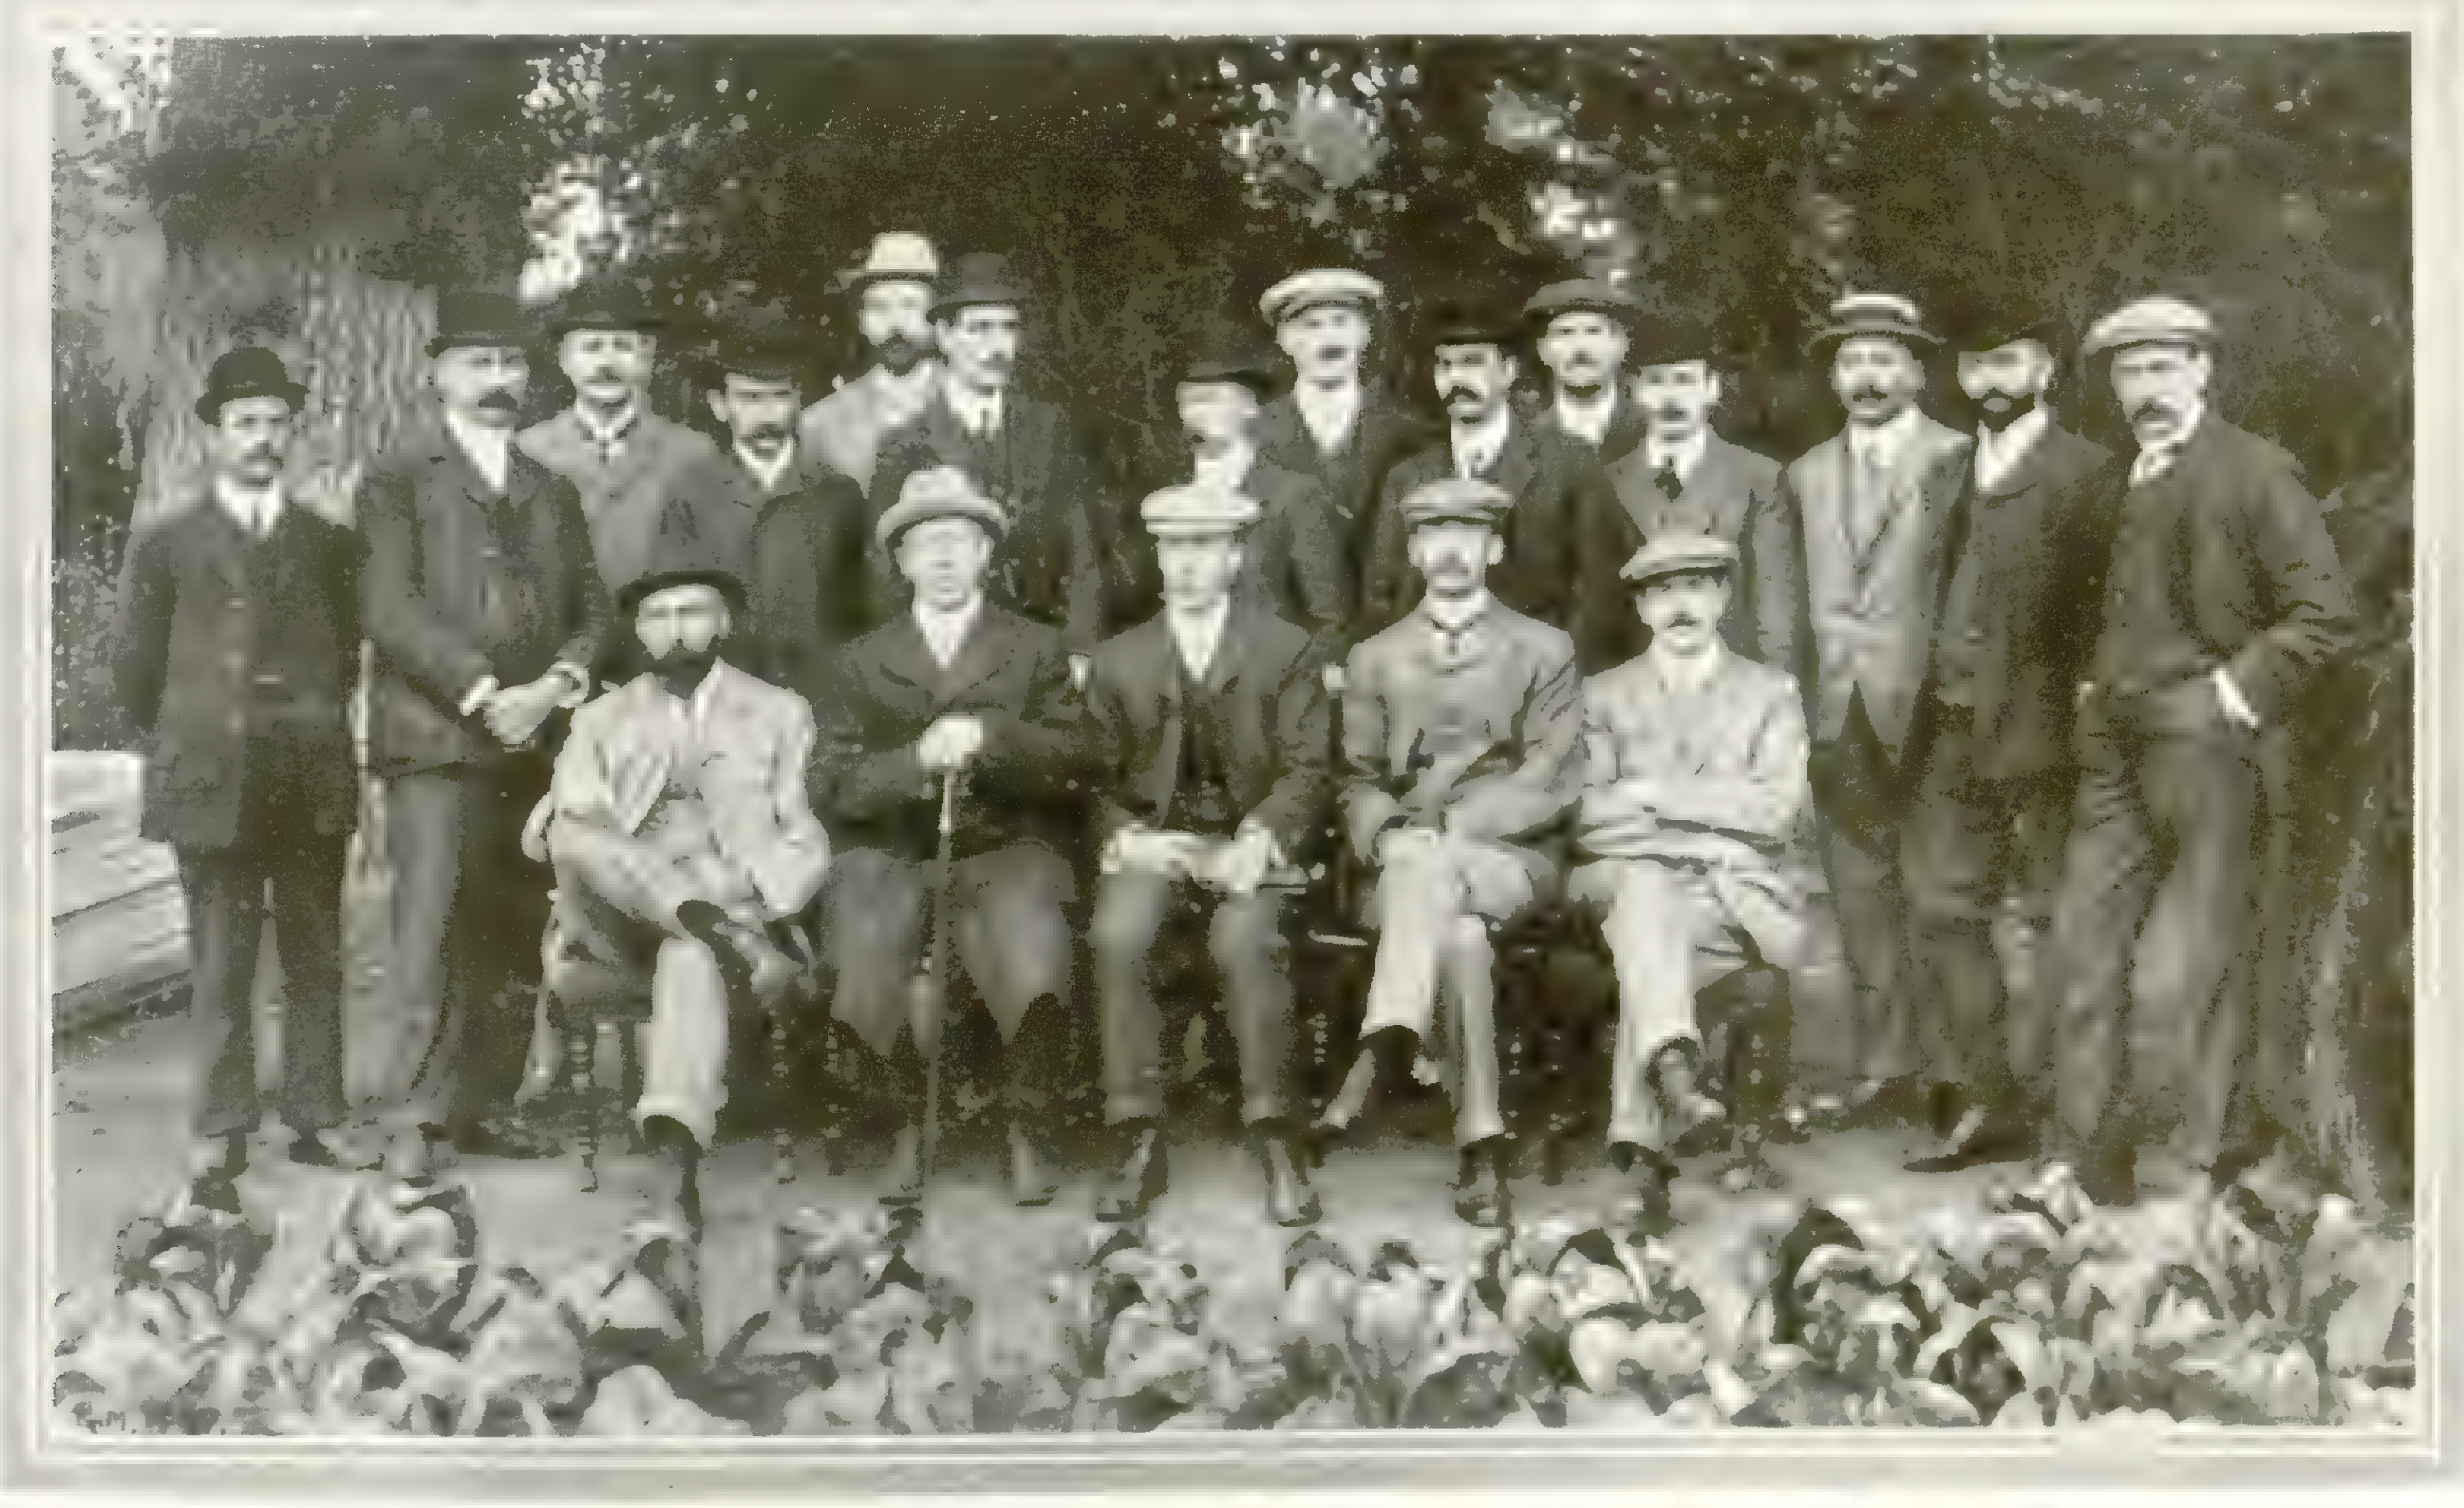
Wrotham Park, Barnet.

Sedum spectabile atropurpureum.—For furnishing a vase in a particularly hot and droughty situation in London various subjects have at different times been tried, but none of them have proved satisfactory. As a last resource it was, in the early part of the spring, planted with this sedum, which has proved to be the right plant in the right place. Throughout the growing season the mass of succulent leaves of a peculiar bluish-green tint was very grateful to the eye, and when in flower the plant was admired by everyone. The varietal name of atropurpureum, under which it occurs in most catalogues, is a decided misnomer, the colour being a decided rosy-red or reddish-rose.—W. T.

THE NEW SCHOOLMASTER.

The Horticultural Education Association; its Members and Their Work.

Poor Mother England, a little alarmed at the quality of the human material dragging at her skirts, has been looking askance at her old type of schoolmaster these latter years, and wondering if everything is for the best in her scholastic system. They can read, these urchins from the elementary schools, but they cannot think. They are able to prime themselves with the cricket averages, and the points in the football leagues; they have a certain familiarity with a particular type of literature; they readily develop a facile insolence of demeanour; and before they are any age to speak of they are clamouring for their "rights" at street-end meetings, and asking that the pensions age-limit shall be reduced to some reasonable figure, such as twenty-five. But of handiness and aptitude of intelligent application to unfamiliar tasks, of interest in the work that is given them to do, there is hardly a trace. So our excellent, if slow-witted, dame has turned to the garden at last, hoping that it can help her.



MEMBERS OF HORTICULTURAL EDUCATION ASSOCIATION AT SUTTON GREEN.

BACK ROW.—C. Martin. G. H. Hollingworth, H. J. Wright, C. Wakely, F. G. Drew, A. E. Burgess, W. H. Neild, W. B. Little, J. Slack, C. Berry, J. G. Murray, L. R. Harvey, J. Stoney, E. C. Parslow.

FRONT ROW.—J. Ettle, W. P. Wright (secretary), C. Foster, F. J. Chittenden (chairman), and J. C. Newsham.

Help her! Of course, it can! What is there that British gardening cannot do? If it can collect and subjugate plants from every clime, raise up new flowers as though by magic, spread its influence over every class of society, sustain the richest literature of modern times, and develop a school of artists of its own, surely it can smooth out this educational entanglement, and put the nation on a smoother road.

The gardener has got into the schools, and he will never be ousted from them. He is there by right of his amazing success as a practical political economist, by his earnestness, his keenness, his proved competence. It is easy to show up the foibles of the gardener, but it is impossible to deny his elemental greatness.

In a country where character has always, and rightly, been preferred to intellect, it was inevitable that sooner or later the influence of the gardener should be turned to the training of the young; for an experienced horticulturist is above all things a "man of character." His good points—concentration, sympathy, self-abnegation—are points of character, differing widely from such purely intellectual qualities as clearness of thought, breadth of view, tolerance, and humour.

Not merely will the gardener retain his footing in the school—he will mould it into a new form. The school of the future will not be a dense mass of bricks and mortar, inadequately ventilated in spite of every modern appliance; and poorly warmed by huge stoves that roast the air immediately around them while leaving the distant portions bitterly cold, or by large fireplaces which send the greater part of their heat to waste up the chimney; it will be a light and airy structure, mainly of glass, cheerful, healthy, and thoroughly warmed by steam or water pipes. Wherever we turn great and expensive blocks of buildings are rising—structures, the cost of which places a heavy burden on the rates, and which are too small, or out of date in respect to hygiene, almost before they are completed; with the result that embarrassing questions of enlargement and alteration arise. When the gardener's influence grows it will reduce the expenditure on buildings by one-third, and, what is more, it will take care that their equipment assumes the form of stimulating living things instead of dazing maps and deadening models.

We of the Horticultural Education Association are but the pioneers of a race of gardener-schoolmasters destined to revolutionise the system of training the lower classes. We are the first generation. We have had to cut the tracks, make the roads, and build the bridges. And our great aim has been to do such work as shall win the sympathy of the masses while inspiring confidence in the ruling classes. Have we succeeded? Go from county to county throughout the land, and tell me of one where it can be said that our influence has not been an acknowledged influence for good.

We are a body, so far, of forty-four strong. That is not so bad, considering that the number of counties in England is forty. It means that we have drawn into our ranks the great majority of the county horticultural teachers. Our doyen is Mr. John Wright, V.M.H., now plodding on towards the eighties, but as full of gardening enthusiasm as ever.

Once a year we foregather at some recognised horticultural centre in order to keep ourselves in touch with the latest developments in our beloved craft, and believe me, the long months of teaching have not so far worn down our voices that we are glad to rest them. Indeed, no! Never was a greater clatter of tongues, never a more incessant bombardment of question and answer, never a more eloquent outpouring of conviction and experience.

The editor asks me to tell his readers something of the individuality of the men who gathered at our meeting this year, as well as to give an idea of the association as a whole. I do this gladly.

From the fair Devonian gardens, whose charms have been sung by no less eminent a resident writer than Mr. Eden Phillpotts, comes Mr. Charles Berry, tall of figure, with the rugged features of a Puritan trooper; with something, too, I think, of the dour and dominating enthusiasm of those gaunt old warriors, for he is ever darting up to state some vehement opinion.

Surrey sends her nature-study expert, Mr. A. E. Burgess, a swarthy giant with the ascetic features and absorbed gaze of an anchorite, yet with the eager spirit of the born student. As keen a learner as teacher, as earnest a teacher as learner, Mr. Burgess is ever prominent. And the Metropolitan county sends one of her lecturing staff in the person of Mr. Horace J. Wright, but I am sure the editor recognises the ability of that exuberant personality to speak for itself.

We have Mr. F. J. Chittenden from the Royal Horticultural Society's Laboratory at Wisley, stalwart and bronzed, reflective and self-contained. Mr. Chittenden sits serene and placid, while the more impulsive spirits rattle the sabre, but when he rises a point darts home, sharp and sure.

Mr. F. G. Drew, the new superintendent of the University College gardens at Reading, peers at plants and people through a pair of prominent pebbles, and talks with the absorbed earnestness of the born plantsman. There is something of the scholar's reflectiveness in his face, of the bookman's stoop in his heavy shoulders, but for all that he is practical to the core.

Burly, deep-chested, black-bearded, Mr. John Ettle comes up from Somersetshire, where he conducts fifty odd school garden centres, looks after the cultural work at the Cider Institute near Bristol, lectures hard all the winter through, and yet is overflowing with energy and vitality.

We should see Mr. Charles Foster this year, in any case, for our first day takes us to "The Times" experimental station at Sutton Green, to spend happy hours among the trials, and in the beautiful gardens of Lord Northcliffe; but he is a faithful member, and, in spite of a press of duties, would be with us even if we wandered far away from his pleasant home.

Mr. A. R. Harvey is the horticultural superintendent of the West Sussex Education Committee, and talks keenly of gooseberry mildew, whose presence in their fields some of the Sussex growers are none too well pleased to be told of. Trim and well-groomed, Mr. Harvey is watchful, and no point passes him.

I gave up the attempt to cope with "H. J. W.," and I am almost in equally hopeless case with "G. H. H." The best thing with their type is to put them together and leave them to it. Yet, incredible though it may seem, "Hollingworth of Gloucester," graduated with me in Kent years ago. And I took trouble with him, too! Those who know their man will realise my discomfiture.

Mr. William B. Little, an old Kewite, whose keenness while in the South I have heard good reports of, came from Carlisle, and told me exciting stories of motor-cycle rides by night on the desolate lake roads. Mr. Little traverses in the winter those glorious passes which we rejoice in during summer, and has many a weird experience; but the hill folk like his lectures, and the fruit thereof is seen in the gardens which we who are merely birds of passage admire as we speed by on the coaches.

Small of figure, but full of alertness, and a capital speaker withal, is Mr. C. Martin, whose sphere of duty is the Isle of Wight.

Mr. J. G. Murray, who has seen service in Cumberland and Lancashire, and now supervises the nature study and school garden work in the Lindsey division of Lincolnshire, comes as a new member, and makes an impression that will not fade quickly. An up-to-date man, this; with many a novel idea for old hands to turn over and try to shatter.

Ridgmont sends us Mr. W. H. Neild, small, fair, voluble, who tells over-night of the unearthly hour at which he proposes to make a start in the morning, and at breakfast time is still sleeping the sleep of the just. Mr. Neild is full of the doings at Ridgmont, where ramming has now become a commonplace. Experiments are the breath of his nostrils.

We have two of a build in Mr. J. C. Newsham, who runs over from the Farm School at Basingstoke; and Mr. E. C. Parslow, who comes from distant Dorchester. Mr. Newsham's way lies rather among the farmers than the gardeners in these days, but he is as keen as ever for his old love. Mr. Parslow talks of the joys and benefits of gardening to the rustics whom his townsman, Mr. Thomas Hardy, has painted on a canvas that will be imperishable. An excellent fellow, this "E.C.P." quietly sensible, and with a humour of his own.

Bedfordshire has now taken up the teaching of gardening, and is working under the wing of Ridgmont. Her practical man is Mr. J. Slack, who gained his early experience as a teacher at Holmes Chapel, under the elder Neild (now, alas! gone over to the majority), and strengthened it in Hertfordshire as successor to Mr. A. E. Burgess.

Mr. J. Stoney represents Staffordshire, where they have one of the most thorough and complete systems of instruction in the county. An admirable gardener, and a man of keen intelligence, Mr. Stoney is one of our most valuable members.

Last of this year's participants, save for the unworthy wielder of the secretarial pen—even myself—comes Mr. C. Wakely, an incisive man, who for many years has been proving his worth in Essex.

The pleasant drives through the Surrey lanes, the hours under the guidance of Mr. Foster at Ladygrove, with Mr. J. Goatley, in the lovely Sutton Place gardens, and under the genial pilotage of Mr. S. T. Wright and Mr. Chittenden at Wisley, will live as a green memory in our hearts.

Walter P. Wright.

NARCISSUS GENERAL GORDON.

Referring to the question whether Daffodil General Gordon is quite new or not (page 724), I may be permitted to state that it was shown by my firm as a new flower for certificate at the Floral Committee Meeting of the R.H.S. on April 14, 1885, when it obtained a First Class Certificate. Curiously enough, the name was changed by the committee into that of Narcissus spurius coronatus, notwithstanding the fact that the Daffodil Conference which had been held the previous year had recommended the system of giving fancy and not Latin names to garden varieties.

Quoting from the Gardeners' Magazine of April 18, 1885, I may add the following extracts from the editorial columns: "First Class Certificate to Messrs. Krelage and Son, Haarlem, for Narcisus spurius coronatus. A very distinct and beautiful variety, which was shown under the name of General Gordon The perianth divisions are broad and spreading, and of a light yellow colour, and the chalice is of great breadth and of a rich golden hue."

In the same issue a further reference is made to this flower as follows: "A noble daffodil catalogued by the conference as Spurius coronatus was certificated on Tuesday. It was one of the grandest of the trumpet section."

In the Gardeners' Magazine of December 12, 1885, there was published a large engraving, being "a faithful portrait of one of Messrs. Krelage's flowers, as drawn by Mr. A. Slocombe at the moment of its appearing."

Unfortunately this really superior early flower is a weak doer, and consequently has not become so generally appreciated and popular as its floral merits would suggest.

Ernst H. Krelage.

[We are extremely obliged to Mr. Krelage for his interesting note. Had the variety been certificated as General Gordon there would have been no real difficulty in tracing its origin.—Ed., G.M.]

THE STRAWBERRY TREE.

The Strawberry Tree, or Arbutus unedo, has several points which recommend it to the gardener, especially to one who is situated in the milder parts of the country, for, though it succeeds fairly far north and away from the milder coast belt, it does not attain such luxuriant proportions as it does from the southern Midlands southwards. In Ireland it is found wild in a few localities, and it assumes the proportions of a moderate-sized tree in the woods about the Killarney Lakes. It is also met with, with a trunk of fair proportions, in some parts of South Wales, Cornwall, etc., particularly when it has been planted amongst other trees, and has been drawn up. In most places, however, we are familiar with it as a bush twelve to eighteen feet high, and as far through. Some years ago a very large number of handsome bushes were to be seen on Lord Morley's estate near Plymouth, while other very fine examples were to be met with so far distant as Orwell Park, Ipswich. In addition to being an excellent evergreen, the strawberry tree has other advantages, for it blossoms freely during September and October, while twelve months later the ripe fruit, which is orange and scarlet in colour, in very conspicuous

Several varieties are known which differ principally in habit, size, and shape of leaves, or colour of flowers. The most showy of these is rubra, sometimes called Croomi, which differs from the type by having reddish flowers, instead of the familiar cream colour of the more common kind Providing lime is not abundant in the soil Arbutus unedo is not fastidious, for it thrives alike in peat and loam. Care must, however, be taken in transplanting, especially after the plants have attained a height of three or four feet, for it is not an easy subject to establish. Plants two feet high are, as a rule, quite large enough to place in permanent situations, and it is usually more satisfactory to depend on young examples rather than attempt to transplant large specimens. Layered branches will form roots in the course of a year after pegging down, while seeds may be expected to vegetate freely. Varieties are usually grafted on stocks of the type.

D.

Notonia Granti.—In the group of miscellaneous flowering plants contributed by Messrs. J. Veitch and Sons to the Temple Show a few examples of this Notonia attracted attention by reason of their showy flowers and uncommon appearance. Botanically the genus Notonia is nearly related to that of Cacalia, which in its turn is sometimes referred to as Senecio. It forms a plant of a decidedly succulent character, the flowers, which are borne on branching stems about eighteen inches high, being of a bright scarlet colour, and collected together in crowded heads about one and a-half inches across. Being a plant of comparatively easy culture this notonia should soon become more generally distributed, as for greenhouse decoration at this season it will prove decidedly useful. Under the name of Senecio Galpini, a plant which must be very nearly related to the notonias, has long been grown at Kew. It has deep orange-coloured flower heads, and keeps up a succession of blossoms for a long time. The specific name of the notonia serves to perpetuate the memory of that intrepid traveller Grant, who, in conjunction with Speke, did so much to discover the source of the Nile. Though discovered during that journey, it does not appear to have been then introduced, and the plants now grown in this country were, I believe, distributed from the Cambridge Botanic Garden, having been raised by Mr. Lynch from seeds sent by a correspondent from Somaliland.—W. T.

A BRITISH FERN SOCIETY.

In 1891 a small coterie of British fern hunters and raisers met at Kendal, in Westmoreland, and started a local society, which they named the Northern British Pteridological Society, the object of which was the association of such as took a particular interest in those beautiful varieties of our native ferns, which had been, and were being accumulated by those who devoted themselves to research in ferny districts, and profited by their discoveries to improve the types they found by selective culture through their spores. Such a society naturally attracted the attention of others than the local enthusiasts, and, as a result, the membership speedily embraced such men as Dr. Stansfield, Messrs. C. T. Druery, W. H. Phillips, P. Neill Fraser, and others, with the result that the name was changed to that of the British Pteridological Society, a name which had been previously adopted by a society with the same object, and formed about the middle of the last century by Mr. G. B. Wollaston, Colonel A. W. Jones, Mr. E. J. Lowe, and others, but which survived its initiation but a very short time.

For some years the new society, which met in the Lake District every August Bank Holiday, published its reports in conjunction with a series of very interesting papers on the culture and general phenomena of fern life, but eventually, for various reasons, the membership dwindled until it became evident that something more tangible was necessary than a merely annual report as a return for the subscription, small though it was, that the members were called upon to pay.

Two of the annual meetings, indeed, were practical failures, and it occurred to Mr. C. T. Druery, who has been for some thirty years past the ardent champion of these beautiful native plants, that it would be well to try the effects of a quarterly journal, to be issued to the members as some definite return for their outlay, and with the aid of the society's funds the "British Fern Gazette" was started, and has proved a great success, the first four issues more than recouping the expenses incurred, and resulting in an addition of more than a hundred members to the society's ranks. A further result of this publication has been such a widespread knowledge of the society's existence that a number of foreign and Colonial members have joined, and some of the most important scientific institutions in the world have lent their countenance thereto. Naturally, under these circumstances, the society has developed from a merely local one into a broad-based institution, and one worthy of a cult which is peculiarly interesting in itself, embracing a study of plant variation which is open to all, and in this particular case is unique in character, since practically all the accumulated material, consisting of thousands of varieties, have been either found wild in Britain's ferny lanes, glens, and woodlands, or on our hills, mountains, and moors, or have been raised and improved by selection through the spores of such wild finds. The plants being of native origin are naturally, with a few unimportant exceptions, perfectly hardy and of easy culture, and it is little wonder therefore that those who once take up their study on thorough lines, inevitably become enthusiasts.

In the early days, when the first society was started, the good material was scanty, the popularity which had been secured by the beauty of the few good "finds" had been alienated by a flooding of the market by inferior varieties, and hence the support the society received was confined to but a few. One result, however, was the issue by Colonel Jones, undoubtedly the master spirit of the time in that connection, of a splendid series of over 300 nature prints, which have been handed down to us, together with the majority of the plants they depict, by his [illegible] in the cult.

The new society finds itself far more favourably situated, popular admiration of the up-to-date varieties is increasing daily, and is fostered by beautiful exhibits at all our shows of note; while the good material has become so abundant that there is no room for the "rogues," "irregulares," "depauperatums," etc., which in the old days did so much to bring British ferns into disrepute. For all these reasons the British Pteridological Society merits support, and Mr. C. T. Druery having now undertaken not merely the editorship of its organ, the "British Fern Gazette," but also the honorary secretaryship, will be glad to communicate with possible members. His address is 11, Shaa Road, Acton, W. The annual subscription is 5s., entitling to four issues of the "Gazette."

PROBLEMS UNDER CANVAS.

With reference to "H.'s" article on "Problems under Canvas," I hope many of your correspondents will support him in denouncing the would-be good gardener. I should like to add my testimony to the value of such an excellent comment on the methods of flower showing.

With regard to the secretary, it is quite impossible for anyone performing the secretarial duties to personally superintend the staging of all the exhibits. A head steward (non-competitive) should always be appointed for that purpose, one with a thorough knowledge of showing in all its aspects, when possible. This would greatly help to prevent the confusion that so often arises in the staging of exhibits; but, more than that, if it were possible, a steward, even in the smallest of local shows, should be in constant attendance in each section in order to show exhibitors where to place their exhibits. If something like this were done everything would be ready for the judges to commence their duties a very few minutes after the time fixed for receiving entries. In the second place, the writer of this note has had the honour of assisting to judge at considerably over three hundred flower shows, as well as having competed, and assisted as steward at many, so that his experience of these gatherings is not of yesterday. Secretaries are often blamed for this and that, whereas it is quite impossible for them to be responsible. In most cases the committee may be of good service to the secretary up to and after the staging of exhibits, but, and as I think in most cases, the majority of the committee are also competitors, they have so much to do in staging their own exhibits as to prevent them being of much service to the secretary, or indeed, to other exhibitors.

In the third place, the suggestion that the judges should be provided with cards to show the number of points they give to each individual dish or exhibit in a collection is a good one, and should be acted upon; and the committee, in arranging schedules, should add the number of points to be given to each dish or kind in a collection, so that intending competitors would know exactly what value they would obtain if it were perfection. They should know, also, that, for instance, turnips or cabbage would not be allowed the same number of points as tomatoes or French beans.

In the fourth place, the judges in the case cited were wrong in upholding their decision, seeing that in the schedule varieties were asked for. One can obtain very different colours and habits in the same kind. In judging such as these I have always given preference to the most distinct. Would it not be better in such a class to say twelve varieties, not more than two or three of any one species. I am not prepared to say what was right or wrong, only my sympathy is with the protestor, because, if it was not a very large collection, one variety of currant was sufficient.

I can here testify to the great harm done to shows by unscrupulous exhibitors, who year after year pose as great men in their profession, and who often cannot even scarcely stage one whole entry in the show without being obliged to some friend. The intrinsic value of a prize is nothing to the honest competitor as compared with the vexation of being deprived of his due award. The successful exhibitor in a case of this kind is undoubtedly dishonest. Certainly, as "H." says, it is a most difficult matter to solve. A society I had to do with some years ago had a protest against an unfair exhibitor, and although he was a Lord's gardener, he was disqualified. This, it was thought, would do the society much harm, as it seemed to be the table talk that, "if So-and-so, in his high position, would condescend to do such a mean trick, what would the ordinary man do?" It was also said by some employers, "I won't support the show any longer by exhibiting, and have my gardener deprived of his rightful position." In another case, a protest was made against a working man who competed in the professional class. It was long known to some that he was not straight, and he was often warned, and the end was thought to have come when he entered no less than eighteen classes. His garden was examined, and not one single entry could he have staged in the amateur division. He was again warned, but he brought forward ten entries, winning eight prizes then. A protest by some of the committee was made, but it was not maintained. This did the society an immense amount of harm. I suggest that the article by "H." should be printed and sent to every horticultural society. A.

FLOWER BEDS IN THE BOURNEMOUTH PUBLIC GARDENS.

Although the past summer has not been an ideal one, as regards the free flowering of bedding plants generally, those in the central gardens of Bournemouth have done remarkably well. Nearly all the beds are large ones, and contain many plants, so that the effect is very good when they are at their best. The following are a few of the principal arrangements, the beds being duplicated in nearly every case.

Cannas and gladiolus, mixed, made a brave show. Zonal pelargonium Paul Crampel formed the centre of two large beds, with blue ageratum as an edging, and standard fuchsias as dot plants. Verbenas, mixed, made the groundwork in two other beds, with broad encircling bands of Alyssum maritimum and blue lobelia respectively, and acacias as dot plants. An extremely rich-looking bed was the one filled with Iresine Lindini and Pelargonium Flower of Spring, mixed, with Lobelia cardinalis used freely all over the bed, and an edging of golden pyrethrum.

Another bed was filled with Centaurea candidissima as a groundwork in the centre, bordered by Begonia Fairy Queen, the outer edging being golden pyrethrum. In the middle of the bed there was a fine healthy specimen of Dracæna indivisa. Probably the two most showy beds in the garden were those containing Salvia Fire King, with dot plants of variegated abutilon, and an edging of ageratum. Fuchsia Mrs. Marshall looked well in two other beds, where dracænas were used as central plants, and Begonia Fairy Queen as groundwork.

Near the entrance to these gardens many herbaceous subjects are used with telling effect in the borders, where the dark blue-grey branches of the fir trees form a background. In one part of the gardens funkias luxuriate under the fir trees, and camellias, dracænas and palms give quite a tropical appearance to the gardens.

Mr. J. B. Stevenson, the able superintendent, deserves great credit for the admirable way in which he maintains the high reputation of these lovely and extensive pleasure grounds. GEO. GARNER.

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and Their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEASONABLE REMARKS. The shortening days remind one that the season is far advanced, and point out the necessity for placing any plants that are in a backward state of growth under the most favourable condition likely to assist the growth and enable them to reach maturity before the winter sets in. In almost all our warm divisions we find plants later than usual in maturing their growth; undoubtedly this may be to some extent accounted for by the unfavourable and practically sunless mid-season. The growths, too, are of a soft and sappy nature, and, as it is practically impossible to obtain flowers possessing high quality and colour unless the growths and pseudo-bulbs are properly ripened, all reasonable facilities should be made use of that will induce satisfactory ripening. In all the warm divisions where permanent shading has been used on the roof glass, this should now be thoroughly washed off, and the glass made clean, so that the plants may have the benefit of all available light, due precaution being taken, of course, to prevent the foliage becoming scorched or discoloured, which the roof blinds may prevent.

DAMPING DOWN.—This is another matter that should be practised with discretion. I find it is a good plan to delay damping in the morning until the normal temperature has been reached. We cannot at all times guard against fluctuations of temperatures, the outside conditions being so variable and the changes frequently sudden. It is a cold, moist atmosphere that causes injury in so many ways, for with a reasonably dry atmosphere there is little to be feared. Again, when damping in the afternoons, in all the divisions, this should be done sufficiently early to permit the excess of moisture being dispelled before the cool evening temperature is reached. Situations are so different and conditions so variable that it is impossible to lay down any hard and fast rules as to the number of times a house should be damped. In the first place this must be governed, to a great extent by the prevailing outside conditions, and then it is those only who have had experience that can best judge the requirements of their plants under those particular conditions. As long as the pseudo-bulbs and leaves remain plump, and there is the least possible obstruction to light, there will be little injury, even if the atmosphere is kept drier than usual.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

MIGNONETTE.—Seedlings raised a few weeks since will now require thinning; three plants in a five-inch pot are sufficient. Keep near the glass to ensure sturdy growth; give air freely, and do not coddle the plants.

ZONAL PELARGONIUMS.—For winter-flowering these will now require protection, and the structures should be thoroughly cleaned before the plants are housed. Do not pinch out the flower spikes from now onwards, but assist the plants with artificial manure at intervals. After housing it is well to fumigate lightly, afterwards giving abundance of air.

CHRYSANTHEMUMS with buds developing will now need removal indoors, as frost may appear at any time. As soon as the house has been filled, fumigate the plants, or greenfly will put in an appearance and spoil the blooms. Continue feeding with some approved artificial manure.

VIOLETS for flowering in pots should be lifted and potted up at once, care being taken not to break away much of the soil or roots. After potting give a thorough watering, and place in a frame, giving shade from bright sun for a few days.

MALMAISON CARNATIONS. — Layers that are still attached to the old plants should be severed and potted up at once, using the same kind of compost as advised in a previous calender. Those that were potted early will now require a shift into larger pots; they should have a rather heavier compost, and be potted extra firm, as more plants are lost through bad drainage and slack potting than from other causes.

SCHIZANTHUSES. — Another sowing should be made to secure plants for spring flowering; those raised earlier will now be ready for pricking out. The soil for schizanthuses should be very porous.

SALVIAS.—Those growing outside should now be lifted and potted; no more pinching will be necessary, but it will be advisable to shade the plants after potting, and spray overhead. Later plants in small pots will now require a shift.

PRIMULAS that have had all their flower spikes removed and have been grown in cool frames, should now be moved indoors for supplying early flowers. Pinching should now cease, and liquid manure should be given once or twice weekly.

REHMANNIA ANGULATA.—Seedlings pricked off into 2½-inch pots will now need a shift into five or six-inch pots. Keep them growing in an even temperature, and near the glass, and they will then furnish fine spikes next spring; with a little care fine specimens can be grown in a few months.—W. STAWARD, Belford Hall Gardens.

THE FLOWER GARDEN.

SHRUBBY CALCEOLARIAS, of whatever variety, should now be propagated for the next season's supply of bedding plants. It is usual with some to defer propagating until about this time, but to do the work earlier is not by any means undesirable if suitable cuttings are obtainable; late propagation certainly prevents the plants making too much growth before the advent of very severe weather, and those of sturdy growth are more satisfactory for wintering in unheated structures than larger plants could possibly be. If frames are at command the cuttings should be put in these, on a hard base, in not more than three or four inches of soil, which should be of a porous, sandy nature. This should receive a surfacing of sharp sand before the cuttings are inserted, and the cuttings should be placed about three or four inches apart, well watered in, and, if in a sunny position, shaded during bright weather, or until the cuttings show signs of rooting; afterwards an abundance of air should be given upon every favourable occasion. Thus treated sturdy plants are obtainable by early spring, when they may be transferred to more roomy quarters, or potted up, as may be deemed desirable. Pentstemons, antirrhinums, and plants of a like nature may be treated in a similar way.

GENERAL WORK in the flower garden just at present demands no special attention beyond the maintenance of neatness, until the beds are cleared, or the plants injured by frost. Advantage might therefore be taken to arrange for any alterations or improvements that are intended during the coming winter. Note may also be made of any plant, or plants, that have, either alone or in conjunction with others, obtained general approval; only such arrangements as are striking—which, however, should not mean gaudy—should be noted, as these are practical helps for guidance in future bedding arrangements.

SWEET PEAS.—Now is a good time for making a sowing of sweet peas in the open ground. Plants from such a sowing—unless the winter should prove exceptionally severe—will survive, and flower much earlier than those sown during the spring, however early that may be; at any rate, this has been our experience, which is doubtless similar to that of many others. Before sowing the soil should be moved to a good depth, or as deep as the natural soil will admit of so doing; at the same time a sufficient quantity of well-decayed manure should be worked into the soil, and a little bonemeal and soot may also be given in addition, or the latter, if not mixed with the soil, might be sprinkled over the surface after the seeds have been sown.—W. HEDLEY WARREN, Aston Clinton Gardens.

HARDY FRUITS.

HARDY VINES. — Where vines are planted against walls or trained to stakes in the open quarters, strict attention should be paid to the removal of all sublaterals, and where the leaves unduly shade the bunches of fruit they should be carefully tied back to expose the bunches to the direct rays of the sun; this will also assist in thoroughly ripening the current season's growth. Probably this phase of fruit culture does not appeal to the ordinary individual, but where vines are planted and grown extensively in the open quarters, such as we have in the vineyards here, the work amongst vines on a large scale is both an interesting and a profitable undertaking. Preparations are now being made here to gather the grapes for this year's vintage, which will probably commence about the middle of October. The fine sunny weather which has prevailed in this locality for the past three weeks has had a very marked effect upon the final swelling and colouring of the berries. The vines in the vineyards are planted in straight rows four feet apart, and the same distance from plant to plant. Stout ash or larch stakes are driven into the ground by each plant, and as the vine rods grow up they are securely tied to these. When they have reached the top of the stakes, which is about four feet above the level of the ground, the young growths are stopped, and the sublaterals continually pinched back to one leaf. The majority of the fruit is usually borne about twelve or eighteen inches above the level of the ground, the lower they are the better they ripen, owing to the warmth being radiated from the lime stones which are found so abundantly upon the surface soil at both vineyards. After the leaves have fallen the vines are pruned—some time before the latter end of December—to within two buds of the base of the vine. In the spring, when the buds start into growth, four or five of the strongest and best-placed shoots are allowed to develop, the weaker ones being all rubbed out. The borders in which vines are planted under walls should be examined, and if at all dry copious supplies of water should be given to the roots, and where good crops of fruit are in evidence frequent applications of liquid farmyard manure will be found most beneficial to hasten the ripening of the bunches.

WINTER MOTH.—By the time these notes appear a commencement should be made with the work of placing a band of "Willesden" paper around the stems of all fruit trees, this being immediately dressed with prepared grease. From early October to the end of February is the season when the wingless females of the winter moth ascend the trees to lay their eggs, and we have found it to be of the utmost importance here to adopt grease banding on practically all our fruit trees, as this precaution has been found to eliminate the necessity of expensive sprayings in the early summer months.—HENRY R. FARMER, Cardiff Castle Gardens.

Calceolaria Burbidgei. — When this calceolaria was first raised by the late Mr. F. W. Burbidge, about thirty years ago, it is questionable if anyone regarded it as likely to attain the popularity which it now has. It is almost impossible to find a garden where the bolder styles of bedding-out are adopted in which this calceolaria is not represented. As good-sized bushes it flowers freely throughout the entire summer, and it is not subject to any of the ailments which affect some of the calceolarias. In the greenhouse it will flower throughout the autumn and winter. The raiser always spoke confidently of it as a hybrid between C. Pavoni and C. fuchsiaefolia, but the appearance of the plant suggests a relationship to C. amplexicaulis, and in the "Kew Hand List" this last and C. Pavoni are given as the parents.—W. T.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

(Concluded from page 764.)

◆

A. Searle, Castle Ashby Gardens, Northampton; Exhibition leeks (six entries), Mr. A. Grubb; Premier onion (ten entries), Mr. F. West, with Mr. T. Jones a very close second; Hercules Pea (five entries), Mr. A. Grubb: Giant Exhibition runner beans (nine entries), Mr. A. Searle, a fine lot, very straight and even; Moneymaker tomato, two clusters (five entries), Mr. T. Abbott, The Holme, Regent's Park.

For three heads of Clibran's Pink celery there were five entries, and here Mr. Searle was first, and Mr. S. Cole second. In Messrs. Massey's classes Mr. Gentle led for Universal potatoes, and Mr. G. Scourfield, Meath, Glam, for Ailsa Craig onions, and Mr. Gentle for Improved Black beet.

In the society's single-dish classes the awards were made as follows: Onions (twenty-five entries), Mr. Thomas Jones, with Ailsa Craig; two dishes of potatoes (seventeen entries), Mr. J. F. Hall, Little Morton, Blackpool, with King Edward VII. and Dalmeny Hero II.; three dishes of potatoes (twelve entries), Mr. T. Jones, Ruabon, with Windsor Castle, King Edward VII., and The Provost; six parsnips (twelve entries), Mr. J. Brown Robinson, Great Barford, St. Neots, with Dobbie's Selected; leeks (ten competitors), no prizes awarded; turnips (twenty-five entries), Mr. J. McCulloch, Maithill, Perth, with Golden Ball; runner beans (twenty-five entries), Mr. G. Gash, Alford Street, Grantham, with Best of All; peas (fifteen entries), Mr. H. Keep, Aldermaston; pair of marrows (sixteen entries), Mr. W. B. Wilson, The Dairy, Southlake Street, Twyford; tomatoes (eight entries), Mr. J. T. Hall; shallots (sixteen entries), Mr. C. Abbott, Lucy Cottages, School Walk, Sunbury; carrots (eighteen entries), Mr. W. Musson, Alford Street, Grantham, with Dobbie's Intermediate; beet (twenty-nine entries), Mr. Thomas Jones, Ruabon, with Dobbie's Purple; four bunches of herbs (five entries), Mr. F. C. Jenden; and celery (sixteen competitors), Mr. Thomas Jones, with Dobbie's Favourite Pink.

SMALL HOLDERS' CLASSES.

Lord Northcliffe provided the prizes in two classes for small holders, five substantial prizes in each. The first class was for holders working not less than two acres or more than twenty acres, and here there were but two entrants. The samples were packed in baskets as for market. First prize was awarded to Mr. T. King, New Road, Bromham, Chippenham, for a clean lot of potatoes, carrots, onions, runner beans, cauliflowers, carrots, and turnips; Mr. A. E. Firth, Bishopsthorpe, was second, his cauliflowers and carrots being the best samples. In the class for six baskets of vegetables or salads, from a holder working not less than one or more than ten acres, Mr. T. King won first prize, and was the only exhibitor. In his baskets he had fair examples of potatoes, carrots, parsnips, turnips, onions, and celery, but here, as in the previous class, the varieties were not labelled.

Mr. Alex. Dean, V.M.H., provided the prizes for a collection of six kinds of vegetables, submitted by cottage garden societies in the county of Surrey. The response to Mr. Dean's offer was not particularly good, and cannot be taken as representing the capabilities of the Surrey Cottagers and Allotment Holders. First prize fell to the South Park and Sidlow Cottage Garden Society, Reigate; second to the Beddington and Carshalton Society; and third to the Ashstead Horticultural Society; there were five entries.

BOTTLED VEGETABLES.

Mrs. E. Beckett, Aldenham House Gardens, led for six kinds of bottled vegetables with carrots, turnips, tomatoes (red and yellow) leeks, and celery: Mrs. V. Banks, Park Street, Grosvenor Square, second. For six bottles of peas or beans, Mrs. V. Banks scored with three bottles of green peas, one of broad beans, and one of whole and one of cut beans; Miss C. Banks, Fulham Palace Road, second.

NON-COMPETITIVE.

Right opposite the entrance Messrs. Sutton and Sons set up a very large and comprehensive collection of 113 dishes choice vegetables, tastefully arranged. Each kind and variety of vegetable was set up distinctive from its neighbour, and the whole display was an excellent one. Sulham Prize and Solid White celery were fine, Autumn Mammoth cauliflower, Ailsa Craig onions, Sutton's All Heart cabbage, Best of All runner beans, Chilian beet, Satisfaction potatoes, Dwarf Gem Brussels sprouts, Satisfaction cucumbers, Witloof chichory, aubergines, and capsicums were all finely represented. Messrs. Barr and Sons, Covent Garden, presented an attractive collection of vegetables, the quality of the individual dishes being excellent; particularly good were the examples of The Czar runner bean, Ailsa Craig onions, Red Globe beet, Autumn Mammoth cauliflowers, Red Dutch cabbage, Golden Nugget turnips, and various kales. The very fine exhibit of marrows and ornamental gourds staged the previous day by Mr. T. Stevenson, gardener to E. A. Mocatta, Esq., Woburn Place, Addlestone, remained for this function, and was very greatly admired for its cultural merit, brilliance, and great variety.

FIRST PRIZE COLLECTION OF TWELVE KINDS OF VEGETABLES.

Shown in Messrs. R. Sydenham's Class by Mr. S. Cole, Althorp Gardens, at the National Vegetable Society's Exhibition.

Messrs. Robert Veitch and Sons, Exeter, contributed a collection of vegetables grown in Devonshire, and in this representative group we noticed growing plants of Veitch's Climbing French bean, a five-pound cluster of Veitch's Glory tomato, splendid Cranston's Excelsior and Ailsa Craig onions, Gladstone peas, and the new and excellent Lady Llewelyn kidney potato. Messrs. Dobbie and Co.'s splendid display of potatoes already described was kept over for this exhibition, and was one of the leading contributions to a remarkable show; the coloured varieties, such as Exhibition Red, Queen of the Veldt, M. Bresee, Herd Laddie, Climax, Edgecote Purple, Crimson Beauty, King Edward VII., and Royal Purple looked very fine in the bright sunshine of this fine September morning.

Messrs. Wood and Son, Wood Green, N., presented a large collection of horticultural sundries, and set up these varied and useful subjects in a most attractive manner. Messrs. Jas. Veitch and Sons, Chelsea, held over their attractive display from the R.H.S. meeting, but had added a fine lot of tomatoes, notably their variety named Invicta, a handsome and heavy cropper.

From the Times Experimental Station, Guildford, came an interesting exhibit of types and varieties of swede turnips, and boxes of market produce, representing ten varieties of onions, nine of potatoes, four of tomatoes, two of carrots, one of radishes, two of turnips, two of beet, and two of cauliflowers, and the average yield per square chain of land was given in each case by Mr Chas. Foster, the director of the station.

MEDALS.

Gold.—Messrs. Sutton and Sons, Reading; Messrs. Dobbie and Co., Edinburgh; Messrs. Barr and Sons, Covent Garden; Mr. T. Stevenson, gardener to E. A. Mocatta, Esq., Addlestone; Messrs. Jas. Veitch and Sons, Chelsea; and Mr. C. Foster, Times Experimental Station, Guildford.

Silver-gilt.—Messrs. Robert Veitch and Sons, Exeter.

Silver.—Mr. W. Sands, Hillsborough, Co. Down.

Royal Horticultural Society.

The meeting held at Westminster on September 27 was a remarkable one, as every available inch of space was filled; two of the committees held their sittings upstairs, and the Orchid Committee was tightly squeezed in one of the annexes. Hardy flowers were present in great abundance, and, though there was a considerable repetition of subjects, the numerous displays were, on the whole, so good that scarcely one can be passed without comment. Dahlias were still in force, while early chrysanthemums and perennial asters were very much in evidence. Fruits, vegetables, and orchids were all well shown, and there was a fair sprinkling of novelties.

FLORAL COMMITTEE

Cactus, pompon, pompon-cactus, and single dahlias were all beautifully shown by Messrs. J. Cheal and Sons, Crawley; their single varieties were superb, especially Brilliant.

Mrs. Joynson Hicks, Leander, Miss Roberts, Miss Bates, Mrs. Miller, Betty, and Sunray. The pompon-cactus varieties attracted a great deal of attention. A big bank of such autumn flowers as Michaelmas daisies, solidagos, phloxes, heleniums, and pentstemons was arranged by Messrs. William Cutbush and Son, Highgate, N., and the Michaelmas daisies especially were displayed in such quantity as to show their character. Bouvardias in great variety and well grown were displayed by Messrs. James Veitch and Sons, Chelsea, who also showed a fine selection of their improved strain of streptocarpuses, Nerine Bowdeni, and greenhouse rhododendrons.

Belladonna lilies were finely shown by Mr. Frank Lilley, Guernsey, who also contributed spikes of the charming Crinum Powelli, of Schizostylis coccinea and Nerine Bowdeni. Great sheaves of gladioli and early chrysanthemums, backed by heleniums and Michaelmas daisies, made up a fine exhibit from Mr. James Box, Lindfield. Early-flowering chrysanthemums were largely shown by Messrs. R. H. Bath, Lim., Wisbech, and their large stands of J. Bannister, Provence, Golden Glow, Rose d'Argent, and Normandie were striking features. Mr. J. T. West, Tower Hill, Brentwood, presented a fine selection of cactus and pompon dahlias, and put up good bunches of such pretty pompon-cactus varieties as Martha, Snowbird, Minima, Cheerful, and Sweet. Messrs. Bakers, Wolverhampton, had a collection of early chrysanthemums, and showed Provence, Horace Martin, and Ralph Curtis in good form; Aconitum Fischeri and the semi-double Anemone japonica Mont Rose were also well shown by this firm.

Very striking, tall, and brilliant is Lobelia Gloire de St. Annes (A.M.), a cardinalis hybrid, shown by Mr. N. Campbell, gardener to Lady Ardilaun, St. Annes, Clontarf, co. Dublin; the stems shown were 4ft. high, and carried large crimson-scarlet flowers. Mr. H. J. Jones, Ryecroft Nursery, Lewisham, had a charming exhibit of Michaelmas daisies, each variety set up in a goodly bunch, and lightly arranged over a white ground; Rev. T. Wilks, Robert Parker, Ryecroft Purple, Rose McDonald, Beauty of Colwall, Mrs. Duncombe Mann (very graceful), Delight, Mrs. Huson Morris, and T. S. Ware, were especially noteworthy for their effectiveness. Clematises, fuchsias, and bamboos formed an interesting group from Mr. L. R. Russell, Richmond. Messrs. Paul and Son, Cheshunt, had a display of the rarer shrubs, especially those flowering late or carrying fruits or coloured leafage; the berberises were well represented, as were the cornus, viburnums, spiræas, and hydrangeas. This firm also sent Solidago spectabilis (A.M.), a fine Golden Rod.

Messrs. G. Bunyard and Co., Maidstone, presented liliums, gaillardias, a fine selection of Michaelmas daisies, anemones, and other useful and beautiful autumn flowers. Shrubby veronicas, dwarf and standard, as shown by Messrs. H. B. May and Sons, Edmonton, were very attractive, notably the varieties Attraction, Mauvena, Mont Blanc, Gabrielle, Eveline, Conquette, and Violette. Mr. Frank Brazier, Caterham, filled one corner with a brilliant exhibit of Michaelmas daisies, pentstemons, liliums, phloxes, and early chrysanthemums—a fine display. Messrs. Frank Cant and Co., Colchester, had a small but very fragrant and beautiful exhibit of autumnal roses, and they showed a large stand of the deep-coloured Hugh Dickson.

In the group of hardy flowers put up by Messrs. T. S. Ware, Ltd., Feltham, a few of the leading subjects were Liatris pycnostachya, Eryngium alpinum, and Aster Beauty of Colwall. This firm had also a gorgeous bank of their superb double and single begonias, a remarkable lot for so late in the season. More roses came from Messrs. Benjamin R. Cant and Sons, Colchester, and from Mrs. Edward Mawley, Claudius, White Maman Cochet, Lyon Rose, La Tosca, and Frau Karl Druschki were very fine. Mr. G. Prince, Longworth, put up a lovely lot of roses in the lower annexe, and of especial beauty were the stands of Frau Karl Druschki, Dean Hole, Lyon Rose, Queen Mab, White Maman Cochet, and Gottfried Keller.

The features of Mr. Maurice Prichard's display of hardy flowers were the groups of splendid kniphofias and gladioli, and the new heleniums and Cimicifuga japonica. Roses were beautifully shown by Messrs. William Paul and Son, Waltham Cross, who, as usual, staged baskets of a variety; the exhibit was suggestive of July rather than late September; leading varieties were Lyon Rose, Mrs. J. Laing, Lady Roberts, Mdme. Abel Chatenay, Joseph Lowe, Caroline Testout, Le Progres, Mdme. Ravary, Joseph Hill, Aschenbrödel, Hugo Roller, and the useful Frau Karl Druschki. Early chrysanthemums were finely shown by Messrs. W. Wells and Co., Merstham, who set up their flowers charmingly, and had, in addition, a splendid lot of seedling pentstemons, phloxes, violas, etc., the whole producing a very fine effect. Among the chrysanthemums some of the finest were J. Bannister, Touraine, Goacher's Crimson, Polly, Leslie, Normandie, Perle Chatillonaise, and Golden Glow. Early singles were also very much in evidence.

A charming group of perpetual carnations from Messrs. Stuart Low and Co., Enfield, contained fine blooms of Lady Alington, a new pink shade; Fire Glow, a striking fancy; Lady Dainty, Dorothy Gordon, Mrs. T. M. Crook, and other good things. Seedling begonias, representing a fine strain of doubles, were staged by Mr. A. Ll. Gwillim, New Eltham. New roses from Messrs. Samuel McGredy and Son, Portadown, were a great centre of interest, and the varieties included Countess of Gosford, Mrs. Herbert Stevens, Mrs. Alfred Tate, Countess of Kilmory, Mrs. E. J. Holland, Earl of Gosford, Ethel Malcolm, and Dorothy Radcliffe.

Mr. J. B. Riding, Chingford, presented collarette and paony-flowered dahlias, and these quaint varieties came in for a good deal of comment. Messrs. G. and A. Clark, Dover, sent a group of hardy autumn flowers, and Mr. H. F. Robson, Ham, Surrey, showed early chrysanthemums.

Mr. Amos Perry, Enfield, set up a bank of delphiniums, a few Michaelmas daisies, a colony of Sarracenia purpurea, and a grand batch of the brilliant Helenium Riverslea.

ORCHID COMMITTEE.

Messrs. Stuart Low and Co., Enfield, brought up Ionopsis paniculata, Cycnoches maculatum, Houlletia Brocklehurstiana, Vanda Kimballiana, Zygopetalum Gautieri, and other interesting orchids, in addition to such showy things as Oncidium oblongatum, O. Marshallianum, Cattleya Iris, C. aurea, Cypripedium Rosetti, etc. Messrs. Stanley and Co., Southgate, presented Cattleya iridescens, and L.-c. Gottiana. From Messrs. William Bull and Sons, Chelsea, came Odontioda Wilsoni var. Gwendoline, of pale pink colour. Mr. W. Thompson, Walton Grange, Stone, sent Cattleya De Geestiana var. Thompsoni (A.M.), with lovely yellow lip and white sepals and petals. From Westonbirt Mr. Alexander, orchid grower to Lieut.-Colonel Sir G. Holford, brought up the brilliant purple Cattleya Dirce magnifica (A.M.), the handsome broad-sepalled Cypripedium Shogun (F.C.C.), C. Germaine Opoix Westonbirt var., C. Actæus Bianca, and C. Gaston Bulteel var. King Edward.

In the little group of orchids shown by Messrs. J. Cypher and Sons, Cheltenham, we noticed Cypripedium Fairrieanum, Dendrobium Phalænopsis, Brasso-cattleya Digbyano-gigas, and the pretty Sophro-cattleya Medea. Mr. E. V. Low, Haywards Heath, brought up Cypripedium Fairrieanum, C. Sanacderæ, C. Rossetti, C. King Edward VII., and C. William Lloyd superbum. Messrs. Mansell and Hatcher, Rawdon, Leeds, brought up Vanda Kimballiana, Odontoglossum grande, Brasso-cattleya Mdme. J. Leeman, Cattleya Gaskelliana albens, C. Armstrongi superba, and various odontoglossums and cypripediums. A small group of charming varieties of Dendrobium Phalænopsis Schröderiana was set up by Mr. Collier, gardener to Sir J. Colman, Bart., Gatton Park, Reigate.

Mr. Black, gardener to R. G. Thwaites, Esq., Streatham, brought up several plants of Odontioda Thwaitesi, Cattleya Iris, and the new C. Roupelliana. Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, sent up Odontioda Craveniana and Cypripedium H. S. Goodson. Messrs. William Bull and Sons, Chelsea, put up an interesting group of Cattleya Gravesiæ, C. Pittiana, C. Iris, C. Marstersoniæ, Cypripedium Maudiæ, and Odontioda Charlesworthi, the latter a very fine variety. Messrs. Sander and Sons, St. Albans, were represented by a large group of orchids that included Phaius Cooperi (A.M.), Lælio-cattleya Luminosa, Brasso-cattleya Lehmanniæ, Cattleya Iris, Brasso-lælia Veitchi, Stanhopea oculata, Zygopetalum rostratum, and other good things.

Messrs. Charlesworth and Co., Haywards Heath, presented a group of interesting orchids, notable things being Cypripedium Rosetti, Odontoglossum eximium, O. illustrissimum, O. ardentissimum, O. Rolfæ, Cirrhopetalum Mastersianum, Brasso-cattleya Lehmanniæ, Cattleya iridescens, and the broad, richly-hued Cattleya Luegæ (C. Enid and C. Dowiana Rossita) (A.M.), and the beautiful Miltonia Harwoodi.

FRUIT AND VEGETABLE COMMITTEE.

A particularly fine display of ornamental gourds and marrows, set up in first-rate style by Mr. T. Stevenson, gardener to E. A. Mocatta, Esq., Woburn Place, Addlestone, was a striking feature. There were over fifty distinct varieties, their colours ranging from deep black-green to vivid orange-scarlet, and in some cases the bright and dark colours were quaintly combined in the same specimen. There was over a ton weight of these ornamental and useful fruits, and all were grown on a pergola nearly 80 yards long, thus providing a unique feature, and one which Mr. Mocatta is personally very keenly interested in. Messrs. G. Massey and Sons, Spalding, tabled a large collection of vegetables, making a special feature of celeriac, kohl rabi, aubergines, maize, onions, and beet.

Messrs. Sutton and Sons, Reading, had two exhibits—one, of runner beans only, showed the remarkable variety of size, form, and colour now obtainable in this useful vegetable. Prizewinner and Best of All were far and away the finest pods, but the purple, golden, and red-striped varieties attracted at least as much attention. In the other and larger exhibit the Reading firm had a remarkable collection of uncommon types of vegetables, and among these we noted chicory, aubergines, radishes in great variety, Couve Tronchuda, kohl rabi, celeriac, chenopodium, various beets, capsicums, and many other interesting, and useful subjects that might well enter more largely than they do at present into our vegetable dietary.

The vegetables staged by Messrs. James Veitch and Sons, Chelsea, were of excellent quality and admirably arranged; Ailsa Craig onions, capsicums, cauliflowers, Autocrat peas, and enormous Hackwood Park runners beans were especially notable. H.R.H. the Prince of Reuss, Gera, Germany, sent over a dozen and a half large specimens of the pale yellow-green cucumber named Abundance. This variety is grown especially for pickling in Germany, and is of great value for the purpose. The fruits have solid white flesh, and a very small seed cavity; some of the specimens were 19in. long, and with a girth of 13in. The exhibit was very interesting.

Fruit trees in pots, carrying excellent crops, were again submitted by the King's Acre Nursery Company, Hereford, their pears and pot vines receiving unstinted and well-deserved praise. Figs and apples were also largely represented, but we think the Hereford firm has never before shown such grandly-cropped pear trees in pots; they were pictures of high culture. Messrs. J. Harrison and Sons, Leicester, showed a few fine varieties of cabbages and savoys. The exhibit of potatoes from Messrs. Dobbie and Co., Rothesay, attracted a great deal of attention. There were four dozen large baskets of selected tubers of the leading varieties, and the arrangement, as well as the cultural merit of the display was excellent. The Provost, Climax, Sharpe's Victor, Admiral, Factor, King Edward VII., Midlothian Early, and Laing's Perfection were a few of the more striking varieties.

Mr. W. E. Sands, Hillsborough, co. Down, sent dishes of a goodly number of varieties of potatoes, many of them produced as second or catch crops after cabbage, or even after potatoes. They were fair samples all round; Irish Queen, Emerald Queen, Leinster Wonder, and Shamrock were Irish varieties of merit.

CERTIFICATES AND AWARDS.

First-class Certificates. — To Viburnum Henryi, from Messrs. James Veitch and Sons, Chelsea; to Cypripedium Shogun, from Lieut.-Colonel Sir G. Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester.

Award of Merit.—To Lobelia Gloire de St. Annes, from Lady Ardilaun, Clontarf, co. Dublin; to cactus-dahlia Flagstaff, from Messrs. J. Stredwick and Son, St. Leonards; to carnation Lady Alington, from Messrs. Stuart Low and Co., Enfield; to phlox Ellen Willmott, from Messrs. Gunn and Sons, Olton; to perennial aster Peggy Ballard, from Mr. Ballard, Colwall; to H.T. rose Dorothy Ratcliffe, H.T. rose Mrs. Herbert Stevens, and H.T. rose Ethel Malcolm, from Messrs. S. McGredy and Son, Portadown; to chrysanthemums Hollicot Golden, Hollicot Pearl White, and Betty Spark, from Mr. W. Roots, Holly Cot, Cranford; to Solidago spectabilis, from Messrs. Paul and Son, Cheshunt; to Lælio-cattleya Degeestiana var. Thompsoni, from Mr. William Thompson, Walton Grange, Stone; to Phaius Cooperi, from Messrs. Sander and Sons, St. Albans; to Lælio-cattleya Dirce magnifica, from Lieut.-Colonel Sir G. Holford; and to Cattleya Luegeæ, from Messrs. Charlesworth and Co., Haywards Heath.

MEDALS.

Silver-gilt Flora.—To Messrs. William Paul and Son, Waltham Cross, for roses; to Messrs. T. S. Ware, Lim., Feltham, for hardy flowers and begonias; to Mr. James Box, Lindfield, for hardy flowers; to Mr. H. J. Jones, Ryecroft Nursery, Lewisham, for perennial asters; to Mr. L. R. Russell, Richmond, for clematis, etc.; to Messrs. James Veitch and Sons, Chelsea, for greenhouse plants; to Mr. J. Brazier, Caterham, for hardy flowers; to Messrs. G. Bunyard and Co., Lim., Maidstone, for hardy flowers; to Messrs. G. and A. Clark, Dover, for hardy flowers; to Messrs. W. Cutbush and Son, Highgate, for hardy flowers; to Messrs. Stuart Low and Co., Bush Hill Park, Enfield, for carnations; to Messrs. H. B. May and Sons, Edmonton, for veronicas and ferns; to Messrs. Paul and Son, Cheshunt, for shrubs, etc.; to Messrs. W. Wells and Co., Merstham, for chrysanthemums; to Mr. G. Prince, Longworth, for roses; to Mr. J. T. West, Brentwood, for dahlias.

Silver-gilt Knightian.—To Messrs. Dobbie and Co., Edinburgh, for potatoes; to King's Acre Nursery Company, Hereford, for pot fruit trees; to Mr. Stevenson, gardener to E. A. Mocatta, Esq., Woburn Place, Addlestone, for ornamental gourds; to Messrs. Sutton and Sons, Reading, for collection of vegetables; to Messrs. James Veitch and Sons, Chelsea, for collection of vegetables.

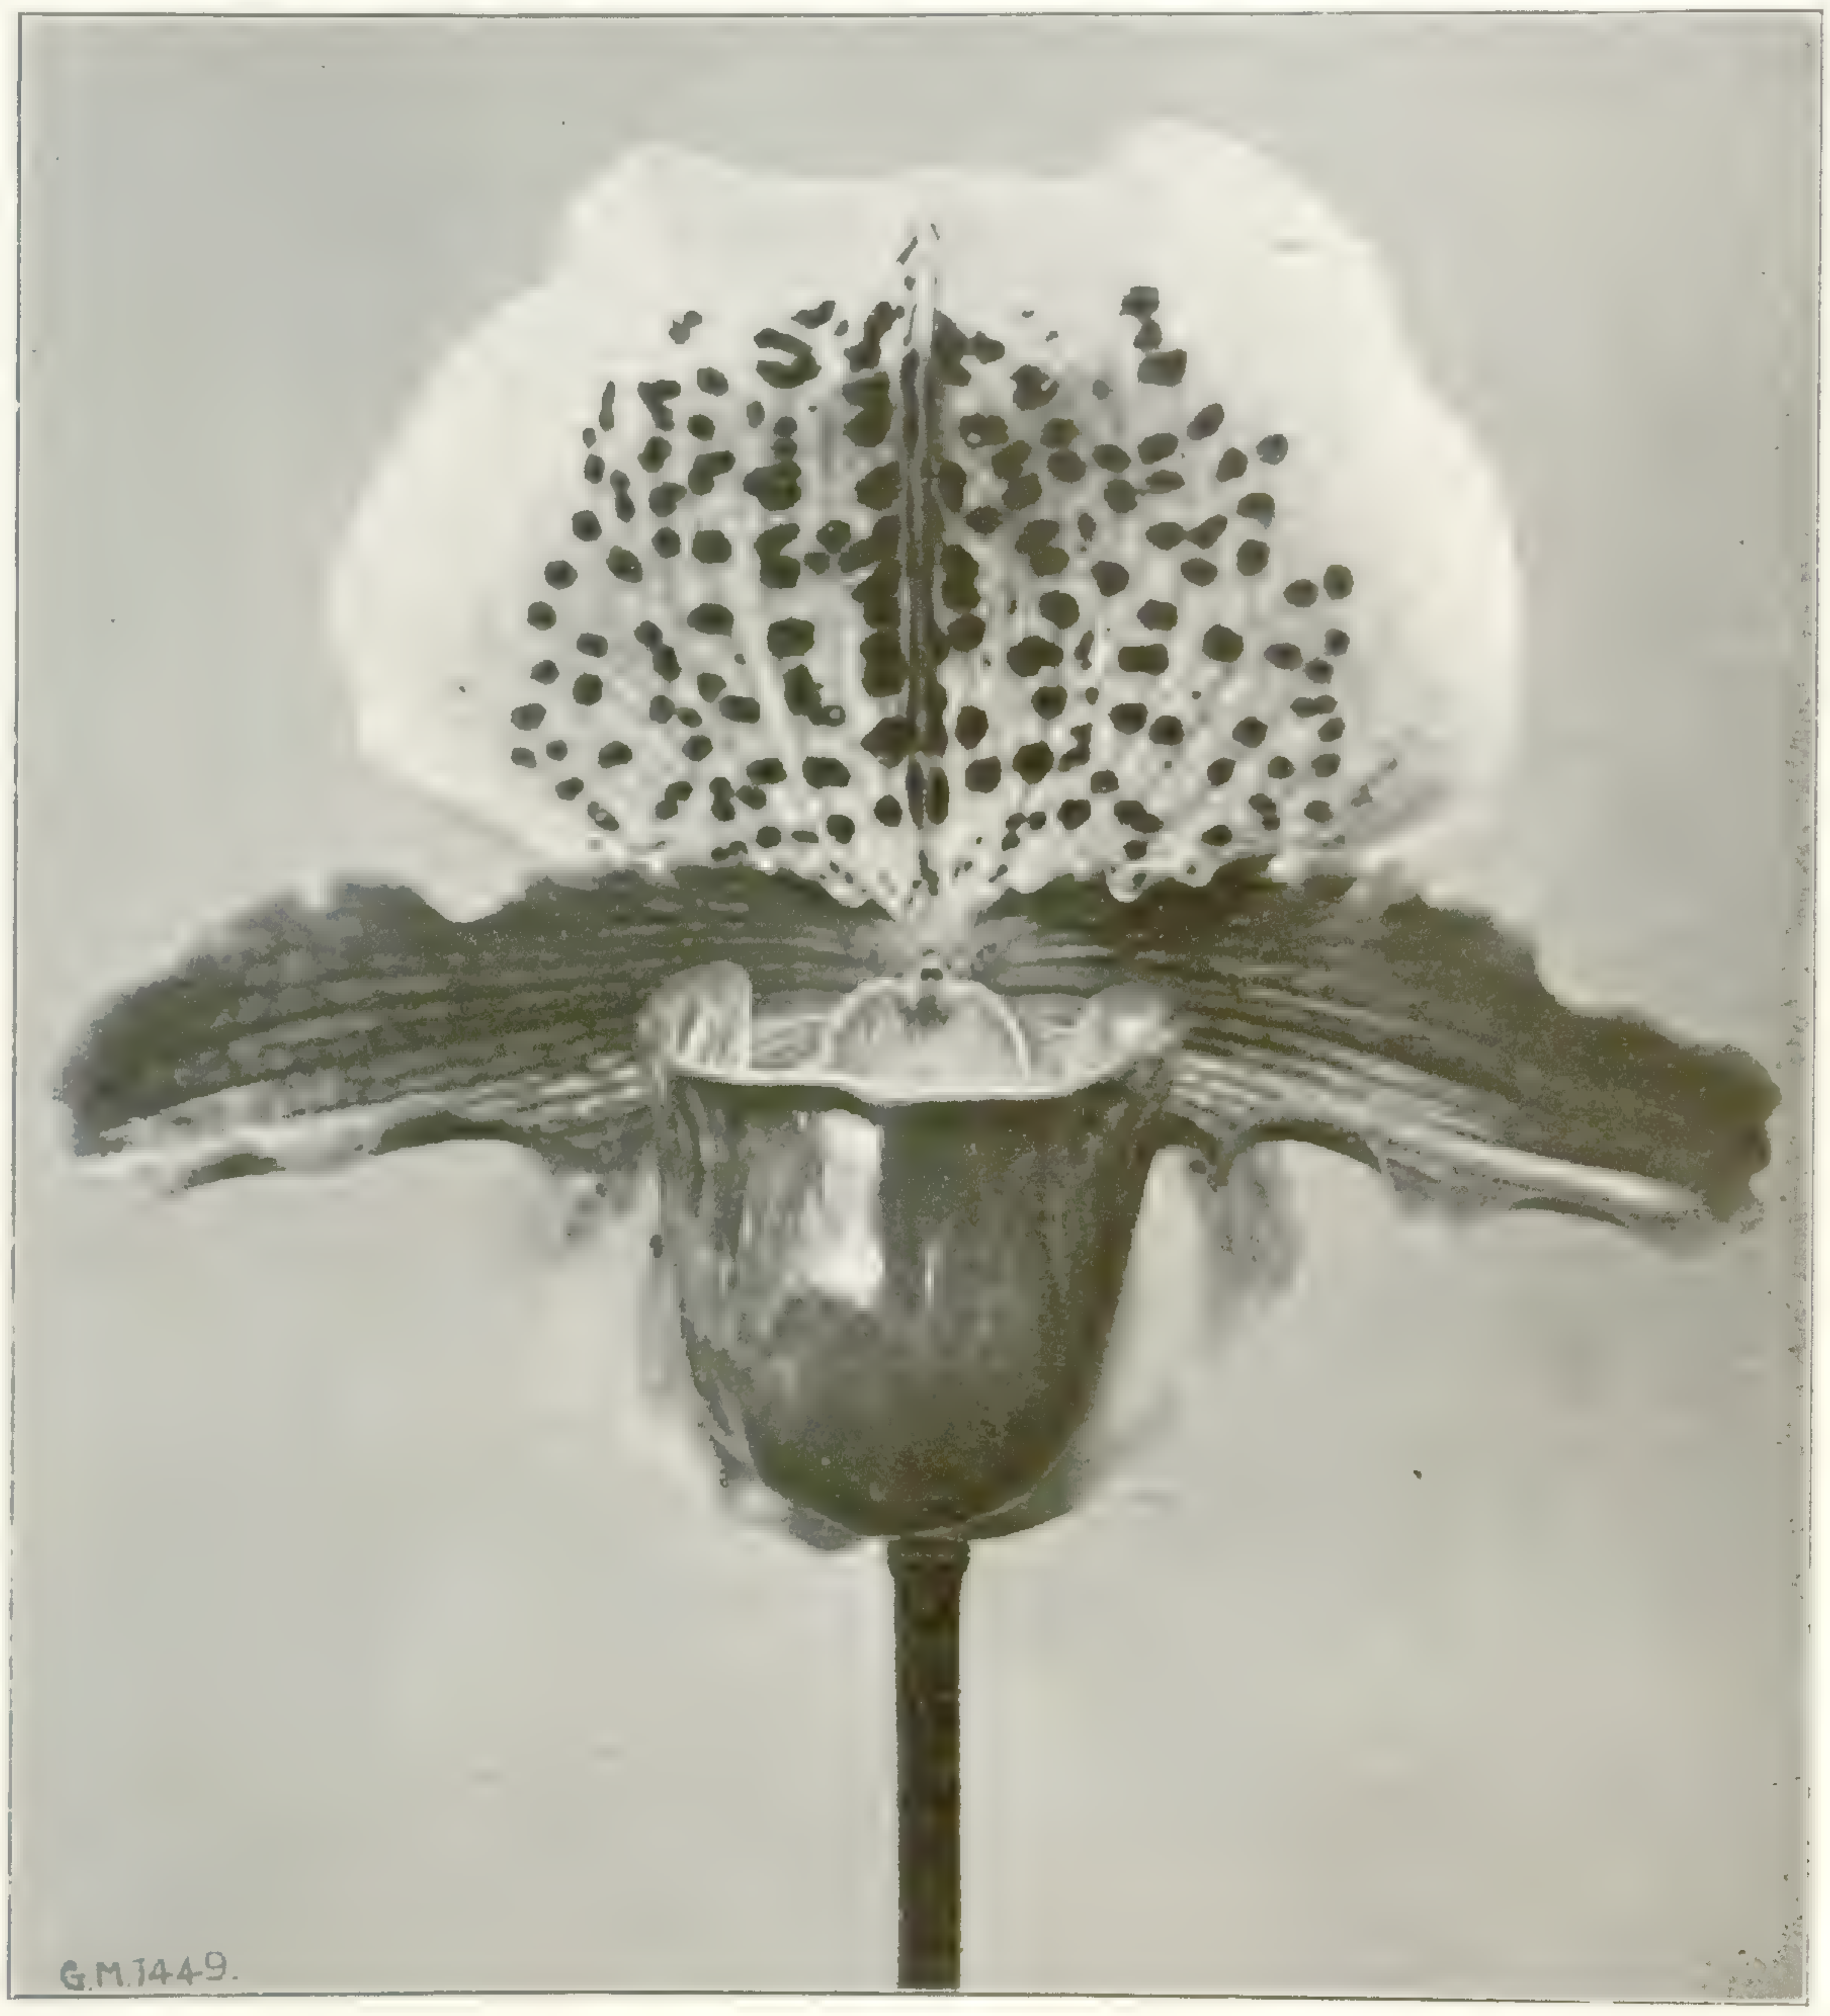
Silver Flora.—To Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids.

Silver Banksian.—To Messrs. William Bull and Sons, Chelsea, for orchids; to Messrs. Mansell and Hatcher, Rawdon, for orchids; to Mr. Black, gardener to R. G. Thwaites, Esq., Streatham, for orchids; to Mr. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate, for orchids; to Mr. Sands, Hillsbrough, co. Down, for potatoes; to Messrs. G. Massey and Sons, Spalding, for vegetables; and to H.R.H. the Prince of Reuss, Gera, Germany, for pickling cucumbers.

Bronze Flora.—To Messrs. R. H. Bath, Lim., Wisbech, for chrysanthemums, etc.; to Mr. F. Lilley, Guernsey, for amaryllis, nerines, etc.

Bronze Banksian.—To Mr. Maurice Prichard, Christchurch, Hants, for hardy flowers; and to Mr. H. F. Robson, Ham, for chrysanthemums, etc.

National Dahlia Society's Awards.—A committee of this society made the following awards at the Royal Horticultural Society's meeting: First-class certificate to pompon dahlia The Moor, from Mr. S. Mortimer, Farnham; to decorative dahlia Loveliness, from Mr. Charles Turner, Slough; to cactus dahlias Kingfisher and Golden Eagle, from Messrs. J. Stredwick and Son, St. Leonards.



CYPRIPEDIUM SHOGUN.
A distinct variety with large, richly-coloured flowers. F.C.C., R.H.S., September 27. Lieut.-Colonel Sir G. L. Holford, Westonbirt (H. G. Alexander, orchid grower).

Woodstock.

SEPTEMBER 13.

In connection with a large show of farm roots, horses, dogs, poultry, and other live stock, for which about 100 classes are provided, the Woodstock Horticultural Society held its 53rd September exhibition in the beautiful domain of Blenheim Park, in close proximity to the Palace, by permission of the Duke of Marlborough. The weather, though overcast, was dry, and there was a very large attendance of the county gentry.

The horticultural schedule provides some seventy classes, but only two are devoted to plants. By the offer of the R.H.S. medals the committee were able to attract a considerable muster of cut flowers as "non-competitive exhibits"; one very prominent display was the collection of dahlias from Mr. John Walker, Thame, who had, effectively disposed on 180 feet space, nearly 140 show and fancy varieties, thirty bunches of singles, a like number of pompons, an extensive array of cactus, and a number of pæony-flowered varieties; a silver-gilt medal was awarded. Mr. Ernest Hicks, Wallingford, made a display of roses, comprising fifty bouquets of teas and garden varieties in three tiers, faced by a line of specimen blooms in which two dozen fine developments of F. K. Druschki formed a central setting, from these boxes depending sprays of climbers formed a fringe. From the upper tier sprang arching lines terminating with funnel-shaped vases of rose blooms; a silver medal was awarded. Messrs. Gardiner, Son, and Adams, Crown Road Nursery, Kidlington, put up a very showy group of dwarf-grown early-flowering chrysanthemums, which secured a bronze medal; and they further augmented the colour in the tent by a large collection of hybrid gladioli, delphiniums, and violets. Mr. Charles Turner, Royal Nurseries, Slough, arranged about eighty vases of choice perennials, roses, cactus dahlias, in triplets; pompon dahlias, in sixes; and a fine showy centre of the pæony-flowered dahlias. Mr. J. White, Worcester, sent a nice collection of garden flowers.

The largest display, however, came from the Palace Gardens, Mr. G. Hunter covering fully 700 square feet with an arrangement of stove and greenhouse subjects. The design, an elongated oval, enclosed four of the tent poles which served as centres of the scheme, each being a conical pyramid surmounted by kentia or cocos palms, the outer mounds being simply displays of tree carnations and highly-coloured plants, the two inner mounds being arrangements of Odontoglossum crispum and Dendrobium Phalænopsis, francoa, etc.; the intervening mounds were massings of Vanda teres and Odontoglossum grande, the groundwork being a myriad of dot plants, such as crotons, liliums, and greenhouse subjects in general; the verge of the design was a wide edging of scarlet zonals, gloxinias, ferns, etc. To this exhibit, and a collection of fifty dishes of fruit, a gold medal was awarded. In the fruit there were some grand clusters of Alicante and Muscat of Alexandria grapes, Dymond, Lady Palmerston, and other peaches, a few pears, a large variety of apples, the Peasgood's Nonsuch weighing fully one pound; the plums included Magnum Bonum and Cox's Transparent.

In competition, the groups of plants on forty square feet were pretty arrangements. Mr. R. Wadham, gardener to Mrs. Bradshaw, The Grange, Steeple Aston, led, and his group contained some nice liliums; Mr. H. M. Gaskell, Kidlington Hall, second, whose set was gay with Scarborough lilies and a specimen Peristeria elata. The awards for early-flowering chrysanthemums went to Mr. W. T. Mattock, Barton End Nursery, Headington; and Messrs. Gardiner, Son, and Adams, Kidlington. Displays of roses on eighteen feet were composed of numerous bouquets and columns; the first prize went to F. Taylor and Sons, Kingham Nurseries, Chipping Norton, who were strong with a front line of specimen blooms; Mr. John Mattock, New Headington, a close second. Displays of cactus dahlias (open) arranged on thirty-six feet, made a rare show, the awards falling to Messrs. J. Walker, Taylor and Sons, and J. Mattock; while the displays of herbaceous perennials secured awards to Mr. John Cooper, Hardy Plant Nursery, Chipping Norton; and Mr. Mark Burden (shoemaker), Stanton Harcourt; these two exhibits also securing the awards for a dozen bouquets of garden flowers in the same order. Mr. J. Walker led for double zinnias and quilled asters; Mr. Burden for any other variety of asters; the premier collection of gladioli coming from Mr. J, Mattock. For a dozen roses, Messrs. Taylor and Sons secured the prize.

One of the attractions were the decorated dinner tables, Messrs. Taylor and Sons scoring a premier for an elegant arrangement of cattleyas, epidendrums, phalænopsis, francoa, and light greenery; Mr. W. T. Mattock second with a charming display of Gottfried Keller rose.

Fruit was a fair all-round show; in the open division Mr. J. M. Bush, gardener to F. J. Myers, Esq., Charlton Lodge, Banbury, led for a collection, and for six dishes; for melon, grapes, and nectarines. Mr. R. Wadham scored premiers for peaches and plums; he also was strong in the classes for tomatoes, potatoes, and Messrs. Sutton's collection of vegetables. Mr. T. Sirman, Stanton Harcourt, led for celery and cauliflowers; Mr. A. Busby, gardener to Colonel Murray, Deddington, proved a champion with onions, carrots, parsnips, and turnips; Mr. J. C. Taylor, 17, Thorncliffe Road, Oxford, was premier for beet, marrows, and runner beans. The amateurs' division was well supported by Oxford cultivators, the cottagers' classes being limited to the Blenheim Estate allotment-holders.

FORTHCOMING ENGAGEMENTS.

SATURDAY, October 1.—French Horticultural Society of London.

TUESDAY, October 4.—Scottish Horticultural Association.

THURSDAY, October 6.—United Horticultural Benefit and Provident Society, annual dinner at the Waldorf Hotel, to be presided over by Edward Sherwood, Esq.; chair to be taken at 7 o'clock.

MONDAY, October 10.—United Horticultural Benefit and Provident Society; committee meeting.

TUESDAY, October 11.—Royal Horticultural Society; committees meet at 12 o'clock; lecture at 3 p.m. on "Cider and Perry Fruits," by Mr. B. T. P. Barker, M.A.; Scientific Committee at 4 o'clock.

British Gardeners' Association; Council meeting.

THURSDAY, October 13.—Royal Horticultural Society's Sixteenth Annual Exhibition of British Fruits; two days.

British Gardeners' Association; London branch.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

PEACHES.—P. S., Swansea: We have in type an article dealing with the subject of stone-splitting in peaches, that will interest you. The specimens sent are being examined, and we hope to report upon them at an early date. What is the variety?

CREEPING JENNY. — F. H., Lee: The botanical name of the Creeping Jenny is Lysimachia Nummularia. It is a common native plant that is propagated with the greatest ease by division in early spring, though at almost any season of the year, if the long trails are pegged down on moist soil, they will root and grow from practically every joint. Seeds rarely ripen, and we do not know of any one who offers seeds.

PLANTING PEACHES. G. G., Aberystwyth.—Amsden June is a suitable peach to plant to ripen earlier than Dr. Hogg and Alexandra Noblesse, and either Violette Hâtive or Raymacker's to ripen later than these varieties. Late Devonian is a still later and a good variety. We may also direct your attention to Dymond and Bellegarde, which are midseason varieties of first-rate quality. Of nectarines Pine Apple and Humboldt are excellent, and will suit your requirements. In making the border, to every five barrowloads of soil of the description you give add one of crushed mortar rubble, or, failing this, of crushed chalk that has been well exposed to the weather, and half a barrowload of wood ashes. Crushed bones might be added, but it is preferable to use bones in the form of meal as top dressings to trees after they have attained the fruit-bearing stage. Thoroughly drain the border, and well mix and firm the compost.

BANK-SIDE OF TENNIS COURT.—A. F., Taunton: If the lawn is freely used for tennis you will find the culture of plants on the sloping bank to be a great nuisance, because, unless netted off from the court, the balls would be continually falling among the plants. This would be annoying to the players, who would have to hunt for them, and the plants would suffer in some degree from the attempts made to find the balls that had fallen among them. However, if you wish to plant the bank we suggest the use of informal groups of Mollis azaleas, cotoneasters, dwarf rhododendrons, and Wichuraiana and Rugosa roses, with spring, summer, and autumn flowering bulbs planted freely among and around them.

HEXHAM FRUIT CONGRESS.—L. E. B., Derby: The Hexham Fruit Show and Congress takes place at Hexham on October 20, 21, and 22. It is being organised in connection with the four northern counties, and the secretary is Rev. J. Bernard Hall, Dalston, Cumberland.

WALL FRUIT TREES.—M. T. J., Doncaster: Undoubtedly the cause of trouble is drought at the roots. Trees planted against walls need considerable attention in regard to a sufficient supply of root moisture, as their position prevents them from obtaining the full benefit of the rainfall, while the absorption and radiation of heat by the wall itself tends to dry the soil. Lightly point over the surface soil with a fork, and set the hose at work; let each tree have a plentiful supply, and when all have had one soaking start again, and let the water run for an hour or two at the roots of each tree.

WHOLESALE PRICE OF BULBS.—Bulb, Rugby: The wholesale price of bulbs is from 30 to 50 per cent. below that of retail prices, sometimes more. This will enable you to gauge the exchange value of any bulbs you have to offer. If the bulbs are of extra fine size their value will be relatively higher, because bulbs of ordinary size are abundant, while small ones of popular varieties have no real market value.

WATER MELONS.—E. R., Rugby: Except as a matter of interest or curiosity the water melon is not grown in Great Britain, and is only grown in Europe along the Mediterranean coast where the summers are hot. The water melon is only at its best in hot, dry countries; in South Africa and in the Southern States of America it is grown very much as we should grow vegetable marrows here, the growths being seldom pinched back. In this country it would need practically the same kind of treatment as our choice melons grown in houses and pits, and the results both in crop and quality would be far below those regularly secured by capable growers. Seeing how cheaply the water melons can be imported from Spain, etc., it would be a waste of time and money to grow them here, especially, as already stated, our home-raised varieties are immensely superior.

TREE ONIONS.—W. N. J., Thirsk: The specimen sent represents the tree onion, a distinct variety, that may be readily propagated by means of the bulblets that form at the end of the stems. These grow into bulbs of goodly size during the first year, and may then be used, but a few should be left to produce bulblets in their second year if a continuation of the crop appears desirable.

SAVING TOMATO SEEDS.—B. R. G., Worcester: Pick the fruits when ripe, and lay them on a shelf in the greenhouse in a sunny position, where they may remain for a few days. Then cut them open with a sharp knife; hold each fruit upright, and cut it in half horizontally. The seeds can then be removed easily from the cells with the handle end of a small spoon. Place the seeds and pulp in a gauze-wire sieve, and clean thoroughly under running water. When the seeds have been thus cleaned as well as possible, spread them out on a sheet of clean glass to dry; when dry, or nearly dry, rub the seeds through fine dry silver sand, to remove any vegetable matter that may still adhere. Sift all the sand away, and store the seeds in a tin in a dry, cool cupboard. If the tomatoes are cut as advised there will be plenty of material for cooking after the seeds have been removed.

FRUIT CULTURE AT WISLEY.—M. R. D., Evesham: A scheme for experiments in fruit culture was initiated at Wisley in 1908 to demonstrate (1) the effects of various methods of planting fruit trees, (2) the influence of pruning and not pruning in the winter after the autumn of planting, and (3) of summer pruning, (4) the importance of planting trees at a correct depth, and (5) the effect of grass around trees. The planting of trees for these purposes will extend over a period of three years, and apples on broad-leaved paradise and crab stocks, and pears, plums, cherries, on various stocks are being prepared.

NAMES OF PLANTS.

B. C. M., Enfield.—1, Viburnum lantana; 2, Euonymus europæus.

M. D. L., Iffley.—1, Vitis Henryi; 2, Cratægus crus-galli; 3, Symphoricarpus racemosus.

W. A. E., Abergavenny.—1, Gloriosa superba; 2, Cattleya Trianæ; 3, Cypripedium Milo; 4, Cotoneaster frigida.

A. G., Penarth.—1, Carex brunnea; 2, Panicum plicatum; 3, Polygonum Baldschuanicum; Chrysanthemum uliginosum.

F. E. B., Southend.—1, Helenium striatum; 2, Liatris spicata; 3, Godetia Schamini; 4, Helianthus multiflorus.

L. E. M., Guernsey.—1, Crinum Powelli; 2, Sciadopitys verticillata; 3, Gunnera scabra; 4, Libertia formosa; 5, Chorozema Lowi.

BOULTON & PAUL, LTD., HORTICULTURAL BUILDERS, Norwich.

OBITUARY.

◆

MR. GEORGE STARK.

On September 23, Mr. George Stark, founder of Messrs. G. Stark and Son, Great Ryburgh, passed peacefully away after a painful illness lasting nearly twelve months. Mr. G. Stark was formerly a gardener, and his wide experience and genial manner made him an excellent companion. The business he founded at Great Ryburgh was of a varied character, comprising provisions, clothing, implements, seeds, and hardy plants, and he also had charge of the post and telegraph office, but he was never so happy as when in the garden, or in the field among the sweet peas. Assisted by his son, Mr. Arthur Stark, he made sweet peas a special feature during recent years, and our readers will remember that the brilliant crimson-scarlet variety named George Stark secured the Silver Medal of the National Sweet Pea Society as the best novelty of the year 1908. Mr. G. Stark was held in very high esteem by all who had business relations with him, and he had many friends. The funeral took place on Wednesday, September 28, at Great Ryburgh, and sweet peas were largely used in the floral tributes to his memory. The business, in all its branches, will be continued under the same title, under the direction of Mr. A. Stark, who has for some time past assumed the chief responsibility. Mr. George Stark was 65 years of age.

Garden Footwear.—The period of the year has commenced when those who have to work in gardens or nurseries may expect to encounter many wet days, and it is of great importance that the worker should provide himself with boots that will keep his feet dry and warm. Herein, as so generally acknowledged, lies the secret of warding off many a chill and cold, that neglected, may have serious consequences. Readers who have not yet done so will do well to try the wood-soled, felt-lined clogs manufactured by Mr. John Greenlees, 4, Wellington Street, Glasgow. They are well made, comfortable, and very strong, while their price is within the reach of all. When in Glasgow recently we found that Mr. Greenlees is a maker of all descriptions of footwear, and the extent of his premises betokens a very large business, whilst the large numbers of letters of appreciation from satisfied clients we were shown bore evidence of straightforward and courteous dealing.

CATALOGUES RECEIVED.

JOHN K. KING AND SONS, COGGESHALL, ESSEX.—A list of bulbs, roses, plants, seeds, and sundries.

CHARLES BLICK, WARREN NURSERIES, HAYES, KENT.—A descriptive list of carnations and picotees, including a number of new varieties.

CHARLES WALL, SOUTH DOWN, BATH.—A neat and handy list of carnations and picotees.

DICKSON AND ROBINSON, CATHEDRAL STREET, MANCHESTER.—A freely illustrated catalogue of bulbs and flowering roots, with a descriptive list of roses.

BEES, LIM., MILL STREET, LIVERPOOL.—Bulbs and tubers for autumn planting, grown at the firm's own farm at Hillegom.

JOHN JEFFERIES AND SONS, CIRENCESTER.—An illustrated catalogue of selected varieties of bulbs.

WM. PAUL AND SON WALTHAM CROSS, LIM., HERTS.—A very complete, well-arranged, and illustrated catalogue of roses.

GISHURST COMPOUND is harmless in use; its soluble Sulphur, etc., has for 40 years cured blight and fungus on plants, and is good for washing unhealthy dogs. Gishurstine keeps boots dry in all weathers; they will polish. Good for harness. Wholesale from
PRICE'S PATENT CANDLE CO., LIM., LONDON.

JAMES GRAY, HORTICULTURAL BUILDER, CHELSEA, S.W., would strongly advise gardeners to carefully watch their Hot Water Heating Apparatus this month. If boilers show signs of wear, it would be wise to have them thoroughly examined at once, before frost sets in. Immediate attention can be obtained by means of a postcard, telephone call (201, Western), letter, or wire to Gray, Chelsea, London.

KING'S ACRE FRUIT TREES, ROSES, AND ORCHARD-HOUSE TREES.

MERRYWEATHER'S ROSES.

All Strong and Home-grown Plants.

COLLECTION "C" OF GARDEN ROSES.

A real bargain, comprising
The finest selection of **25 Garden Roses** possible in dwarf plants for **13/6** (with Acme Labels **16/-**), carriage and packing free for cash with order.

The varieties are:—

Captain Hayward, H.P.
Caroline Testout, H.T.
Charles Lefebvre, H.P.
Commandant F. Faure, H.P.
Dean Hole, H.T.
Dupuy Jamain, H.P.
Fisher Holmes, H.P.
Frau Karl Druschki, H.P.
General Jacqueminot, H.P.
Gloire de Dijon, T,
Gruss an Teplitz, H.T.
Hugh Dickson, H.P.
J. B. Clarke, H.T.
Killarney, H.T.
La France. H.T.
La Tosca, H.T.
Liberty, H.T.
Maman Cochet, T.
Mrs. Sharman Crawford, H.P.
Mrs. W. J. Grant, H.T.
Pharisaer, H.T,
Phyllis, Poly.
Prince C. de Rohan. H.P.
Ulrich Brunner, H.P.
Victor Hugo, H.P.

FRUIT TREES
OF ALL KINDS TO SELECT FROM,

A GRAND STOCK OF
SHRUBS & ORNAMENTAL TREES.

HERBACEOUS PLANTS in great variety.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Floral Societies.

To the students of floricultural progress undoubtedly one of the most interesting phases must be the wonderful development of many flowers and the marvellous diversity of form and colour which cultural selection and new introductions have brought about. As a result of this, it has gradually become obvious that none but special experts could possibly be qualified to deal with them as judges, and hence, in the first place, they became the particular object of special committees, and eventually, in many instances, special societies have been formed, as has been the case with the chrysanthemum, the auricula, the daffodil, the carnation, the sweet pea, the dahlia, and other flowers which have shown themselves capable of a diversity so great as to entirely defy the judgment of the general florists. One great difficulty in connection with this question of judging, that is of determining whether the innumerable new introductions are really new at all, and if new, represent any improvement on known types, is that a great many growers are concerned, and, as a result, very similar or even identical sports or varieties crop up in different quarters, and being regarded by their raisers as presenting new and improved features, are christened according to their fancy with different names. In such cases it is obvious that it is only the expert, who has familiarised himself thoroughly with all the good forms extant, and has a memory sufficiently retentive to recall those already certificated, who is in a position to determine the novelty or otherwise of the new introductions. An ideal committee or society would need to be a solitary central one to which all presumed novelties would require to be presented for judgment; but, unfortunately, this ideal is an impossibility, since in these days of free international intercourse, many presumed novelties originating abroad speedily find their way here, and are introduced under fancy names, while even here, exhibitions on a large scale are held in various great centres besides London, and awards given as may be determined by local judges. The result is that with most of the flowers of chief importance, the number of names indicating distinct forms is undoubtedly very largely in excess of the actual number of varieties, in fact no sooner is a society proper formed than one of its first attempts is to rectify this by classing together the "too much alikes," which generally means the "exactly similar." It is, indeed, only a judge of flowers who can really grip the difficulty involved. On a given date in the proper season, some dozens it may be, say of cactus dahlias or phloxes, are presented for awards or other certificates of merit, which involves not merely merit in itself, but a definite measure of distinctness in the way of colour, size, habit, or other characteristic. Superficially the varieties are on familiar lines, and it is often a matter of surprise to the expert as to what the distinct feature is that experienced growers see in them to induce their presentation. Scores of varieties of all imaginable tints, and with the cactus dahlia, of the true slender-petalled curly cactus form, have already been certificated, and to permit of proper judging, must be present in the memory of the judge. As a rule the great majority are recognised at once as being mere replicas of known varieties, while some are probably condemned for imperfection of form. The eye of the expert, however, may detect some particular good feature not hitherto noted, some subtlety of colouring or delicacy of make, and in that case, if his opinion be sufficiently supported by his fellow experts, an award is given; but, not infrequently, a remark is made by another that he has had precisely the same type for some time under another name. Obviously under such circumstances it is only by the establishment of societies and the consequent concentration of expert knowledge, that really distinct varieties can be determined in these days when the multiplicity is so great and the recurrence of identical forms originating simultaneously in different hands is so frequent.

MR. FRANK BOUSKELL.
Hon. Secretary Hardy Plant Society.

Mr. Frank Bouskell, whose portrait is given in this issue, has, during the past twenty-three years, devoted a large share of his attention to the cultivation of hardy flowers, and has achieved so high a degree of success that he has long since occupied a foremost position among amateurs who are recognised as authorities on the occupants of the herbaceous border. We have on so many occasions had the opportunity of enjoying the beauty of the magnificent collections contributed by Mr. Bouskell to the principal exhibitions held in the Midlands, that we are not surprised to learn that during the last six years he has been awarded five silver cups, ten gold medals, and twenty silver-gilt and silver medals. Mr. Bouskell has not devoted his whole attention to cultural matters, but has recognised the possibility of improving classes of plants that have not as yet received much attention from raisers, and he is at present specialising with the verbascums, and, judging from some varieties we had an opportunity of seeing at the Abbey Park Flower Show, at Leicester, considerable progress has been made in the work of improvement. In view of his accomplishments as a grower and exhibitor of hardy flowers, and his remarkable activities in other directions, it is not surprising Mr. Bouskell should have been regarded as especially adapted to the position of hon. secretary of the newly constituted Hardy Plant Society, and unanimously elected. It can hardly fail to be of interest to mention, in view of what Mr. Bouskell has accomplished in connection with hardy flowers, that he is a solicitor by profession, and that he is the Deputy Coroner for South Leicestershire, and Clerk to the Board of Guardians and the Rural District Council of Market Bosworth. From 1891 to 1894 he was hon. secretary of the Knighton Horticultural Society, and he is vice-president and hon. solicitor of several horticultural societies in Leicestershire. Mr. Bouskell takes a keen interest in entomology, as evidenced by the fact that he has been a Fellow of the Entomological Society since 1891, was hon. secretary of the Leicester Entomological Society from 1894 to 1904, and this year is its president. This does not by any means exhaust Mr. Bouskell's activities, but we have mentioned more than sufficient to justify the members of the Hardy Plant Society in heartily congratulating themselves on his having accepted the position of hon. secretary.

The Gardeners' Magazine Autumn Number.—As announced in our issue for the 1st inst., we shall devote the greater part of the space in our issue for the 22nd inst. to the discussion of matters of special import to those who contemplate planting hardy trees and shrubs either for floral or foliage effects, select fruit trees, small fruits, and choice subjects for the embellishment of the herbaceous border and other parts of the flower garden. The articles will be by recognised authorities on the several subjects, and the issue will be freely illustrated. In the same issue we shall give a full and illustrated report of the Royal Horticultural Society's exhibition of British grown fruit.

Brussels Horticultural Exhibition.—It was originally arranged to hold two autumn flower shows in connection with the International Exhibition now being held in Brussels, and of these one was to have been held from September 24 to October 2, and the other from October 29 to November 2. Owing to the destructive fire that occurred some time since, it was feared that both exhibitions would have to be abandoned, but, thanks to the support of the Belgian Government, the Société Royal de Flore, and the Société Linnéenne, have decided to hold an exhibition on the dates last mentioned, which shall include the whole of the products included in the two shows that had been previously arranged. Accordingly there will be classes for chrysanthemums, orchids, and other flowers, ornamental plants, market produce, and fruits. It is not proposed to issue fresh schedules, but all contributions of flowers, fruits, plants, and market produce will be received and exhibitors be recompensed according to the merits of their exhibits.

September in the North.—In marked contrast to the fearful weather experienced in the corresponding month last year, the September just closed has, our Aberdeen correspondent writes, proved one of the finest on record. The rainfall in the Aberdeen district was barely 1.5 inches, and it was on the first two days of the month that most of the rain fell. The number of days on which the gauge contained a measurable quantity of water was only seven or eight, and on most of these the amount was very trifling. There were no gales; in fact, the atmosphere was unusually quiet, often dead calm in the morning and evening. Needless to say, the husbandman made the most of his opportunities, and the hum of the reaper might have been heard morning, noon, and night. A vast area has been cleared of the crops, which are now snugly housed under "thack" and "rape." And more pleasant still to relate, the crops have been secured in first-class order. The disease spot on the potato leaves, which made its appearance in some districts during the last few days of August, and continued to spread gradually ever since, has received a check owing to the fine dry weather experienced. It is hoped, therefore, that the damage done to the tubers will not amount to very much. The turnip crop—a very important one in the North of Scotland—on dry-bottomed land has been feeling the want of rain, some of the leaves turning yellow. As is well known, this crop requires much moisture in the autumn season. The required moisture came, however, with the advent of October, as there was a veritable deluge on the night of the 2nd and morning of the 3rd. Altogether the September of 1910 will long remain a pleasant memory in the mind of the Scottish gardener and agriculturist.

Proposed Horticultural Society for Yorkshire.—On the evening of the 30th ult., a meeting of horticulturists was held at the Grand Central Hotel, Leeds, for the purpose of considering the question of forming a horticultural society for Yorkshire or the North of England. Mr. P. Clapham, of Calverley, presided over a representative gathering. Mr. W. Mansell suggested that the proposed society should extend its work over an area bounded by the Tyne in the north and the Trent in the south, as at present, to see a good exhibition, it was necessary for a Yorkshire gardener to go either to Edinburgh or the South of England. Mr. T. H. Gaut considered the society should be on the lines of the Royal Horticultural Society. After some discussion it was, on the motion of Mr. J. Donoghue, seconded by Mr. Gaut, resolved to appoint a temporary committee, with Mr. A. J. Allsop as chairman and Mr. Clapham as secretary, for the purpose of drafting a scheme. It was also decided to submit the scheme to a representative meeting, to be held, if possible, on the 22nd inst., at the Grand Central Hotel, Leeds.

Cider and Perry Fruits will be discussed by Mr. B. T. P. Barker, M.A., on Tuesday, October 11, who will lecture on this subject at the Royal Horticultural Hall, at 3 p.m.

Transparent Museum Specimens.—At the recent meeting of the Royal Horticultural Society's Scientific Committee, Dr. J. A. Voelcker showed a section of a woody stem prepared in the same manner as those of zoological anatomical specimens shown by him last year. The section was immersed in a fluid which rendered it practically transparent, and made its structure throughout evident to the eye, although the specimen was about ¼ inch thick. The mixture of oils and ethers, etc., which renders this mode of preparation possible, is the discovery of Professor Werner Spalteholz, of Leipzig University.

Pentstemons from Hawick.—The Buccleuch Nurseries, Hawick, have been so closely associated with the development of pentstemons as florists' flowers, that the box of spikes of the finer forms we have had the pleasure of receiving from John Forbes Hawick, Lim., was of quite exceptional interest. The florists' pentstemons are alike remarkable for the height and strength of the flower stems and for the splendid development of the individual blooms, and when grown under the conditions favourable to their full development they produce a fine effect, whether occupying positions in the mixed border, or in beds wholly devoted to them. Especially noteworthy among the fine varieties received from Hawick are: Sandringham, bright red; Mrs. J. McHattie, rich purple; Mrs. Michie, crimson; Marchioness of Linlithgow, bright pink; Miss Noble, rose-red; John Lamont, scarlet; Colonel Seely, violet; Mrs. Cook, rich rose; Lizzie Roberts, white with mauve lobels, and Mrs. Forbes, deep purple.

Horticultural Club.—The next house dinner and conversazione will be held at the Hotel Windsor, on Tuesday, October 11, at 6 p.m. Mr. George Bunyard, V.M.H., has promised to lecture on "Impressions of Carnae," and will illustrate his remarks with lantern views of the dolmens, menhirs, etc., of this part of Brittany.

Northern Fruit Congress, 1910.—The arrangements for the fruit congress and fruit show to be held at Hexham from the 20th to the 22nd inst., are, we learn from the Rev. J. Bernard Hall, the energetic honorary secretary, progressing satisfactorily. The exhibition will be of a comprehensive character, and the programme of the congress has been so prepared as to leave no doubt that the proceedings will be varied, interesting, and instructive. As indicating the importance of the gathering, it may be mentioned that deputations from the Royal Horticultural Society, the Royal Caledonian Horticultural Society, and the Scottish Horticultural Society will attend.

Admission of Dematured Tobacco.—At the meeting of the National Fruit Growers' Federation, held at the Horticultural Hall on Monday last, the secretary, Mr. W. Miskin, reported that there had been no developments in the agitation initiated by the Federation to induce the Government to allow dematured tobacco to come into the country free of duty. From this waste tobacco a solution was obtained which was of great value as an insecticide. The only source of supply at the present time was from waste tobacco in bonded warehouses, and so meagre was this quantity that the price had this year been forced up to 17s. a pound. Only amateurs had been able to avail themselves of the nicotine, which for the commercial fruit grower should cost no more than 5s. a pound. Mr. Miskin was directed to ask the Board of Agriculture if there were any hopes of the matter being dealt with in the next Finance Bill. It was arranged provisionally to hold a conference of large fruit growers and delegates from federated societies, on the invitation of the principal, at Wye College on December 2.

Fruit Trade in France.—According to a Foreign Office report on the trade of Lyons, various attempts have been made in the last few years to form small local co-operative unions of growers in this district for the disposal of their produce, but hitherto without success. In 1909, however, a group of fruit growers in one commune of the Department of the Rhône, agreed upon common action for the sale of their cherries on the Paris market, each member being responsible in turn for the collection of the fruit, its delivery to the railway station, and its despatch to Paris. The experiment was a great success, and the growers realised handsome profits. On its side, the Paris, Lyons, and Mediterranean Railway Company endeavours to stimulate the cultivation of early fruit and vegetables for the Paris and foreign markets in the districts through which that line passes. By means of special packing and fast trains, these perishable goods arrive quickly at their destination. The time now occupied in transit from Lyons to London is only twenty-eight hours.

"**Plant Life in Alpine Switzerland**" is an interesting contribution to the literature of the Swiss Flora. It is illustrated with forty-eight plates of photographs from Nature. The author is Mr. E. A. Newall, M.A., F.L.S., F.G.S., and the work is published at 7s. 6d. net by Mr. John Murray, 50a, Albemarle Street, London, W.

Dry Weather at the Equinoxes.—"W. M., Cheshire," writes: The year 1910 will be remembered as remarkable for the unusual dryness of the months of March and September, the time of the vernal and autumnal equinoxes. During March we registered 0.56in. of rain, and this amount fell during six days; in September we registered 0.22in., which, by a singular coincidence, was also distributed over six days. It is really surprising how dry the ground has become during September, although August was such a wet month; therefore it will be a good plan to defer the planting of trees and shrubs until the ground is fairly moist with the rains we may expect during October.

Perpetual Carnation Society.—This society will hold its winter exhibition at the Royal Horticultural Hall, Westminster, on December 13. Full particulars and schedules may be obtained from the Secretary, Mr. Hayward Mathias, Lucerne, Stubbington, Fareham.

American Gooseberry Mildew in Suffolk.—At a recent meeting of the Suffolk County Council, at Ipswich, it was reported by the clerk that the thirty outbreaks of gooseberry mildew reported on July 15 had increased to fifty-four, and there was reason for believing that there were other cases which had not been reported. It is possible during the autumn to take remedial measures to cope with the plague, and thus save next year's crop from heavy loss. An expert explained that the methods of treatment are by spraying and then cutting off the shoots attacked and burning them, otherwise the germs are blown about and infection is spread. Young bushes are more likely to become diseased than are seasoned bushes.

Horticultural Education in Edinburgh.—The interesting departure of the Edinburgh School Board in instituting a horticultural class for adults has met with great success. The class, which comprises both men and women, is associated with the school in Gilmore Place, while a quarter of an acre of waste ground in Warriston Park has been transformed into a flower, fruit, and vegetable garden. The class has two sessions—summer and winter—and instruction is given on two days in the week—Tuesday and Saturday. During the past summer session 42 pupils attended the class. The instruction given relates to the preparation of the ground by digging and manuring, sowing seeds, and tending the growth of the crops, special attention being devoted to insect pests.

French Horticultural Society of London.—The annual "Bulletin" of this society has reached us, and proves not less interesting than those of previous years. Sir Albert Rollit's portrait adorns the frontispiece; there is a list of members, and accounts of the monthly meetings, and a word of counsel to young Frenchmen proposing to enter service in horticultural establishments in the London district. There is a capital account of the banquet and proceedings held in January, 1910, and M. E. Stappaert gives an account of horticulture in the London area. Numerous articles follow, these having been given at the society's regular monthly meetings. The Temple Show of 1909 is described at some length, and at the end the Board of Agriculture's account of forestry education in Great Britain is reproduced in English. The society's finances, like everything else connected with it, are flourishing under the care of Mr. Schneider and Mr. W. O. Hiehle; a balance to the good of £232 10s. 1d. shows the excellence of the management.

British Grown Fruit.—We may remind our readers that the Royal Horticultural Society's exhibition of British grown fruit will be held at the Royal Horticultural Hall, Westminster, on October 13 and 14; doors will be open at 1 p.m., on the first day, and 10 a.m. on the second day, and will close at 6 p.m. each evening.

A New Disease of the Tomato.—We have to record the fact that a tomato disease practically unknown to cultivators in this country has made its appearance in the Henllys district of Monmouthshire. Specimens of plants and fruit affected by the disease have been sent to the Board of Agriculture for identification of the nature and origin of the disease, and for information as to its prevention. The Board has been able to declare the disease to be the tomato and potato bacteriosis, the organism concerned being termed Bacillus solanacearum (E. F. Smith). This disease was first discovered in potatoes, though on a very small scale, in the North of England and in Scotland in 1902. So far as Mr. Grant, the Director of Agricultural Education for Monmouth, has been able to ascertain, the first and most pronounced attack upon the tomato has been in the county of Monmouth. It would appear, says Mr. Grant, that the spread of this disease is caused by insects of various kinds which feed alternately on diseased and healthy plants, hence the necessity of immediate destruction by the burning of any tomato plants that may show the slightest indication of being attacked. Mr. Grant believes this new disease to have been imported from America in tomato seed. He strongly recommends that the soil in which an affected tomato crop has been grown, though only a few plants may have been attacked, should either be burned or treated with an application of gas lime. Soil in which tomatoes are to be grown might, as a precaution, be treated with a half-hundredweight per acre dressing of superphosphate, and the plants, from an early stage of growth, be frequently sprayed with Bordeaux mixture.

The Potato Crop.—It is highly probable that before the winter is over there will be a shortage of potatoes. From many quarters we hear of disease spreading badly in crops that were lifted as soon as fit, and when there was little appearance of disease in the haulm. Where harvest operations of various kinds delayed the work of lifting potatoes, the tale of diseased tubers is unpleasant. In the United States it is estimated that the potato yield is 70.5 per cent. of a full crop. Reports to hand also tell of the failure of the late potatoes in Southern France.

Pinching the Plums.—Our contemporary, the "Agricultural Gazette," tells the following amusing tale: A teacher of a large school in the East End of London sent one of her scholars to buy a pound of plums from one of the costers outside, and as she handed the girl sixpence, said: "Be sure, Mary, before buying the plums to pinch one or two just to see that they are wholesome." In a little while the girl returned with flushed face and a triumphant look in her eyes. Handing the teacher the bag of plums, she dashed the sixpence on the desk, exclaiming: "I pinched one or two, as you told me, and when the man wasn't looking I pinched the lot!"

BIRDS IN THE GARDEN.

There are many persons who set the highest value on the services of birds in the garden, even among those owners who cultivate with a view to supplying domestic needs. A few there are who presume to be quite satisfied if the birds take all, or practically the whole of the fruit crop as each kind comes into season, but it is pretty certain that even the most whole-hearted bird lover will sooner or later tire of the cost of gardening when bird monopolies are absolute. The passing season is one when the garden seems to have been overrun with birds, not of one species only, but many. Blackbirds, at the present moment, swarm everywhere, and whole crops of pears, plums, and apples have been ruined by them, and this, too, in a season when the supply is so disappointingly limited.

Tomtits usually spoil quantities of choice pears by sampling, and, unless placed in bags, few remain sound to be brought into the store. They are not content this year with sampling only, they are seen actively engaged feeding with blackbirds on pears as yet unripe. As a change of diet they choose late peas as quite their own property, and from several lengthy rows of Autocrats and Gladstones one cannot get a respectable dish for the table. Chaffinches are usually looked upon as seed-eating birds, and in summer time give but little trouble among garden crops. This year, for the first time, they have set upon garden peas, in company with the impertinent tomtit. We had not taken serious notice of chaffinches flitting about the pea rows, until it was observed they were engaged in feeding on green peas. It is true, birds do change their customs, and vary their tastes with passing seasons, and so, perhaps, it is not so very unusual for chaffinches to find new diet from the pea rows. At the same time the gardener's chances receive another setback, when invasions such as these become so numerous and varied.

It is curious how blackbirds choose certain kinds of apples and pears, following their favourites with such assiduity that unless steps are taken to protect them they clear the whole tree of its fruit in a short time. Doyenne Boussoch we have for years noticed to be an early favourite of the blackbird, and unless netted a large tree provides no supplies for home dessert. In some previous years wall plums escaped both blackbird and thrush, but in later seasons nets have become as essential for these as for strawberries. Formerly, too, it was only the dark-coloured plums that attracted the notice of these birds; this year they do not discriminate at all between colours. Starlings, when they visit fruit areas, terrorise the owner or those responsible, because invasions of these birds are in flocks, and crops vanish quickly. Hawfinches seriously reduce peas, and bullfinches not only convert fruit buds into food during winter, but they assert a right to their share of raspberries in summer. It is passing strange that in a year when weeds of all kinds have been so plentiful, and passed freely through flower and seed stages, offering, one would think, ample natural foods, that birds assume a right to cultivated crops. W. S.

Wilts.

DODDER.

The question to what extent the various species of dodder are harmful to crops is one which is of considerable interest, and the leaflet relating to this destructive parasite that has been issued by the Board of Agriculture, and is herewith reproduced, will be found helpful to cultivators.

Description of Certain Species of Dodder.

Some eighty species of dodder are known to science, and of these several occur in Britain. Dodder is botanically included in the order Convolvulacæ under the genus Cuscuta. The dodder plant is an annual, growing from seed either self sown or sown with other seed, and it is parasitic on other plants of a higher order, germination, however, taking place in the soil. Four species or varieties are mentioned in Hooker's Flora of the British Islands, these being Cuscuta europaea, C. epilinum, C. epithymum, and C. trifoli, the most important being C. trifoli. Other species, however, which have been introduced with imported clover and other seeds, may cause much damage in European countries, these being C. corymbosa (of American origin), C. Gronovi (also American), and C. monogyna. All species are parasitic on other plants, and all have the same method of reproduction.

Cuscuta trifoli.—This species, significantly termed "clover dodder," and, according to Hooker, a variety of C. epithymum, is the species commonly met with. It chiefly attacks red clover and lucerne. After a seed has once germinated the seedling quickly dies unless a clover or other suitable plant be at hand. Once established on a plant, however, it sends out roots or suckers (haustoria), which take firm hold of the host, loses its connection with the soil, and thereafter, unless checked, will rapidly spread in all directions by means of its slender, thread-like stems, which twine round the plants from which the pest draws its sustenance. C. trifoli is quite leafless, but produces clusters of small white bell-shaped flowers, each of which yields a two-celled capsule. Each cell contains two seeds, a single flower, therefore, producing four.

C. epithymum.—The flowers of this species are variable in colour, and about ¼ to ¾ inch in diameter, opening from July to October. The stems are reddish in colour, and very slender. It occurs in Britain from Ayr southwards. It is also termed C. minor, or lesser dodder.

C. europaca.—In this specias the stems are reddish or yellow in colour, and as thick as twine, the flower-heads being from ¼ to ¾ inch in diameter, and tinged with red. Flowering takes place in Britain during the summer months, the species being found from York to Sussex and Devon; it is, however, rather rare in Britain. This species is also known as C. major, or greater dodder.

E. epilinum.—This species, flax dodder, occurs sporadically on flax in Great Britain and Ireland, and is distributed throughout Europe. It is as large as the last species, but is paler and more succulent. It flowers during summer.

C. Gronovi.—This parasite, known as large American dodder, was identified in France by M. Schribaux some twenty-five years ago, when it appears first to have been introduced into that country from Canada or the United States. Owing to the fact that the seeds are about the same size as those of lucerne, they are with difficulty separated therefrom, and this renders the pest more dangerous. It is believed that this species does not ripen its seeds in this country, but the seeds germinate when sown, and produce dodder plants which are quite able to kill their host plant.

C. monogyna and C. corymbosa (C. hassiaca, or C. suaveolens) are also harmful to certain plants. The latter is of American origin, and bears large seeds.

Description of Dodder Seed.

The seeds of most species of dodder are very small—usually much smaller than the seed of red clover—roundish, and angled. It may be stated that they are generally smaller than the seeds of the plants on which they are parasitic. Exception must be made, however, in the case of the large American dodder, C. Gronovi, which is much larger than the seed of most species. The seeds of C. trifoli are roundish, about 1 mm. in diameter, dull in appearance, and grey, brown, olive-brown, or yellowish-brown in colour. In the case of C. epithymum the seed is round-oval in shape, and yellowish-brown in colour.

Dodder seeds can soon be recognised with a little practice, but cannot be certainly identified without the aid of a pocket-lens, or a slightly enlarging microscope.

Life History.

The embryo of the dodder seed is simple and thread-like, and coiled spirally round the fleshy albumen, while the radicle is thickened. The seeds seem to germinate best during damp seasons. At a suitable temperature they will germinate in five to eight days. When a seed germinates the thread-like coil unwinds gradually, the radicle end taking root in the soil, the remainder meanwhile lengthening and when it reaches a suitable host commences to twine itself round the stem, to which it attaches itself firmly by means of the suckers or haustoria. (Should the thread-like stems fail to reach a suitable host plant, they die.)

The plant now extends its thread-like stems to neighbouring plants, and large patches may rapidly become infested and overcome, the dodder soon leaving its hold of the soil, and living wholly on the host plant. On becoming firmly established the dodder grows and spreads rapidly, produces flowers, and, if nothing be done to prevent it, seeds are formed and the soil is re-sown. Small fragments of the stems, constituting veritable cuttings, may suffice to establish new centres of infestation, attaching themselves to fresh plants. M. Marre states that dodder may also be spread by means of little tubercles, which are formed in winter.

As stated above, however, dodders are annual seed-producing plants, and are no doubt chiefly distributed by seed included amongst agricultural seeds.

As regards the life-history and manner of growth, the various species closely resemble one another. The harm done is best explained by stating that dodder possesses no chloroplasts, and is unable to take up carbon dioxide from the air like ordinary green plants, but after leaving its hold of the soil, it depends entirely for its food material on the ready-made products which it absorbs from its host plant, which therefore becomes exhausted and dies. So rapidly does the pest spread that it has been stated that in three months a single stem may kill all the clover or lucerne plants on an area of twenty-eight square metres (thirty square yards nearly), and so complete is the destruction that one would say a fire had passed over the spot. Infested plants may be said to present the appearance of being wound about with reddish or yellow threads.

(To be continued).

Nerine Fothergilli major.—There are now a great number of nerines in cultivation, many of them being garden hybrids, but for general purposes this is second to none. Its requirements are less exacting than some of the others, and it will flower freely, providing the bulbs get a good roasting in the summer. The effect produced by its brilliant scarlet flowers is very striking, and when well-bloomed plants are arranged in the conservatory they at once attract attention. Though the above name is the one generally applied to it, this nerine is now by botanists assigned the specific name of curvifolia.—W. T.

ORNAMENTAL GOURDS.

The cultivation of gourds is not so much taken up in this country as it might be, occasionally one sees a few plants grown for the sake of novelty, but even then they are planted out and allowed to ramble about much as the vegetable marrows are, and, consequently, much of their beauty and colouring is lost. On the Continent many of them, besides the ordinary vegetable marrow, are grown for eating purposes, and are largely used for soups and jam making.

As decorative subjects they are well worth attention, and, as they cover a very large amount of space in a very short time, they in many instances are very useful, and, whether trained up a larch pole, or covering a trellis or pergola, they are equally at home, providing they are not placed in too exposed a position. The cultivation is very simple, but as their season of growth is very short, the ground in which they are to be planted must be thoroughly well prepared. Personally I do not advocate the growing of them on manure heaps, as with too vigorous growth the fruit does not set so well as when the growth is a little less rampant. I prefer to trench the ground about three feet deep, giving a fair dressing of manure, in fact about the same as for any other kitchen-garden crop.

The seeds should be sown in 48's, two seeds in each, about the first week in April, and placed in a moderately warm house, or in a frame on a mild hotbed. As soon as the plants are large enough to make sure they are going to grow away nicely, the weakest of the two should be pulled out, and a few days after this they should be strong enough to remove to a cold frame. Keep well supplied with water, and about the middle of May they should be ready to plant out. Previous to planting thoroughly pulverise the soil to give them a chance to grow away freely; should there be any chance of cold winds or frost they must be protected for a time with handlights, or a few branches of laurel, till all danger is past. With the advent of warm nights growth will be very rapid, and if the plants are to be trained they must be attended to regularly, and the tying should be done with some strong soft string, as when they are well set with fruit, particularly with the larger fruited varieties, there is a good deal of weight to support.

At all times they should be kept fairly moist at the roots, and once the fruits begin to set freely liquid manure should be given in quantity, and occasionally a little artificial fertiliser will help to swell the fruits. If they are wanted to be kept during the winter for filling large bowls, etc., in the house, they should be left on the vine till they become thoroughly hard and dry, when they will keep for a good length of time, some of them for two or three years.

There are very many varieties worth cultivating, but it is a difficult matter to keep them true; they intercross very freely, and where they are just grown for garden decoration this is not a disadvantage, as the results are very curious and interesting.

A few useful varieties are as follows: the Giant White, Yellow and Grey, Red Etampes, Crown Gourd, Turk's Cap, Crook Neck, Striped Bergin, and Ohio Squash, these are all fairly large. Amongst the smaller varieties are the Egg-shaped, Pear, Apple, Orange, Nutmeg, and Gooseberry, these taking after the shape of the fruit from which they are named, and many of them may be had in the warty and striped forms.

Thomas Stevenson.

AZALEA NOTES.

Azaleas are such favourite subjects for spring flowering under glass that one is apt to lose sight of the fact that they are especially valuable for outdoor decoration, and in the hands of a careful planter they are capable of some gloriously effective displays.

They are of especial value for lawn groupings, and are delightful subjects for favourable positions in the rock and wild gardens, and ought to become very popular for emphasising rockwork formations and for crowning bluffs and banks with a dominant note of colour.

In the gardens of Japan azaleas are freely planted, and in the majority of cases very charming effects are created by their use. This free adoption of azaleas in the making of the garden is doubtless derived from the wealth of native Japanese forms, and the glorious pictures they produce in a state of nature. Mountain slopes and rocky bluffs are "fired" by the glow of the azaleas when in blossom. Rich hues are delineated in all their beauty against the dark boulders and the grassy slopes, and a distant view gives a truer idea of their value than close inspection, though they are beautiful at any distance. Having regard to their picturesque effect, I would urge the idea of massing suitable forms on the higher summits of the rock garden, using them freely in order to produce those "glowing masses" which are so pleasantly effective.

In the open spaces of the wild garden, upon the grassy knolls, and rising banks, the azaleas are worthy of extended planting. Bold, free grouping will give delightful results, especially if the species or varieties used are grouped separately, and not intermixed in an indiscriminate manner. In the flower garden proper azaleas of the various types look well in beds upon the lawns, and will provide pleasing front-row plants to groups of rhododendrons, or to other arrangements of flowering shrubs.

Peat is usually recommended for the culture of these subjects, but it is not absolutely necessary, as the majority can be well grown in good rough fibrous loam and leaf-mould. A combination of the three might attain to the ideal, and I certainly regard the use of loam as being of value for the production of short bushy growth, as well as assisting in the prolonging of the display of blossom. Many of the species grown are of Japanese origin, among these being the favourite A. mollis. No word of mine is necessary to advocate the merits of this group, for it is extensively grown in the majority of gardens.

There are many named varieties of note, including such gems as W. E. Gumbleton, multiflora, Elizabeth, M. Koster, Mrs. L. J. Endtz, and Comte de Gomer, these being but few among a very fine range of colourings. The newer hybrids, raised by crossing superior forms of mollis with A. sinensis, are certainly a noteworthy group, among which are some specially bright forms. Among the finest one might note Alma Tadema, a soft rosy-pink; Charles Darwin, a bright clear red; Emil Liebig, a glowing salmon-red; Anthony Koster, bright yellow; Baron von Wolff, primrose, margined with pink; General Vetter, orange; and Dr. Pasteur, a bright shade between orange and red.

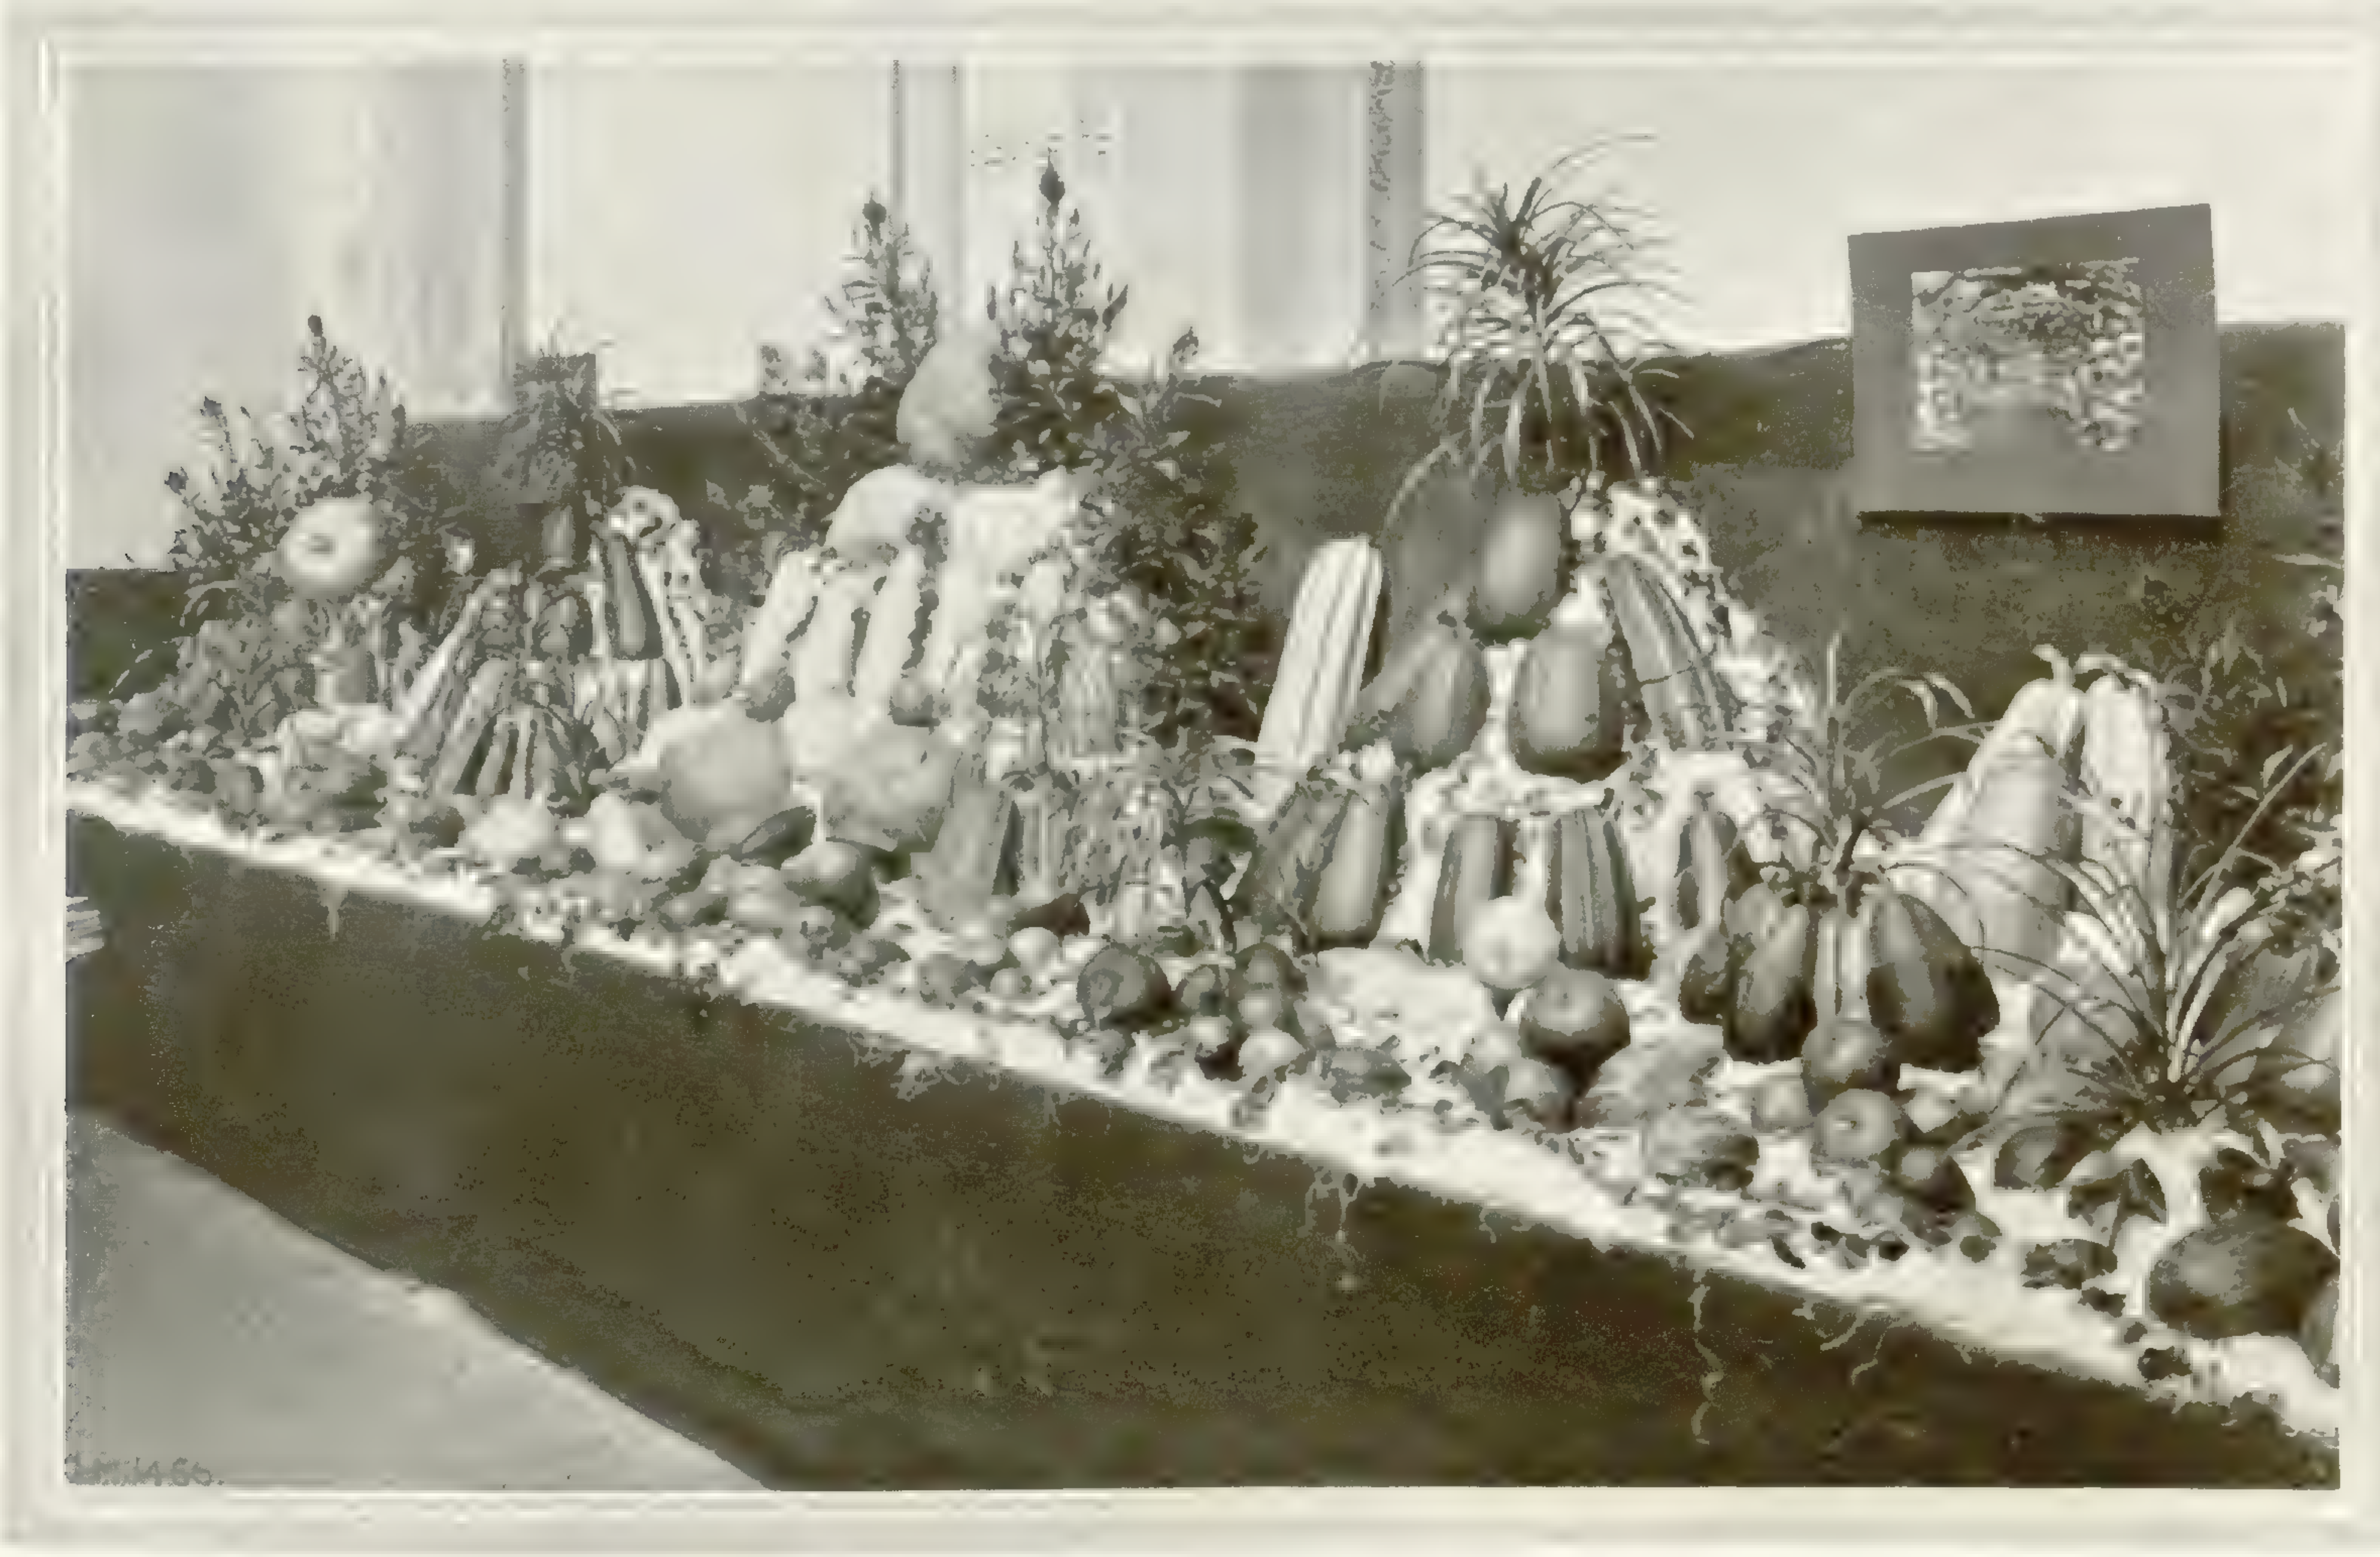
These, of course, are excellent for forcing, but grown outside they are of even greater importance, and after the blossoms are past and forgotten one has the beauty of the foliage colourings in the autumn. The dwarf evergreen species and varieties are exquisite for rock garden adornment. A. roseflora is typical of the value of the group, and one notes with pleasure that this beautiful rosy-salmon gem is becoming popular; certainly its neat habit and rich-hued blossoms are great points in its favour. Others of the same Japanese group are Daimio, an effective dwarf with glowing salmon-scarlet blossoms; Mikado, a bright rich red; and the soft rosy-pink Forsteri.

Other sterling Japanese azaleas include the exquisite A. ledifolia, and its charming varieties. These are extremely fragrant, and the forms alba, a wonderfully profuse white, and rosea, a somewhat rare rose-pink, are probably the best. The clouds of blossoms which these varieties carry make them very conspicuous and pleasing.

A. Omurasaki, a new introduction, is recommended for its freedom and earliness; the blossoms are of a bluish-lilac shade. In A. Hinodegiri we have a typical favourite of the Japanese garden maker. It is delightful for massing, and its "fire-lit red" colouring, and its floriferous habit, should make it as popular here in the future as it is in the Flowery Land. A. amœna, a neat little shrub with rosy-magenta flowers, is of service for the rockery, where its earliness and its bright touch of colour are duly appreciated. Somewhat dwarfer, but a very pretty companion plant, is A. alpina, which is of a soft pink shade.

Of the North American group one briefly notes A. Vaseyi, an April-flowering gem of pale pink colouring, which is of especial value for wild garden plantings. A. lutea, a deep yellow of medium height, is wonderfully pretty en masse; the white A. nudiflora, which loves a cool soil with a little shade, is noteworthy with its tube-like blossoms; whilst the fragrant cream-coloured A. viscosa is somewhat similar in formation.

P. S. Hayward.



DISPLAY OF ORNAMENTAL GOURDS.
Made at the Royal Horticultural Hall, Westminster, on September 24, by Mr. Thos. Stevenson, gardener to E. A. Mocatta, Esq., Woburn Place, Addlestone.

Philesia buxifolia.—This is a near ally of Lapageria rosea, and, like it, a native of the temperate regions of South America. Instead, however, of being like the lapageria—a decided climber, the philesia forms a dense tuft of leaves, not much bigger than those of the box, though they have the harsh texture of the lapageria. The flower, too, greatly resembles a small bloom of Lapageria rosea, while they were both introduced by William Lobb about 60 years ago.—W. T.

NOISETTE ROSES AND THEIR HYBRIDS.

In the majority of catalogues the Noisettes are amalgamated with the tea-scented roses: and justly so, seing the number of varieties that possess the generally recognised characteristics of both classes. Caroline Kuster is usually spoken of as a Noisette, while such authorities as Messrs. Paul and Son put it among the Teas. A rose that is surprisingly little known, considering its age and great decorative beauty, viz.: Souvenir de L. Viennot (Bernair, 1897), is considered a Tea by Messrs. B. R. Cant and Sons and William Paul and Son, but Messrs. Paul and Son place it among the Noisettes, and personally it seems quite as much entitled to that class as does Caroline Kuster; but I must add the National Rose Society classes it as a Tea. Many such variations occur to one who has any acquaintance with roses.

It was not of these differences of opinion as to classification that I wished to treat. however, so much as call attention to a few of our best Noisettes, and we number many very old favourites among these. For instance, Céline Forestier has been with us since 1858, and is still one of the best yellow climbers, almost evergreen, and very sweetly scented. But we have a much older favourite in La Marque (1830), a rose it is difficult to beat in its colour—pure white, with a lemon shade in the centre—and where it seems at home we have no stronger growing or freer blooming variety. Near here is a plant that is known to be upwards of 60 years old, and that has a stem about four inches in diameter; and yet it produces a good crop year after year. La Marque needs a warm and sheltered situation, and then, like the Banksians, it is difficult to dethrone.

DISPLAY OF POT-GROWN FRUIT TREES.
Made at the Royal Horticultural Hall, Westminster, on September 24, by the King's Acre Nurseries, Lim., Hereford.

In Aimée Vibert (1828) we still possess one of the hardiest and most continuous bloomers, which is justly considered by many the best pure white cluster rose for arbours, pergolas, and any rustic work, while it is almost evergreen, and as free from mildew and red rust as any variety I am acquainted with. Ophirie (1841) is yet another old rose that always flowers freely late in the season, when its nankeen and copper blossoms are very welcome. It is not so much grown as it deserves, but one sometimes meets with a veteran plant upon the wall of old buildings. Rêve d'Or (1869) and William Allen Richardson (1878) need no commendation except to say that, with L'Ideal (1887), they are quite indispensable climbers; their colours being too well-known to need any description. I had almost overlooked Triomphe de Rennes (1856), a seedling from La Marque, but by no means so rampant a grower. It is very much hardier than its parent, and pure primrose yellow throughout.

There is a newer Noisette that I do not find in many lists, which can be recommended. This is Crépuscule. It is a good grower and free blooming. Rather a difficult colour to describe, quite distinct, and one of the best. "A rich coppery-yellow, rayed and tinted with nasturtium-red," fits it very well, and is from the only list in which I find it. Our own experience of this rose is very favourable, it being hardy and with good foliage.

A few Hybrid Noisettes deserve a word or two, for in them we have Madame Alfred Carrière (1879), a Nickerson Cup winner, which is about the highest praise a rose can have, seeing it is the result of so many votes from all growers of repute. A large, almost white flower, with a tinge of pale yellow at the base of its petals, very sweet-scented, and as suitable for any purpose or position as the old Gloire de Dijon, if not more so. Boule de Neige (1867), often placed among the Hybrid Perpetuals in nurserymen's lists, claims its correct place under the Hybrid Noisettes.

But I must not miss Maréchal Niel (1864), still the best yellow upon a sheltered wall, and unapproachable under glass. The opinion has been expressed that we do not see this grand rose in the same perfection as was the case some ten to fifteen years back, and many theories have been advanced to account for this. Last spring I saw it in a cool conservatory, and never came across better specimens. I must admit it is long since I saw it in any way approaching the grand blooms almost everyone seemed able to secure some twenty-five years ago; so many plants produce comparatively small flowers, and entirely deficient of the intense golden yellow so much desired. This, I take to be a Noisette, although not a few folks list it as a Tea.

Uckfield. **A. Piper.**

TWO FINE EXHIBITS.

There were many fine exhibits at the recent meeting of the Royal Horticultural Society, and two of these we selected for illustration in the present issue. Both came under the jurisdiction of the Fruit and Vegetable Committee; both of them merited and received a Silver-gilt Knightian Medal, and yet each was as distinct from the other as it possibly could be.

From the King's Acre Nurseries, Hereford, came a fine collection of grandly grown fruit trees in pots, the wonderful crop of fine fruits that these carried proving a great source of interest to the visitors. The kinds represented were apples, pears, grapes, figs, plums, and peaches, and though all these were good, the grapes, Alicante, and the pears were of outstanding merit.

The ton weight of gourds, squashes, and marrows staged in most attractive fashion by Mr. Thomas Stevenson, gardener to E. A. Mocatta, Esq., Woburn Place, Addlestone, was probably the very finest exhibit of ornamental cucurbits, fruited out of doors, ever exhibited. As already stated, these are grown on a pergola 12ft. wide and nearly 80 yards long, and each year the display at the end of the summer is a wonderful one, the brilliant colouring and varying form of the fifty or sixty varieties grown being unusually attractive.

THE BARNHAM NURSERIES, LTD.,
BARNHAM, SUSSEX.

Messrs. WM. ARTINDALE & SON,

Nether Green Nursery, Sheffield.

THE FIRST AND ONLY PURE WHITE DELPHINIUM.

Two Startling Novelties.

THESE two new varieties, which are now offered for the first time. Both grow 5—6ft. high, and produce enormous flower stems with large flowers, and the branches, which are produced in enormous quantity at the base of the central spike, are longer than of any other variety, several measuring over 2½ft. This makes both these varieties the best for cutting purposes, as they flower from June till late in summer.

DELPHINIUM HYBR. MOERHEIMI, has large flowers of the purest white, and not the slightest shade of creamy, bluish or greenish, like the so-called "white" Delphiniums, which have been introduced the last few years, and to which it cannot be compared. **It is doubtless the best hardy perennial introduced in the last ten years.** Award of Merit R.H.S. July, 1909. **10/6** each. (Only a limited quantity will be sold and orders are requested at once.)

DELPHINIUM HYBR. CAPRI, of quite the same growth as "Moerheimi," being a counterpiece of same it much resembles in colour to "Persimmon," but is in every respect an improvement of this variety; the flowers are larger and the spikes longer and of a more branching habit. We consider it as the **best sky blue single Delphinium** in commerce **10/6** each.

Our Catalogue of 200 pages will be posted free on application

DAFFODILS AND NARCISSUS.

NEW PLANTS, ETC.

CYPRIPEDIUM SHOGUN.

This very fine cypripedium is of unknown parentage. It has a dorsal sepal over three inches broad, and of the finest shape, white at the apex, yellow-green below, and heavily marked with rows of purple spots. The petals are yellow-green shaded with brown, and the lip is of similar colour. The lower sepal is particularly large, green and white. F.C.C., R.H.S., September 27.; Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester.

PHAIUS COOPERI.

This new species was shown previously, on January 11 of the present year, when a Botanical Certificate was granted, but on this occasion a higher award was made. The leafage is long and robust, but the flower spike is dwarf, the flowers being of fair size, with deep bronzy-red white-margined sepals and petals, and a white, purple-marked lip. A.M., R.H.S., September 27. Messrs. Sander and Sons, St. Albans.

CATTLEYA LUEGEÆ.

A very handsome and large-flowered cattleya, obtained by crossing C. Enid with C. Dowiana Rosita. This splendid hybrid has one small tailing, i.e., the throat of the lip expands rather much, and displays the whole of the column. The sepals and petals are broad, deep rose-purple, and the big spreading lip is ruby-purple handsomely veined with gold. A.M., R.H.S., September 27; Messrs. Charlesworth and Co., Haywards Heath.

LÆLIA DEGEESTIANA THOMPSONI.

A pretty hybrid derived from L. Jongheana alba and L. flava. The sepals and petals are white, and somewhat narrow; the narrow lip rich deep yellow, and waved. A. M., R.H.S., September 27; W. Thompson, Esq. (gardener, Mr. Stevens), Walton Grange, Stone, Staffs.

CATTLEYA DIRCE MAGNIFICA.

A large and handsome form of the hybrid between C. Warscewiczi and C. Vulcan. The sepals and petals are deep rose-purple, the lip of brighter hue, and lightly veined with gold. A.M., R.H.S., September 27; Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester.

VIBURNUM HENRYI.

A new and hardy Chinese shrub that has already been well proved. As shown, it is about 4½ft. high, and has rather narrow, serrately-margined bronzy-green leaves, and an abundance of axillary clusters of red and black fruits. It will evidently be a very useful shrub. F.C.C., R.H.S., September 27. Messrs. James Veitch and Sons, Chelsea.

DAHLIAS.

Flagstaff.—A garden cactus variety, long-stemmed, and a pretty combination of yellow and rose. A.M., R.H.S., September 27. Messrs. J. Stredwick and Son, St. Leonards.

Loveliness. — A fine rose-pink decorative variety of splendid size, and with long stems, described on p. 742. F.C.C., N.D.S., September 27; Mr. Charles Turner, Slough.

The Moor.—A neat pompon dahlia of deep dark crimson hue. F.C.C., N.D.S., September 27; Mr. S. Mortimer, Farnham.

Kingfisher.—A finely-formed cactus dahlia of deep rosy-mauve colour; very striking. F.C.C., N.D.S., September 27; Messrs. J. Stredwick and Son.

Golden Eagle.—A beautiful cactus dahlia with incurving tips; the colour is soft yellow overlaid with rose and fawn-pink. F.C.C., N.D.S., September 27; Messrs. J. Stredwick and Son.

CHRYSANTHEMUMS.

Hollicot Golden.—Another member of the new race of large-flowered early chrysanthemums. It is of rich golden-yellow colour. A.M., R.H.S., September 27; Mr. Roots, Holly Cottage, Cranford.

Betty Spark.—Though not so large as other fine things from this raiser, the new-comer has substantial flowers of a rich deep rosy-lilac or rosy-pink shade. A.M., R.H.S., September 27; Mr. W. Roots, Cranford.

CARNATION LADY ALINGTON.

A useful long-stemmed fragrant perpetual carnation with flowers of good form and substance, an excellent non-bursting calyx, and a lovely shade of self pink. A.M., R.H.S., September 27; Messrs. Stuart Low and Co., Bush Hill Park, Enfield.

ROSES.

Mrs. Herbert Stevens. — A shapely tea-scented rose with pointed flowers of great beauty; the colour is soft creamy-white. Gold Medal N.R.S., September 15; A.M., R.H.S., September 27; Messrs. S. McGredy and Son, Portadown.

Ethel Malcolm.—A fine hybrid-tea rose of rich blush-pink shade; a large, full bloom. A.M., R.H.S., September 24; Messrs. S. McGredy and Son.

Dorothy Ratcliffe.—A beautiful H.T. rose, rather lighter, perhaps, than the Lyon Rose, but of very similar colouring, and we are afraid there will eventually be some confusion between the varieties, unless Dorothy Ratcliffe eventually assumes a more decided character. Silver-Gilt Medal, N.R.S.; September 15; A.M., R.H.S., September 24; Messrs. S. McGredy and Son.

PHLOX ELLEN WILLMOTT.

A distinct and charming phlox of dwarf habit, and carrying large heads of fine lavender-coloured blooms; a splendid addition. A.M., R.H.S., September 24; Messrs. Gunn and Sons, Olton, Warwick.

LOBELIA CARDINALIS GLOIRE DE ST. ANNES.

A very bold and stately variety of the Cardinalis group of herbaceous lobelias. The flowers are of large size, and rich crimson-scarlet colour, and these are borne freely on an erect spike at the head of 4ft. stems. The leaves are green, and of a shade that does not enhance the colour of the flowers. The variety is said to have resulted from crossing L. Firefly and L. Lord Ardilaun. A.M., R.H.S., September 24; Mr. A. Campbell, gardener to Lady Ardilaun, Clontarf, Co. Dublin.

PERENNIAL ASTER PEGGY BALLARD.

A useful addition to the select Michaelmas daisies. It is of dwarf habit, and carries a wonderful profusion of double rosy-violet flowers. It is a miniature Beauty of Colwall. A.M., R.H.S., September 24; Mr. E. Ballard, Colwall.

SOLIDAGO SPECTABILIS.

A fine hardy plant for autumn flowering. It grows about 2ft. high, and bears long graceful plumose spikes, crowded with tiny deep golden-yellow flowers. A real acquisition. A.M., R.H.S., September 24; Messrs. Paul and Son, Cheshunt.

SOLIDAGO SPECTABILIS.
A graceful golden-yellow hardy flower; A.M., R.H.S., September 24.
Messrs. Paul and Son, Cheshunt.

Pentstemon Newbury Gem.—This pentstemon, which has made considerably headway in popular favour within the last few years, and is often largely planted in the flower garden, is at Kew considered to be a recognised species, namely, Pentstemon Hartwegi. It is a native of the mountainous regions of Mexico. There is also a white-flowered variety, known as P. Hartwegi alba, which corresponds with the White Newbury Gem.—W. T.

Crossandra undulæfolia.—This near ally of the aphelandras is, like several members of this last-named genus, a very attractive flowering plant for the cool portion of the stove, or for the intermediate house. It is an upright growing subject that will flower when from a foot to eighteen inches in height. The blossoms are individually about an inch across, and of a bright orange-salmon tint. They are borne in a terminal head, from which a succession is kept up for some time.—W. T.

APPLES CROPPING WELL IN 1910.

An inspection of our trial apple orchard early in September showed certain varieties bearing well, even in this bad season, and my notes may be of interest to your readers who contemplate planting. The trees are sixteen years planted upon the paradise stock, grown in basin form, and they are summer pruned in August-September, and the leaders are tipped back to four leaves in February. They have a dressing of cow manure on the surface one season, followed by lime, then soot, kainit, and a light dressing of nitrate of soda, one stimulant being used in a season; nitrate or mulch of dung being given where the trees crop freely.

The trees average about seven feet in height, and have a spread of from 12 to 14 feet, according to the habit of the variety. They are a mass of fruiting spurs, which are thinned from time to time. The crop is given attention in June for the first thinning of the fruit, and again early in August. The result of this care is that every fruit is perfect of its kind, and the trees are sprayed for winter moth caterpillars as soon as the buds open, and, if needed, again after the blossom falls. In addition, a winter wash is given, so that the trees are unusually clear in the bark and healthy in the foliage. Many sorts are cankered, but as they are in trials, this enables us to avoid working such kinds. The land is lightly dug in winter, and the surface is kept open by hoeing, which is a most important factor in getting the wood ripened. The plantation is the admiration of all visitors, and an admirable guide to those who are about to plant. The trees have grown faster than expected, and are too close at 9ft. by 12ft.; 12ft. square would give best results.

Cooking varieties that can be recommended for general culture in gardens are: *Mere de Menagé, *Royal Jubilee, Hambling's, Warner's King, *Newton Wonder, *Bramley's, King's Acre Bountiful, Stirling Castle, *Lord Derby, *Lane's Prince Albert, *Grenadier, *Bismarck, *Lord Grosvenor, Alfriston, *Lady Henniker, *Golden Spire, and *Histon Favourite.

Dessert varieties are: *Venus Pippin, *Worcester Pearmain, *Cockle's Pippin, *Ross Nonpareil, *Baumann's Reinet, *Mabbot Pearmain, *Gravenstein, Adam's Pearmain, *Mannington Pearmain, James Grieve, Cox's Orange (some trees only), Braddick's Nonpareil, *Wealthy, *Sanspareil, *Hereford Queening, D'Arcy Spice, Old Nonpareil, *May Queen, *Lady Sudeley, Winter Ribston, *Allington Pippin, and Early Transparent.

Those marked with an asterisk are loaded with fruit; the others carry a fair crop.

The following less known kinds are also fruiting well, but they are not adopted for general cultivation, except in a few cases: Brabant Bellefleur, Dredge's Fame, Hereford Beaufin, Seaton House, Old Royal Russet, Nelson Codlin, Sultan of Devon or Red Ribbed Greening, Old English Codlin, Betty Geeson, New Bess Pool, Cobham, Mrs. Barron, Chatley's Kernel, Reinet Superfin, Frogmore Nonpareil, Boston Russet, Washington, Baxter's Pearmain, Cat's Head, Farmer's Seedling, Foster's Seedling, Gospatric, Croucels, and Early Rivers.

The crops in many cases are larger than were anticipated, but one fact is patent, i.e., that it is the well tilled arable lands that give crops this season. In orchards the long grass, lush from the wet season of 1909, prevented that ripening of the wood which is essential to secure fruit in an adverse season.

Maidstone. George Bunyard.

NEW PERPETUAL CARNATION LADY ALINGTON.
Flowers, bright pink; A.M., R.H.S., September 24; Messrs. Stuart Low and Co., Bush Hill Park, Enfield.

OUTDOOR PEACHES.

In a season like the passing one, when it has been the exception rather than the rule to find a good crop of peaches on outside walls, it is satisfactory to note that in a few gardens average, and occasionally more than an average, crop has been secured. Of the several crops that have come under my notice, the best is in the Wychcross Gardens, and comprise the following varieties: Waterloo, Alexander, Hale's Early, Bellegarde (extra good), Stirling Castle, Sea Eagle, Royal George, Goshawk, and Late Devonian, all carrying heavy crops of highly-coloured fruits. Other varieties are cropping fairly well, but those enumerated are the best. Nectarines carrying good crops at the time of writing are Humboldt, Pine Apple, Milton, etc., the first-named carrying the heaviest crop. The soil at Wychcross is strong, and with a disposition to encourage strong growth in the trees.

Mr. Field is a believer in annual or biennial lifting of the trees, and his trees so far justify his procedure. Certainly, it entails some extra labour, but it also checks that strong growth which is neither desirable nor useful in peaches, whether grown outside or under glass. One of the principal factors in successful peach culture is wood of medium length, well ripened, and all that tends to such production should be studied; this is much more necessary with outside trees than with those grown under glass, as inside trees will ripen a longer growth than can be secured outside.

It is not every gardener who has the courage to lift his outside peaches or nectarines annually or biennially, and even if he is bold enough, he may not be able to afford the necessary labour, as such work requires to be well done. Besides this lifting there are other essential details in the successful culture of outdoor peaches, and the question sometimes arises: Is it all worth the trouble, considering our seasons and climate? But with everything grown in or on the land, it is the man who does the thing thoroughly who commands success.

The condition of many stone fruits points to a too free root-run, and a too liberal compost at the start; it is not the amount of space a tree may have to root in that produces good crops, but healthy fibrous roots which cause the trees to make suitable fruit-bearing wood.

T. H. Slade.

STACHYS LANATA.

An old-fashioned plant, at one time fairly common in old gardens, but now less frequently met with, is the Woolly Woundwort, or Lamb's Ear, as it is frequently called, but Stachys lanata in botanical parlance. It is always a plant that those unversed in flowers view with some interest if his or her attention is drawn to it. This is because of the thick, wrinkled, woolly leaves, which are so soft beneath, and look so silky that one cannot well quarrel with the fancy which likens it to the lamb's ear. They are large, and quite white in dry weather.

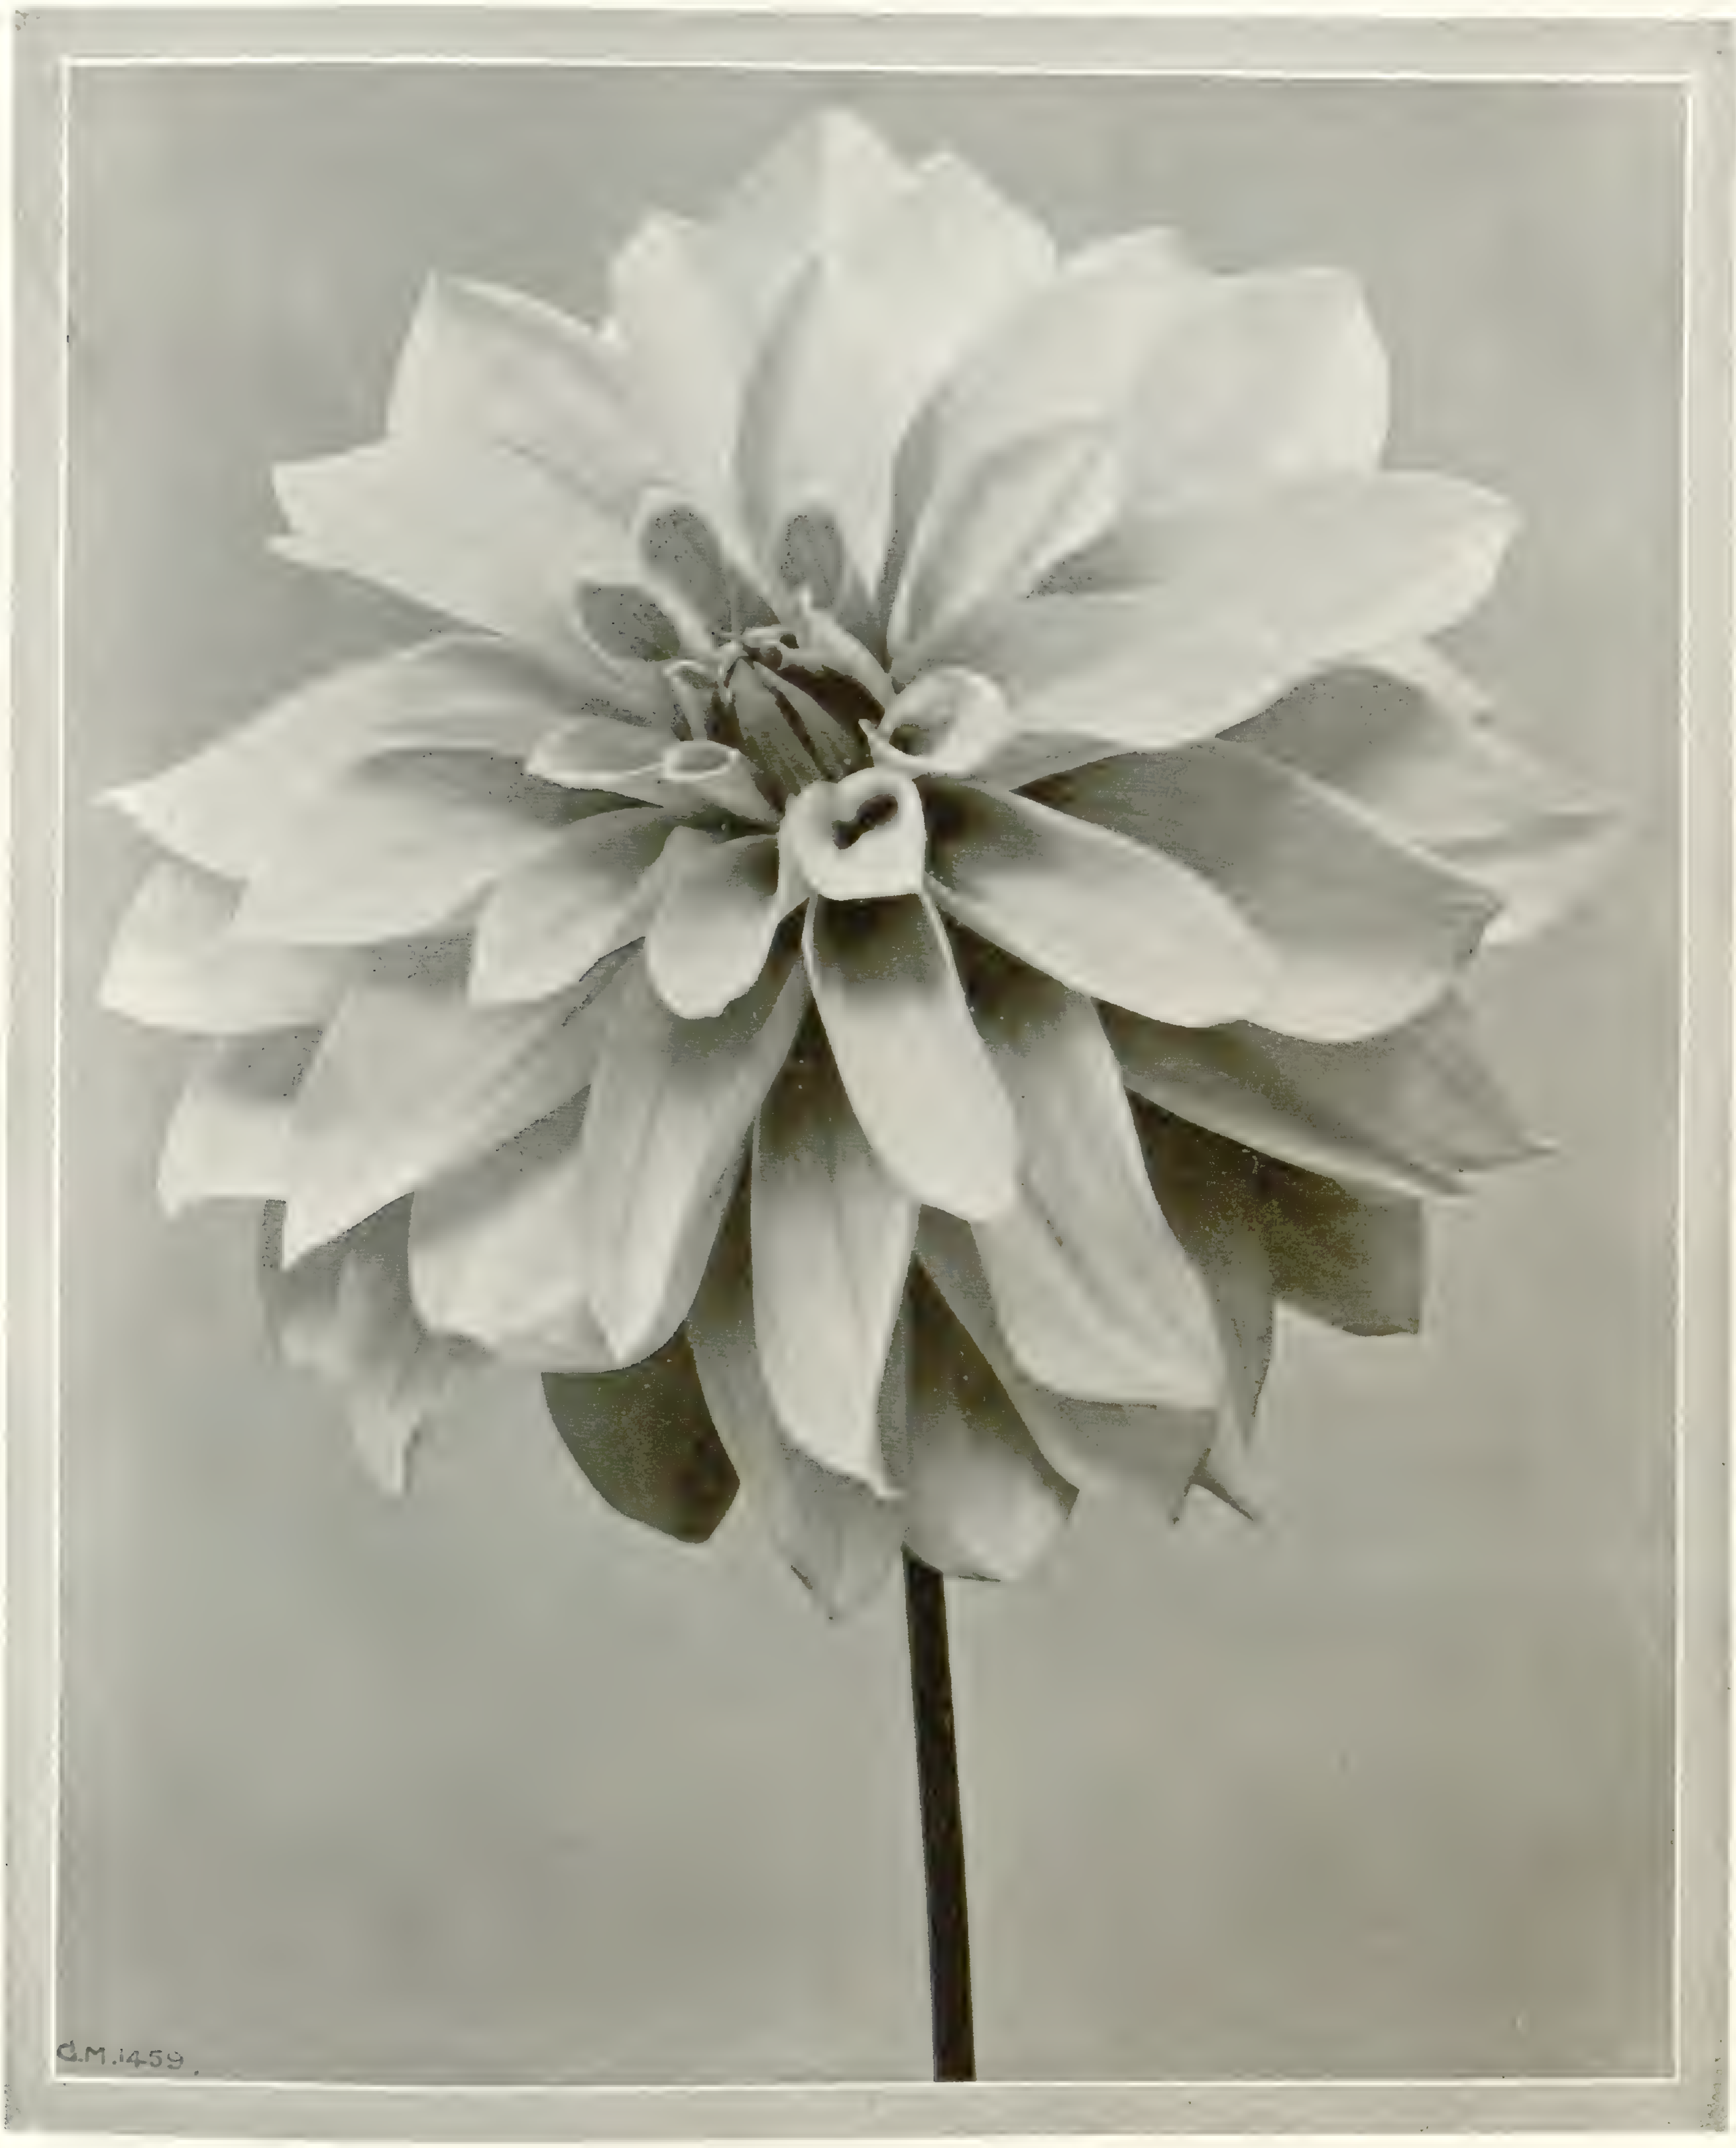
It makes rather a good edging plant, especially in dry situations. Like many other plants its floral attractions are not commensurate with those of its foliage, as the long spikes, from a foot to a foot and a-half in length, are not showy, their purple flowers being small, although numerous, there being some thirty or more flowers in one of the whorls which form the inflorescence.

Mingled with the stem leaves, also white, they give little effect, and for edging they are better cut off as they appear, their height making them unsuitable for the edging of the border.

In clumps in a border, or even on a large rockery, this plant has a good appearance with its snow-like foliage in summer.

It is of rather spreading habit, and is easily increased by division, and as it is liable to become bare in the centre, it should be lifted occasionally, and replanted when in a clump. As an edging, where it is not allowed to spread out, it does not require this so frequently. A native of Tauria and the Caucasus, it does not suffer much in our winters, but dislikes excessive wet at that season.

S. ARNOTT.

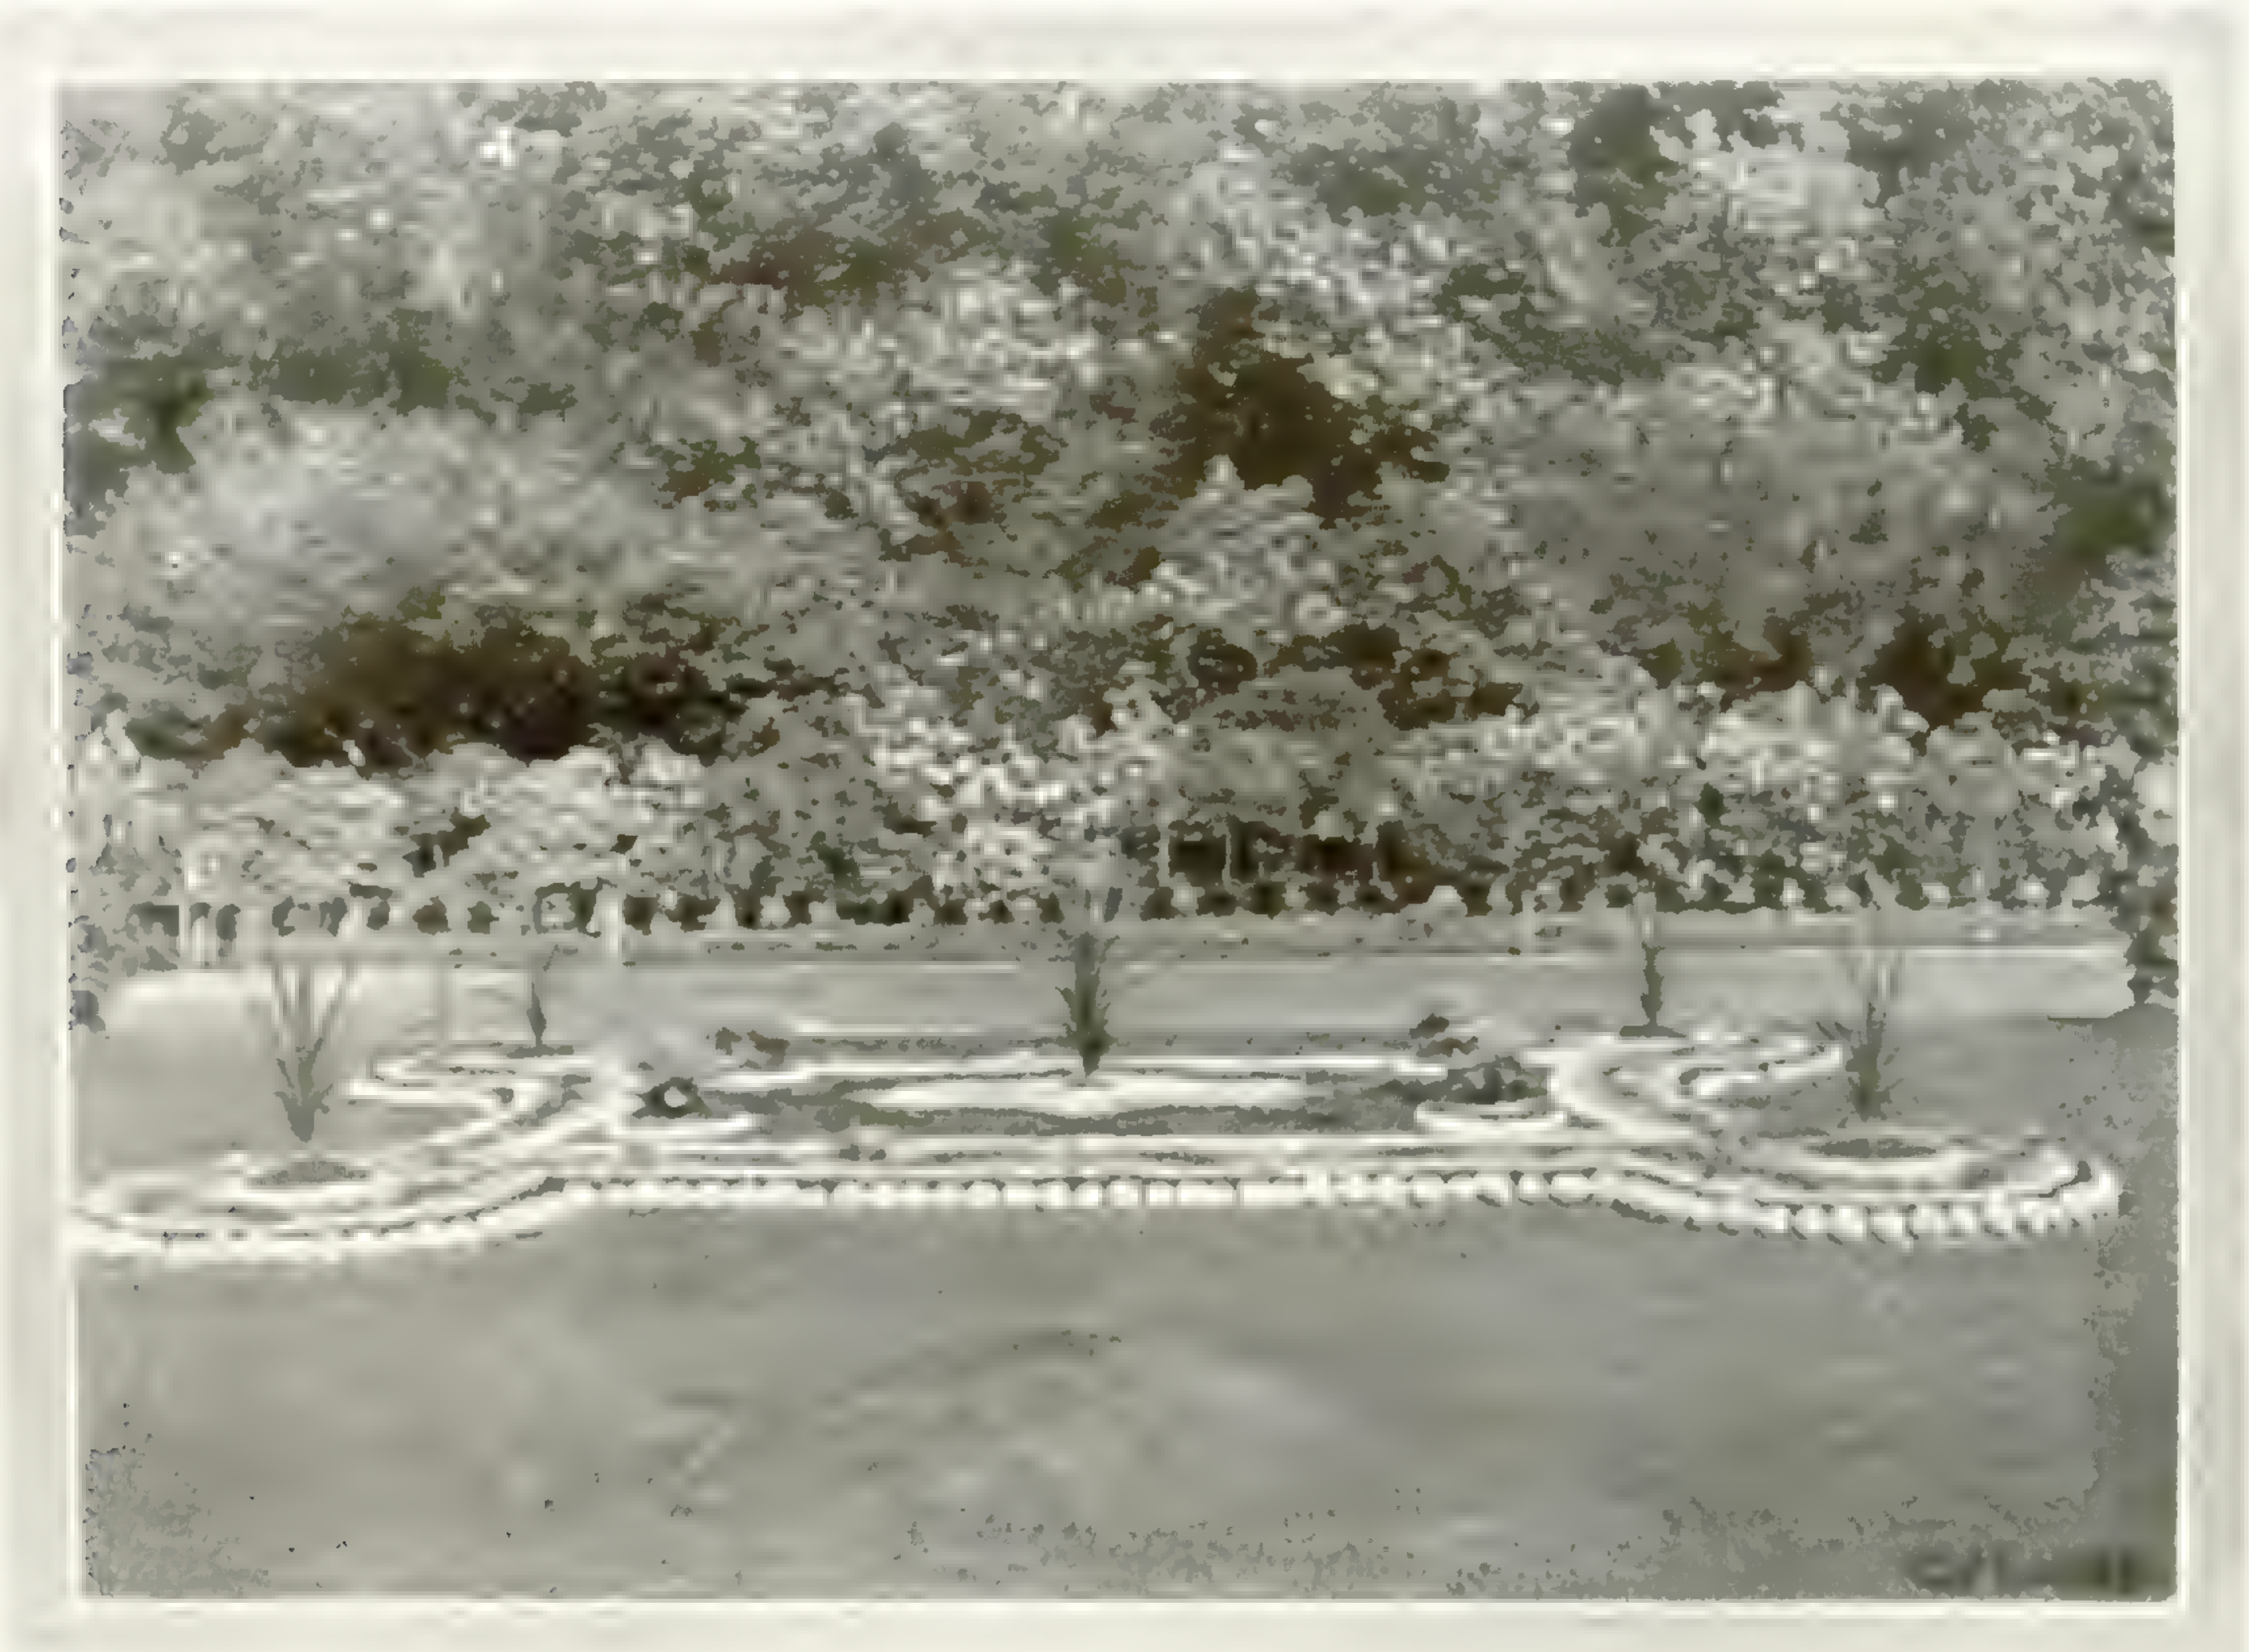


NEW DECORATIVE DAHLIA LOVELINESS.

Flowers, bright rose-pink. A.M., R.H.S., September 13; F.C.C., N.D.S., September 27; Mr. Chas. Turner, Slough.

PECKHAM RYE PARK.

To residents north of the Thames Peckham Rye Park is comparatively little known, but in the south-east its beauties are much appreciated, as is well shown by the great number of visitors that are at all times to be seen there. Opened first in 1894 as a fourth-class park, it has steadily advanced till it now stands out as one of the first class.



AN EFFECTIVE CARPET BED IN PECKHAM RYE PARK.

A few years ago an adjoining estate was purchased and added to the park, this extension being first opened to the public in 1908. This being well timbered, and to a great extent retaining its wild woodland character, it has, with the many improvements effected therein, proved to be a source of delight to thousands. The attractions of the park (the area is nearly fifty acres) are many, but the principal features are the groves of umbrageous elms, the delightful Old English garden, the long pergola clothed with climbing roses, clematis, and ornamental-leaved vines, the herbaceous borders, the high class of its summer bedding, the picturesque lake with its ornamental waterfowl, and the splendid turf of its playing fields.

In the wild portion, with its wooded banks clothed with ferns and other native plants, a little streamlet meanders along, and it is difficult to imagine that one is only just outside the four-mile radius from Charing Cross. Taking matters further in detail, on entering by the Forest Hill Road Gate, the principal walk is bounded for some distance on either side by a wide border containing a selection of the finest herbaceous plants. This border extends on the left for a distance of about 250 yards, and is backed throughout its entire length by ornamental shrubs. On the right it is only about half the length, but where it finishes the scheme of decoration is maintained by beds of flowering subjects, some of the finest displays in the park being there shown. By the second half of September many of the herbaceous subjects are past their best, but there is even now a brilliant display of colour from the numerous asters, the later kinds of phloxes, chrysanthemums, dahlias, Sedum spectabile, Anemone japonica in variety, helianthus of sorts, pentstemons, hollyhocks, rudbeckias, and many other well-known and showy subjects.

The flower beds on the right are varied in size, shape, and arrangement, a few notable examples being one of large plants of ivy-leaved pelargonium Souvenir de Charles Turner alternated with standards of Veronica Andersoni variegata, carpeted and edged with blue viola, in which are set plants of Phalangium lineare variegata. Another of Lobelia cardinalis Queen Victoria and the variegated Fuchsia gracilis over a double red-flowered form of Begonia semperflorens with bronzy foliage is bright and attractive. There is not space to enumerate the occupants of the various beds, but a few more uncommon subjects are worthy of especial mention. Fuchsias are very fine, one bed being planted entirely with large and small plants of Fuchsia Cadmus, which I have not before seen bedded out. It was distributed by Messrs. William Bull and Sons, of Chelsea, about half a dozen years ago. It is a bold, but not too large flower, with a single white corolla, and bright coral-red sepals. The flowers are borne in great profusion, and I should not be surprised if this variety was in time to supersede the popular Madame Cornellison for bedding purposes. Two of those distinct hybrid fuchsias, namely Andenken and Heinrich Henkel, associated with tall plants of Artemisia argentea, and Furst Otto Von Wernigerode, alternated with the grey-leaved Gnaphalium microphyllum are very pretty and uncommon. In an attractive bed of succulents the bright-flowered Kalanchoe flammea is flowering freely. I have not before met with it planted out of doors.

VIEW IN BAMBOO GARDEN, PECKHAM RYE PARK.

Early chrysanthemums are bright and effective, the open weather being greatly in their favour. A bed of the bright yellow Horace Martin, edged with the dwarfer bronzy tinted Harrie, is particularly noticeable, as also is Marie Massé, the deep rosy flowers being very fine. There are many other kinds, but these are the best, though the somewhat later Soleil d'Octobre promises well should the weather keep open.

One of the finest examples of carpet bedding that I have seen this season is at Peckham, the dot plants being Cordyline australis and Echeveria metallica. Other plants employed in this carpet bed, whose pattern is too intricate to detail, are the golden-leaved spergula, Alternanthera amabilis, A. magnifica, A. Kingi, A. versicolor, Echeveria farinosa, and E. secunda glauca as an edging. Opposite the flower beds, and forming, as it were, a continuation of the herbaceous border is another long border in front of shrubs, planted entirely with tender subjects disposed in bold masses or groups. So treated, there is quite a collection of fuchsias and many pelargoniums, both as dwarfs and standards. One variety that is now seldom grown, namely, Chelsea Gem, with variegated leaves and double pink flowers, is particularly good as a standard plant. Lantana delicatissima, begonias, cupheas, calceolarias, heliotropes, especially the variety Madame Bussey, and many other plants, combine to form a very effective whole.

From near the Forest Hill Road Gate, previously alluded to, is an avenue of fine elms affording a direct walk to the ground set apart for games. Proceeding along this avenue to the left are the old English and wild gardens, while to the right is the nucleus of an arboretum, in which many uncommon subjects are planted, with sufficient space to allow for future development. Pinus excelsa does well, as also does Pinus laricio, while there are a number of thriving examples of Cupressus Lawsoniana from seed saved in the park. Other trees and shrubs not often met with are Cornus macrophylla, which was just passing out of bloom, Spiræa Aitchisoni, Elæagnus angustifolia, Liquidambar styraciflua, Abies pungens glauca, Betula Maximowiczi, and many others. Close by a grove of elm trees, not so large as those forming the avenue, but sufficiently lofty to afford a delightful retreat during hot days, extends for quite 300 yards. The pleasures of this grove are enhanced by the fact that seats are plentiful, as indeed they are throughout the entire park.

The old English garden is intersected by a pergola of rustic oak branches. The roses, which play an important part in its embellishment are now over, but many of the clematis are still bright, while some examples of Solanum jasminoides planted out during the summer are laden with blossoms. In the centre of this pergola is a fountain, in which gold fish and water lilies thrive. The pergola there takes a circular sweep, and, instead of roses and clematis, it is, just at that rounded portion, furnished with fine-leaved vines, thus forming a striking and distinct feature. Apart from the pergola there is much to interest in the old English garden, a few fine old specimen trees being there. Next, a large thuja is completely enveloped with Polygonum Baldschuanicum still a mass of its feathery flowers, and Clematis montana has quite taken possession of a neighbouring tree. Dahlias are just now very much in evidence, and the roses have been very fine, but are almost over. Of the numerous autumn-flowering composites, one that merits a note to itself is Helenium Riverton Gem, with brilliant terra cotta red flowers. Some masses of this stand out for a considerable distance, the colour being so rich and glowing.

The wild garden has been, to a very great extent, left to itself, at least as far as it could possibly be done consistent with the making of paths and other arrangements for the convenience of visitors. Wandering about under the shade of the trees pretty little scenic effects may be met with, in some of which a meandering streamlet plays a conspicuous part. In one portion the water has been allowed to form a little pond, on the edge of which Myosotis palustris has made itself quite at home. Irises of sorts, Senecio clivorum, spiræas, Lobelia cardinalis, and other moisture lovers there find a congenial home. The ground in the neighbourhood is moderately moist, and there a bamboo garden has been formed. It has not been long planted, but the bamboos are growing so luxuriantly as to afford conclusive evidence that the position just meets their requirements. Associated with the bamboos are Arundo conspicua, whose silvery plumes are just developing; yuccas of sorts, and the different eulalias. The effect is heightened by some tall stately specimens of Cordyline (Dracæna) australis being plunged in the turf of the bamboo glade, while a bright feature is furnished by three or four masses of cannas, which are still laden with bloom.

The condition of everything speaks volumes in favour of the superintendent. Mr. Ashmore—who has, I believe, occupied that position since the park was opened—and the other responsible members of the staff.

W. Truelove.

GREENHOUSE MANAGEMENT.—The Amateur's Greenhouse, the popular book by T. W. Sanders, not only treats of the selection and cultivation of greenhouse plants and flowers, but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the management of the plants and flowers grown in it. The price of this book of 416 pages is 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

FRAMES AND PLANT PROTECTORS.

The value of frames and other forms of protectors for forwarding garden crops have for many generations been recognised in British gardens, and it is possible that in former years they were more cherished by gardeners than is now the case. Perhaps the larger number of frames and cloches now being employed for forwarding crops on a commercial basis has something to do with the greater interest that owners of gardens are taking in the matter of frame protectors for the forcing of early vegetables, salad, and low-growing fruits like the strawberry.

In private gardens the number, size, shape, and whether they shall be artificially heated or not, are matters that must be decided upon by those having to produce continuous supplies of given things over a period of the year when they cannot be had in a naturally-grown state; more detail in management of crops is necessary when manure alone is the heat-producing medium than when it is supplemented by hot-water pipes. In private gardens a number of smaller frames are superior to a few large ones for producing regular and continuous supplies, and a proper system must be maintained all through the season to prevent irregularities. In the near future gardeners are likely to suffer more than ever for the want of good stable manure, which is such an essential item for not only producing moist healthy warmth to their growing crops, but also for providing the rich residue of humus that is also so essential to the growing wants of many vegetable crops when it is sufficiently decomposed to enrich the rooting medium.

Portable Cold Frames.

These will always be popular with every class of grower on account of the general ease with which they may be moved at different seasons of the year to varying aspects that are peculiarly suited to the occupants they are intended to protect. Frames of this description are also easily arranged at varying angles, according to the sun's power, and for many crops a sharp pitch during the dull winter months makes all the difference between success or failure with them. What have been termed cucumber and melon frames in gardens for many years past may still claim to be better suited to taller growing vegetable crops than those termed French frames, which are so much in evidence for salads and the dwarfer-topped vegetables. A general size are those 6ft. wide and 12ft. long, carrying six lights of 4ft., and frequently with four panes of glass in each fitted into wooden bars. These frames are very cheaply produced by many large firms, being often made from surplus material from larger buildings. Three panes of glass in a 4ft. wide light is much superior to four, and, provided the glass is well bedded in good oil putty on the bars, no top putty is required. If the front boards of the frame are 1ft. deep, those at the back will require to be 2ft. in a frame 6ft. wide. Larger frames of this type are in use in some gardens, but on account of the greater difficulty of giving attention to the growing plants, they are not generally recommended.

The low frames so popular for salad and other crops on the Continent, and which have latterly been increased very much at home, are undoubtedly a great asset to any garden. As the secret of success with many of these salad plants is their proximity to the glass the type of frame is specially suited to them. The frames are composed of unplaned planks 1½in. thick, 7in. high in front, to 9in. or 10in. high at the back, with a length of 13ft. 6in., to carry three lights, each 4ft. 6in. wide; the lights fit on to the frame, and have no wooded partitions between them, as in the ordinary English frame. There are two cross pieces, 1½in. x 2in., with hoop iron at each end; these rest on the legs of the frame, and support the lights; there are also legs at each corner, and the whole frame is fitted together with hoop iron at each of the four corners. Flat pieces of iron attached to the front of the frame are required to prevent the lights slipping when propped up for giving attention to the crops. Lettuces, carrots, radishes, endives, cauliflowers for wintering, and such crops are very much at home in these almost flat frames. In the later spring months, when lettuces would burn under the ordinary English frame, with its deeper pitch, they are perfectly at home in these French frames; the atmosphere is also more humid, and watering less frequently needed by the crops.

Portable Span Frames.

For many classes of plants it would be difficult to overestimate the value of the span frames, particularly those with glass ends. For subjects like alpines, where the maximum amount of light is an important factor, and for other plants required to be kept during the dull winter days in a dry yet airy state, these frames are superior to any other. Not only are they provided with hinges or rods, which simplifies the airing and watering, but top, end, or either or both sides may be ventilated at one time, or in the direction which the wind at certain seasons best allows. For this type of frame I always think it worth the trouble to prepare a foundation for it; it costs very little to fill a shallow trench with some six inches of concrete, on which should be fixed a single brick, on which the frame may rest always clean and dry. For growing dwarf peas, dwarf French beans, bush marrows, potatoes, cos lettuces, etc., early in the year, they are excellent, also for carnations, schizanthus, flowering stocks, and many other plants that like cool treatment. During the summer they are the ideal home of many winter-flowering intermediate temperature plants. The general width of these frames is 6ft. to 7ft. wide, with wooden base of frame composed of 1½in. planed and well painted boards; these latter should not be more than 1ft. deep.

Fixed Heated Frames.

These possess many advantages over the portable cold frames, and if, as in the case of forcing early crops, manure alone is the heat producer, there are many advantageous points in favour of frames heated by hot water. Damp in winter is more easily expelled, also less outside covering is required to keep out frost. From the practical working of both cold and heated frames the latter are the more economical in many districts, as the pipes keep the wood dry, while in the case of manure forcing, the moist warmth very quickly sets up decay. A frame 50ft. long x 6ft. wide, heated by 2in. pipes running once round, will keep up a forcing temperature. For such a frame either two or four courses of bricks may be allowed out of the ground. These, of course, should rest on a 9in. bed of concrete; 1¼in. boards will be required for the front, back, and ends of the frame, and these boards are strong enough to carry the hot-water pipes, to which they are secured by bent flat iron screwed into the wood; this keeps the frame rigid. The base of the frame is best cemented where it rests upon the brickwork, and the pipes are most convenient kept close to the boards and arranged just above the brickwork. Such frames are of the greatest value, and the interior soil may always be thrown out to also allow of manurial bottom warmth for such crops as benefit most by it. My frames of this description have been 6ft. wide, 2ft. high at the back, and 1ft. in front, and the cost of heating, connecting to existing pipes, £9 for 50ft. frame run. For lettuce in winter, carrots, French beans during the spring months, and similar crops, one pipe arranged along the front is sufficient, the return pipe being taken along the end and carried back along the front of a second frame, which is best fixed one brick lower.

Frames are often economically heated by ordinary gas pipes, and I have had excellent results from the span frames having one row of 2in. pipes running all round. Span frames are more suited to potatoes, French beans, early forced turnips and carrots, and similar crops, making in the case of the two latter, less foliage, and developing a larger root more quickly. For winter work in the purely French type of frame I greatly prefer tee iron bars, as they allow much more light for the crops grown.

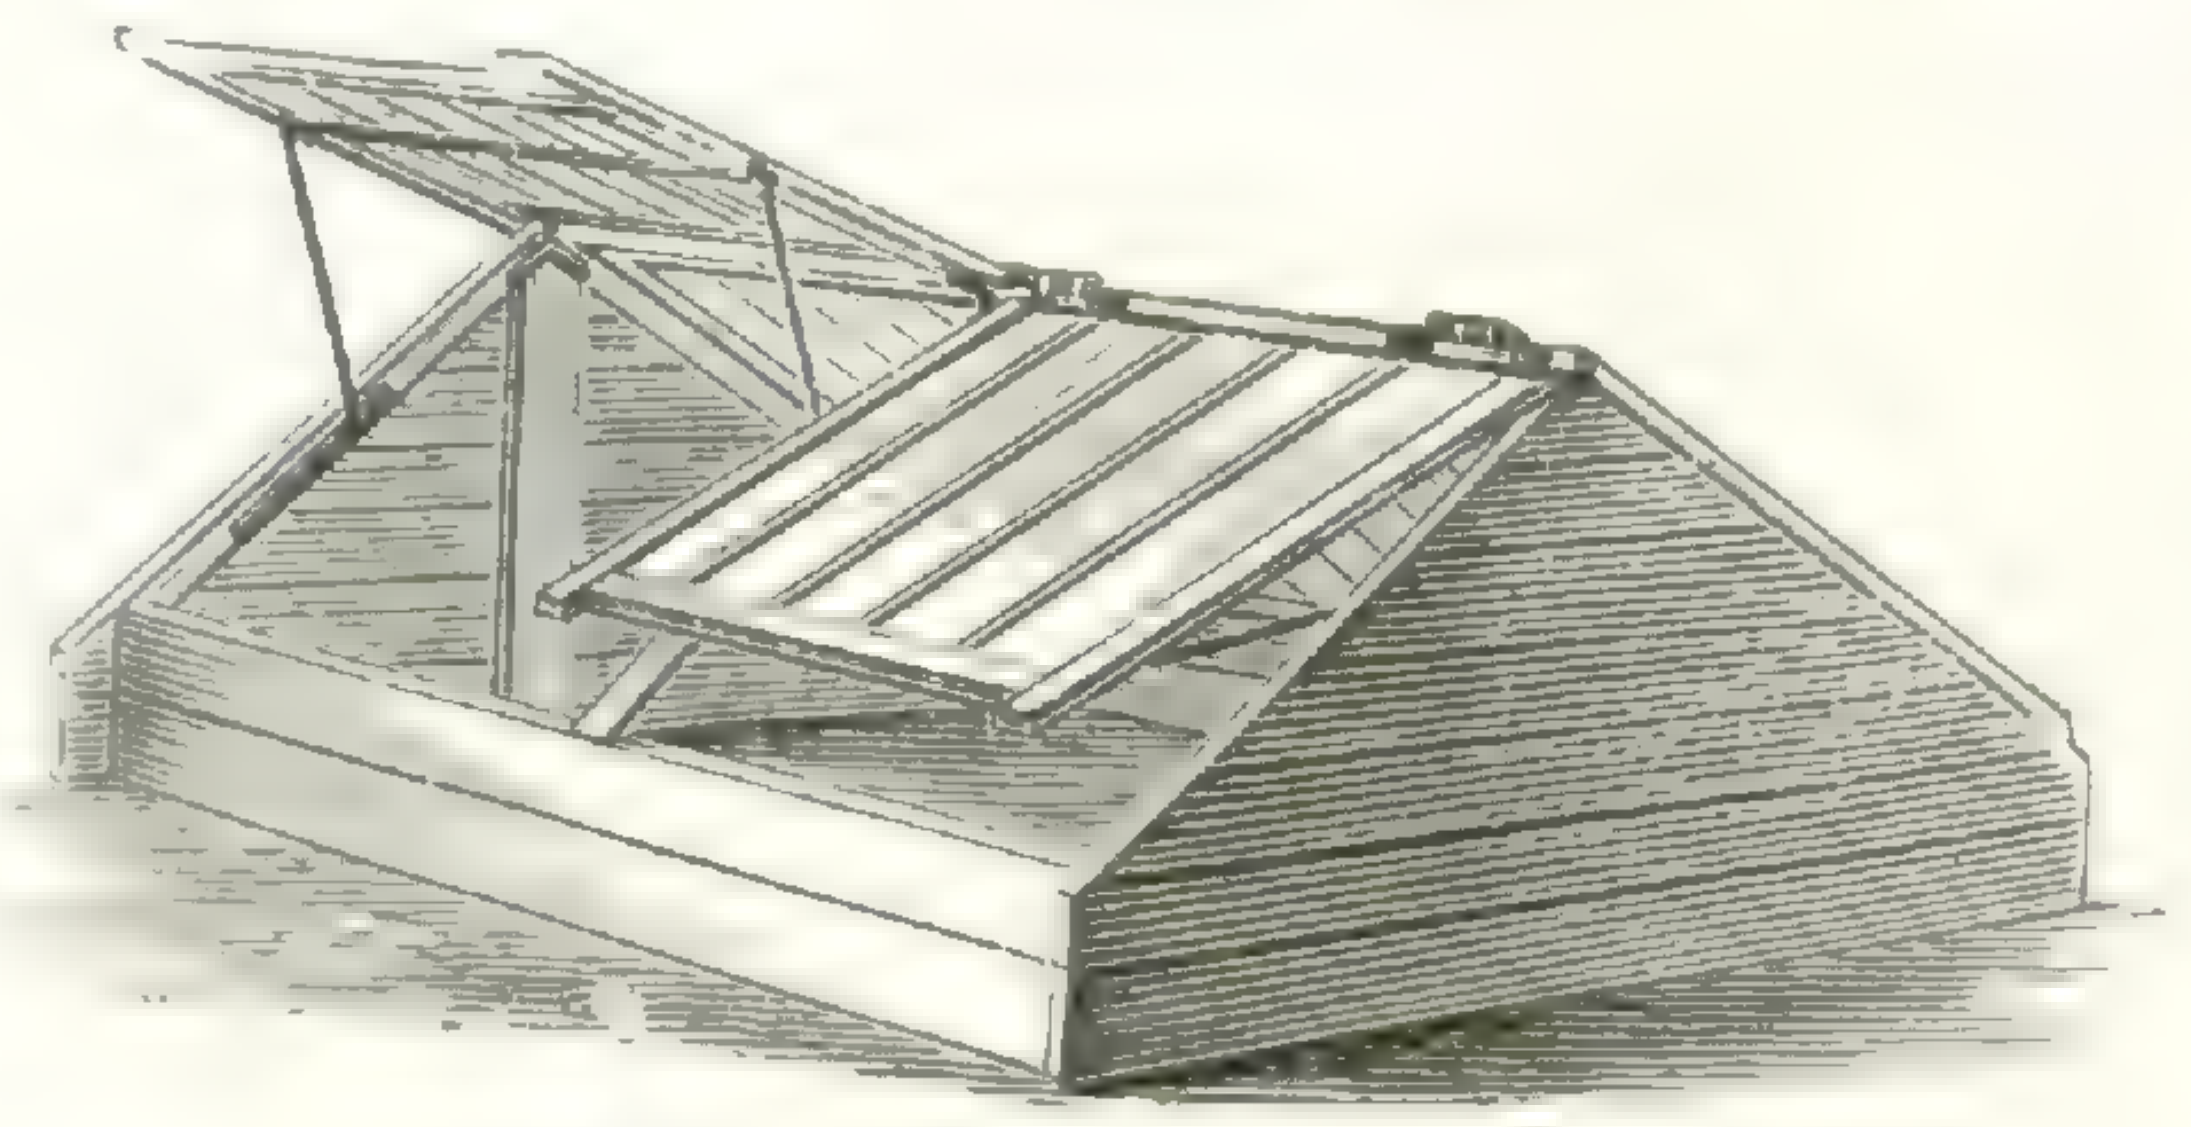
Smaller Protectors.

In addition to bell glasses, or cloches as they are sometimes termed, there are many forms of protectors that are elaborations of the old hand-lights of our boyhood days that were so effectively used for protecting early cauliflowers, and for pricking off numerous seedlings for first early crops. The white appearance, under which crops like lettuce quickly burn, has now been overcome by several makers in England, who are placing a strongly-made cloche at a reasonable price upon the market. A decided greenish tint is required for the ideal bell glass, and it is also important that there should be as few blisters in the glass as possible. There are now several forms of bell glass with more upright sides and open tops, over which a small square of glass is fixed when no air is required. These are made of whiter glass, and I am now testing their value. For early salad crops during the dullest season of the year bell glasses are superior to frames; both lettuces and radishes mature more quickly under them, and if only a limited number are in use they are better arranged in two lines instead of three, upon prepared hotbeds 18in. deep and 5ft. wide. I greatly prefer bell glasses to hand-lights for giving protection and for forcing crops. For propagating many subjects in the ordinary garden soil they are invaluable, and lettuce, cauliflower, and similar tender seedlings, are quite safe under them during the whole winter, and seeds of them may also be sown during any month from October to March. Lettuces, radishes, carrots, marrows, ridge cucumbers, cauliflowers, and tomatoes are all crops that may be forwarded by their aid, and, as I am now proving, strawberry plants are considerably forwarded by their use. Their good points are that there is no drip, and no cold draughts, and the labour required by crops under them from October to March is very little. After that time airing and watering require daily care. Hand-lights are more cumbersome and draughty, and the crops do not come on so quickly as they do under bell glasses. As plant protectors, however, they are of more general use, air being more important to many subjects that are not required for salad purposes. The Eclipse hand-light is a lighter-made protector than many, also much closer fitting than the old type, with removable top. These are made in varying sizes, from 16in. square to 22in. square. A small square cloche, by the same firm, is also made, and for owners of small gardens is a handy protector; the largest size made is 20 square inches, and the most generally useful size. The most useful size in cloches are those 18in. in diameter, and when bought in moderate numbers the price is reasonable enough. The cultivator with knowledge of the varieties of vegetables suited for growing under them, and who knows the ins and outs of soil management may, near a town, produce useful and profitable crops by their aid.

Charles Foster.

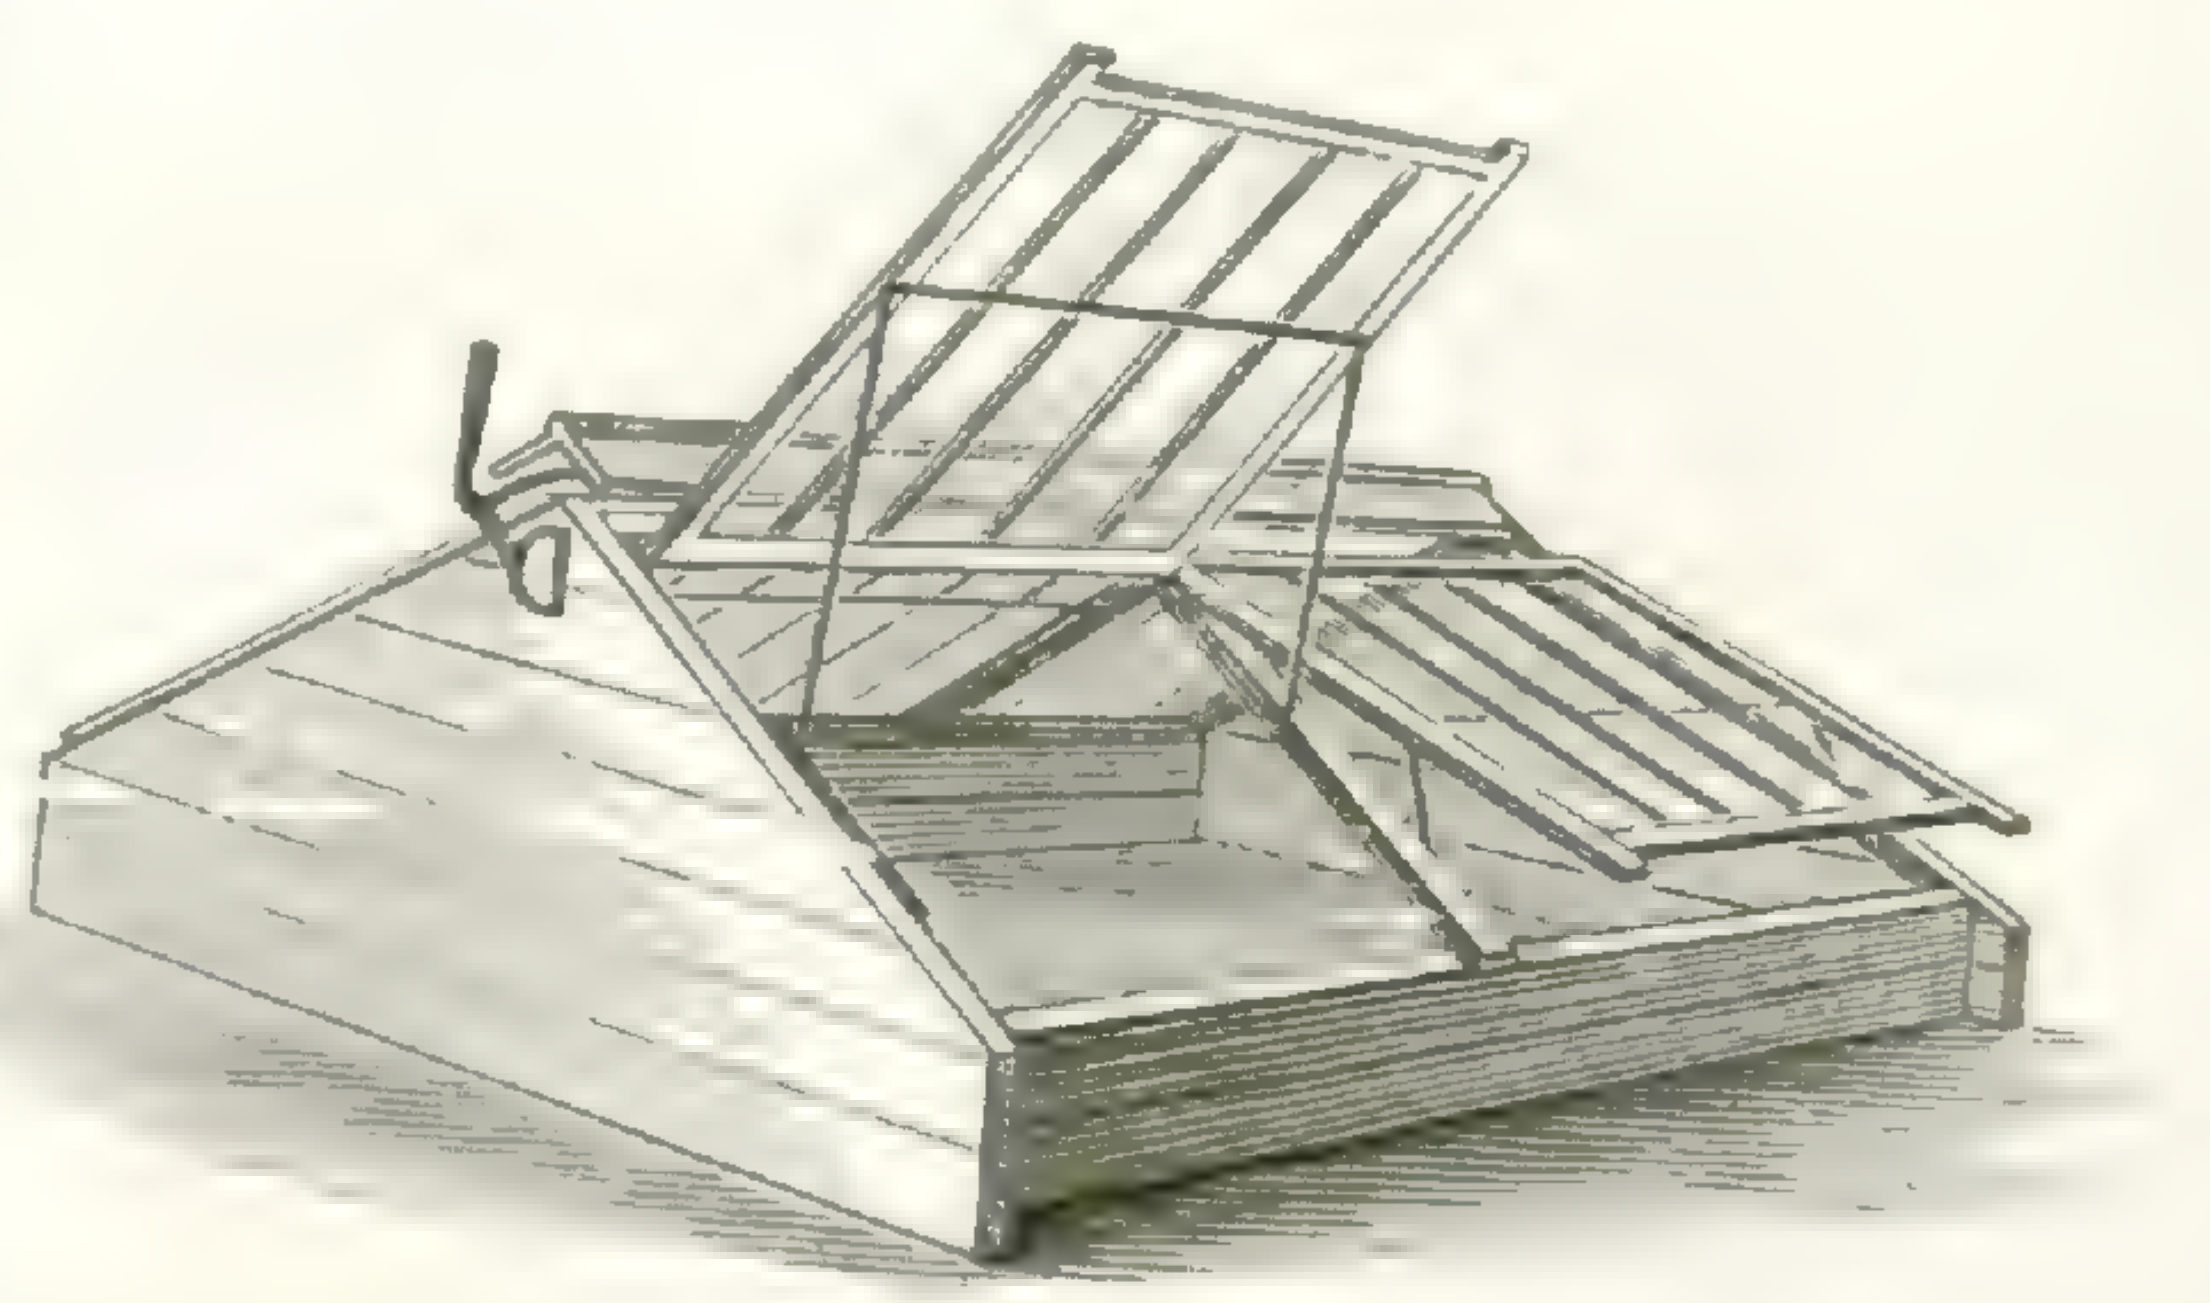
SPLIT PEACH STONES.

In my earlier connection with peach culture the splitting of the fruit stones, especially in houses where the trees had been subjected to hard forcing, was both troublesome and inexplicable, seeing that the growths were of a texture to warrant solidity, with a complete absence of secondary shoots. The borders were well prepared, thoroughly drained, and contained an ample supply of old plaster, bonemeal, and potash in the form of potassic sulphate, but neither stable or farmyard manures. In autumn the wood took on the nut-brown colour which is generally accepted as a sure sign of thorough maturation. As may naturally have been expected, the wood of the trees which had been forced early in the season was the best ripened.



PORTABLE PLANT FRAME,
Constructed by Messrs. R. Halliday and Co., Middleton, Manchester.

In spite of all this, it was always the fruits on the trees in houses where early forcing was carried on that the greatest percentage of split stones occurred. Having noted this fact, I concluded that the evil agency was in some way due to the course of treatment, or influences differing with those under which later supplies were obtained, and this induced me to adopt a keener observance of everything affecting the growth in order that I might fathom the mystery.



SPAN-ROOFED FRAME WITH RISING RIDGE,
Constructed by Messrs. R. Halliday and Co., Middleton, Manchester.

To secure peaches early in the year it is necessary to start the trees into growth at a time when the days are short, and, under ordinary circumstances, during cold, changeable weather. Some days are dull, others bright, with a few "blinky" ones thrown in amongst them, so that the man in charge is sometimes at a loss to know how to use the ventilators. If the wind is cold and the sunshine comes in bursts more often than otherwise the temperature is allowed to rise unduly in the house, and rather than admit a cold current of the external atmosphere water is freely sprinkled over the border and path. This is undoubtedly right at certain periods of the development of the fruits, but when it is practised while the stones are forming, or in the early stages of their growth, its virtues are doubtful.

As the matter of which the stones consist in their formative stage is more or less liquid, and more susceptible of changes of temperature than the dry kernel of the mature fruit, it is not very difficult to conceive why the thin wall should give way under pressure of the expanding mass within caused by a sudden increase of heat. This sudden swelling of the pulpy matter overcomes the cohesion, or chemical affinity, of the thin wall enclosing it, and a split stone is the result. This is the solution I arrived at, and since then my aim has been to maintain a lower, rather than a higher, temperature during the stoning period, and the almost complete absence of split stones among the fruits induces me to believe that the evil and remedy are within the influence of the ventilators.

The ventilators of houses in which late supplies of peaches are cultivated are usually kept open throughout the summer months, so that there is no sudden rise of temperature within the structure, and an almost complete absence of split stones is found in these crops. My method for many years has been to maintain a night temperature of from 50 degrees to 55 degrees in the house while the peaches are stoning, and admit air freely under favourable climatic conditions when 60 degrees is reached. In the afternoons of fine days I avoid early closing. Since adopting these precautions against sudden changes of temperature split stones are of very rare occurrence.

Hibernia.

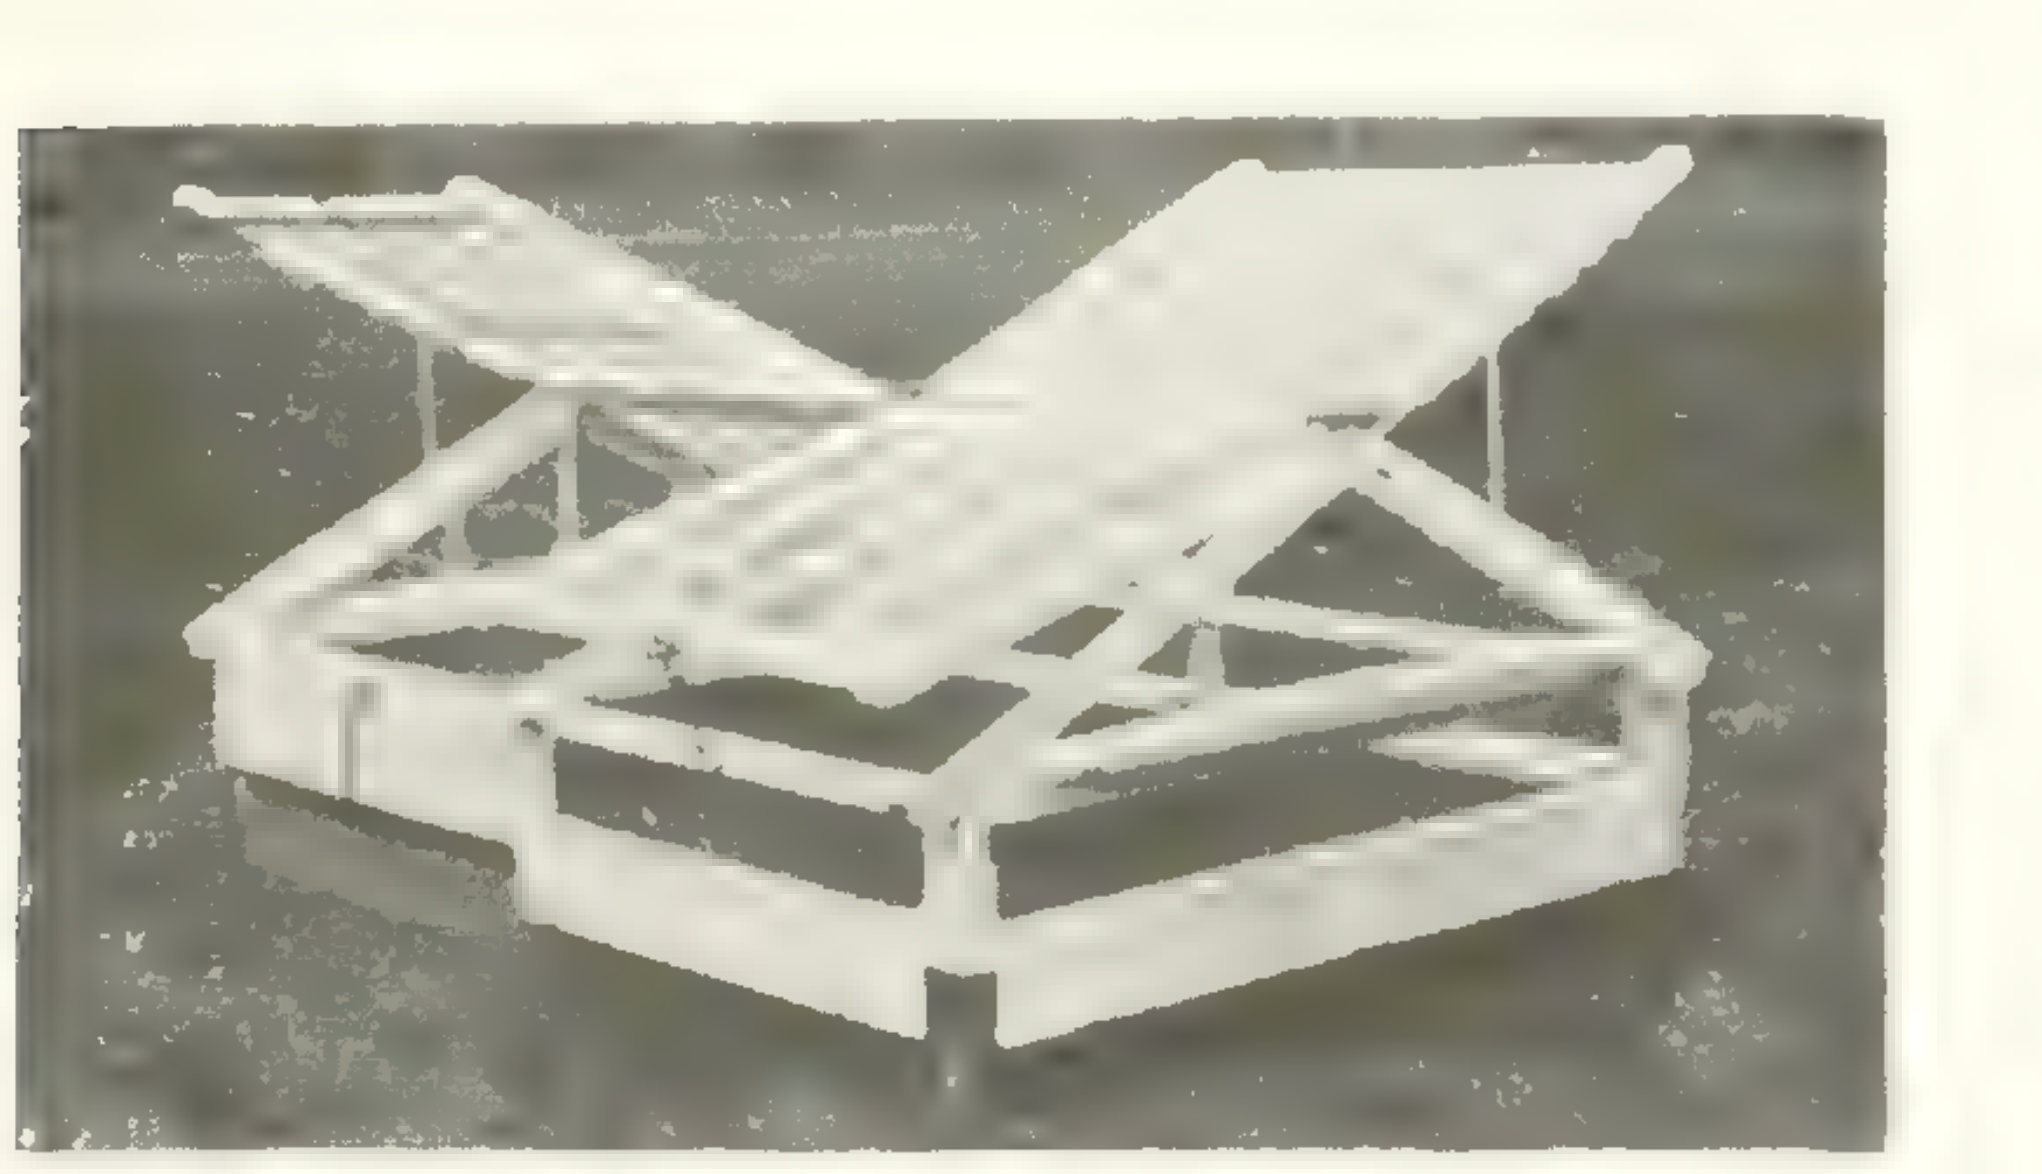
Gilia coronopifolia.—This biennial, to which some attention of late has been directed, is a valuable subject for the embellishment of the greenhouse during the summer months. It may be grown as a bushy specimen, and in this way, reaching as it does a height of 3 to 4 feet, with each upright growing branch laden for the greater part of its length with tubular shaped blossoms, it makes a goodly show. The colour is a very distinct tone of scarlet.—W. T.

Salvia patens has flowered abundantly with us this season, and once again proved its general usefulness as a summer bedding plant; whether planted in beds or border it has alike proved attractive and beautiful, and it well deserves a front place among our blue-flowering plants. It is a distinctive subject, wherever placed, charming alike in flower and foliage, the long erect spikes of flower being freely produced all through the summer and early autumn months.—W. Hedley Warren, Aston Clinton Gardens.

Grape Melton Constable.—Although Mr. Shingler, the raiser of this grape from seed (the result of a cross between Gros Colmar and Lady Hastings), does not claim for it much difference in flavour as compared to its parent, he does consider it superior to Gros Colmar in other respects. One matter of importance is the ease with which it colours, as compared with Gros Colmar, which, under ordinary circumstances, colours indifferently, especially if started late in the season. I have seen the two growing at Melton Constable many times, and always could see the advantage of the newcomer.—E. M.

GARDEN FRAMES.

The value of frames in a garden cannot be overestimated, but it is essential that the frames used be well built. In the old days a garden frame, even of one light, was a cumbersome thing, and the solid weighty light was not easy to move. Now we have frames of altogether lighter build for general purposes, and yet they are at once durable and lighter, and more easy to handle. Messrs. W. Duncan Tucker and Sons, Lim., 27, Cannon Street, E.C., while catering for the most extensive and elaborate of horticultural buildings, also make a speciality of garden frames. They have fitted up several French gardens in this country, and the accompanying illustration shows one such installation, at Howberry Park, Wallingford, for Harvey Du Cros, Esq. In this case, durability, lightness of construction, and wide panes of glass are essentials. Span-roofed frames with hinged sashes, and with the wooden sides constructed with hinged flaps, are another speciality, and these are of immense value for accommodating perpetual carnations all through the summer and autumn, and for other purposes, but there is almost no end to development and adaptation of garden frames in the hands of the Messrs. Tucker.



SPAN-ROOFED CARNATION FRAME,
Constructed by Messrs. Wm. Duncan Tucker and Sons, Lim., Cannon Street, E.C.

Garden frames are also a feature of the horticultural work executed by Messrs. R. Halliday and Co., Royal Horticultural Works, Middleton, who construct these useful plant protectors in a great variety of shapes and sizes. Two of these we illustrate. One is a span-roofed portable plant frame, with hinged reversible sashes and swing bars that serve to keep the sashes open at any angle; the whole thing is extremely handy, and so constructed that it can be taken to pieces and re-erected elsewhere in a few minutes. The other frame illustrated is constructed on very similar lines, but there is this great difference, i.e., that there is a ridge that can be raised by a swing bar, and thus the frame can be ventilated at a time when it would not be desirable to have the sashes set open. For very many purposes this kind of frame is especially useful, notably for hardening off tender subjects, and their value is not less in the garden of the amateur than in the ducal establishment.

Cotoneaster horizontalis.—Beautiful as are many of the cotoneasters, this is, to my mind, one of the best. Its distinct growth marks it out from every other hardy shrub, and the specific name of horizontalis is a particularly appropriate one. It is now fairly well known, therefore it will suffice to say that it forms a spreading bush, whose sturdy branches are disposed in an almost horizontal manner. The minor shoots are disposed in a regular fishbone-like fashion, while the leaves are almost all on one plane. It is deciduous, and the pale pink flowers nestling among the freshly-expanded leaves make a pretty spring feature, while in August the berries acquire their bright red tint.—W. T.

LIME AS A FERTILISER.

The element calcium is a necessary constituent of plants; but as almost all soils contain it in sufficient amounts for their needs, the action of lime is not like that of a direct fertiliser. Indirectly, however, it is an agent by which insoluble potash is changed to a form available as plant food. For this very reason, says Bulletin 163 of the Connecticut Experiment Station, it must not be made to take the place of potash fertiliser unless it is absolutely certain that large quantities of insoluble potash are present in the soil under consideration. Otherwise, the time when the soil will be depleted of potash is simply hastened. Whether the addition of lime affects the solubility of soil phosphates is undecided. Any chemical action on these compounds must, at least, be slight.

The other important chemical action of lime is to correct soil acidity. This lies largely in its effect on low forms of plant life. Neither of these reactions is affected by the form of lime used. Soil, air, and water contain much carbonic acid, which quickly acts on burned lime, on water-slaked lime, and converts it back into a calcium carbonate, the form in which it existed before burning. The kind of lime to be used thus depends almost entirely on the cheapness of the brand when figured to burned lime or calcium oxide, and on the ease with which it can be handled from the car to the field. The only time when the use of burned lime is inadvisable is when large quantities (2,000-3,000 pounds) are necessary to correct the acidity, and the application is to be made in the spring. It takes some time for such quantities as these to be changed to calcium carbonate, and in the meantime the caustic lime is burning out the humus in the soil. If large amounts of quick lime are to be applied to the soil, it should be spread early in the winter and worked into the soil in the spring.

Lime has a further effect upon soils which may be partly a chemical action, but which is in the main an effect upon their mechanical character. Clay soils are probably the most benefited, for it greatly increases their porosity. The movement of water, both upward and in drainage, is thereby facilitated. A possible injury may result, however, if clay soils are limed too much or too frequently, through its cementing action, analogous to that when used in mortar. Paradoxical as it may seem, light soils are also benefited, for lime increases both their water holding capacities and their capillarity.

FRAMES FOR FRENCH GARDENING,
As constructed by Messrs. Wm. Duncan Tucker and Sons, Lim., Cannon Street, E.C.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

WINTER - FLOWERING CYPRIPEDIUMS.—Many of the autumn and winter-flowering section of cypripediums are expanding their flowers or developing their flower scapes. These must now have every attention, so that their requirements may be met to assist the development of flowers. In cases where plants have filled their pots with roots, particular care is necessary to see that they do not remain for any length of time in want of root moisture. There is nothing affects the substance and quality of the cypripedium flowers so much as permitting them to suffer from want of root moisture. The favourable bright conditions outside, combined with the increasing hours of artificial heat, has a tendency to make the plants dry more quickly than was the case a few weeks ago, therefore close observation is necessary to keep the plants moist. We find it very beneficial to spray the plants once or twice a day with the syringe whenever the outside conditions permit, until the flowers are about to expand, when overhead moisture is best dispensed with.

THRIPS.—At the present season, where the houses are in close proximity to herbaceous borders and deciduous trees, it is necessary to keep a sharp look-out for black thrips. In windy weather these pests are blown into the houses, and frequently after a shower of rain I have observed the surface of the water in the rain-water tanks literally covered with them. They are easily dipped from the tanks and conveyed to the plants when watering, and they quickly establish themselves on the flower scapes and leaves of the cypripediums. It is desirable to fumigate and spray the plants with some safe insecticide at regular intervals, and where the eggs are deposited on the undersides of the leaves they must be carefully removed with a sponge and warm soapy water.

STAKING.—It frequently occurs that the flowers on the same plant point in different directions. I always find that where the plants can be induced to expand all their flowers facing to one front the general appearance is improved, and if they are required for exhibition purposes it is desirable they should all be showing to one front, as most of the exhibition stages are only suitable for such a display. It is impossible to do this satisfactorily at one tying and staking. The stakes used in the first place should be long, and only thick enough to hold the flower in position, so that when the scape has advanced a few inches they may be gradually trained in the desired position. The flowers should be open before the final tying is made.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

THE WEATHER.—Since writing the last calendar notes, we have experienced probably the brightest fortnight of the whole summer, and those of us who had removed our blinds from the roofs of the houses must have felt that we were a little premature in the matter. However, it has been an easy matter to provide a little temporary shade where it was absolutely necessary, and though we have had very little sunshine all the summer, we can hardly hope for this bright spell to continue very much longer, and even if it does, the sun is very fast losing its power, so that I hope no real injury may have been done, even to the more tender things. In many instances it will have proved of great benefit, the crotons colouring exceptionally well, and the wood of many of the stove flowering plants is now in a good condition to go through the winter.

POINSETTIAS.—The earlier batches are now throwing up their bracts, and, though they must be kept growing steadily, care must be taken not to unduly excite them. Keep them going with light doses of liquid manure, and as the bracts expand decrease the moisture in the house, and keep a little top air on on all favourable occasions; a temperature of 60 deg. is quite high enough at night. Later batches, on being brought into the houses, must be kept moist, and occasionally sprayed overhead for the first few days, or there may be leaf-dropping; if damping is looked after, and watering carefully done the plants will soon get over the change of environment.

EUPHORBIA JACQUINÆFLORA will have especially benefited by the past bright weather, providing, of course, that watering has been well done. Well-ripened wood is quite necessary for the production of long racemes of bloom. These may also be still fed, and, as it is necessary to increase the fire-heat in the house, due attention must be given to the watering.

FERNS.—These generally will need less atmospheric moisture, and if the house in which they are grown is at all inclined to be damp, it is wise to leave a little air on the top whenever the weather permits, this applying more particularly to the adiantums and other close-growing kinds; by this means the fronds and plants will keep in a good usable condition for a long time. Whether growing in pots or planted out on walls, or on rockeries in the house, ferns should all have a thorough good picking over, removing all old or decaying fronds, thus allowing air to pass more freely through them. Keep such subjects as Lygodium scandens carefully trained up their strings for the greater convenience when cutting, as, when the outside foliage is over, this and smilax will be in greater demand for the table, especially where there are shooting parties, etc. — Thomas Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

NEW PEACH BORDERS.—Where the planting of peach and nectarines has to be done this autumn no time should now be lost in preparing the borders. For early forced trees borders placed entirely inside are preferable, but for midseason and late supplies of fruit the roots may have the run of borders both inside and outside, or, particularly in the case of late supplies, those wholly outside. Efficient drainage is important, and should be secured by first concreting the site of the border so that it falls slightly to the front, where a four-inch tile drain should be placed and slightly sunk in the concrete. Upon this place ten or twelve inches of brick, or some similar rubble, and cover it with a layer of turves grass side down. The compost should consist of roughly broken good turfy loam, mixed according to its texture with more or less crushed mortar rubble, wood ashes, or burned garden refuse, and if the soil is poor some finely crushed bones may be added.

EARLY PEACH HOUSE.—This house should be prepared for next season's crop as soon as the trees have lost their leaves, by attention, in the first place, to pruning, releasing their branches from the trellis, and tying them in bundles. The pruning will be a light matter if the advice given in a former calender concerning the work to be done as soon as the fruit was gathered was followed. Cleanse the glass and woodwork of the house by washing it with warm soapy water, and, if necessary, paint the woodwork and limewash the walls. In cleaning the trees well wash them with the aid of a brush, and a warm solution of insecticide, but in doing so avoid wetting the young wood, as the buds are impatient of powerful insecticides. The young wood may be cleansed with warm water mixed with soft soap, not exceeding 4ozs. to the gallon of water. If the trees are badly affected with scale, previous to applying the insecticides syringe them with water at a temperature of 130 degrees, and, subsequently, when using the brush, dislodge the scale, being careful in so doing not to injure the buds.

STRAWBERRIES.—The continuance of heavy rains experienced immediately after the plants were placed in their fruiting pots was detrimental to their well being, but the plants improved greatly during the recent spell of fine weather, and their pots have now become well filled with healthy roots. The maturing of the crowns is an important item to now further as much as possible, and to assist it the weak side growths and runners should be regularly removed, and means taken, such as screwing the pots round occasionally to prevent the roots from running through the holes at the bottom. On no account, however, should checks be enforced by such means as withholding necessary supplies of water.

LATE CROPS OF FIGS.—Good fruits of figs can be obtained at this season of the year from thinly trained trees grown in houses placed in sunny positions. The fruits, nevertheless, are liable to split unless the atmosphere of the house is kept dry, and for this reason a little fire heat should be employed in damp or cold weather, and the house be carefully ventilated at favourable times. Supplies of root moisture will be now less needful, and after the fruit is all gathered root pruning, if it is necessary, should be carried out, as was recommended for earlier cropped trees.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

LATE PEAS. — With such favourable weather as we have experienced during the last month, and is still with us, late peas will go on bearing for some weeks to come. The health of the bine is very good, with freedom of flowers and pods, reminding one of June. The rows should be well supplied with both liquid manure and clear water. The points should be stopped, and side growths pinched to hasten the development of the late pods, as one cannot possibly expect the very late bloom buds to mature after this date, therefore, every attention should be given to those that can develop under reasonable weather conditions. The Gladstone, Webb's Masterpiece, and Autocrat are the varieties successful here.

CABBAGE.—The first plantings are doing remarkably well, and will soon be in need of earthing-up. Ply the hoe frequently between the rows. During this dry weather and until the earthing-up takes place, give a scattering of soot and burnt garden refuse around each plant, as this is an excellent stimulant, and a deterrent to slugs. If any plants go off quickly and unexpectedly, withering up in wind or sun, one may be certain that the cockchafer grub has eaten the stem through; hunt for, and kill the grubs, otherwise every plant will be killed. Continue to plant later, sowing as ground becomes vacant; a great gain is assured by early planting, as strong and well-rooted plants are obtained before the unfavourable weather sets in.

CAULIFLOWERS.—If the seedlings are not satisfactory in health or number, sow seeds in boxes, and place in a cold frame. Prick off those seedlings in frames and boxes that are ready, and grow them on as sturdily as possible while weather permits.

ENDIVE. — The earliest sowing is now quite ready to take up and place in pits and frames for protection; a fine day must be chosen for this important task. Lift the plants wth good balls of earth attached, and place thickly in frames. We place finely-sifted ashes around the plants as the work proceeds, finding this prevents decay. Draw the lights of the frame on all fine days to keep them hard and strong. For blanching, a portion can be covered with a good quantity of clean straw, and the flavour will be more nutty and crisp under these conditions than if blanching is done in a warm mushroom house. Water must be given, if needed. The later planting must be hurried on by hoeing and watering. Those sown for March and April use should be pricked out in frames forthwith.

LETTUCES are in excellent condition still. Care should be taken of the forward plants, as at this season they remain fit for use over a long period if decayed leaves are cleared away and the hoe worked among them. It will soon be time to treat them as advised for endive, particularly if much wet and frosty weather is experienced. The August sowings of lettuce should ere this be planted in various positions, and encouraged to root freely, whether in frames or the open ground, by regular hoeings and a dressing of soot amongst them.

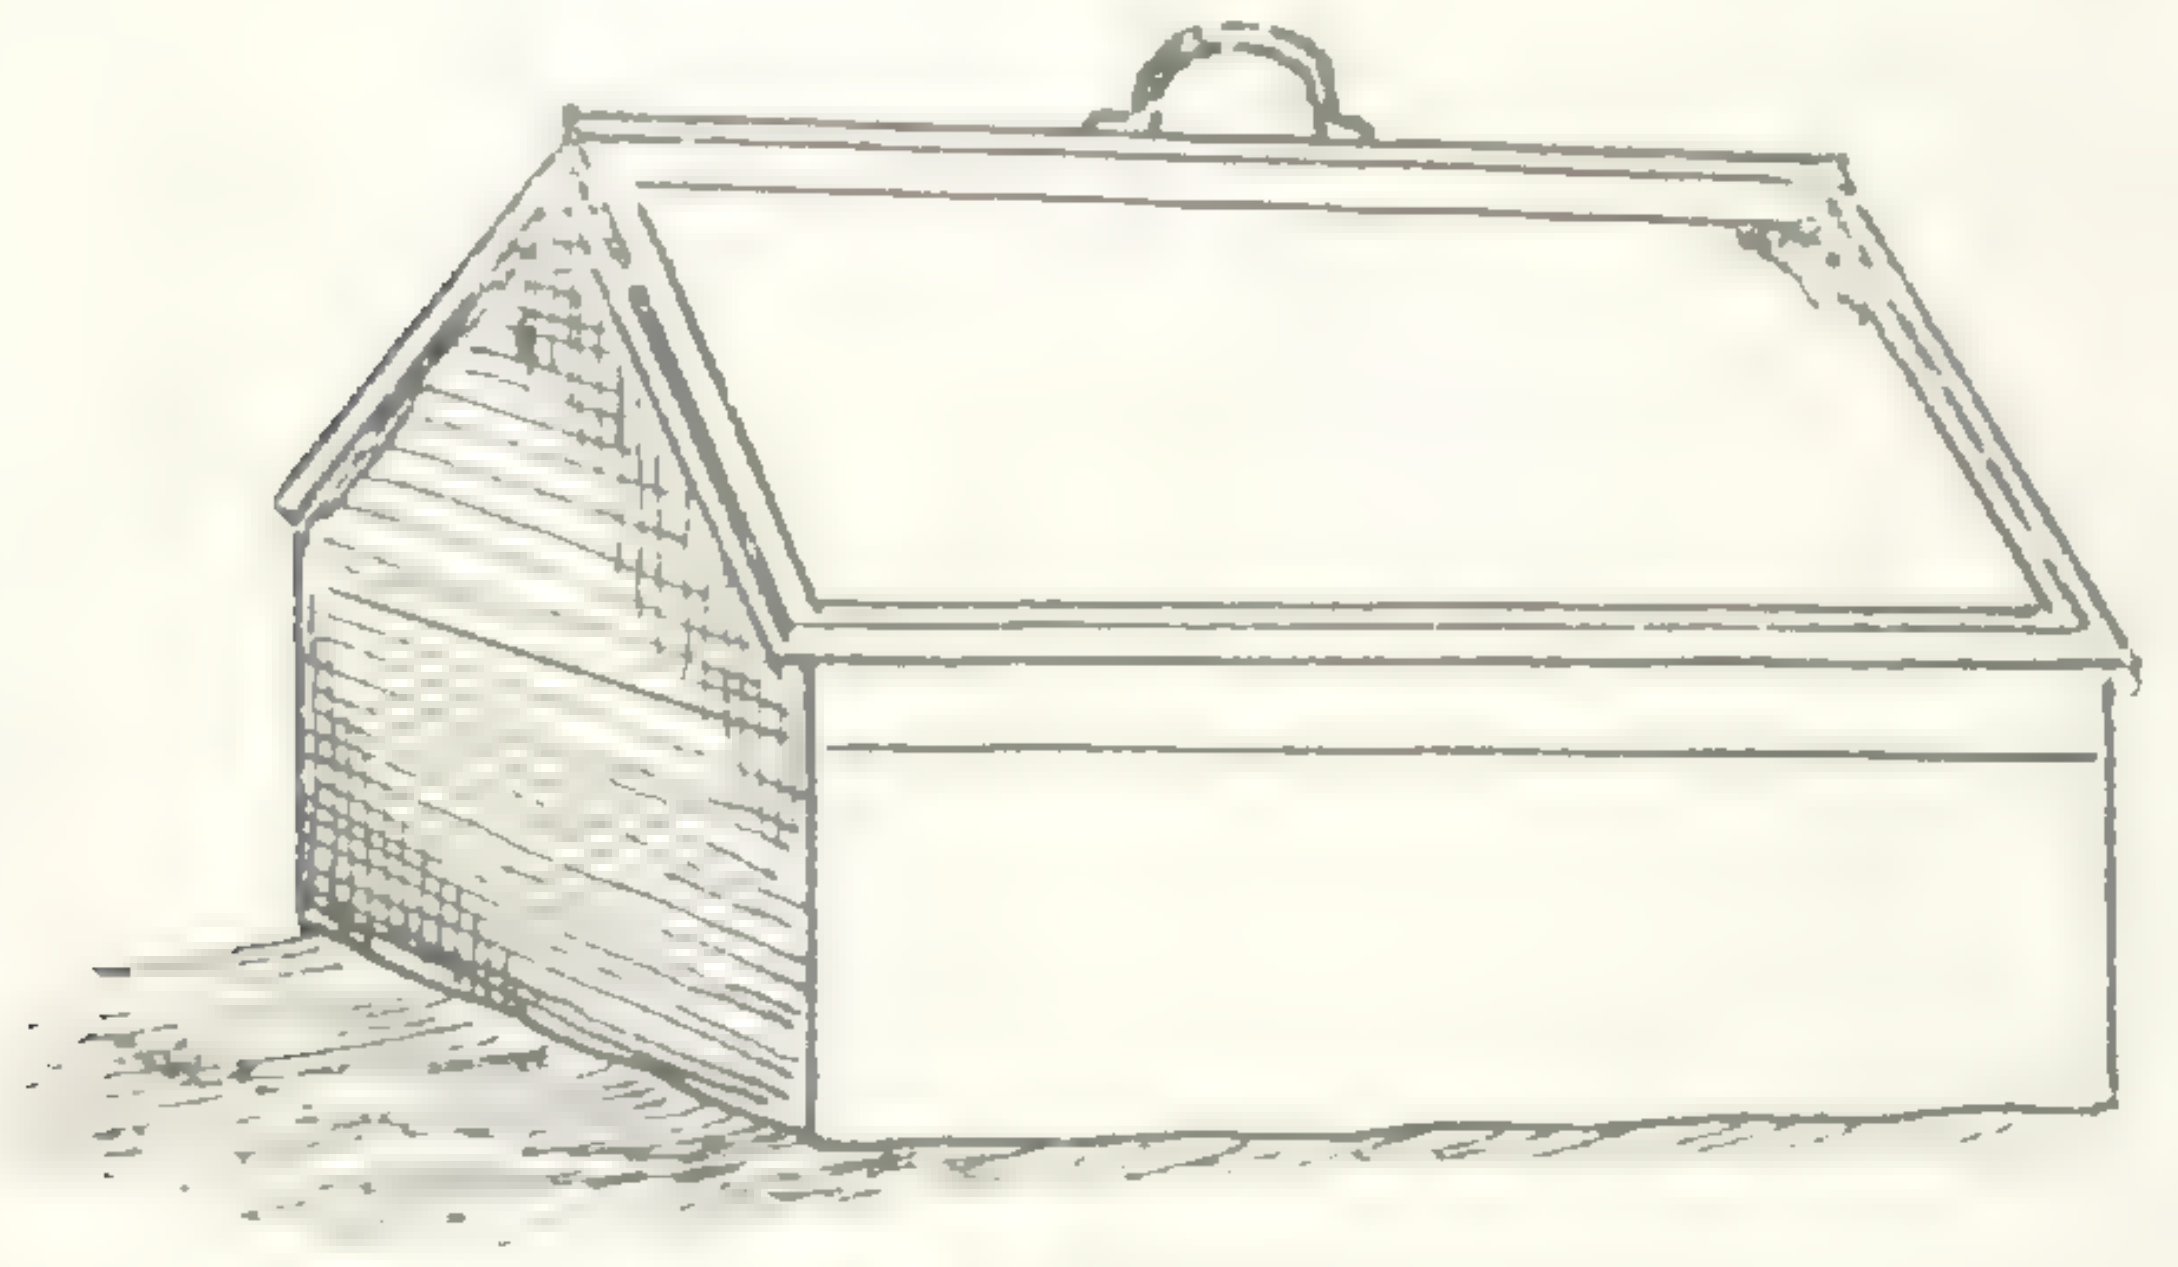
GENERAL.—Such summer-like weather as we have had lately will tend to ripen and harden up all vegetable crops for winter and spring supplies. If any help is needed amongst the Brassica crops, to assist this give it by clearing off any foliage that is spotted or decaying, and so letting every possible sunbeam reach each plant. Brussels sprouts will be greatly benefited by this procedure, as will the kales. All vacant ground should be roughly broken up, or trenched if time will allow, during this dry spell of weather, and all growing crops be well hoed weekly. Frosts must be prepared for by having in readiness either lights, boughs, mats, or strawy litter, according to the subject to cover.—George Ellwood, Swanmore Park Gardens.

Freesias.—These Cape bulbs can hardly be over-rated where choice fragrant flowers are needed. Bulbs are now to hand, and if potted at once can be had in flower from Christmas onwards, and just at the time when chrysanthemums are waning. Freesias are of great value for table decoration. The bulbs should be potted in a mixture of good loam, with peat, sand, and some charcoal added. When potted, place in a cool frame or house, give a good soaking of water, and never allow them to become dry. A temperature from 50 deg. to 60 deg. will be quite warm enough, and as growth advances neat stakes should be provided to support it.—W. Staward, Belford Hall Gardens.

Clethra arborea.—This tender species of clethra is a native of Madeira, from whence it was introduced in 1784. When oranges and other plants were grown in tubs, and stood outside during the summer months, this clethra was often treated in a similar way. Owing to this large examples are now occasionally to be met with in old-fashioned gardens. It is well suited for growing in lofty conservatories, as it forms quite a tree, a dozen feet or more in height. It is an evergreen, and in general appearance very much suggests an arbutus, while the flowers (at their best in the autumn) are a good deal like those of the lily of the valley. They are freely borne in spike-like racemes.—W. T.

DRY GLAZED GARDEN FRAMES.

The garden frames manufactured by the well-known firm of horticultural builders, Messrs. Saunders and Biss, of Exeter, are especially deserving of attention for their usefulness in the cultivation of a wide range of subjects, and for the distinctive character of their construction. For fully a quarter of a century this firm has achieved a high degree of success in the use of their system of zinc bar dry glazing in the construction of the roofs of conservatories, plant and fruit houses, and forcing pits, of which they have built large numbers in various parts of the British Isles. Their system of dry glazing has been adopted with equal success in the construction of span-roof and other garden frames. We hope to have an opportunity at no distant date of describing the system of dry glazing, as used by the firm in glazing plant and fruit houses of various descriptions, and we need not, therefore, do more now than mention that it admits the fullest light, and is thoroughly sound, watertight, and drip proof. In the glazing of the lights of garden frames and plant protectors, the zinc bars that hold the glass are affixed to the wooden bars, these being placed at the usual distances apart and the squares slipped into the grooves, which hold them firmly in position. The zinc bars are of the same pattern as those used for houses erected by Messrs. Saunders and Biss, and consequently are watertight and drip proof. We give an illustration herewith of an extremely useful form of span-roof frame that is fitted with the firm's patent zinc dry glazing bar, and equally adapted for the cultivation of ornamental plants and such useful crops as early vegetables and saladings. We also illustrate a simple handlight, which is made in various sizes, and can be used for the raising of seedlings, the shelter of small plants, and other purposes. The sides and ends are made of wood, and the glass at the top is held firmly by the patent zinc dry glazing bars, but in such manner as to admit of the glass being readily moved horizontally for the admission of air. We have had our attention called to a four-light telescopic garden frame. In this the lights instead of being made in one length, are made in two portions, and slide one over the other. The advantages are, it is suggested (1). The sashes being small the wear and tear is considerably reduced. (2). They are more easy to handle. (3). Ventilation can be given at the top and bottom. (4). The sashes are not pulled out over the paths, are not likely to be blown about in windy weather, and space is economised.



A USEFUL HAND LIGHT.
By Messrs. Saunders and Biss, Exeter.

DRY GLAZED GARDEN FRAME.

BRITISH PERPETUAL CARNATIONS.

The following British-raised seedlings of perpetual-flowering carnations have been registered by the Perpetual Flowering Carnation Society this year.

By Mr. C. F. Waters, Balcombe, Sussex: Albert E. Manders, orange with red stripes; Edith Waters, cerise.

By Mr. H. Burnett, Guernsey: Aurora, buff marked with pink; Bridesmaid, deep salmon-pink; Countess of March, salmon-pink; Daphne, deep pink; Fortuna, yellow inclined to buff; Marmion, cherry-red, with white margin; Mikado, deep heliotrope at its best; Mrs. W. B. Clode, reddish-salmon; Mrs. W. J. Hunter, cherry; Mrs. Tatton, white, overlaid with pink and margined white; Orpheus, bright yellow ground, marked with pink and white; R. F. Felton, pink; Snowball, white, inclined to blush in centre on opening; Snow Queen, white (pure); Vulcan, buff, heavily marked scarlet.

By Messrs. Young and Co., Cheltenham: Duchess of Devonshire, bright crimson, after President colour; Lady Henderson, bright flesh pink.

By Mr. A. Smith, Enfield Highway: Empire Day, pale salmon-pink.

By Mr. W. H. Lancashire, Guernsey: Emperor, white ground, striped carmine.

By Mr. C. Engelmann, Saffron Walden: Harlequin, yellow ground, heavily striped red.

By Messrs. Stuart Low and Co., Bush Hill Park: Lady Dainty, white overlaid purple; Rival, coral-red.

By J. Wormald, Esq., Harrogate, Pride of Wharfedale, mauve ground, marked pink; The Socialist, scarlet.

By Mr. Hayward Mathias, Medstead, Etna, bright orange-scarlet; Mascot, salmon-pink; O.K., blood-red; Pink Pearl, rose.

CROYDON CHRYSANTHEMUM SOCIETY.
23RD AUTUMN SHOW, ADULT SCHOOL, PARK LANE. WEDNESDAY and THURSDAY, OCT. 26th and 27th.
Challenge Cups, £35, with £20 money. Total Prizes over £100.
Entries close Oct. 20th.
W. B. BECKETT, "Woodcote," Purley.

THE FOUR NORTHERN COUNTIES, FRUIT CONGRESS and SHOW, HEXHAM, 20-22 October, 1910. Particulars of space for Trade Exhibits from the General Secretary, Rev. J. BERNARD HALL, Hon. F.R.H.S., Dalston, Cumberland.

THE BOURNEMOUTH HORTICULTURAL SOCIETY EXHIBITIONS:
AUTUMN SHOW. SPRING SHOW.
1st and 2nd Nov., 1910. 4th and 5th April, 1911.
For Schedule and particulars apply to
C. W. BARRETT, Sec., "Lucerne," Fenton Road, West Southborne, Bournemouth.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

National Chrysanthemum Society.

In glorious autumn weather this society held its first show of the season on October 5 and 6, at the Crystal Palace. The schedule was not a large one, and the competition was not particularly keen, except in a few instances, but what the show lacked in extent it made up for in quality, while decorative features and non-competitive displays were numerous and good.

OPEN CLASSES.

Mr. W. Howe, gardener to Lady Tate, Park Hill, Streatham, led for a floral display of chrysanthemums, either pot plants or cut flowers, with a bold semicircular group of big blooms, associated with bamboos, crotons, and ferns; Mr. F. Brazier, Caterham, was second with a bright exhibit of cut flowers of outdoor early varieties.

There were five stands of twelve blooms of Japanese varieties, distinct, and here the premier award fell to Mr. Thos. Stevenson, gardener to E. G. Mocatta, Esq., Woburn Place, Addlestone, with Lady Talbot, Capt. Mitford, Mrs. L. Thorn, Master James, Mary Farnworth, Mrs. F. C. Stoop, Mrs. A. T. Mills, C. H. Totty, Francis Joliffe, Blanche, Mrs. H. D. Thornton, and Harry Poulton. Mr. T. J. Broom, gardener to Miss Langworthy, Gay's House, Holyport, second; and Mr. J. Kirkwood, gardener to E. Wormald, Esq., Grass Farm House, Finchley, N., third. All of the flowers were remarkably good for this time of year. For six Japanese, distinct, Mr. F. Cordell, gardener to Alfred F. Blades, Esq., Rookfield, Reigate, scored with Mrs. L. Thorn, G. F. Bunyard, Mrs. G. Milcham, Master James, Mrs. A. T. Miller, and Mrs. W. Knox, in good form; Mr. T. W. Stevens, gardener to W. H. Stone, Esq., Laurie Park, Sydenham, second.

Mr. J. Smellie, Busby, Glasgow, won first prize for a dozen bunches of early-flowering pompons, showing good flowers of Canari, Alice Butcher, Mignon, White St. Crouts, Blushing Bride, Bronze Bride, Early Blush, Scarlet Gem, and Piercey's Seedling; Mr. G. Bowness, Riverside Nursery, Busby, second. There was but one entry in the class for a dozen bunches of undisbudded early chrysanthemums, and this, which was awarded the first prize, was a fine set from Mr. G. Bowness, who had big sheaves of Jas. Bateman, Roi des Blancs, Nina Blick, Elstob Yellow, Feu Parisienne, Market White, Miss B. Melville, Normandie, Wells' Scarlet, Hector, Polly, and Lillie.

Only a third prize was awarded in the class for six vases of early varieties, raised from Messrs. Wells' seeds of earlies, and this fell to Mr. W. Newton, gardener to Miss Nathan, Little Heath Road, Potter's Bar.

Mr. J. Emberson scored for half a dozen bunches of early Japanese or decorative varieties with fine flowers of Goacher's Crimson, Lillie, Hector, Roi des Blancs, Wells' Scarlet, and Harry; Mr. F. Brazier, Caterham, a good second, and Mr. G. Bowness third. Mr. T. Stevenson had the best single vase of three Japanese blooms, showing immense brilliant flowers of Master James; Mr. A. Smith, gardener to Mdme. Stuart, The Convent, Roehampton, second with White Queen; and Mr. G. Mileham, gardener to A. T. Miller, Esq., Emlyn House, Leatherhead, third.

Mr. G. Bowness was to the fore in the class for a vase of yellow or bronze early-flowering single varieties with a fine sheaf of Eric; Mr. F. Brazier, second. Mr. Brazier won in a similar class for any other than yellow or bronze varieties with Brazier's Beauty; Mr. Bowness second, and Mr. L. T. Groves, Cedar Nursery, Ham, third. Mr. Bowness scored for a vase of early single varieties with a big bold effort in mixed colours; Mr. J. Emberson, Walthamstow, second; and Mr. F. Brazier, third, the latter having too flat an arrangement.

The display in the class for one vase of chrysanthemums for table decoration was good, and out of the five competitors Mr. C. Fox led the way with a bold vase of white, yellow, and crimson flowers, pleasingly associated with suitable foliage; Mr. J. Kirkwood, second, and Mr. Webb third.

AMATEURS.

There was only one exhibitor of six bunches of early Japanese varieties, and this was Mr. C. Fox, Eridge Road, Tunbridge Wells, whose set was only considered worthy of a second prize. For six bunches of early pompon varieties, Mr. J. Smellie scored with very fine bunches of Blushing Bride, Scarlet Gem, Alberta, St. Crouts, Canari, and La Luxembourg; Mr. J. Emberson, Grove Road Nursery, Walthamstow, second, and Mr. G. Bowness third.

There were two sets of three vases of early-flowering varieties, undisbudded, and here Mr. C. Fox was to the front with Roi des Blancs, Horace Martin, and Goacher's Crimson; Mr. W. Webb, second.

DECORATIVE EXHIBITS.

Mr. A. H. Cole, Camberwell New Road, secured the first prize for a table of floral designs, the most notable effort being a golden crown of chrysanthemums on a cushion of crimson flowers.

Five competitors came forward in the open class for a table decoration, and here Mrs. A. Robinson was first prize winner with a bold design in white and bright chestnut-red flowers, elegantly arranged; Mr. T. W. Stevens, gardener to W. H. Stone, Esq., Donnington, Laurie Park, Sydenham, second; and Mr. W. Webb, gardener to J Chapman, Esq., Laurie Park Road, Sydenham, third. Two competitors came forward in the class for three epergnes, and here the honours fell in due order to Mr. T. W. Stevens and Mrs. Brewster, St. Peter's, Canterbury.

In the amateurs' section for a table decoration of chrysanthemums, Mrs. A. Robinson, Norhyrst, Park Hill, Carshalton, led with a light arrangement of yellow and bronze flowers; Mrs. W. Maslin, Ongar Hill Cottage, Addlestone, second, with yellow flowers; and Mr. J. B. Harrison, gardener to R. Girvin, Esq., Ashbourne, Laurie Park, Sydenham, third. Mrs. Brewster was a good first for a hand basket of chrysanthemums with golden and bronze flowers, prettily disposed; Miss J. Martin, Warminster Road, South Norwood, second; and Mr. R. F. Groves, third.

Mrs. Brewster led for a hand basket of autumn foliage and berries with a design in which honesty, clematis, physalis, berberis, asparagus, and bracken were well arranged; Mrs. Maslin second, and Mr. F. Brazier third.

Out of five entries, Mrs. W. Maslin led in the class for one epergne of chrysanthemums, with a pretty association of chestnut, white, and soft yellow flowers; Mr. C. Fox second, and Mr. W. Webb, third.

NON-COMPETITIVE.

On this occasion the trade growers nobly supported the society, providing the great bulk of the display, and setting up exhibits of excellent quality and considerable extent.

Messrs. J. Cheal and Sons, Crawley, presented a collection of dahlias; the centre of their group consisted of the finer cactus varieties, and this was flanked at one end by single and pæony-flowered dahlias, and at the other with delightful pompon and pompon-cactus varieties. The latter are charming, and if they can be produced with long stems, they have a great future before them for all kinds of floral decoration. Messrs. T. S. Ware, Lim., Feltham, filled three sides of a square stage with brilliant groups and stands of pæony-flowered and cactus dahlias, some of the latter being especially good, and represented by choice varieties. Early chrysanthemums, pentstemons, solidagos, and Michaelmas daisies were all used effectively in this exhibit.

A large and imposing group of chrysanthemums was arranged by Messrs. W. Wells and Co., Merstham. At the back were big stands of such attractive varieties as Eden, Mrs. Balfour Melville, October Gold, Roi des Blancs, Tapis d'Or, Normandie, and Provence. In front of these were a few plants, carrying big blooms of the new white Japanese variety, White Queen, while the foreground consisted of large vases of early single varieties, among which Formidable, Netty King, Surrey, Eric, Richard, Esther, Dolly, Kate Carter, and Jano were conspicuous. In addition to this group, the Messrs. Wells had a lengthy exhibit of Michaelmas daisies in great variety, a selection of their fine pentstemons, phloxes, and other late hardy flowers.

Messrs. H. Cannell and Sons, Swanley, presented a collection of early-flowering chrysanthemums, and set these up in goodly bunches; pentstemons, Cosmos bipinnatus, Sweet Sultans, and Helianthus sparsifolius were also included. A delightful exhibit of graceful Michaelmas daisies was made by Mr. H. J. Jones, Ryecroft Nursery, Lewisham; this was 60ft. long, and included about seventy varieties of these useful autumn flowers. The setting up was excellent, and every variety and every vase was well displayed. In front of the big group there were huge vases of mixed Michaelmas daisies, and a central vase of big blooms of chrysanthemum Mrs. Thorn, while the whole exhibit was edged with small bunches of early chrysanthemums.

Two distinct and very effective groups were set up by Messrs. Hobbies, Lim., Dereham. One consisted of a blaze of pæony-flowered dahlias margined with cactus dahlias and backed by Michaelmas daisies and early chrysanthemums. This firm has done good work in continually representing the value of the pæony-flowered dahlias for decorative purposes. The other exhibit was composed of roses set up in vases and stands of varied sizes, the whole making up a fragrant and charming exhibit for thus late in the season. Mdme. Abel Chatenay, Earl of Warwick, Mdme. Melanie Soupert, General McArthur, Frau Karl Druschki, Caroline Testout, Duchess of Wellington, C. J. Grahame, and Mdme. Ravary were roses freely shown.

Mr. Norman Davis, Framfield, Sussex, put up a particularly handsome and well-arranged exhibit of early chrysanthemums, Michaelmas daisies, and the elegant Solidago grandiflora, these latter forming a fine background for the chrysanthemums. Very fine were the stands of Tom Edwards and David Ingamells, two splendid yellow Japanese varieties. With these were stands of Roi des Blancs, Goacher's Crimson, La Somme, Perle Rose, La Garonne, Belle Mauve, and other good new and old varieties; while small groups of the Framfield varieties of Amellus bessarabicus were associated with ferns close to the front margin. Mr. Frank Brazier, Caterham Valley, set up a very bold exhibit of select Michaelmas daisies, early chrysanthemums, and branches of autumn-coloured foliage. Phloxes also entered into the composition of a striking display that proved Mr. Brazier to be a good decorator as well as grower, and that he is improving at a great rate as an exhibitor.

Messrs. Dickson and Robinson, Cathedral Street, Manchester, had a large exhibit of early chrysanthemums in great variety and well set up, but some of the flowers had suffered during transit. Mr. T. Williams, Oxford Road, Ealing, put up a small exhibit of floral designs.

MEDALS.

Large Gold.—Mr. H. J. Jones, Ryecroft Nursery, Lewisham, for Michaelmas daisies and chrysanthemums; Mr. Norman Davis, Framfield, Sussex, for chrysanthemums, etc.; Messrs. W. Wells and Co., Merstham, for chrysanthemums and hardy flowers; and Messrs. Hobbies, Lim., Dereham, for dahlias and roses.

Gold.—Mr. F. Brazier, Caterham, for Michaelmas daisies and other hardy flowers.

Silver-Gilt.—Messrs. J. Cheal and Sons, Crawley, for dahlias; Messrs. T. S. Ware, Lim., Feltham, for dahlias; Messrs. Dickson and Robinson, Manchester, for early chrysanthemums.

Silver. — Messrs. H. Cannell and Sons, Swanley, for early chrysanthemums, etc.

Bronze.—Mr. T. Williams, Oxford Road, Ealing, for floral decorations.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE.

SEPTEMBER 26.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair), Prof. J. A. Voelcker, M.A., Messrs. A. W. Sutton, F.L.S., V.M.H., A. W. Hill, M.A., F.L.S., J. Douglas, V.M.H., J. T. Bennett-Poe, M.A., A. Worsley, E. M. Holmes, F.L.S., R. Irwin Lynch, M.A., V.M.H., R. H. Pearson, W. Hales, J. Fraser, F.L.S., W. Cuthbertson, J.P., R. A. Rolfe, A.L.S., and F. J. Chittenden, F.L.S. (hon. secretary).

BULBS DECAYING.—A number of narcissus bulbs teeming with bulb mites and in a decaying condition were received for examination. There seemed no doubt that the mites were the cause of the trouble, though doubt is sometimes cast upon this idea. On this point Mr. A. D. Michael, F.L.S., writes: "I have investigated the question of the injury done by the bulb mite to the best of my ability, and for the purpose of tracing the life history have kept specimens frequently under observation in confinement throughout their whole development from egg to adult. I have found it best to feed them on sound, healthy bulbs, which they eat with avidity. . . I have no doubt as to its attacking healthy bulbs, and look on the creature as a true destroyer." (See also "British Tyroglyphidæ, Vol. ii., Ray Society, pp. 92-95.)

CATASETUM SP.—Mr. G. Rae Fraser, of Letchmore Heath, sent a pistillate flower of a species of catasetum from Bermuda, which Mr. Rolfe considered to be probably C. macrocarpum, but as the pistillate flowers of the different species of catasetum are so similar to one another, there is a little doubt about the name, which can only be settled when the much more commonly produced male flowers appear. The whole inflorescence has, by the kindness of Mr. Fraser, been deposited in the Kew herbarium.

FASCIATION IN EUPHORBIA CYPARISIAS.—A well-known example of fasciation in the stem of this euphorbia was shown.

OAK GALLS.—Mr. J. Fraser showed a number of oak galls from the common oak, and commented upon the variety that may be found even upon a single leaf.

VARIATIONS IN RYE GRASS.—Mr. John Fraser also showed some specimens of Lolium multiflorum (equals L. italicum), which he had collected on a rubbish heap, to illustrate the wide variation in the form of the inflorescence of this species. One of them had the spikelets set very close together on the rachis, and was apparently the forma cristatum of C. T. Timm, a rare form analogous to the Lolium perenne var. cristatum, which is much more common. Another had a branch spike with two or three empty glumes at the

base of each branch and scarcely-awned outer glumes, appearing to be a hybrid, probably between Lolium multiflorum and Festuca pratensis.

VARIATION IN ACER. — From Mr Beamish, of Glounthaune, Co. Cork, came a specimen of the Japanese maple Likonishke, with branches showing very much the character of the stock upon which it had been grafted arising considerably above the place of grafting. It was thought probable that the variation might be due to the tendency of the variety to vary.

FROST INJURY.—The Secretary produced a draft of the report on the damage done by frost during the winter 1908-9.

Bristol Gardeners' Association.

The usual monthly meeting was held at St. John's Parish Rooms, Mr. Hayball in the chair. Mr. Gostling read a paper on "Orchids," and the lecturer gave several reasons why orchids are, or should be, grown, and in the discussion gave cultural details, in reply to enquiries made. Three new members were elected. Mr. Wall, of Melrose Nursery, Bath, had on view several vases of perpetual-flowering carnations, including Princess and Salmon Queen, two new varieties of his own introduction; also May Day, Enchantress and sports, Mikado, Carola, Afterglow, Aristocrat, Winsor, and White Perfection. A special certificate was awarded Mr. Wall. Mr. Shaddick was awarded an ordinary certificate for three large bunches of outdoor-grown tomatoes.

There was keen competition in the class for three bunches of hardy flowers, for which Messrs. Binfield, T. Clark, and Scott were placed in the order given.

Reading Gardeners' Association.

The opening meeting of the autumnal session took place on Monday, September 26, at the Abbey Hall, Reading (by kind permission of Messrs. Sutton and Sons), when the president, Mr. Alderman Parfitt, J.P., gave a cordial welcome to the large number of members present.

The minutes of the last meeting having been read, eight new members were elected.

The President then announced that the gathering was honoured with the presence that evening of Mr. Hart Synnott, D.S.O., B.Sc., Director of Agriculture and Horticulture at the Reading University College, and his object in attending was to offer every possible assistance from the college to the association. The announcement was received with applause. Mr. Powell then proposed, Mr. Tunbridge seconded, and was supported by other members, that a non-competitive exhibition be held, on the same lines as last year, during the latter part of November. This was carried, and the arrangements were left in the hands of the committee.

The lecturer for the evening was Mr. H. C. Loader, The Gardens, Erleigh Park, Reading, and his subject was "Spring Bedding—The Arrangement of Plants and Bulbs for Harmonious Effect." Mr. Loader opened his remarks by expressing regret that in many gardens spring bedding was almost entirely neglected, and pointed out that empty beds were out of harmony with Nature, and, he might add, out of touch with all things. He then proceeded to deal with failures, warning his audience to avoid certain combinations, which, though having a good appearance on paper, he had proved by experience to produce "discord" rather than harmony. The lecturer then pointed out the necessity in arranging colour schemes of making sure of the "angles," so that, no matter from what point of view the arrangement might be regarded, there was nothing, such as a distant bed or building, which might clash, or appear ill-assorted, with the effect desired.

In conclusion many examples of harmony in colour which the lecturer had proved to produce most gratifying and beautiful results, were enumerated, and carefully noted by the members.

An animated discussion followed the paper, and at the close of the evening Mr. Loader was accorded a hearty vote of thanks.

Certificates for cultural skill were presented to Mr. G. Carter, head gardener to S. Griffith, Esq., Gordon Lodge, and to Mr. F. Townsend, head gardener to L. G. Sutton, Esq., Hillside.

Very fine seedling carnations were exhibited by Mr. H. C. Loader, head gardener to M. H. F. Sutton, Esq.; Lobelia cardinalis by Mr. W. J. Townsend, head gardener to Sir W. Farrer; and a group of perennial asters by Mr. J. Durrant, gardener to Miss Cripps, Preston House.

CLASSIFICATION OF SWEET PEAS.

The following is an up-to-date selection of varieties in commerce, drawn up by the Floral Committee of the National Sweet Pea Society. The varieties are in order of merit. * Indicates a grandiflora variety, all others are waved.

- Bicolor—
  - Arthur Unwin.
  - Mrs. Andrew Ireland.
  - Colleen.
- Blue—
  - Flora Norton Spencer.
  - Mrs. G. Charles.
  - *Lord Nelson.
- Blush—
  - Mrs. Hardcastle Sykes.
  - Princess Victoria.
- Cerise—
  - Cherry Ripe.
  - Chrissie Unwin.
  - *Coccinea.
- Cream, Buff, and Ivory—
  - Clara Curtis.
  - Paradise Ivory.
  - *James Grieve.
- Cream-Pink—
  - Mrs. Hugh Dickson.
  - Gladys Burt.
  - Constance Oliver.
- Crimson—
  - King Edward Spencer.
  - *King Edward VII.
- Fancy—
  - *Sybil Eckford.
- Lavender—
  - Masterpiece.
  - Asta Ohn.
  - Frank Dolby.
  - *Lady Grisell Hamilton.
- Lilac Shades—
  - Mrs. R. H. Carrad.
- Magenta—
  - Menie Christie.
- Marbled—
  - Helen Pierce.
- Maroon—
  - Nubian.
  - Othello Spencer.
  - Tom Bolton.
  - *Hannah Dale.
- Mauve—
  - Tennant Spencer.
- Mauve—(continued)
  - Helio-Paradise.
  - *Mrs. Walter Wright.
- Orange-Pink—
  - Helen Lewis
  - *Miss Willmott.
- Orange-Scarlet—
  - Dazzler.
  - Edna Unwin.
  - St. George.
- Picotee Edged (Cream Ground)—
  - Mrs. C. W. Breadmore.
  - Evelyn Hemus.
- Picotee Edged (White Ground)—
  - Elsie Herbert.
  - Mrs. Townsend.
  - *Dainty.
- Pink and Salmon Pink—
  - Countess Spencer.
  - Zarina.
  - *Prima Donna.
- Rose and Carmine—
  - John Ingman.
  - Marie Corelli.
  - *Prince of Wales.
- Salmon Shades
  - Earl Spencer.
  - Nancy Perkin.
  - *Henry Eckford.
- Scarlet—
  - Doris Burt.
  - George Stark (1908 medal stock).
  - *Queen Alexandra.
- Striped and Flaked (Purple and Blue)—
  - Suffragette.
  - *Prince Olaf.
- Striped and Flaked (Red and Rose)—
  - America Spencer.
  - Aurora Spencer.
  - *Jessie Cuthbertson.
- White—
  - Etta Dyke.
  - Nora Unwin.
  - *Dorothy Eckford.

TRADE NOTE.

At the Brussels International Exhibition Messrs. John K. King and Sons, of Coggeshall, Essex, have been awarded a prize medal for an exhibit of their pedigree seed corn and farm seeds, and an exhaustive exposition of their system of pedigree selection of seeds.

Plums at Aldenham.—In a season like the present, when plums are generally scarce, it is a pleasure to find even one garden with a good crop. On the south wall at Aldenham I lately noted trees of the following varieties carrying desirable crops of extra fine fruit: Golden Transparent Gage, Coe's Golden Drop, and especially the purple form, which usually does well at Aldenham; Grand Duke, and Jefferson, which is a plum not nearly enough grown.—E. M.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

DISEASED VIOLET LEAVES.—A. B., Ashbourne: The violets are suffering from an attack of Cercospora violæ. Spray with diluted Bordeaux mixture, and provide for a free circulation of air among the plants.

SULPHIDE OF POTASSIUM.—M. E. M., Milborne: We thought we had made it quite impossible for any of our readers to make the mistake of confounding sulphate of potassium with sulphide of potassium. The latter is the substance used as a fungicide, and its popular name is liver of sulphur.

SMALL HOLDINGS.—H. L. B., Rainham: Three books that will be of special interest and value to you are "The Small Holder's Guide," 1s. 2d., post free; "Profitable Fruit Growing," 1s. 2d., post free; and "Packing and Selling Fruit and Vegetables," 1s. 2d., post free. All of these can be obtained from the GARDENERS' MAGAZINE office, 148, 149, Aldersgate Street, E.C.

CORAL-SPOT FUNGUS ON RED CURRANTS: J. C., Halstead: The coral-spot disease is caused by one of the most common and most generally distributed of British fungi, i.e., Nectria cinnabarina. The first stage of the disease takes the form of bright coral-red warts, which are about the size of millet seed, and are thickly scattered over the surface of dead or dying branches of the tree attacked. These red warts are very conspicuous, and at one time this condition of the fungus was considered to be an independent plant, and called Tubercularia vulgaris. At this stage numerous and exceedingly minute spores are produced, and readily scattered by the wind or by insects. At a later stage the coral-red changes to a rusty-brown colour. The surface becomes rough with projecting points, and a second form of fruit is produced. In many instances the fungus passes through all its stages on dead branches, and in such a case no direct injury will be done, but rather a certain amount of good consequent upon the hastened decay of the wood on which the fungus is growing. The indirect danger arising from its presence on dead wood is the possibility of infection of living plants by the spores produced. The earliest indication of disease caused by Nectria cinnabarina is the drooping and yellowing of the leaves, which soon die and fall to the ground. In a few weeks the bark becomes slightly shrivelled, and the characteristic coral-red warts appear on the surface. Death of the leaves, and finally of the branch, is due to the choking of the wood vessels by the mycelium, which cuts off the supply of water and food. The fungus is remarkable for the great number of species of woody plants upon which it can grow and produce perfect fruit, being met with on all fruit and forest trees, excepting conifers, and also on various shrubs. Amongst plants specially susceptible to the attacks of nectria may be mentioned sycamore, elm, hazel, apple, pear, and red and black currants. Preventive measures suggested by the Board of Agriculture are: (1) Whenever diseased branches are observed they should be removed and burned without delay, as after infection recovery is impossible, and any delay in removal permits the formation of spores, and probable infection of neighbouring plants. (2) Fallen branches, stored pea rods, poles, etc., are often literally covered with the bright coral-pink warts of the nectria, and should then at once be destroyed. (3) When pruning, it is a wise precaution to protect every cut or damaged surface with a coat of gas-tar, and also to remove and trim the ends of branches broken by the wind or by other agency.

INSECT AND FUNGUS PESTS.—A. C., Helensburgh: There is no one book that covers the subject, or subjects, for an expert on injurious insects is seldom also an expert on fungi. Further, the expense of issuing books of this character, freely illustrated in colours, has hitherto been practically prohibitive, but now that reproductions in natural colours is becoming simpler and cheaper, we may in the near future have books of the character you suggest. Miss Ormerod's "Handbook of Insects Injurious to Orchard and Bush Fruits" (Simpkin, Marshall, Hamilton, Kent, and Co.) is still of great value, though we have advanced a good deal in methods of prevention since its publication in 1898. More recent is Mr. T. Martin Duncan's "Insect Pests of Farm and Garden" (Swan, Sonnenschein, and Co., Bloomsbury, 2s. 6d. net), illustrated from photographs and original drawings. "Fungoid Pests of Cultivated Plants" practically reaches your ideal in the matter of identification of species, as it contains two dozen coloured plates representing no fewer than 357 fungoid diseases, besides illustrations in black and white. This is by Dr. M. C. Cooke; it was issued in various numbers of the "Journal" of the Royal Horticultural Society, and is now issued by that body in one volume, 5s., post free. One other book we would draw your attention to in this connection, and it is "The Book of Garden Pests and Plant diseases" (John Lane, 2s. 6d.), by Mr. R. Hooper Pearson. Microscope slides of a few injurious insects, and plant diseases, may be obtained from or through firms that make a speciality of microscopes.

POND WEED.—Welshman, Llanelly: What kind of weed is it that you wish to destroy? If you tell us that we may be able to help you. We do not know a chemical preparation for the despatch of water weeds, which at the same time will do no harm to cultivated water plants.

FIG TREE DISEASE.—J. P., Worthing: The disease is by no means a new one, but a few years ago it became very prevalent, and at our request Mr. G. Massee investigated the matter, and his report, together with an illustration of the disease, were published in the GARDENERS' MAGAZINE of July 23, 1898, p. 475. A fig tree branch that is attacked always dies above the point of attack: the branch is girdled and cankered, and from the dead portion the minute spores ooze out in little hair-like strings, connected by a viscid substance that is brittle in dry weather and soluble in wet, so that the spores are readily distributed. Experiments conducted on healthy fig trees have shown that the fungus (Libertella ulcerata) will not cause the disease when placed on the unbroken surface of even very young branches, whereas, when the spores are placed on the end of a cut branch or on injured bark, inoculation always followed, and the mycelium was found in abundance at the expiration of ten days. In one experiment a badly diseased branch, showing numerous threads of spores, was cut through; immediately afterwards the same knife was used for making an incision in the bark of a branch of a healthy young plant of Ficus religiosa. At the expiration of ten days the wound showed undoubted symptoms of disease, and at the end of five weeks the white threads of spores were formed. This experiment proved that the disease may be imported to healthy plants by using a knife that had been used for pruning diseased plants, and an examination of various diseased plants suggested the idea that this method of spreading the disease is a not unusual one. With regard to preventive measures, there is no evidence to show that the mycelium of the fungus ex-

1 Year, **10/6** post free; 6 months, **5/6** post free; 3 months, **3/-** post free; to Foreign Countries, **15/-** per annum.

*** If a receipt is required for amounts under 10s. a stamped envelope should be forwarded.

tends backwards below the point of infection, hence, when a canker spot appears, the removal of the branch below the diseased spot should be effected at once as the upper portion is certain to be killed by the fungus. every cut curface should be painted at once with a solution of sulphate of copper dissolved in water, and afterwards with tar. It would be wise when cutting diseased plants to dip the knife in a solution of sulphate of copper after each cut, to remove any spores that may adhere to it.

NAMES OF FRUIT.

N. D., Sidmouth.—1, Pitmaston Duchess; 2, Golden Noble.

F. J. F., Chesham.—1, Black Hamburgh; 2, Alicante; 3, Madresfield Court.

M. E. J., Lincoln.—1, Ribston Pippin; 2, not recognised; 3, Worcester Pearmain.

D. C., Widcombe.—1, Warner's King; 2, Pott's Seedling; 3, Golden Noble; 4, Beurre Rance.

M. W., Chippenham.—1, Beurre Hardy; 2, not recognised; 3, Gascoigne's Scarlet; 4, Cox's Pomona.

L. S., Worksop.—1, Beurre Diel; 2, Beurre Clairgeau; 3, Durondeau; 4, Hessle; 5, Catillac; 6, Pitmaston Duchess.

L. S. B., Allendale.—1, Blenheim Pippin; 2, Cellini; 3, Gloria Mundi; 4, Sandringham; 5, Lane's Prince Albert; 6, Golden Spire.

NAMES OF PLANTS.

D. A. S., Abbeyleix.—Rodgersia podophylla—remarkably large and well grown.

G. W. (no address).—Your specimens were named on p. 780, under the initials of "F.W."

C. W. A., Monmouth.—1, Cassia corymbosa; 2, Berberis vulgaris; 3, Chrysanthemum uliginosum.

C. S., Wingham.—1, Not recognised, should have been sent earlier; 2, Aster Linosyris; 3, Ceanothus azureus; 4, Reseda alba.

M. E. M., Milborne.—1, Caryopteris mastacantha; 2, Helenium striatum; 3, Aster diffusus horizontalis; 4, Helianthus multiflorus.

G. T. J., Stamford Hill.—1, Lastrea filix mas; 2, send when in flower; 3, a spiræa, probably S. discolor; 4, Ligustrum lucidum; 5, a prunus, send when in flower or fruit; 6, probably a cratægus, send when in flower.

THE HORTICULTURAL EDUCATION ASSOCIATION.

Apart from the novelty of the thing, there is something funny about the idea of giving brief "character" sketches of the members of an association after their annual meeting, and I am undecided as to which is the most complimentary, to be described in the likeness of a "Puritan trooper," "a swarthy giant," "burly, deep-chested, and black-bearded," "trim and well-groomed," "small, fair, voluble," or, as with two unfortunate members of the party, "hopeless cases." If it wasn't so amusing the latter description might be perturbing, but, as one of the "hopeless," I wish for nothing better than to be "left to it" with a type like "H. J. W.," my good chum of nearly twenty years' standing, who is one of the best, and I know this statement would be supported by Kentish cottage gardeners and Surrey schoolmasters. It is hard to believe that "Nield of Ridgmont," the small, fair, and voluble, should be late for breakfast, considering that at Bristol last year he was out on Clifton Downs with his inevitable camera in the early hours of the morning, and the modesty of the estimable secretary of the association, in describing himself as "unworthy," is overwhelming, but there, you know, he doesn't mean it. It is sad to think of him as trainer of the "hopeless cases"—and he took trouble with me, too. Dear, dear, how very disappointing, but who has the greater claim to sympathy, "Wright of Kent" or

"Hollingworth of Gloucester"?

MARKETS.

◆

COVENT GARDEN.

Flowers.

Flowers are plentiful, and of good quality, and business is fairly brisk.

GARDENING ENGAGEMENTS.

Mr. W. Staward, for many years at Belford Hall Gardens, Belford, has been appointed head gardener to Mrs. Henry Callender, at Preston Hall, Dalkeith, N.B.

CATALOGUES RECEIVED.

AMOS PERRY, ENFIELD.—Three separate lists have reached us, one of bulbs, one of irises—very interesting and descriptive, and one of delphiniums.

CHARLES TURNER, SLOUGH.—A classified and descriptive catalogue of roses.

T. JANNOCH, DERSINGHAM, NORFOLK.—A list of specialities in lilacs, lily of the valley, and liliums, chiefly for forcing; the list is well illustrated.

H. MERRYWEATHER AND SONS, LIM., SOUTHWELL, NOTTS.—Roses, fruits, and trees, and shrubs are all listed in this catalogue, including the new Crimson Bramley apple and the Merryweather damson.

ROBERT VEITCH AND SON, EXETER.—Dutch bulbs, with flowering roots and sundries are the features of this catalogue.

GEO. COOLING AND SONS, BATH.—An autumn plant and bulb list.

DANIELS BROTHERS, LIM., NORWICH.—Catalogue of bulbs, flower roots, fruit trees, roses, etc.

PRICE'S PATENT CANDLE CO., LIM., LONDON.

JAMES GRAY, HORTICULTURAL BUILDER, CHELSEA, S.W., would strongly advise gardeners to carefully watch their Hot Water Heating Apparatus this month. If boilers show signs of wear, it would be wise to have them thoroughly examined at once, before frost sets in. Immediate attention can be obtained by means of a postcard, telephone call (201, Western), letter, or wire to Gray, Chelsea, London.

KING'S ACRE FRUIT TREES, ROSES, AND ORCHARD-HOUSE TREES.

AWARDED 20 GOLD MEDALS SEASONS 1909-10.

100 acres to select from of the finest Trees that natural conditions and the skill of man can produce.

ILLUSTRATED CATALOGUES FREE ON APPLICATION.

(Dept. 12), **GARDEN SPECIALISTS,**
SOUTHWELL, NOTTS.

Premier Honours Great Show, Haarlem.

ESTABLISHED 1832.
No connection with any other Firm of a similar name.

ANT. ROOZEN & SON'S
GUINEA PACKAGE
(Delivered Entirely Free in London)
OF
CHOICE HARDY BULBS.
COLLECTION "F" FOR SPRING GARDENING

Contains **1,002** Bulbs.

48 Hyacinths, distinct colours.
50 Tulips, single early.
50 Tulips, double.
25 Tulips, single late.
20 Narcissus polyanthus.
30 Narcissus incomparable
24 Narcissus poeticus.
24 Anemones, double.
50 Anemones, single.
36 Gladiolus nanus.
300 Crocus, in four distinct colours.
100 French Ranunculus.
50 Snowdrops, single.
75 Spanish Iris.
18 Scilla sibirica.
4 Lilium umbellatum.
50 Eranthis hyemalis (Winter Aconite).
24 Ixias, best mixed.
24 Triteleia uniflora.

Half of the above for **11s.**

Our Bulbs are Perfect Bulbs direct from Holland—THE Great BULB LAND.

The above Package may be had from our Agents,
MERTENS & Co.,
3, Cross Lane, London, E.C.,
On Receipt of Cheque or Post Office Order.

Our **DESCRIPTIVE CATALOGUE** of SPLENDID BULBS (100 pages in English), containing FULL CULTURAL DIRECTIONS, will be sent post free on application to our Agents, as above, or ourselves direct at
OVERVEEN, HAARLEM, HOLLAND.

VOL. LIII.—No. 2,972. SATURDAY, OCTOBER 15, 1910.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Silver-leaf Disease of Fruit Trees.

The diseases with which fruit growers have to contend are many, and a considerable proportion are so difficult to hold in check that it is only by unremitting endeavour on well-devised lines they have found it possible to maintain their trees in a vigorous state of health. Of the several diseases affecting fruit trees there has not, perhaps, been one that has been so great a source of perplexity to both scientists and practical men as the one commonly known as silver-leaf. In some parts of the country, and especially in the Thames Valley, much injury has been caused to the plum orchards by the fungus to which the silvering of the leaves is due, and as the owners have found themselves quite unable to check its development, the most divergent views have been expressed with regard to the cause of the disease and its prevention and cure. None of the suggested remedies have proved efficacious, and it is, therefore, of special interest that Mr. Spencer Pickering should have devoted the annual report of the Woburn Experimental Fruit Farm, which is just published, chiefly to an account of his investigations of silver-leaf. The disease, which has long been known, manifests itself, as Mr. Spencer Pickering points out, by the leaves of affected trees assuming a silvery appearance. The trees thus attacked often die, although death may not supervene for several years, and they may, in the interval, continue to bear fruit, and for a time present a somewhat vigorous appearance. To Professor Percival, of the Reading University, belongs the credit of having associated the silvering of the leaves of the plum and some other fruits with fungoid action, and of having been the first to determine that the fungus known as Stereum purpureum, which bears its fruit only on the dead wood of a tree killed by the attack, is the cause of the disease. When, in 1902, Professor Percival published the results of his investigations in the "Journal" of the Linnean Society, his conclusions were received with some doubt. But Mr. Spencer Pickering has accepted them, and states that, independently of the results obtained by Professor Percival, those described in the report now before us would be quite sufficient to place the matter beyond doubt and with this statement we are in full agreement. The inoculation of a tree with a piece of the fungus has, in the experiments at Woburn, almost invariably been found to produce silver-leaf, while neighbouring trees which were not thus inoculated remained quite healthy. Further, we learn from the report, that trees which have died, partially or entirely, after an attack of silver-leaf, so often develop the stereum on the dead wood as to render it impossible to avoid connecting the one with the other, especially as no single instance is on record of the appearance of this fungus on a tree which has been known to have shown no signs of silvering while alive. One of the first points investigated at Woburn was the manner in which the disease may be conveyed from tree to tree, and in 1906 Mr. Spencer Pickering initiated his experiments in the inoculation of healthy trees. The fungus forms flat roundish discs on the bark of the dead tree, and in inoculating a healthy tree a small portion of the fungus about twice the size of a pin's head is inserted in a cut made in the bark, the cut being bound up to prevent the fungus being washed out. The first sign of infection is a gradual silvering of the leaves, and this, when the tree is in active growth, may occur in a week or two after the inoculation, while the whole tree may become seriously affected in four or five weeks. As might be expected, the infection seems to spread from the point of inoculation, and if one branch only has been inoculated it is on that side only that the silvering first appears. The outward manifestation of disease is, in Mr. Spencer Pickering's opinion, due to a poison formed during the growth of the fungal threads, for no evidence of the mycelium has been found in the leaves. The silvery appearance of these is attributed to the cells composing them having become partially disconnected owing to changes brought about in the nutrition of the tree. When the experiments at Woburn were commenced a plantation of plum trees consisting of twenty-eight trees each of Czar, Rivers' Early Prolific, Monarch, and Victoria, was formed. Forty-eight of these trees were inoculated early in the year with stereum obtained from a silver-leafed plum, and of these thirty-nine showed signs of silvering before the end of July, four of them having been killed outright by that time, and two others were half dead. On the other hand, none of the sixty trees that were not inoculated showed any signs of silvering, and none of them, unless subsequently inoculated, has shown any signs of the disease during the succeeding years. These results may well be regarded as ample proof that the disease is a consequence of Stereum purpureum. It is generally considered that once a tree is attacked by silver-leaf it never recovers, but, in Mr. Spencer Pickering's opinion, this view is erroneous. In proof of this, he states that of fifty-six trees that were silvered in the first year eighteen recovered, and also cites a case at Harpenden where about 25 per cent. of silvered trees, some sixteen years of age, had recovered. With regard to the relative susceptibility of the

MR. JAMES STREDWICK.

several varieties of plums to silver-leaf, it would appear that in plantations under ordinary treatment the Victoria is the most liable to attack, but in the case of inoculated trees at Woburn there was no appreciable difference. The results obtained at Woburn are, in Mr. Spencer Pickering's opinion, readily reconciled with the experiences recorded by growers, for while the experiments show that different varieties are equally susceptible when inoculated with the disease, the extent to which trees in an ordinary plantation would suffer would depend on the ease with which stray fungus spores could effect an entry into the different trees. This, as pointed out, would naturally be greater in the case of those most liable to injury in consequence of being soft-wooded, or of being heavy bearers, and subject to having their branches broken. The experiments conducted with a view to determine the influence of the vigour of the tree and the character of the soil on the development of the disease, the possible infection of the trees by the pruning knife, the utility, or otherwise, of sulphate of iron as an antidote, are all of interest, and of considerable practicable value, but as the report can be obtained for a small sum there is no occasion for us to refer to them in detail. Briefly stated, the strong-growing trees suffer rather less from the disease than weak ones, there does not seem to be any connection between the appearance of silver-leaf and gumming, the character of the soil has no appreciable influence on the development, or otherwise, of silver-leaf, and the application of a solution of sulphate of iron to the roots has no effect upon trees that have been attacked. With regard to the pruning knife as a carrier of the disease the results of the experiments show that so far as the pruning of diseased trees which contain no dead wood is concerned, there is no danger of infection being carried to other trees by the tools used. But when a tree with dead wood is pruned the knife or other tool should be disinfected before being used on healthy trees. Although Mr. Spencer Pickering is not, as the result of his investigations, able to give us a remedy for silver-leaf, he has placed at the command of fruit growers much valuable information relating thereto, and we recommend our readers to obtain a copy of the report and carefully peruse its contents.

Mr. James Stredwick, whose portrait is given herewith, affords an excellent example of the possibility of a man possessing ability to achieve a high degree of success in a vocation wholly different from that for which he was trained. Mr. Stredwick, who is the head of the firm of Messrs. J. Stredwick and Sons, of St. Leonard's-on-Sea, is at the present time best known for his success as a raiser of cactus dahlias, and yet he was trained for the building trade, and made a good position in connection therewith, when he began to show his strong affection for floricultural matters. He first engaged in the cultivation of chrysanthemums, and for several years he was, as an amateur, a successful exhibitor of these flowers at the shows of the National Chrysanthemum Society, and of the leading chrysanthemum societies in the South of England. After a time, as the result of his success, he became so interested in flowers as to greatly extend their cultivation, and subsequently to engage in their cultivation as a matter of business. About this time the cactus dahlia began to obtain prominence, and, appreciating its distinctive characteristics and recognising its possibilities, he engaged in the raising of seedlings on a large scale, and achieved much success. In this work he has been assisted by his son, and the number of varieties raised and distributed by the firm must be very large. There is no occasion to give figures in proof of the success achieved in the raising of new varieties, and in the production of blooms of cactus varieties for competitive purposes, for that is well known and fully recognised by those who are interested in this section of dahlias. Neither is there occasion to enumerate the most noteworthy of the varieties raised at St. Leonard's, because they are in general cultivation. While giving close attention to dahlias, Mr. Stredwick does not overlook his responsibilities as a citizen, as evidenced by his occupying the position of Alderman of his borough, and filling the chair of one of the most important of the committees of the Corporation.

Our Autumn Number.—As previously announced, we shall devote the greater part of the space in our next issue to the discussion of matters of special import to those who contemplate planting ornamental trees and shrubs, fruit trees, and the various kinds of hardy flowers. The contents of the issue will include articles on the mock orange, cypresses, ceanothuses, as bedding plants, the making and planting of an orchard for a private garden, raspberries and blackberries, choice plums as bush trees, a remarkable new rhododendron; the planning and making of a herbaceous border, moon daisies, and herbaceous pæonies. The articles will be by recognised authorities, and the issue will be freely illustrated. We shall also give a full and illustrated report of the Royal Horticultural Society's exhibition of British grown fruit.

National Rose Garden. — In several quarters a suggestion has been made that a National Rose Garden should be formed at the Crystal Palace. It is further suggested that there should be trials of all new roses in connection with this garden. Both suggestions are good, but the circumstances of the Crystal Palace are not sufficiently settled at present to permit of a serious discussion of the suggestions. The need for a public and independent trial of new roses is obvious to all who take a close interest in roses and rose culture, but whether the Crystal Palace would be the best place at which to hold such trials is an open question.

New Park at Winchmore Hill. Sixty acres of the Grovelands Estate, Winchmore Hill, are being acquired by the Southgate District Council for the purposes of a public park, and towards the £20,000 required the Middlesex County Council has promised to contribute £5,000. There is a rumour to the effect that owing to its shape the park will be known as the Leg of Mutton Park.

Sand Dunes and Golf Links.—At a meeting of the Botany Section of the British Association, Professor F. O. Bower gave an interesting lecture on "Sand Dunes and Golf Links," which proved highly attractive to the members. In his opening remarks he described the qualities of sand as a medium for the growth of plants, and then proceeded to point out that to flourish in sand plants had to be capable of readily standing extremes of heat and drought, and of recovering after being buried deeply by sand carried on the wind. It was due to the fact that there were such plants that it was possible for the sand to be bound together in a permanent way, and form the dunes that became the basis of our most attractive links. With the aid of photographs Professor Bower indicated the process of the building up of dunes, showing the sand gathering between the branches of various plants, and gradually heaping itself into hills—a process which the plants followed faithfully, ever rearing their heads above, while at the same time spreading their roots laterally underneath, and forming a strong network structure. He directed special attention to the work done in this direction by the coarse, sharp-edged grass which is known as ammophila, a stiff and wiry plant that may be buried a foot deep by a gale, but which goes on pluckily with its task of binding the sand. He described the plants which are most valuable in giving permanence. Thistles, gorse, heather, the sea buckthorn, and the moonwort were among them, together with the lichens, which perhaps more than anything gave its name to the grey dune. Between them these plants formed a sort of skin on the top of the sandhills, forming a rough turf which was the raw material of the golf links. This was the plan of Nature, then came man with his scythe and mowing machine and roller, and almost entirely removed the actual factor which had built up the dunes.

Monument to Mendel.—The monument erected to the memory of Gregor Johann Mendel, at Brunn, was recently unveiled in the presence of the University authorities and many representatives from foreign institutions, including Cambridge University. Mendel, botanist-naturalist, was born at Amsterdam in 1822, and died at Brunn in 1884.

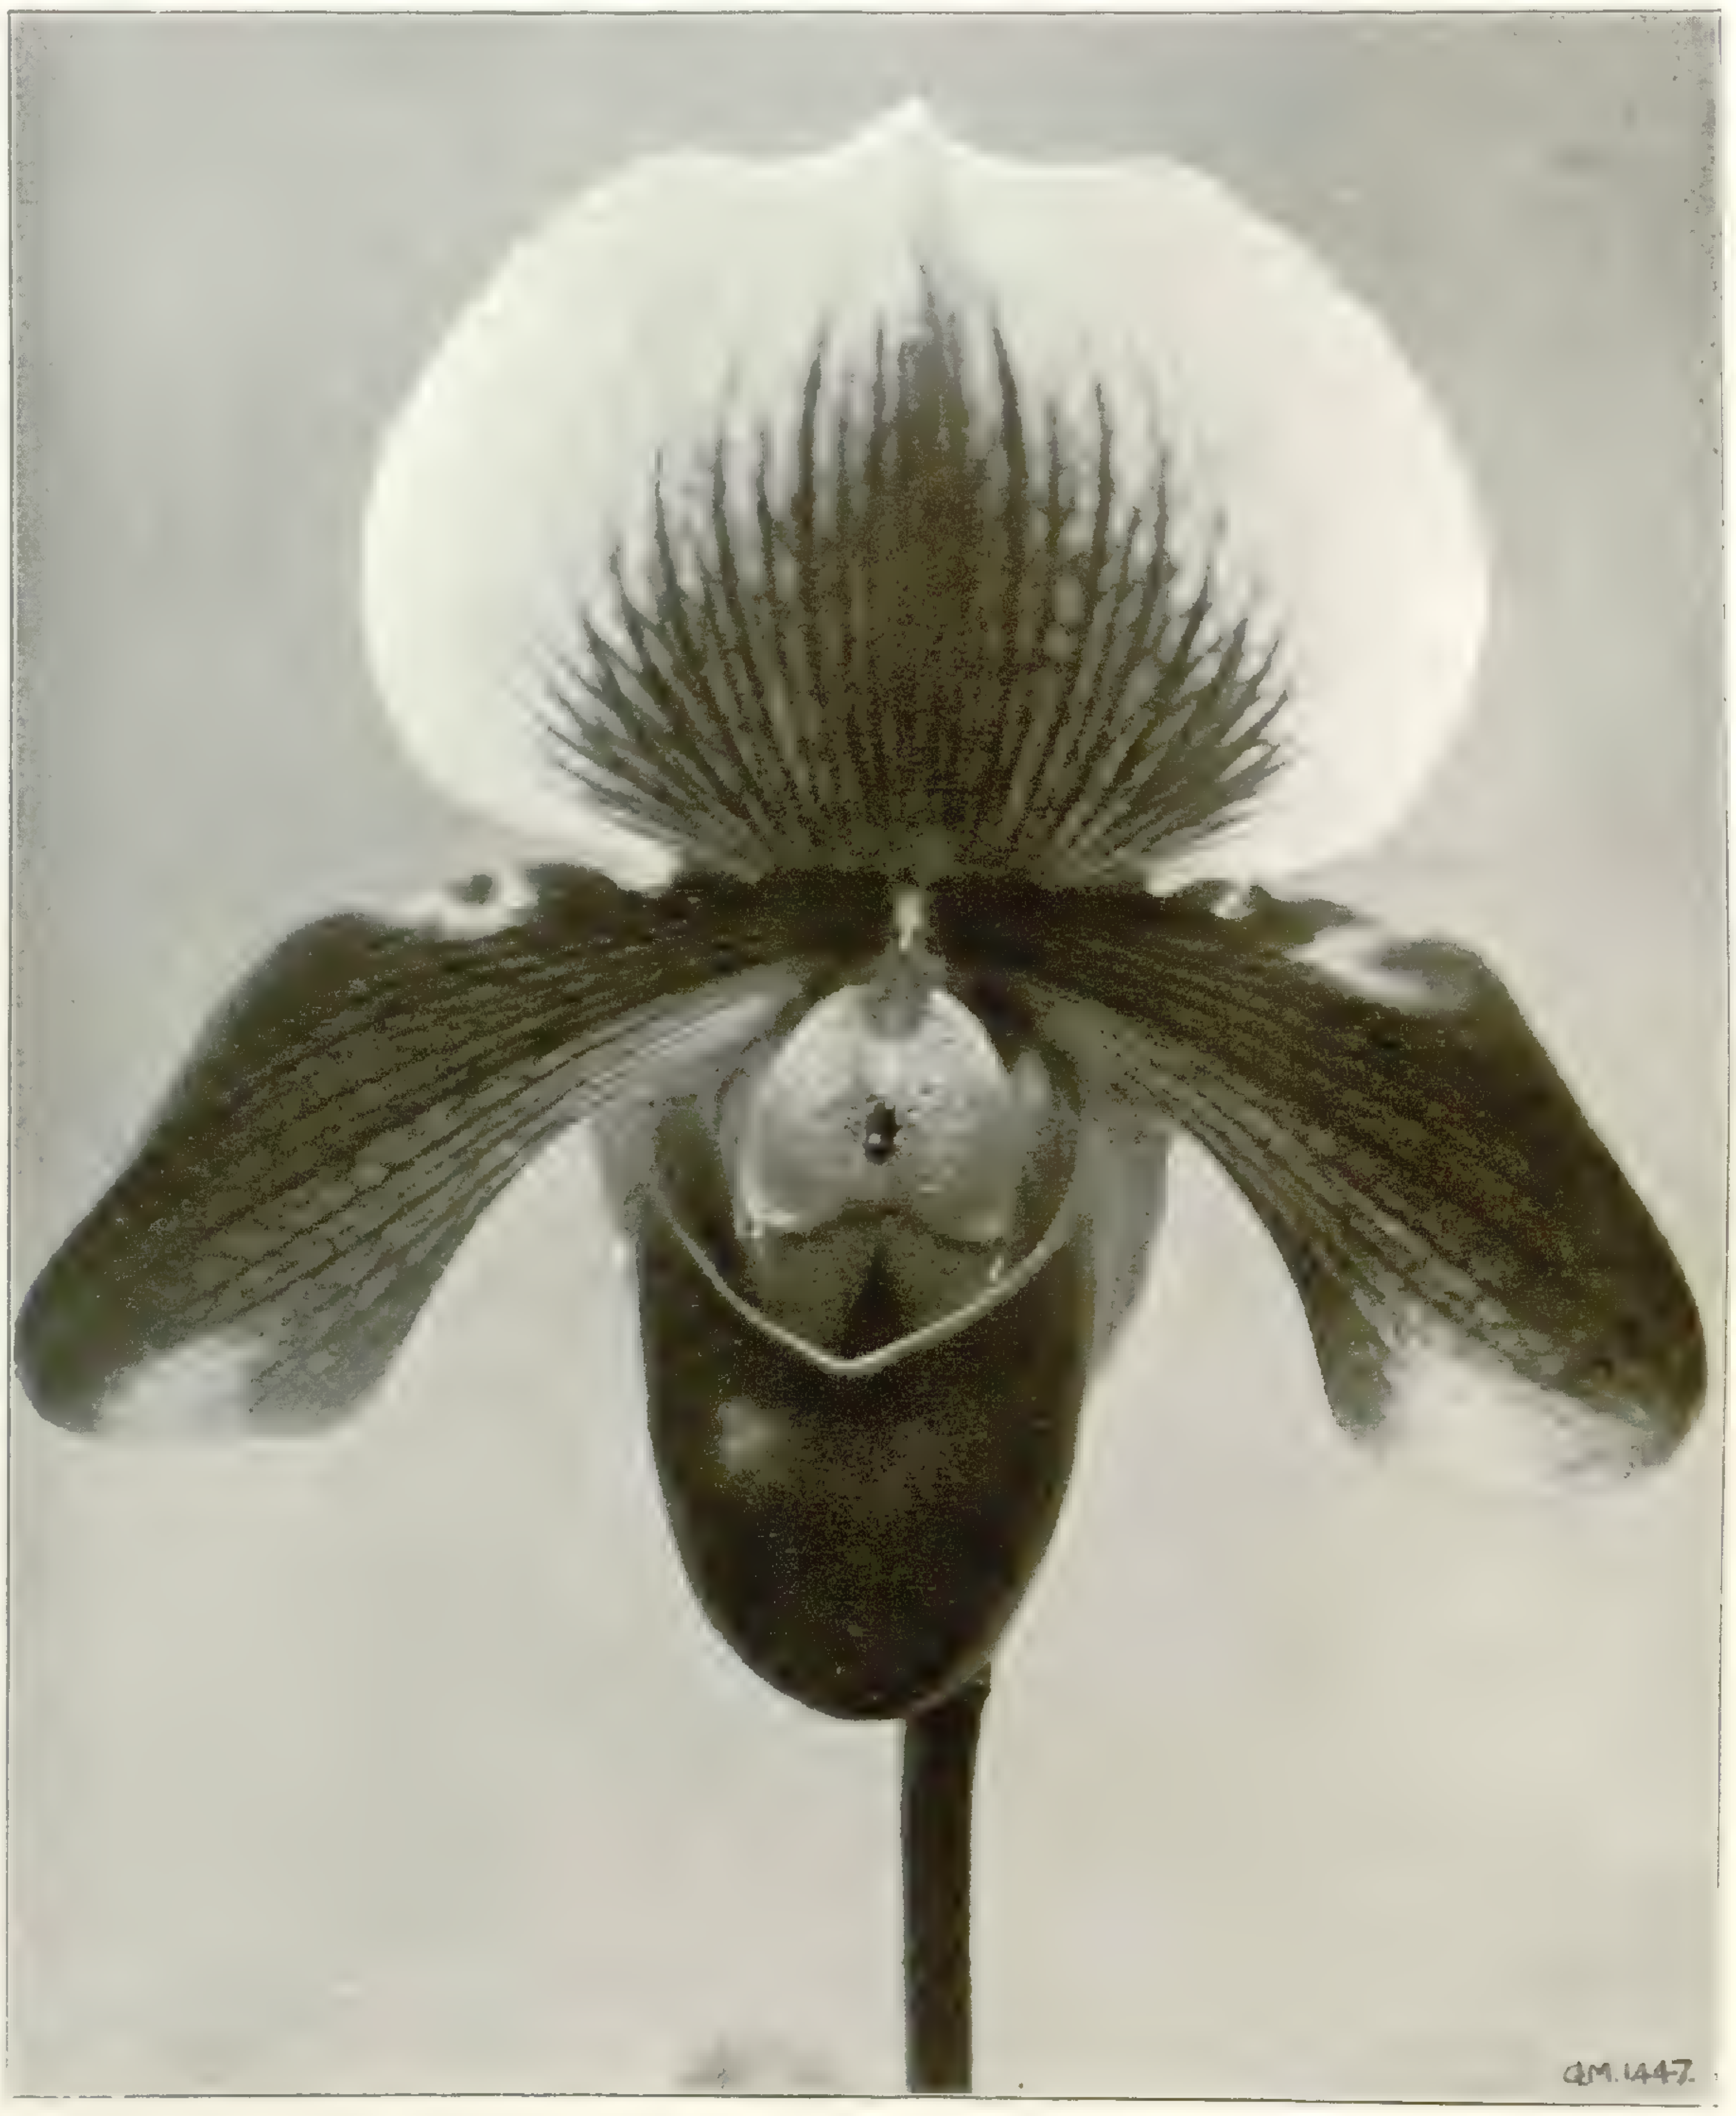
Northern Fruit Congress.—The final arrangements for the fruit congress to be held at Hexham on Thursday next and two following days, are as follows: Thursday, 2.45 p.m., formal opening of the show and congress in the Town Hall by the joint presidents, Mrs. J. C. Straker and Captain J. H. Cuthbert; 3.15, papers will be read by Mr. G. P. Berry, Mr. W. B. Little, on "Fruit Storage and the Bottling of Fruit," and "The Storage of Fruit," respectively; 6 p.m., papers will be read by Mr. H. Somers Rivers on "Stocks for Fruit Trees Historically Considered," Mr. J. S. Chisholm on "The Best Apples for Northumberland," and Mr. W. B. Little on "The Best Apples for Cumberland and Westmorland and Stocks for Same," Mr. G. Bunyard, V.M.H., on "Manners and Culture of Fruit Trees." The discussion will be opened by Mr. G. O. Rimington, and be continued by Mr. J. W. Robson, who will speak on the "Fruit Industry in the North of England." Friday, spraying trials and demonstration in the asphalte tennis court opposite the Town Hall; judging will commence at 10 a.m., and the demonstration will be given at 11 a.m. Gold, silver, and bronze medals are offered for knapsack sprayers; silver and bronze medals for other hand-power machines, and also for spraying syringes. The congress will reopen at 2.15, and papers will be read by Mr. F. B. Theobald on "Fruit Pests and their Treatment." Mr. H. Hogbin on "Smudge Fires, or Orchard Heating," and by Mr. S. T. Parkinson on "Damage done to Fruit Trees by Cold and Late Frosts." The discussion will be opened by Mr. R. A. H. Gray, and be continued by Mr. F. J. Chittenden. At the evening meeting, which commences at 6 p.m., papers will be read as follows: by the Rev. H. Purefoy Fitzgerald on "French Gardening," Mr. Cecil H. Hooper on "Small Holdings," and by Mr. G. W.

Avery on "Bees as Aids to Fruit Culture." At 8 p.m. Mr. E. S. Salmon will give a lantern lecture on "Fungus Diseases of Fruits and their Remedies." On Saturday at 10 a.m. there will be a meeting at which "Co-operation in the Marketing of Produce" will be discussed, but the names of the speakers are not given in the programme; at 2.30 p.m. and 3 p.m., Mr. J. S. Chisholm will deal with "Fruit Bottling" in the Wesleyan schools, and at 3.30 p.m. the cups and medals will be presented in the Town Hall to the successful competitors. In addition to the foregoing the British Gardeners' Association will hold a meeting at 2 p.m., and the National Fruit Growers' Federation have arranged a meeting for 4 p.m. As we have previously intimated, the Rev. J. Bernard Hall, Dalston, Cumberland, is the hon. secretary.

Hampton Court Palace.—The restoration of the Moat at Hampton Court Palace has been completed, and it is expected that the hoardings will be shortly removed. The work of restoration has been carried out under the direction of Mr. E. Chart, the resident surveyor, and so well has it been done that it harmonises perfectly with the rest of the buildings.

Flowering of Trees and Shrubs.—We have received intimation of several instances in which various trees and shrubs that usually bloom in spring are flowering at the present time. A peach tree in a garden at Kentish Town has flowered; an apple tree at Highgate has blossomed and set a second crop of fruit, and a laburnum tree in the same neighbourhood is in bloom. There is nothing exceptional in this, indeed, it is a quite common occurrence to meet with fruit and laburnum trees in blossom during the course of the summer months. It is due to the development of some of the latent buds some time after the trees have made their growth. In 1908 we obtained in the autumn a fine display of flowers upon a large laburnum tree that we headed back after it had flowered owing to the branches obstructing the light.

The Origin of Osmotic Effect.—In an important contribution to the Royal Society, Professor H. E. Armstrong and Mr. E. F. Armstrong dealt at some length with the function of hormones in stimulating enzymic change in relation to narcosis and the phenomena of degenerative and regenerative change in living structures. The authors state that when a leaf of cherry-laurel is exposed to the vapour of an anæsthetic, hydrogen cyanide is at once liberated, and affords a delicate indication of the occurrence of enzymic change in the leaf. Not only the common anæsthetics, but most organic vapours, appear to act as excitants. Ammonia is very active, and it is noteworthy that even carbon dioxide, hydrogen cyanide, and benzaldehyde effect the breakdown of the cyanophoric glucoside in laurel leaves. When solutions are used, it is found that weak solutions of mineral acids, alkalies, and most salts are inactive, but the simple organic acids all pass into the leaf from solutions. Apparently, the behaviour of the laurel leaf resembles very closely that of the barley grain. It is proposed to divide substances other than colloids into two subclasses, according as they will or will not pass through differential septa such as occur in the barley grain and the laurel leaf; also to apply to the former the term hormone, introduced by Starling. The change brought about by hormones may be attributed largely, but not entirely, to the influence they exercise in causing alterations in concentration of the fluids within the leaf. Experiments were adduced showing that water actually passes into the leaf, together with the hormone; also that not only is hydrogen cyanide liberated and water absorbed, but that the amount of reducing sugar in the leaf is increased. The hypothesis is advanced that when substances which are not attractive to water are introduced into the living cell, they exercise stimulative effects that are primarily mechanical. It was pointed out, also, that the hypothesis may afford an explanation of a number of more recent observations on plant metabolism. Partially sterilised soils, for example, which Russell has shown to be so fertile, are rich both in carbon dioxide and ammonia: it is suggested that these are two factors of prime importance as stimulants of plant growth; for a similar reason, sulphate of ammonia may have special value in comparison with other nitrogenous fertilisers. The deleterious effect of grass growing over the roots of fruit trees may be more or less due to the removal, which the grass effects, of ammonia, and the consequent withdrawal of the stimulus which this hormone affords to the roots of the trees.



CYPRIPEDIUM KING GEORGE V.

A handsome variety with large, finely-formed flowers, attractively coloured rose, green, brown, and white. F.C.C., R.H.S., October 11. Mr. E. V. Low, Haywards Heath.

Importation of Plants into Canada.—By the Destructive Insects and Pests Act (Canada) and regulations under the Act nursery stock, including trees, shrubs, plants, vines, grafts, scions, cuttings, and buds, may be imported into Canada only through the following ports and during the following periods:—Vancouver, British Columbia, and Niagara Falls, Ontario, from October 1 to May 1; Winnipeg, Manitoba, and St. John, New Brunswick, from March 15 to May 15, and from September 26 to December 7. Any nursery stock or other vegetable matter infested with any of the following insects and diseases will be destroyed, together with the cases, etc., in which it is contained:—San José Scale (Aspidiotus perniciosus), Brown-Tail Moth (Euproctis chrysorrhœa), Woolly Aphis (Schizoneura lanigera), West Idian Peach Scale (Aulacaspis pentagona), Gypsy Moth (Porthetria dispar), Potato Canker (Chrysophlyctis endobiotica), parasitic diseases affecting potatoes externally or internally, Branch or Stem Canker (Nectria ditissima), Gooseberry Mildew (Sphærotheca mors-uvæ), White Pine Blister Rust (Peridermium strobi). In certain cases provision is made for the fumigation of nursery stock entering these ports, but such stock originating in Europe is exempt from fumigation, and may be inspected on arrival at its destination instead of at the port. Compensation up to two-thirds of the value of vegetation, cases, etc., destroyed will be granted on the recommendation of the Minister of Agriculture.

Chrysanthemums in the London Parks.—The annual exhibition of chrysanthemums in Southwark was opened to the public on Saturday last, and the exhibitions in Battersea Park, Brockwell Park, Finsbury Park, Victoria Park, and Waterlow Park will be opened to-day (October 15).

DODDER.

(Concluded from page 784.)

◆

Plants Attacked.

The cultivated crops attacked by the various species of dodder are numerous, the most important, however, being clover and lucerne.

C. trifoli.—This variety is that which is most commonly found on clover and lucerne in Great Britain. According to Frank, however, it has been found on vetches, lupines, potatoes, beet, carrots, fennel, aniseed; not infrequently the wild species C. epithymum, of which C. trifoli is a variety, is found in meadows and pastures, on heaths, etc. M. Marre cites also Lotus corniculatus, lavender and other labiates, St. John's wort, species of heaths, Achillea millifolium, and even (according to Prillieux) such graminaceous plants as ryegrass, as having been noticed attacked by this species. He observes, however, that very probably in some cases the dodder is merely entwined round the plants, and not attached to them by means of its suckers. C. epithymum is also found on furze, thyme, and ling.

C. europaea.—In Britain, this species is found on vetches, nettles, etc. In France, it is recorded as living on hops, hemp, vetches, potatoes, the vine, acacia, poplar, aconite, and other plants.

C. epilinum.—Known as flax dodder; this species chiefly attacks flax, but on the Continent it is found also on hemp and camelina.

C. Gronovi. — Besides attacking lucerne, and without doubt other leguminous plants, it is stated to infest chicory, potatoes, and beet.

C. monogyna infests vines and some other plants; and C. corymbosa not only develops on lucerne, but on various other leguminous plants.

Prevention and Remedy.

1. As it is so harmful when once established it is very important that dodder should not be allowed to obtain a footing on clean land. This is undoubtedly only rendered certain by taking great pains that no seed is sown in which there is any trace of dodder. Bearing this in mind the purchaser should only deal with reliable firms, and should always insist, among other things, on a guarantee that all his seed is absolutely free from dodder.

2. If the purchaser is not satisfied as to the purity of any seeds he may have purchased an excellent plan is to sift clover and lucerne seeds, using a sieve of twenty meshes to the inch. Although the seeds of large American dodder are not removable in this manner, those of other dodders are separated with comparative ease. According to Nobbe's experiments, however, this method is not always entirely satisfactory owing to variations in the size of the clover and dodder seeds. In the case of white clover, for instance, the seeds may approximate in size to those of dodder. To make a cheap serviceable sieve for the purpose a light wooden frame may be constructed about twelve inches square and three inches deep, over the bottom of which a 20-mesh wire screen (made of No. 32 English gauge, round wire) should be tacked. In this one-fourth to one-half a pound of seed may be placed at a time and vigorously shaken for half a minute. A man should be able to deal with from five to ten bushels per day. It may be remarked that where much seed is to be dealt with a larger sieve would be more useful.

3. In the case of all seeds the purchaser will be well-advised to consider the question of submitting samples to some authority for expert examination and approval.

4. Where dodder is found infesting a crop, however small the patch, steps should at once be taken to destroy it. This may best be done by digging up the infested plants and burning the whole, in situ, by covering the area six to nine inches thick with long chaff, sprinkling it with paraffin, and then firing it. It is wise not to remove the infested plants for burning, as small pieces left on the field or dropped in fresh places may only serve to spread the pest. It is better to lose completely a small area of the crop by burning than to take risks and possibly have a much more serious infestation another year, especially since dodder seed may lie dormant in the soil for five or six years.

5. An infested field should not be allowed for a few years to carry a clover, lucerne, or other leguminous crop.

6. Thaer recommends that the infested spot be surrounded by a small trench at a suitable distance from the outermost threads of dodder, the soil removed from the trench being thrown on the infested spot. This method, or burning with straw, he considers to be better than the employment of corrosive substances, sulphate of iron, large quantities of superphosphate, or the refuse liquor from the manufacture of sulphate of ammonia, all of which work certain destruction to dodder Such substances, however, ruin the soil for one or more years after use.

7. Tearing out the dodder with a rake is to be condemned, as this only serves to spread the evil.

8. Infested clover or lucerne should not be fed to stock, as the seeds may pass through the alimentary canal unaffected, and Frank mentions a case in which a field was actually infected by means of manure from young cattle which had been fed on rape and linseed cake containing dodder seed, the germinating capacity of which had not been destroyed.

9. Frank suggests that substances which will smother the dodder may be effectually employed, such as a layer three inches deep of chaff, tan or gypsum, covered with an inch or so of fine soil and saturated with liquid manure or sprinkled with powdered quicklime in winter. The clover will generally break through such coverings but the dodder will be unable to do so.

10. In cases where the infestation is very extensive, covering the larger part of the crop, it is perhaps better to plough the whole under before seeds are formed.

11. M. Garrigou called attention in 1904 to the value of calcium sulphide as a means of combating dodder and other parasites. In this connection he says, "One may, with this parasiticide, cause the dodder completely to disappear in two days. A few hours after it has been sprinkled with calcium sulphide the dodder commences to blacken and wither, and, forty-eight hours afterwards, above all if the weather has been somewhat damp, it is completely destroyed." M. Garrigou's experiments show that this substance is very clearly superior to sulphate of iron. It should be applied in the form of a powder when the dew is on the leaf.

12. Above all good cultivation in the widest sense should prevail, and all fields, hedges, and ditches should be kept clean and free from weeds.

It may perhaps be stated generally that clover seeds are imported into Great Britain from nearly all parts of the world, particularly Germany, France, Austria, Russia, Chile, the United States, and Canada. With the exception of the seed from the United States and Canada nearly all these contain more or less dodder, but it is hardly known in the two last-named. English-grown seed also rarely contains dodder. Some particularly fine samples of clover seed have lately been exported to Great Britain from New Zealand. These samples are clean and of the best quality, and appear to be generally free from dodder.

Lucerne is chiefly imported from France and the United States, but in much larger quantities from the former. The plant, too, from French seed is altogether superior to the American. Lucerne from these countries hardly ever contains dodder.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price, bound in cloth, 1s. 6d. net, post 1s. 9d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

TOO-MUCH-ALIKE SWEET PEAS.

The following varieties have been bracketed as too-much-alike by the Floral Committee of the National Sweet Pea Society. "Not more than one of the bracketed varieties shall be shown on the same competitive stand at any exhibition of the National Sweet Pea Society." The names are placed in alphabetical order.

Blue—Anglian Blue, Flora Norton Spencer, Kathleen McGowan, Shawondasee, Zephyr. Blush—Bobby K., Countess of Northbrook, Florence Morse Spencer, Mrs. Hardcastle Sykes, Princess Victoria; Blush Spencer, Lady Althorp, Mrs. T. G. Baker, Paradise Regained, Sankey Spencer. Chocolate flaked—President, Senator Spencer, W. R. Beaver. Cream-pink — A. B. Bantock, Earl of Plymouth, Holdfast Belle, Mrs. Henry Bell, Mrs. Hugh Dickson, Mrs. Routzahn, Queen (Sutton's), Romani Rauni, W. T. Hutchins; Constance Oliver, Nell Gwynne. Cream-pink (deep)—Anglian Pink, Doris Usher, Miriam Beaver, Mrs. R. Hallam Syeira Lee. Crimson—Dodwell F. Browne, G. C. Waud, King Alfonso, King Edward Spencer, Paradise Crimson, Rosie Gilbert, Sunproof Crimson, Sunproof King Alfonso, The King. Ivory—Paradise Beauty, Paradise Ivory, Queenie, Sea Foam. Lavender—Asta Ohn, Frank Unwin, Masterpiece, Mrs. Charles Foster, Mrs. E. Noakes. Magenta—Menie Christie, Mrs. Charles Mander. Maroon—Anna Lumley, Black Knight Spencer, Douglas Unwin, Dusky Monarch, Maroon Paradise, May Gerhold, Nubian, Othello Spencer, Silas Cole, Tom Bolton. Mauve—Amethyst, Empress, Helio-Paradise, Ida Townsend, Mrs. Walter Wright Spencer, Queen of Norway, Tennant Spencer, The Marquis, Wenvoe Castle. Orange-pink—Anglian Orange, Edrom Beauty, Helen Grosvenor, Helen Lewis, Maggie Stark. Orange-scarlet—Dazzler, Edna Unwin, Gordon Ankentell, Ruby (Aldersey), St. George, Thomas Stevenson. Picotee-edged (cream ground)—Evelyn Hemus, Mrs. C. W. Breadmore. Picotee-edged (white ground) — Dainty Spencer, Distinction, E. J. Deal, Elsie Herbert, Picotee, Winifred Deal. Pink—Countess Spencer, Enchantress, Paradise, Pink Pearl. Red flake—America Spencer, Lizette Lumley, Mrs. Wilcox, Paradise Red Flake, Uncle Sam, Yankee. Rose and carmine—Albert Gilbert, Lady Farren, Marie Corelli, Marjorie Willis; E. J. Castle, George Herbert, John Ingman, Mrs. W. King, Paradise Carmine, Spencer Carmine. Salmon—Earl Spencer, Nancy Perkin, Stirling Stent. Salmon flake—Magnificent, Mrs. W. J. Unwin. Scarlet—Doris Burt, George Stark, Scarlet Monarch. White—Etta Dyke, Freda, Moneymaker, Nora Unwin Paradise White, Purity, Snowflake, White Spencer, White Waved. Yellow and buff (grandiflora)—Harold, James Grieve, Mrs. Collier, Mrs. A. Malcolm, Safrano, Yellow Hammer. Yellow and buff (waved)—Clara Curtis, Giant Cream Waved, Mrs. Miller, Paradise Cream, Primrose Paradise, Primrose Spencer, Primrose Waved, Princess Juliana, Waved Cream (Malcolm's.

Hydrangea paniculata grandiflora.—An attractive flower bed just now in Hyde Park is filled with large specimen plants of this hydrangea, each carrying several massive heads of bloom. The entire surface of the bed is thickly carpeted with the rich pink-flowered pelargonium Constance, and the total effect, though bold, is decidedly pleasing. Such an arrangement is, to my mind at least, preferable to a bed with a great variety of subjects planted therein.—W. T.

Berberis vulgaris is now looking very beautiful, and although a somewhat common shrub, there are few to equal it at this season of the year. It will thrive in almost any position, and does not require any special preparation of the soil, as many shrubs do. At the present time it is holding its own against other hardy shrubs in the grounds and gardens, while used for indoor decorations the sprays last a long while after being cut.—W. Hedley Warren.

HARDY FLOWER CHAT.

Montbretia Comet.

A new montbretia which promises well is that called Comet, one of the noble flowers which owe their creation to Mr. G. Davison. It is, I believe, from Prometheus, and has all the fine qualities of that glorious montbretia. Its colour is deeper, and the dark centre gives this flower an aspect of its own. One expects it to reach as good a position in the estimation of the public as any other of Mr. Davison's noble flowers. The blooms are large and well-formed, and when this notable flower is distributed growers who wish to keep to the front will do well to secure it.

Pentstemon cobæa cæruleus.

Of quite a lovely tint of blue is this fine variety of the old Pentstemon cobæa, and a very large grower of hardy flowers was enchanted with it, especially noting its value for the autumn herbaceous border. He is a past master in the planting of borders for autumnal display, as well as a specialist and raiser of pentstemons, so that he was well qualified to judge. He drew my attention to this plant at the Edinburgh Show, and I do not wonder at his enthusiasm for this glorious pentstemon, which might have been the product of many years of the work of a pentstemon raiser. Its colour is exquisite, and the flowers are individually large and of a good shape, while the spike is long and well-formed. As a flower for the autumn border or for a blue bed this should be in demand.

Antholyza paniculata.

Antholyzas are not very well known, but they are fine border plants for late autumn. Probably the hardiest is Antholyza paniculata, which is after the montbretia style, but is yet distinct in the formation of its flowering portions. The blooms are of scarlet and yellow, and the leaves are broad and beautifully ribbed. I think, also, that this antholyza has a future before it, and that there is a field for the work of a Mr. G. Davison in this South African bulb. There is a variety called major, but this is not such a good thing for the garden, inasmuch as it is later than the other, and is sometimes caught by frost. But, as I have said, there is room here for the seedling raiser, and I am hoping that somebody will take up this fine bulbous plant and improve it for garden effect.

Alstrœmeria psittacina.

There is something almost barbaric in the colouring of this handsome herb lily, but in my estimation it suffers from its dullness of colouring. Yet I find that some people appreciate it for its autumn bloom, and for its curious form and its colouration of chocolate and crimson. The interior of the throat is often prettily spotted, and I observe that some forms are much finer in their markings than others. I do not think that it is as hardy as A. aurantiaca, aurea, or chilensis, nor is it of so much use either for the garden or for cutting as these lovely herb lilies are. But there is room for all in the affections of a lover of the alstrœmerias, and if he lives in a cold district a little covering in winter will put A. psittacina beyond the reach of danger. But alstrœmerias are not too easily established, and some experienced growers put the tubers in pots at first, and then plant them out when they have made a little growth.

Galega Hartlandi.

It has been said that the pretty Galega Hartlandi, which is so finely variegated in its foliage in spring, and follows up its vernal beauty by giving us hosts of its lilac and white flowers, never seeds. This is an utter error, as not only have some people succeeded in raising seedlings, practically the same as the parent from it, but it is seeding this year with me very freely. We owe a debt of gratitude to Mr. W. Baylor Hartland, of Irish daffodil fame, for this pretty goat's rue. Its variegation of silver and green in spring is charming, and then the flowers compensate for the most of that passing away as the season goes on. Like the other goat's rues, it is hardy enough and accommodating enough for anybody.

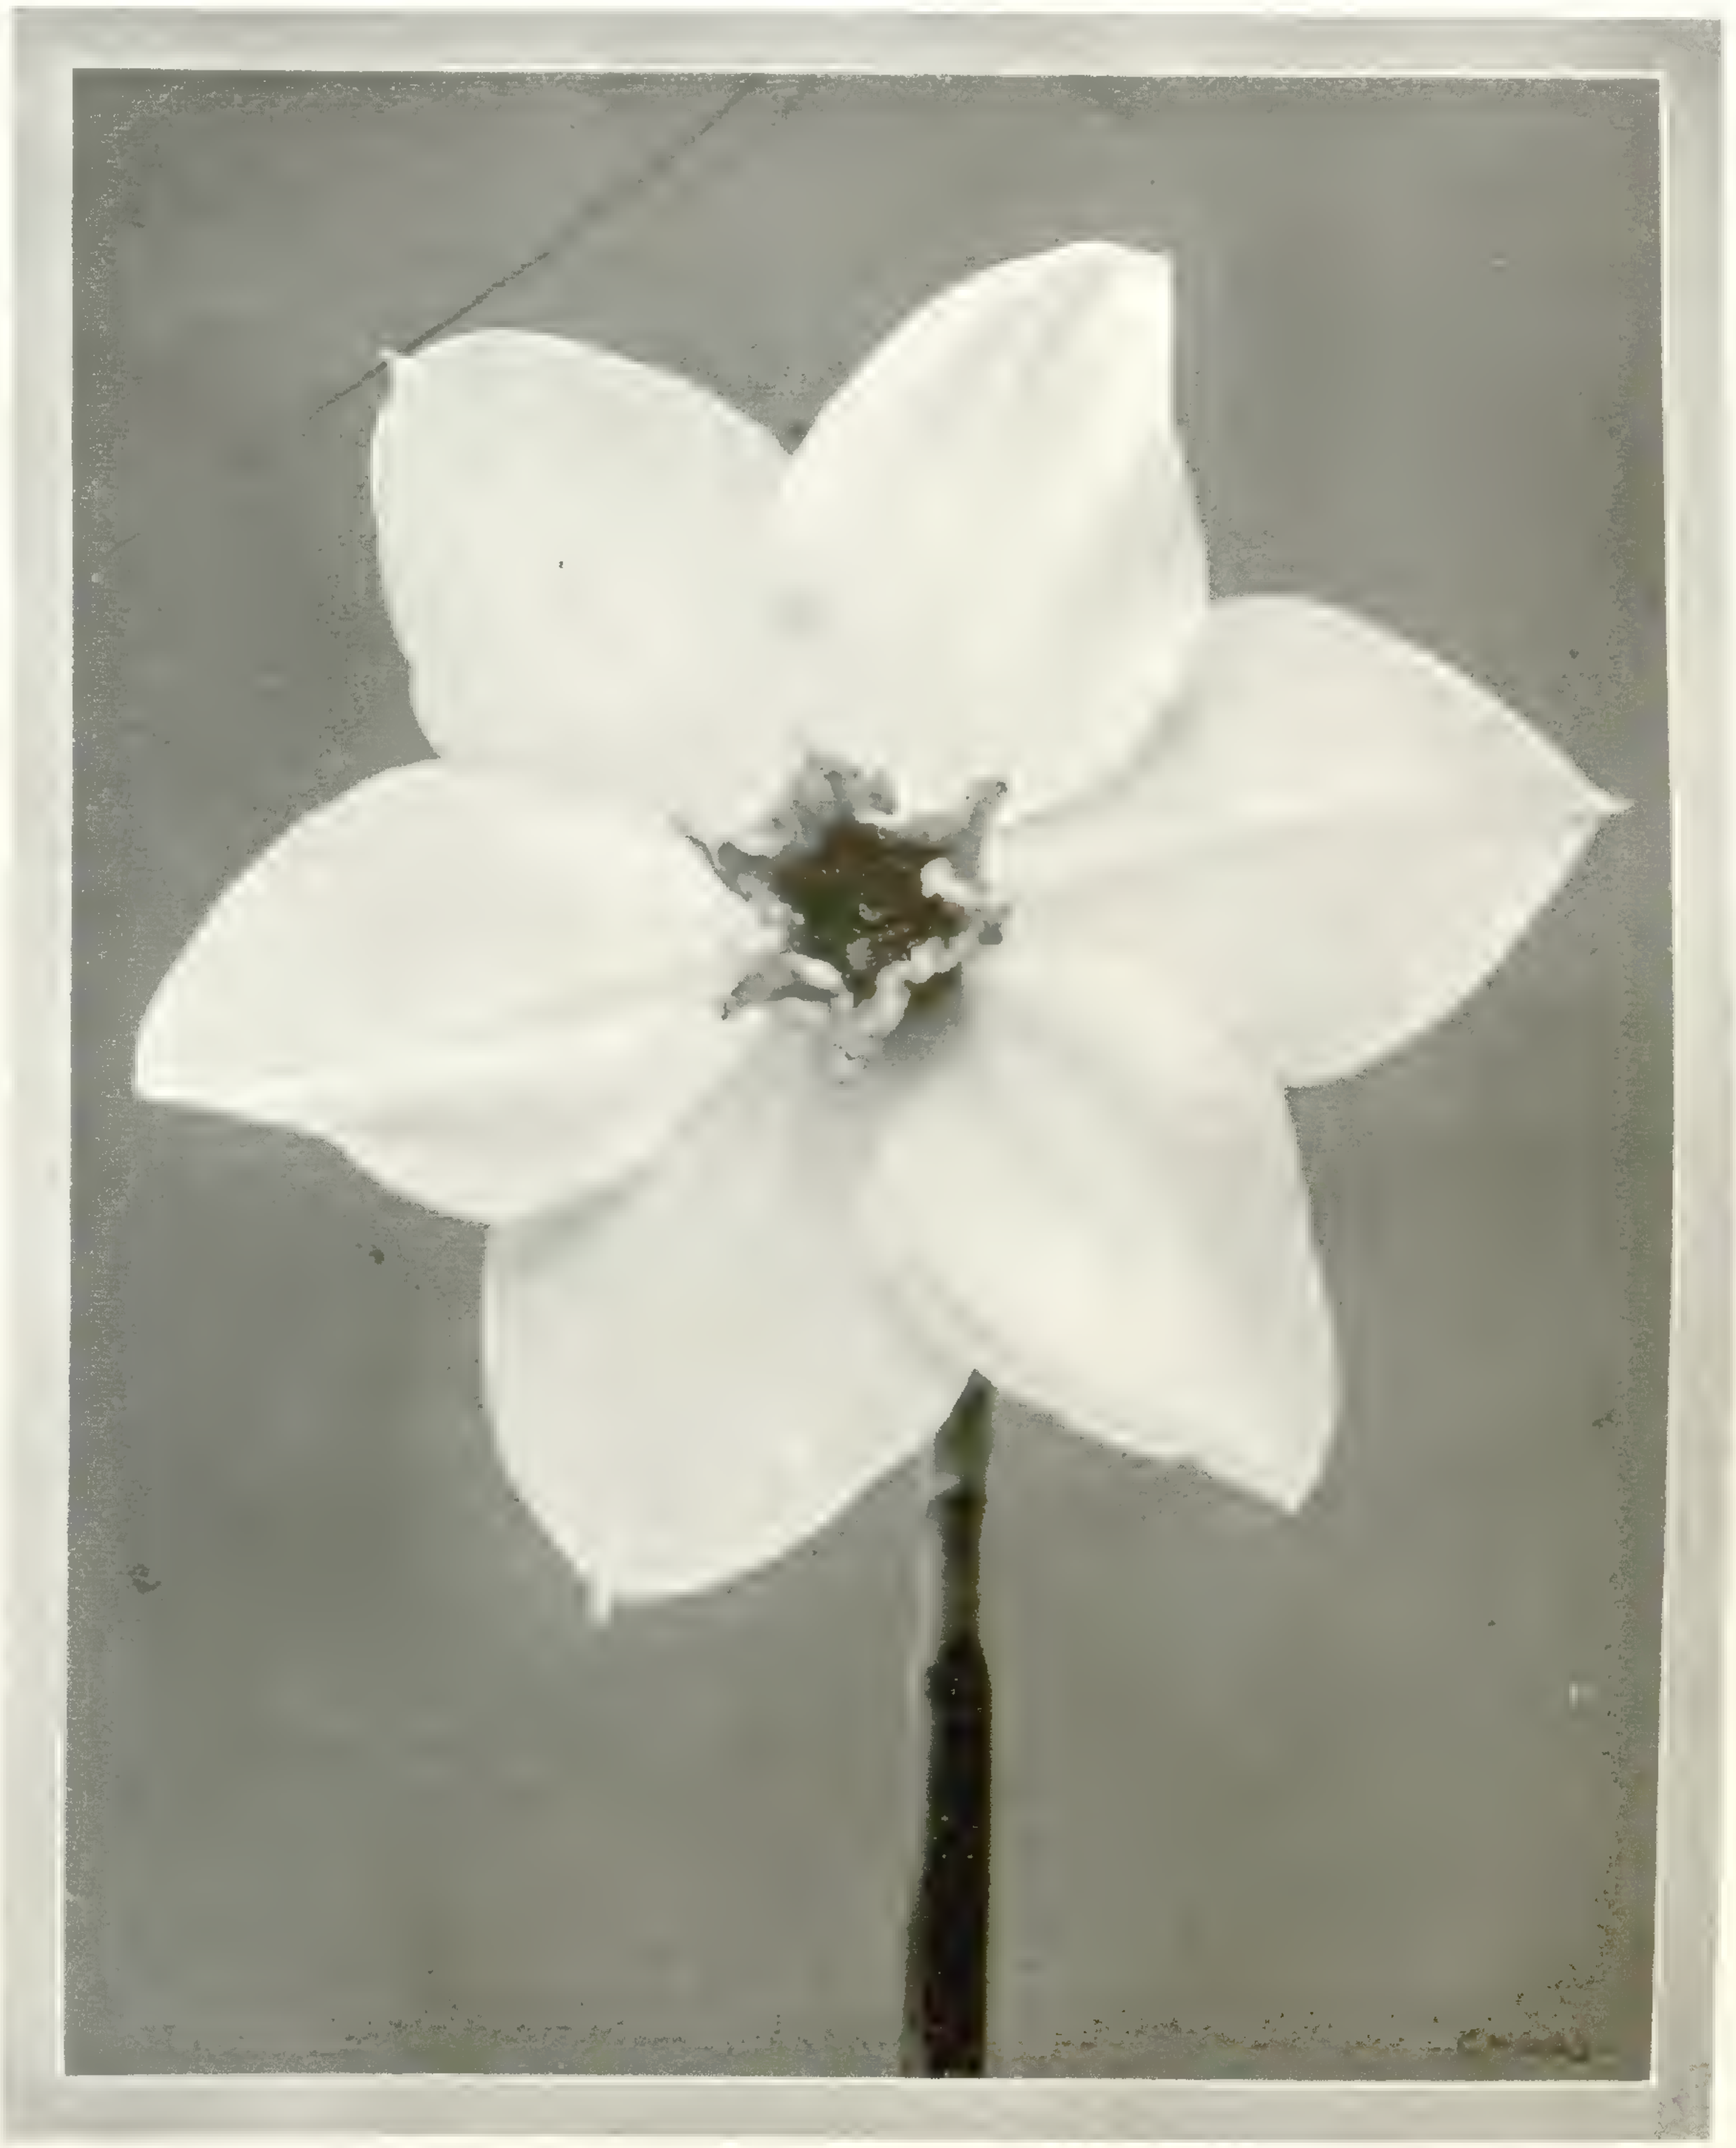
Incarvillea Olgæ.

The popularity of the best of the incarvilleas may lead to purchasers investing in some plants of Olga's Incarvillea, but it may lead to economy and prevent disappointment if I say that this species is not so hardy as the fine I. Delavayi or I. grandiflora, and that it may cause disappointment in gardens where plants with a little tenderness are sure to be lost, if not in the first, in subsequent winters. It is a nice species with its neat leaves and good rose-coloured flowers, but is too tender for all but the milder gardens, and is thus not an incarvillea for the many. But it is cheap, and may thus be tried by many as a variety. I well recollect seeing it when it was introduced, and I had frequent opportunities of watching its behaviour, with the result that I noted it as pretty, but not quite hardy. Further experience confirms this, but a plant which can be bought for sixpence (I see it catalogued at that by a reliable firm) is not unworthy of a trial. But I do not consider it as fine as I. Delavayi or I. grandiflora, and it should not be cultivated to the exclusion of these.

S. ARNOTT.

NARCISSUS WHITE LADY.

One of the most beautiful, as well as one of the finest, of the Leedsi group of narcissi is White Lady. It produces flowers of fine form and large size, and carries these on long stout stems. The broad, pure white perianth segments make up a round and very pleasing flower. The cup, or crown, is very prettily crinkled, and of a very pale shade of canary-yellow. White Lady is a good grower and a free bloomer, and as its price is now just over a shilling per bulb, if a dozen are taken, it cannot be regarded as an expensive variety. White Lady is in the hands of most bulbs dealers, and it has the hallmark of an Award of Merit from the Daffodil Committee of the Royal Horticultural Society.



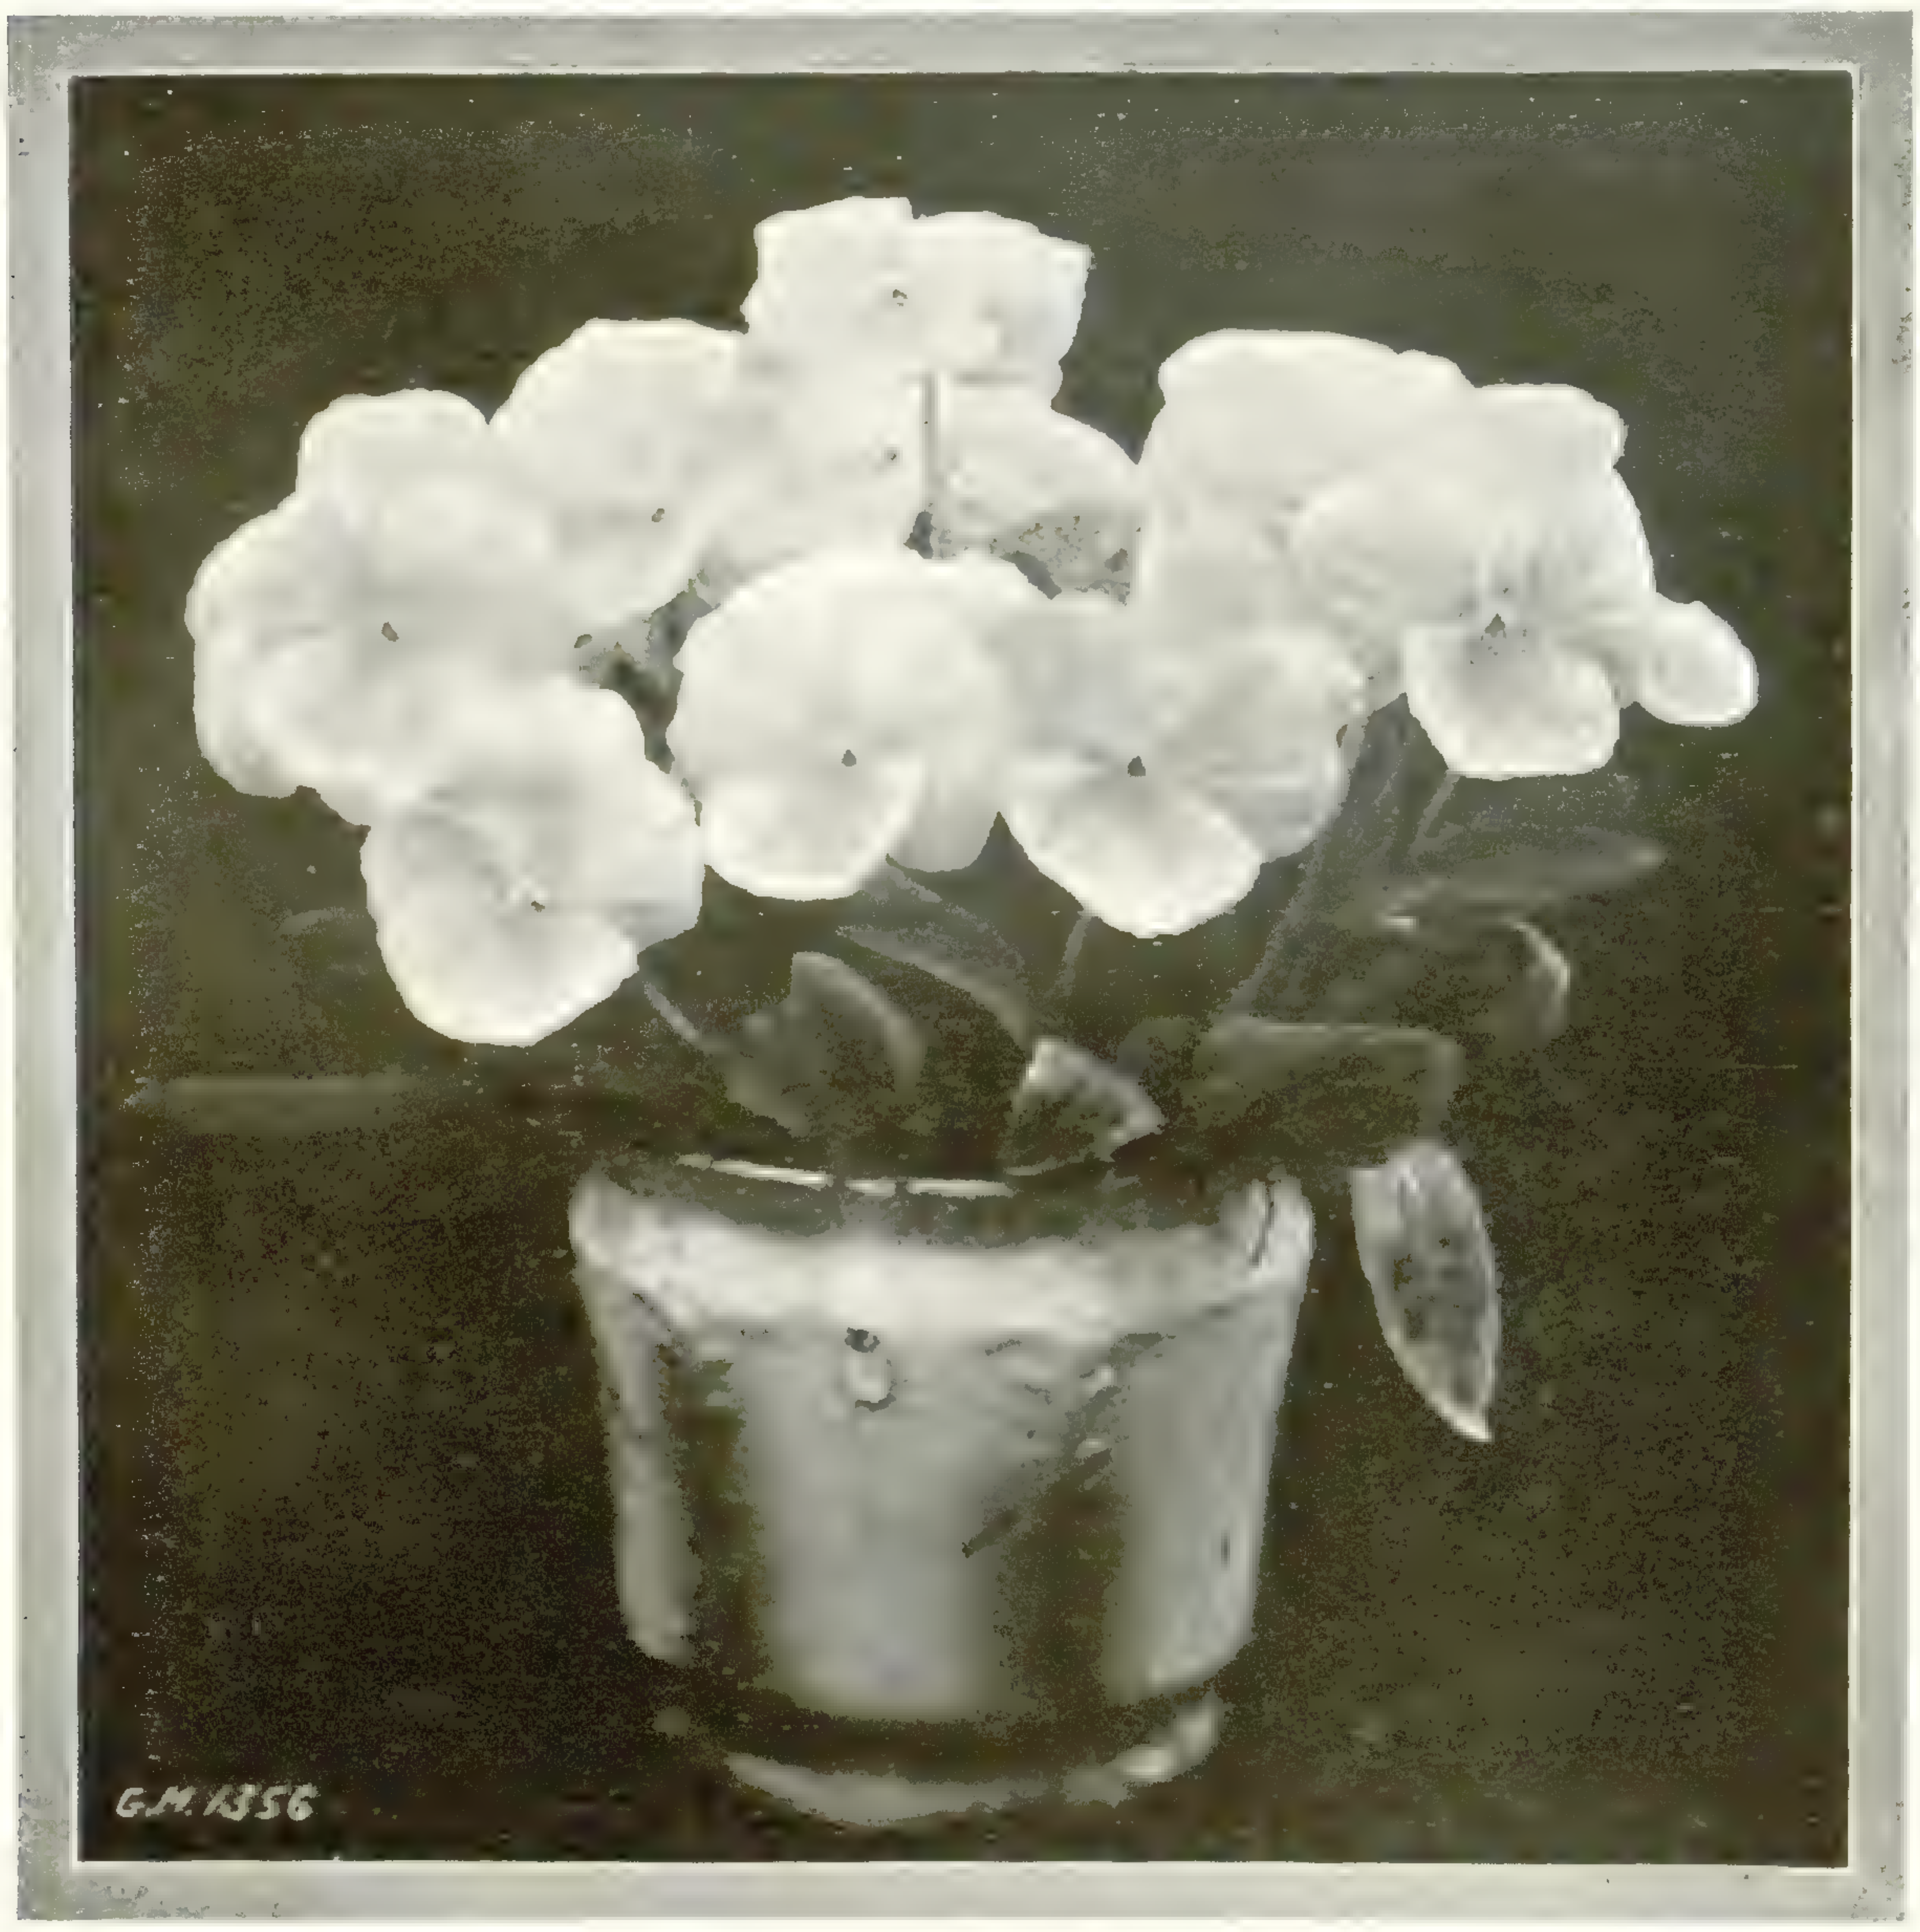
NARCISSUS WHITE LADY.

A beautiful Leedsi variety with pure white perianth and pale yellow cup.

BULBS.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "BULBS AND THEIR CULTIVATION," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

MYSTERIES OF GRAPE CULTURE.

In the every-day phases of grape cultivation, whether it pertain to the modest garden of the villa, the ducal ranges, or the market-growers' extensive blocks, there often occurs some mystery, varying in subject, not easy to understand, nor simple to investigate. In a recent issue of the Gardeners' Magazine Mr. Coomber gave an instance coming under his charge wherein mystery abounds in regard to the new grape Prince of Wales. This grape is one that has not many years' culture behind it, and therefore the habit and constitution is not yet understood. We have recently included it in our stock, though not with any great hope of gain over and above that obtained from well-tried varieties. We have not observed the leaf peculiarities in our own case, but in another garden recently we came across a newly-planted specimen showing apparently the same failing Mr. Coomber complains of. No reason, however, could be adduced by those in charge; other varieties planted at the same time assumed normal vigour and leaf characters.



VIOLA MOSELEY PERFECTION.
Deep golden-yellow; raised and exhibited by Messrs. Bastock and Son, Moseley, Birmingham.

Reviewing a heavy crop of grapes in a market nursery recently, a mystery presented itself in regard to the growth of the berries, as well as the process of colouring. The ground had a natural rise, though but a slight one, from one end of the house to the other, and as would be naturally expected, there were the usual graduations common in such cases in the progress of the crop. Strangely enough, though the work of thinning, beginning at the higher end, was continued by a natural passage forward, and was carried out promptly, yet at the time of our inspection all appeared to be in the same stage of colouring through the whole range. Then, too, while the forward bunches assumed their natural size at the first swelling, the later bunches, instead of doing the same, showed signs of colour whilst the berries were yet undeveloped, and it was explained this is no unusual course, but a yearly recurring experience. Mystery is extended further in that at the finish all are equal in the matter of size and perfection of colour. Truly the remarks of the proprietor struck us as being aptly put, when he says: "The mysteries of grape-growing in some of its phases are unfathomable, both to the simple as well as the cultured mind."

Instances are often recorded where vine roots are found ramifying among potato and other vegetable plots, when exhaustive, and even expensive, means, have been adopted for their accommodation within the house itself. Stout, strongly-built walls have been passed by these strenuously persistent roots in order to escape from a well-provisioned larder to wander into areas altogether opposed to the gardener's ideal, the result of which, in due time, is plainly discerned in shanked berries and a considerably lessened output in bulk and value. Gardeners, again, who have only the old-time turf-made borders as the base of their experience, almost stand aghast when the market-growers' methods are recommended as a better alternative scheme; yet how often does experience obtained from these sources verify the truth of modern adaptation.

From such simple rules as apply to the market growers' vine borders come wonderful results; it may be in individual quality of bunch or berry, or extent of crop, as the case may be. Yet in the gardeners' hands, even when he has the advantage of park or meadow land for border construction, he sometimes signally fails when comparisons are made. Though much might be done by aiding Nature with chemical compounds, there is, according to our own personal experience, no equality of result following the natural versus chemically-constructed vine borders. We have recollections of borders made from soils obtained from no less than four different areas, the hope arising in the mind of the operator that, among the many a perfect combination would result. The end of all this effort was failure. Some would suggest an analysis of the soil, and, perhaps, rightly so, and though by such means sometimes faults are located, the remedy applied is not equal to conditions that Nature herself provides.

Then, again, does not mystery arise when the differing characters of the several sorts are seen when they are grown in a comprehensive collection? In the setting of the berries, their development, and particularly in colouring, there are no uniformly applied laws governing each or any, consequently the highest possible state of perfection, though an outstanding hope of everyone, is acquired by only a few. While the old-favourite Black Hamburgh is such an adaptable vine, and attains to so high a state of perfectness in the hands of some, others are denied that pleasure, not from want of will, but often from conflicting circumstances. Madresfield Court, Duke of Buccleuch, Alnwick Seedling, Lady Downes, Canon Hall Muscat, and Mrs. Pince, to name only a few, have each of them some disturbing element that upsets the calculations of those who set their thoughts on possible trophies.

Is there no mystery in insect and fungoid attacks that are made on the vine? How many have tried year by year to conquer that most loathsome of pests "mealy bug," and yet how few really succeed? Both red-spider and thrips, common though they are, have a mystery in the mind as to their origin, and still less the purpose of their undesirable mission. Mildew parasites are equally mystifying and undesirable, though science comes to the rescue when early and intelligent means are sought to combat them. One might continue to recount the many incidents that follow the trail of the grape enthusiast, aiming apparently, and most assiduously, at defeat, but aiding voluntarily success, perhaps, never.

W. Strugnell.

Rood Ashton Gardens.

VIOLA MOSELEY PERFECTION

There is no need to emphasise the value of violas in general, or yellow violas in particular, because the merits of these sweet, free flowering plants are now recognised—not to the full perhaps, while golden colouring in the garden is as necessary as the sunshine. A viola that came under our notice at Handsworth Park, on the occasion of the Summer Show, on July 22 last, was named Moseley Perfection. This was shown by Messrs. Bastock and Sons, Moseley, Birmingham, and attracted a great deal of notice because of its splendid yellow colouring, fine form, and good habit. It stood out conspicuously among numbers of excellent violas, and was so good that we obtained the photograph from which the present illustration is reproduced. Messrs. Bastock and Son are raisers as well as growers of violas, and they have scored a great success with Moseley Perfection, for the keen florists of the Birmingham district have signified their approval of the variety.

HERBACEOUS BORDERS

Original Schemes designed by our Border Expert. Choice mixed Borders. Colour Schemes. Borders flowering through the Season from Spring until Winter. Borders to flower over a given period. Existing Borders renovated or remodelled. Advice freely given. Terms strictly moderate. Plans and Estimates submitted.

ROCK GARDENS

Estimates given for Constructing Rockeries, Furnishing Plants. All kinds of Natural stone supplied to any Station. Clients interviewed in all parts of the Kingdom by appointment. No enquiry too large or too small to gain our prompt attention.

ROSES, FRUIT TREES

Roses—Hybrid Perpetual, Hybrid Teas, Standards, Dwarfs, Climbers, Ramblers in choicest variety.
Fruit Trees—Standards, Pyramids, Dwarf Trained up-to-date sorts. All clean, well grown and sturdy.
Hardy Evergreen Trees and Shrubs, Climbers and other Plants for Greenhouse, etc.
Delphiniums, choice varieties, **6**/- to **18**/- doz.
Phloxes, superb colours, **6**/- to **9**/- doz.
Pæonies, grand selection, from **10/6** doz.
Tree and Border Carnations, great variety, from **5**/- doz.

THE BARNHAM NURSERIES, LTD.,
BARNHAM, SUSSEX.

Messrs. WM. ARTINDALE & SON,
Nether Green Nursery, Sheffield.

THE FIRST AND ONLY PURE WHITE DELPHINIUM.

TWO STARTLING NOVELTIES.

THESE two new varieties, which are now offered for the first time. Both grow 5—6ft. high, and produce enormous flower stems with large flowers, and the branches, which are produced in enormous quantity at the base of the central spike, are longer than of any other variety, several measuring over 2¼ft. This makes both these varieties the best for cutting purposes, as they flower from June till late in summer.

DELPHINIUM HYBR. MOERHEIMI, has large flowers of the purest white, and not the slightest shade of creamy, bluish or greenish, like the so-called "white" Delphiniums, which have been introduced the last few years, and to which it cannot be compared. **It is doubtless the best hardy perennial introduced in the last ten years.** Award of Merit R.H.S. July, 1909. **10/6** each. (Only a limited quantity will be sold and orders are requested at once.)

DELPHINIUM HYBR. CAPRI, of quite the same growth as "Moerheimi," being a counterpiece of same it much resembles in colour to "Persimmon," but is in every respect an improvement of this variety; the flowers are larger and the spikes longer and of a more branching habit. We consider it as the **best sky blue single Delphinium** in commerce **10/6** each.

Our Catalogue of 200 pages will be posted free on application

476 PAGES, AND 255 ILLUSTRATIONS OF PLANTS AND FLOWERS FROM PHOTOGRAPHS.

EASILY-GROWN HARDY PERENNIALS.

By G. H. VOS, B.A., Editorially supervised by T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

Price **5/-** net; Post Free, packed in box, **5/6**

SOME FEATURES OF THE WORK:

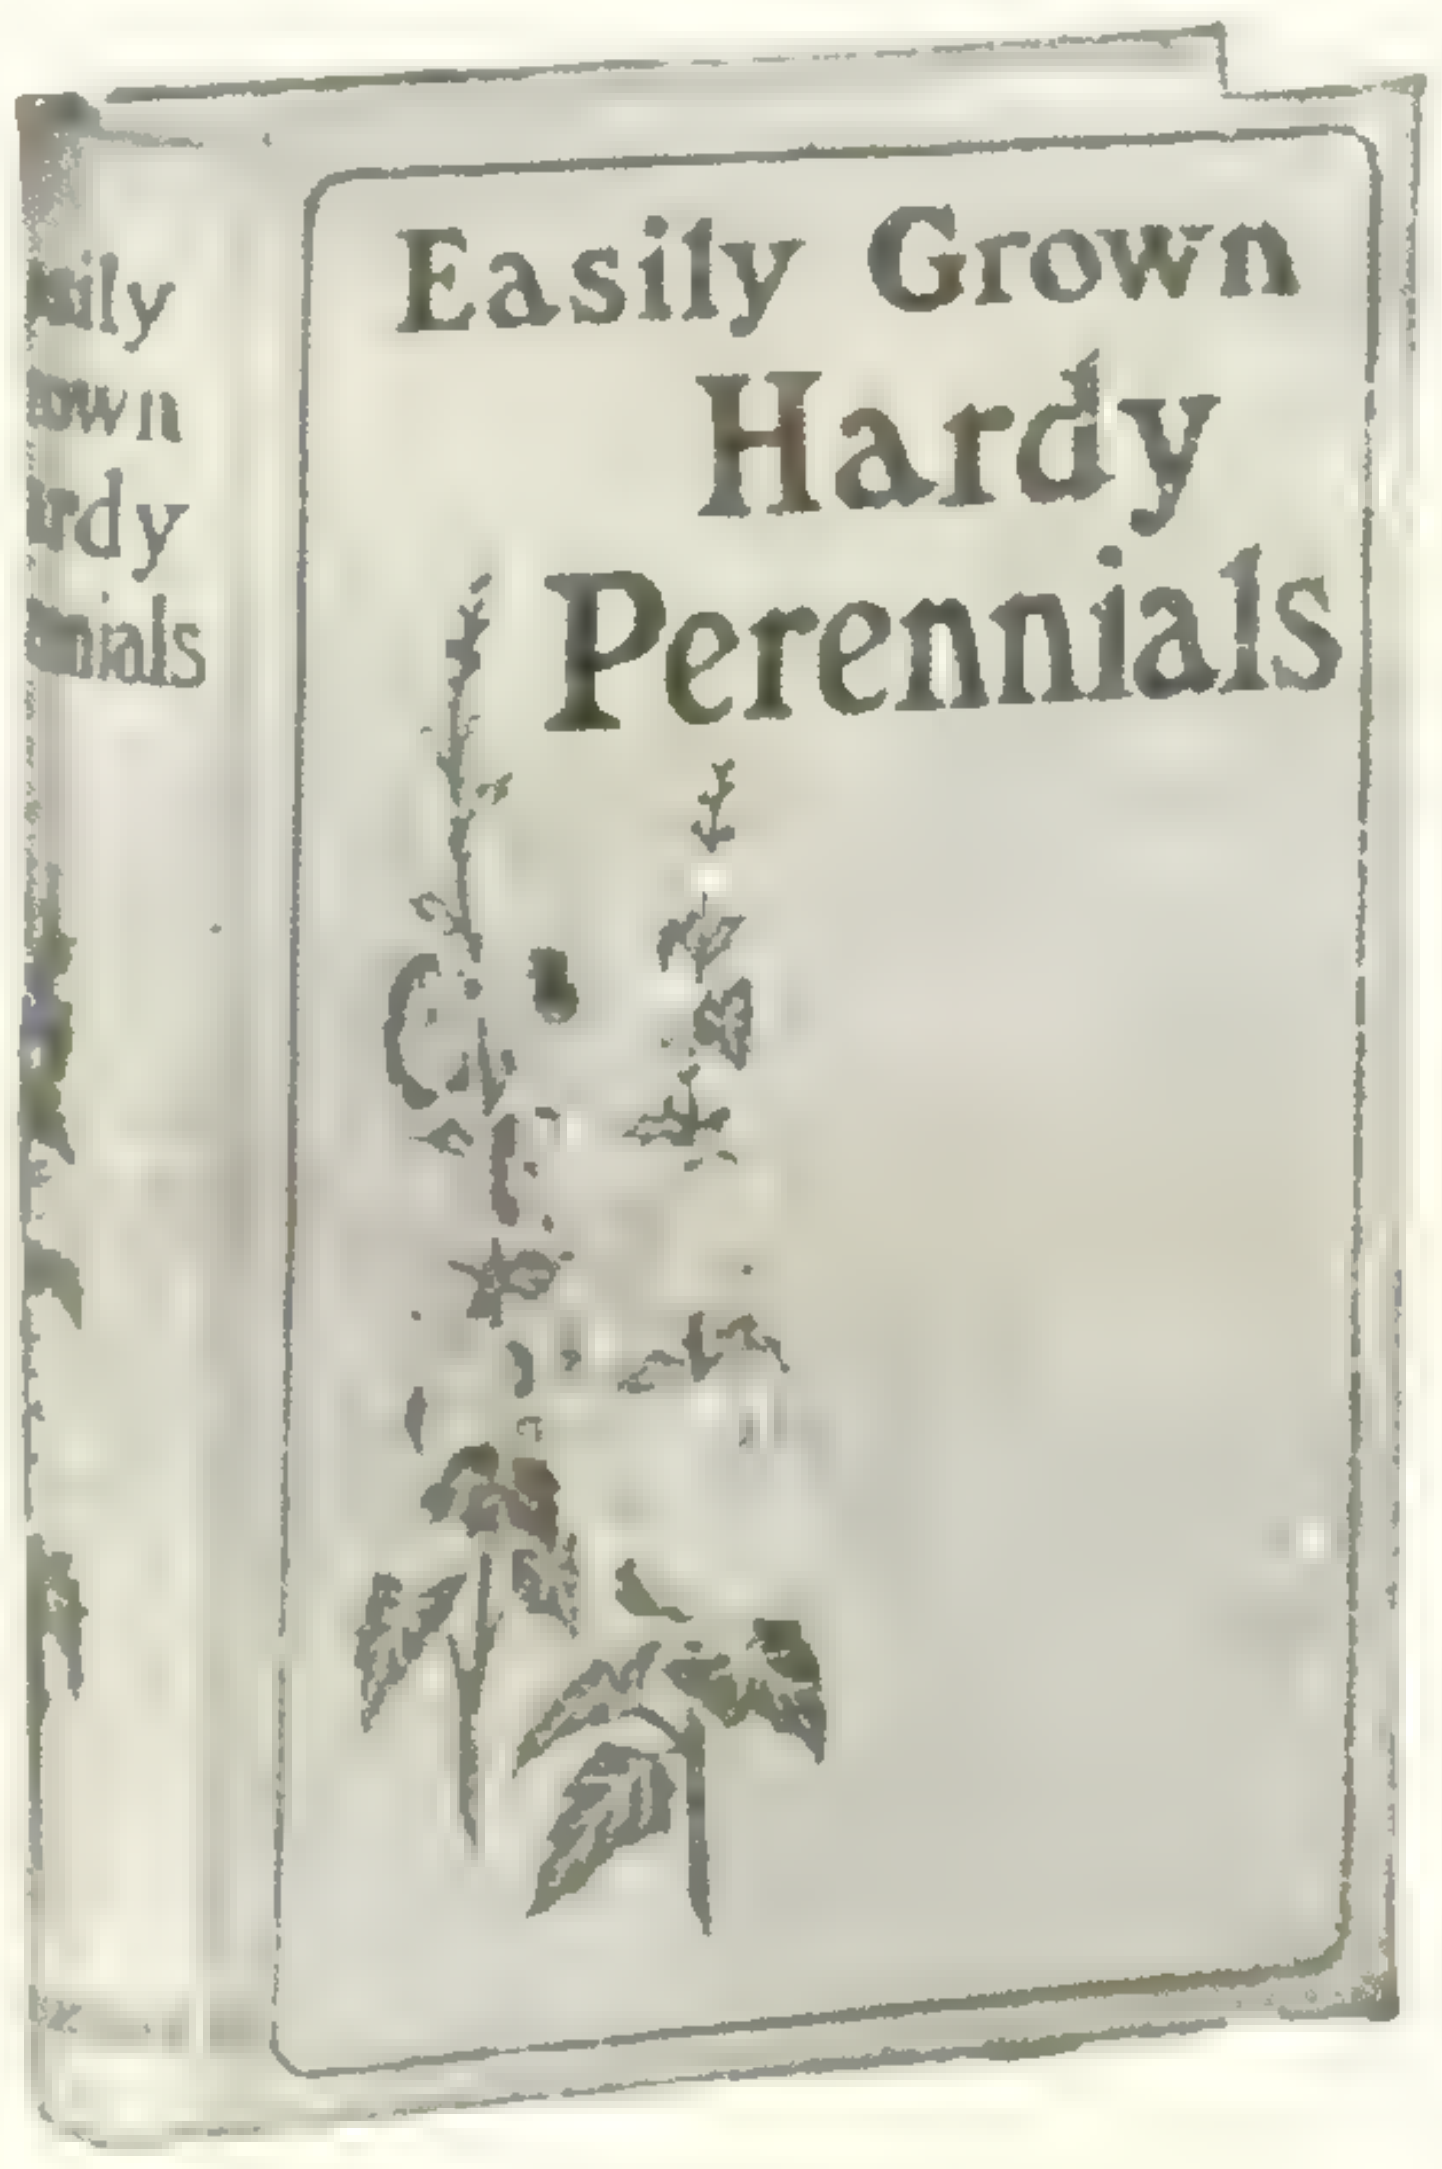
Soil and Position.—The particular soil or compost and position for each genus of plants are very fully and carefully described. Shade and sun-loving plants specially mentioned.

Planting.—The best time and method of planting are also clearly set forth

Pests.—Special mention is made of any plants likely to be attacked by insect pests, and remedies are given.

Propagation.—The best mode of increasing each family of plants described in detail—seeds, cuttings, and division.

Illustrations.—Two hundred and fifty-five of the most popular species and varieties portrayed, mostly as growing in the garden.



Botanical Name.—Gives the botanical or generic name of each genus of plant described in the book.

Common or Popular Names.—Supplies the common or popular English names of all the plants described.

Natural Order.—The botanical family to which kind belongs.

Habit and Uses.—States whether the plant is fibrous, tuberous, or bulbous rooted, and to what use it can be most effectively put in garden decoration.

Species and Varieties.—Describes the most showy varieties worthy of culture, the colour of their flowers, season of blooming, height and native country.

"The cultural details are very valuable."—*Gardeners' Chronicle.*

ORDER FORM.

SOILS AND MANURES IN RELATION TO PLANT GROWTH.

(Continued from page 767.)

Nitrogen.

Among the elements of the nutrition of plants the first place must be given to nitrogen; not only does it cost more per pound to the gardener than do the other necessary ingredients, but as a fertiliser applied to ordinary soils it seems to have a more direct and immediate effect upon plant growth. There are several forms of nitrogen—the question therefore arises: What form should be used? What amount, and when and how should it be applied?

Nitrogen may be obtained in the form of nitrate of soda, nitrate of lime, sulphate of ammonia, and Peruvian guano. Other materials that supply nitrogen are dried blood, bonemeal, fish and meat refuse, the horns and hoofs of animals, rape-cake, and shoddy.

Nitrate of soda and nitrate of lime are the most immediately available forms of nitrogen; consequently, upon the advent of rain, after long periods of drought, or in instances where plants are losing their dark green colour for the want of nitrogen, as in soils in which nitrification is inactive, of all compounds of nitrogen nitrate of soda or nitrate of lime will produce the most rapid results

Sulphate of ammonia and the other nitrogenous manures are less rapidly assimilated than are the nitrates, but should always be applied during the most active period of plant growth, but the application must not be so late as to trespass upon the ripening period. Excessive applications of nitrogen and dressings made too late in the season cause rank leaf growth, late ripening, with impure and weak sap.

Potash.

Potash salts when applied to the soil perform an essential part of the mechanism of the process of assimilation of plant food, and act as a carrier of nitric acid from the roots to the various organs of plant growth. When potash is deficient in a soil the manufacture of carbohydrates, like starch, sugar, and cellulose is greatly reduced, and in practice it is the crops rich in carbohydrates which are most dependent upon a full supply of potash. These crops include beets, carrots, peas, beans, potatoes, parsnips, asparagus, onions, tomatoes, and all kinds of fruits.

There are three kinds of potash salts on the market, sulphate of potash, muriate of potash, and kainit. Sulphate of potash is the purest kind, and can be mixed in safety with other fertilisers. Muriate of potash and kainit should not be used on soils deficient in lime. When kainit is employed three times the quantity of the other two must be used.

Phosphoric Acid.

Just as nitrogen delays plant maturity by promoting an extended growth, so phosphoric acid has an opposite effect. Phosphates are in some way very closely bound up with the formation of flowers, fruits, and seeds, being always found in greater proportions in the reproductive organs of the plant than elsewhere. The action of phosphoric acid on plant growth is not, however, confined to its ripening effect, for it stimulates the early development of young seedling plants to a remarkable extent, especially in the lateral and fibrous feeding roots.

Taken as a whole, phosphoric acid improves the quality of vegetables, flowers, and fruit, and greatly assists in the formation of brilliant colours. As a manure it can with advantage be used on most descriptions of soil, and is not liable to be washed away by heavy rains.

The most common kinds of phosphatic manures are superphosphate, basic slag, ground bones, guanos, and fish meal. They can be applied early in spring at the rate of from four to six ounces per square yard. If applied a little in excess of the usual requirements phosphoric acid has not the injurious effect upon plant growth as many of the other concentrated manures have.

CACTUS DAHLIA SWEETBRIAR.

A long-stemmed garden cactus variety, raised by Messrs. J. Stredwick and Sons. The colour lavender-rose.

Growth of Fruit Crops.

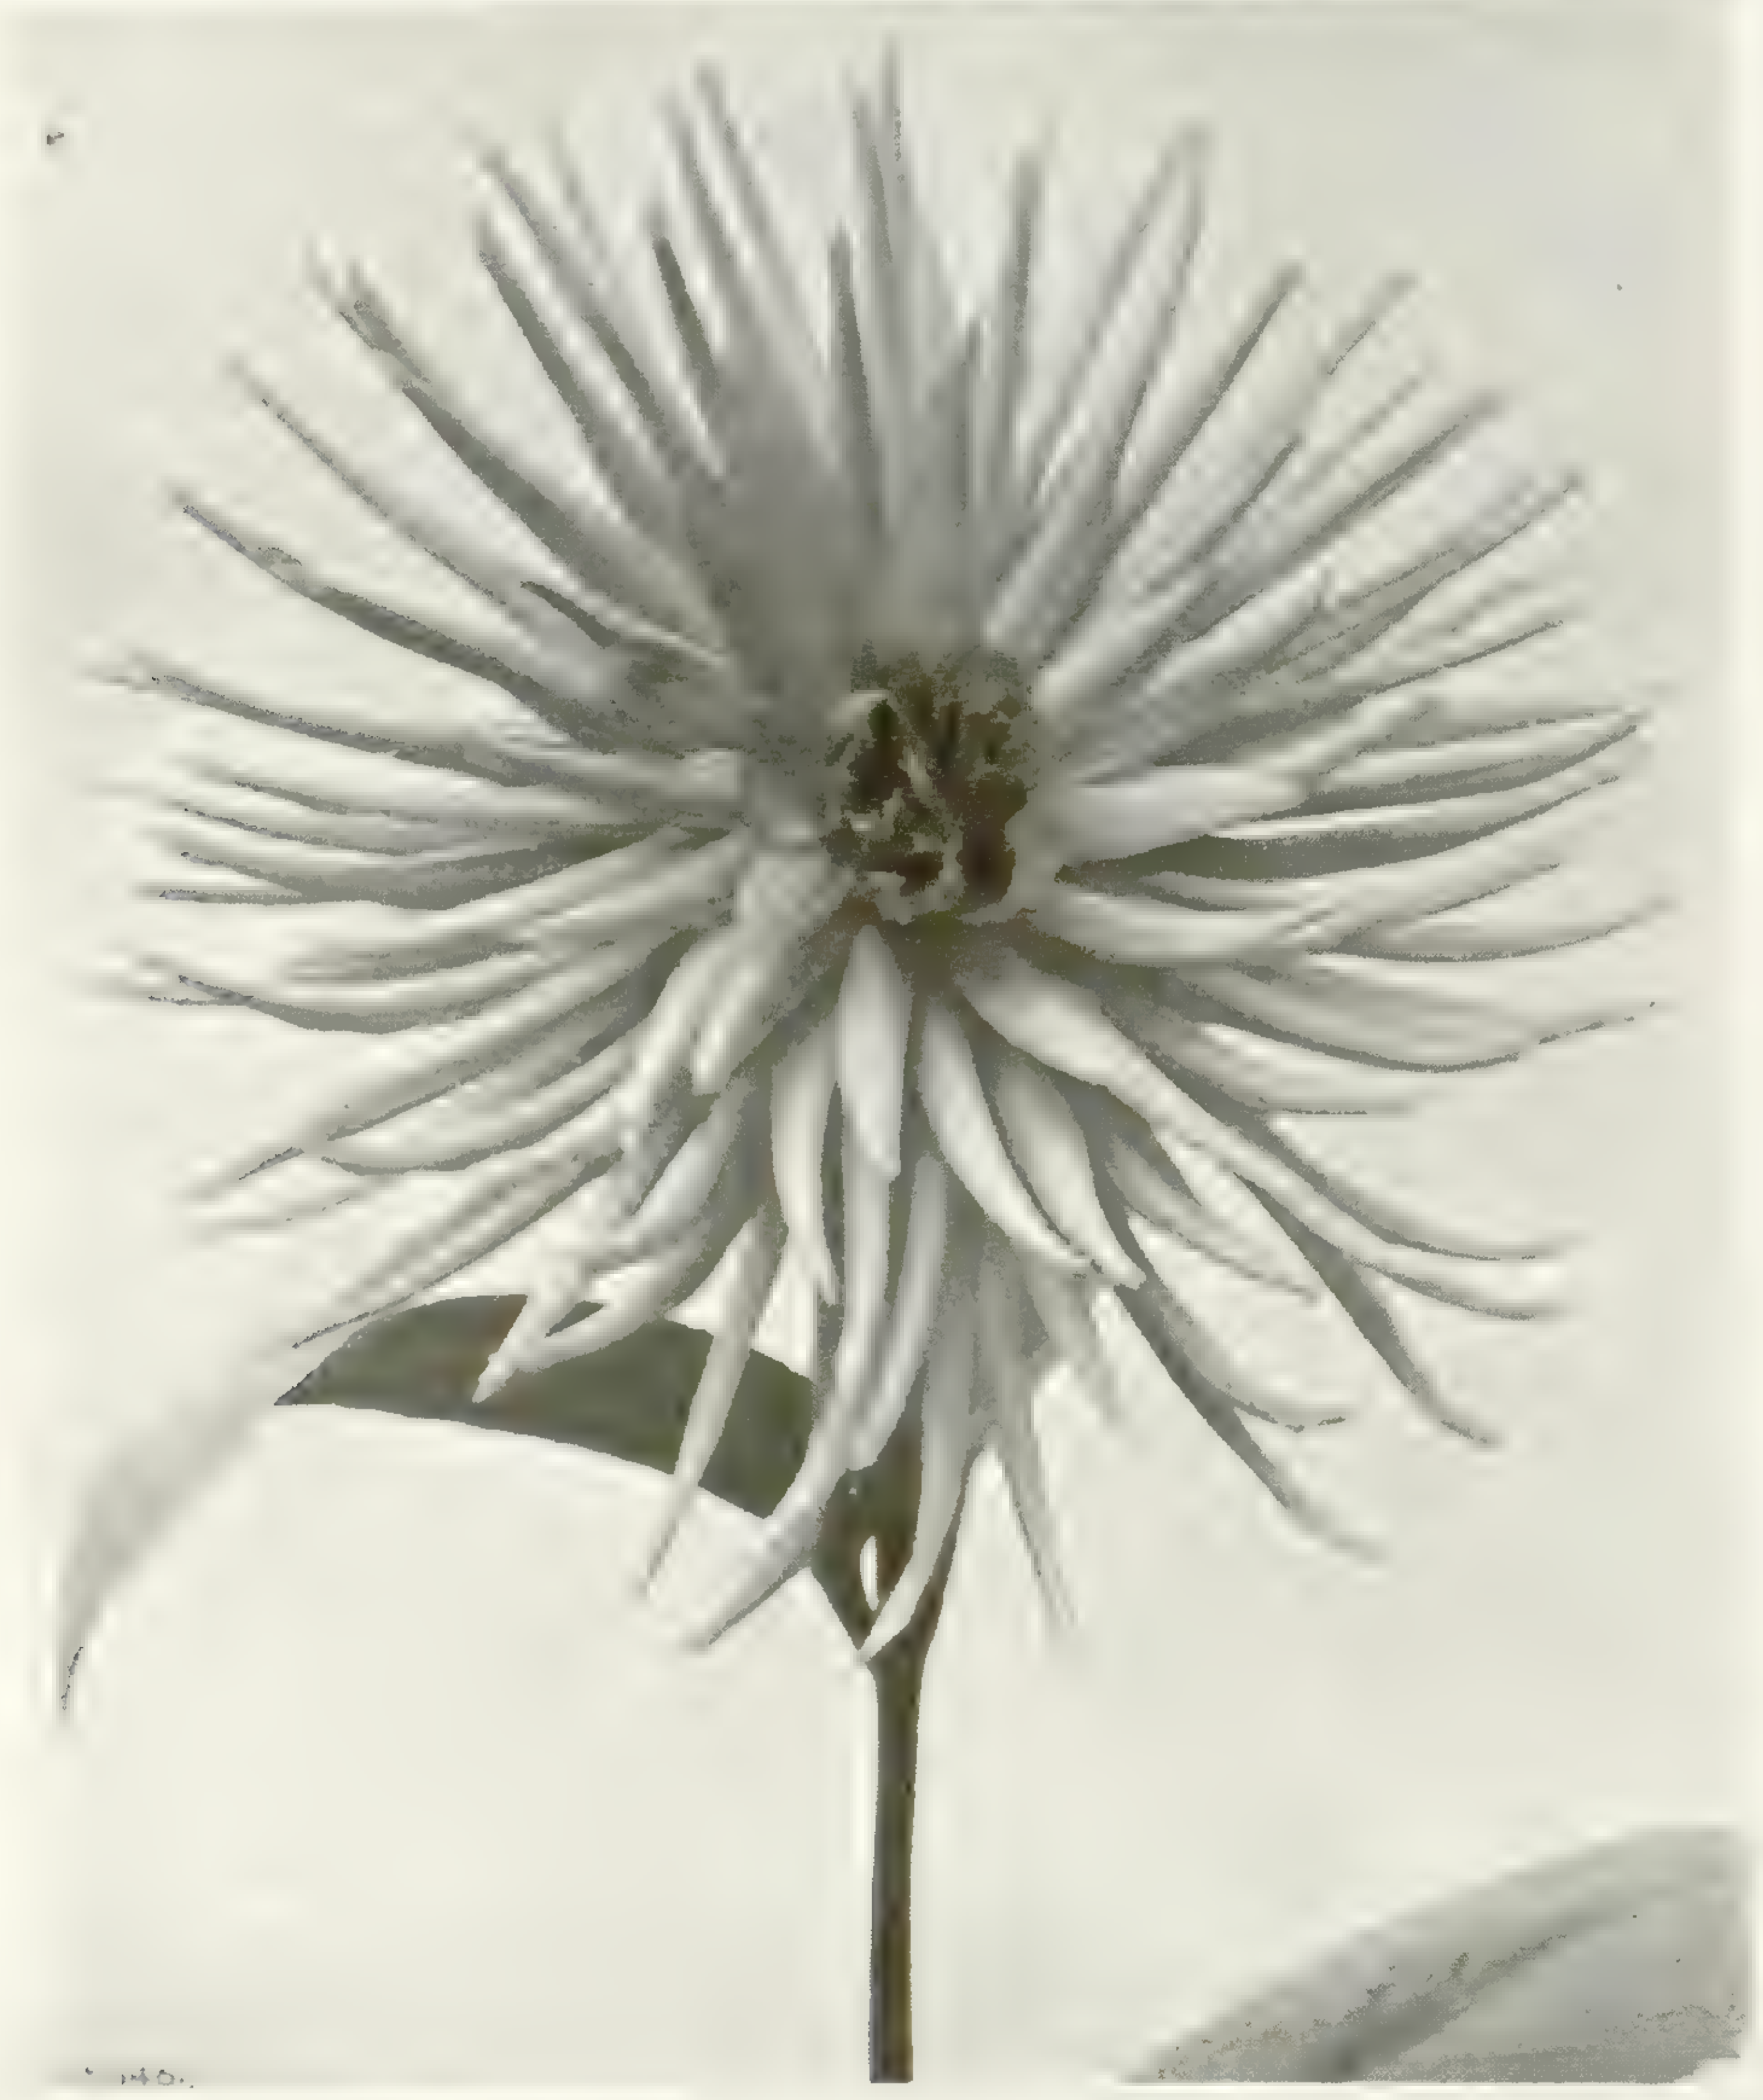
It is obvious that suggestions as to the manuring of vegetables and flowers must be somewhat different from that of fruits, because the former differ from the latter, not only in their habits of growth, but in the character and chemical composition of the crop produced. Vegetables and flowers, with few exceptions, require but one year for the entire processes of vegetation and maturation. Fruit crops, as a rule, require a preparatory period of growth of tree or bush before any crop is produced, which is longer or shorter according to the kind of fruit. Also, after the fruit-bearing period begins, the vegetative processes do not cease, but are coincident with the growth and ripening of the fruit. That is, in fruit growing it is necessary that there shall be a constant transfer of the nutritive juices from the tree to the fruit throughout the entire growing season, while the growth for each succeeding year of both tree and fruit is dependent upon the nutrition stored up in buds and branches, as well as upon that which may be derived directly from the soil.

Harpenden. J. J. Willis.

Tibouchina semi-decandra.—This is the name that botanists have now given to an old favourite, namely, a plant long grown in gardens as Pleroma macrantha, or Lasiandra macrantha. For furnishing the end of a greenhouse, or in some similar position, it is an extremely desirable subject, the large saucer-shaped blossoms of the richest purple being freely borne, and spread over a considerable period in the late summer and early autumn months. There is a less vigorous form, known as Lasiandra macrantha floribunda, which used to be a favourite for growing into specimen plants.—W. T.

LONG-STEMMED DAHLIAS.

From a comparatively early period of my association with the affairs of the garden I have had a strong affection for the various classes of flowers that have, as the result of the persistent endeavour on the part of the florists, old and new, been brought to the high degree of perfection for which they are now so remarkable. No one who is not busily engaged in the raising of new varieties could possibly more highly appreciate the distinctive form and exquisite colouring characteristic of the more highly-developed florists' flowers than myself, and possibly I might have devoted some time to the improvement of some of them had my avocation permitted. Whether I should have achieved success as a raiser is a matter on which it is not necessary to express an opinion. But it may be said without question that my views have not for a long time been in full accord with those of many of the raisers. The teachings of the florists, as handed down to us from past times, has been to regard the size, form, and colouring of the individual blooms as practically the only essentials of importance in estimating the merits of new varieties. Many proofs of this might be given, but it must suffice to say that it is a doctrine to which I have not been able to suscribe. The desirability of flowers of high quality in the respective classes has not, of course, occasioned any difficulty; but I have consistently held the view throughout that there is another factor of the highest importance, and that is a plant strong enough in growth to produce the flowers in profusion and with a habit that will ensure their distinctive characteristics being readily seen. I urged the necessity of the character of the plant being taken into consideration upon many of my florist friends of past days, and the memory of their kindly smile as they endeavoured to formulate a reply that would not completely annihilate me will ever remain fresh in my memory.



CACTUS DAHLIA HON. MRS. GREVILLE.
A long-stemmed variety, raised by Messrs. J. Cheal and Sons.
The colour rich rose-pink.

I have not only held the view that the plants should possess the two characteristics mentioned, but have persistently advocated the flowers being shown on stems of sufficient length to carry them in a graceful manner. When I began to advocate the exhibiting of asters, carnations, zinnias, and similar flowers with a portion of stem it was said by not a few that the advocacy was that of a faddist, and when, some years later, a further step was made, and the exhibiting of the large Japanese and the formal incurved chrysanthemums on long stems suggested, such method of staging was stated to be an absurdity by those whose opinions differed from mine. Has it proved so? The exhibitions have afforded an answer in the negative. After much persuasion the National Chrysanthemum Society, in the management of which I was then taking active part, provided classes for flowers in vases; other societies followed the example, exhibitors soon fell into line, and the exhibitions have been enormously increased in attractiveness and utility.

The dahlia is one of the first of the florists' flowers to which I gave my attention, and it has been a matter of much regret for some years past that it should not be more freely utilised in beautifying the garden at the end of the summer and early in the autumn. The introduction of the elegantly formed cactus varieties that had been derived from Dahlia Juarezi so diverted attention from the more formal varieties that had rendered good service for a long period, that the public would not buy and plant them. Instead, they bought and planted the cactus varieties. It is not surprising they should have done so, for the individual blooms possess lightness and elegance in a marked degree, and are exceedingly attractive in colour. The earliest of the cactus varieties possessed much beauty, and of late years the improvement in the individual blooms has proceeded at a very rapid rate. If one had only to consider the exhibition side of dahlia culture nothing better could well be desired than the many beautiful varieties now in commerce. Unfortunately, in the work of improving the cactus dahlia the chief attention was, as in the case of other florists' flowers, given to the development of the individual blooms. The habit, which was not good, has not been improved to the extent it should have been, and many of those who have planted cactus varieties for the decoration of their gardens have been woefully disappointed with the results. The growth has been robust, but the blooms that charmed them on the exhibition stage have been hidden away among the foliage. This naturally brought about a decrease in the cultivation of this section of dahlias for garden decoration, and a material decline in the interest taken by the public in the dahlia.

Two years ago the National Dahlia Society were good enough to invite me to occupy a position in the executive that would necessitate my taking a more prominent part in the work of the society than I had previously done. In accepting the position, which involved increased responsibility, it appeared that some change in policy should be made, and that increased attention should be given to dahlias specially adapted for garden decoration. As the views of Mr. E. Mawley, V.M.H., the president, and myself upon this point were practically identical, there was no difficulty in bringing about the desired change. One point that impressed me most was the necessity of so improving the cactus section that cultivators should have at their command a race of varieties of moderate growth and bearing the blooms well above the foliage.

In other words, that there should be, in addition to the varieties bearing flowers of exhibition quality, a race of cactus dahlias that would produce a good display of colour in the garden. My views were regarded as somewhat visionary, but I knew that those who had accomplished so much in the development of the individual blooms could improve the habit if their energies were diverted in that direction. I knew, of course, that before progress could be made in this direction it was necessary to formulate rules for estimating the merits of garden varieties, for not until committees charged wih granting certificates recognised the value of long stiff stems could it be expected that raisers would turn their attention to the development of varieties specially adapted for the garden. This year, as duly recorded in these pages, a considerable number of garden varieties has been submitted to the committees of the Royal Horticultural Society and the National Dahlia Society, and a large proportion of them have received distinction from one or both of these bodies. Three of these are herewith illustrated, and with reference to them it may be said that they have erect stems ranging from fifteen to eighteen inches in length, and so stiff as not to require support of any kind when exhibited; other varieties certificated have stems of similar lengths. The varieties are Hon. Mrs. Greville, raised by Messrs. J. Cheal and Sons; Minerva, raised by Mr. Charles Turner; and Sweetbriar, raised by Messrs.

J. Stredwick and Son. These, it should be added, are illustrated as good types of the new race of garden cactus varieties, and not as being superior to others that have received distinction.

G. G.

SHOWY-FRUITED EUONYMUSES.

Among British shrubs or small trees the common Spindle-tree, Euonymus europæus, is conspicuous in autumn by reason of its crimson fruits, which when mature, burst open and disclose the pretty orange-covered seeds within. It is to be met with in hedges and copses in some part of the country, while in many cases it has been introduced to the garden with effective results. For park planting and grouping in a more or less informal manner it has much to commend it, as it may be left alone to develop at will, without fear of encroaching on, and interfering with the development of some choice shrub, and under such conditions it is seen at its best, for mature specimens rarely fail to produce an abundant crop of fruit.

Some considerable difference is noticeable in the colour of the fruits of different forms of this species, for, in addition to several shades of red, purple and white fruits are met with. It is not, however, the common spindle-tree only which is useful amongst species of euonymus for the sake of ornamental fruit, for there are other kinds which are equally showy, while some bear fruits as large again as those of E. europæus. One of the most showy of the larger fruited kinds is E. latifolius, a native of Europe and Asia; another quite as decorative being the North American, E. americanus, commonly called the strawberry bush. Both these have the additional advantage of the leaves colouring brilliantly previous to falling.

Then we have the Chinese and Japanese E. oxyphyllus, which bears red fruits with less prominent ridges than those of the kinds previously mentioned; while yet another showy fruited kind is met with in E. planipes. Though not a very free fruiting species, E. alatus is well worth growing for the sake of the brilliant orange and scarlet shades assumed by its foliage in autumn. It is a Japanese species and may be recognised from other kinds by reason of its curiously winged branches. The deciduous species of euonymus are accommodating shrubs, for they can be grown almost anywhere in an open position, and are not fastidious about soil, for any ordinary garden soil suits them.

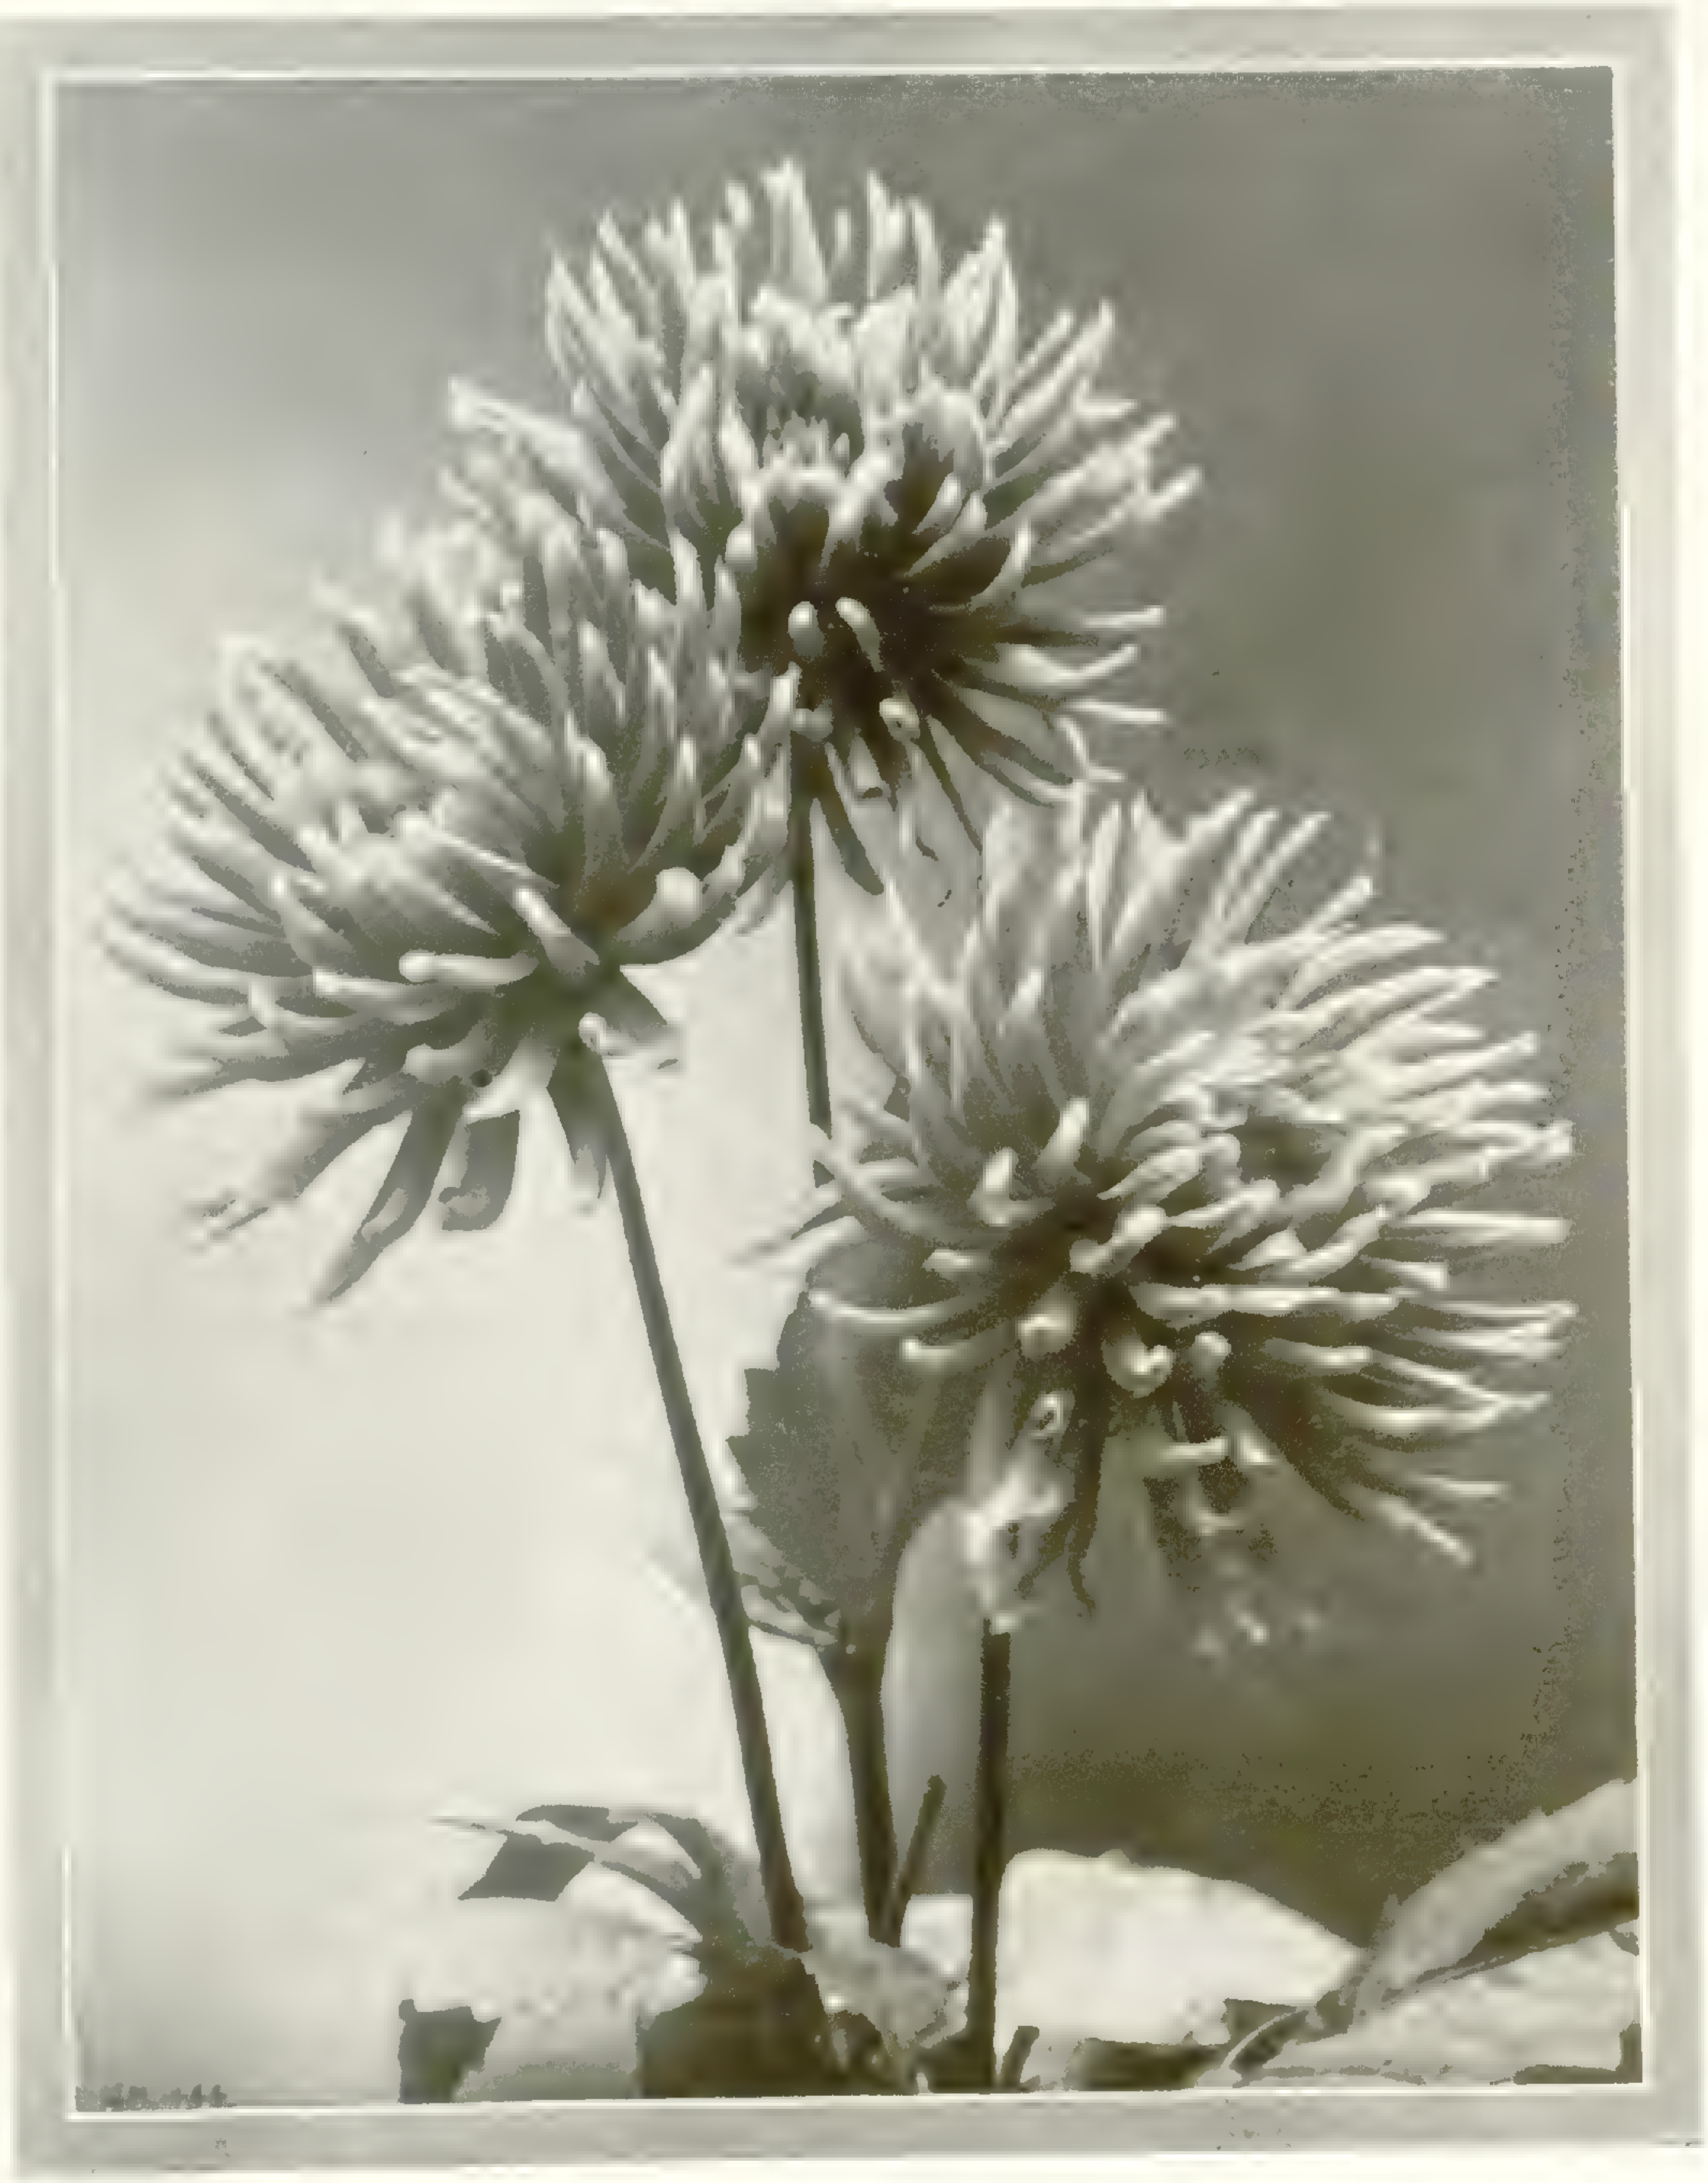
D.

Ilex Fargesi.—Among the many interesting shrubs which have been received from China within the last few years are several new species of Ilex which differ to a remarkable degree from those kinds which were previously in cultivation. Of this number I. Fargesi is very distinct. Up to the present time small plants only have been seen in British gardens, but in China it is said to grow to a height of 15 feet or thereabouts. Its chief peculiarity lies in its evergreen leaves, which are from three to four inches in length and a quarter to one-third of an inch wide. The margins are but slightly serrated without any approach to spininess. Judged from dried specimens the fruits appear to be borne in axillary clusters, and are red in colour. As far as can be ascertained at the present time, similar culture to that given to hollies in general will meet its requirements; while, though it is of less decorative value than many of the other kinds, its distinct appearance warrants it a place in gardens where collections of rare and curious plants are encouraged.—D.

WORTHLESS FRUIT TREES.

One can scarcely believe, without seeing, that there are as many worthless fruit trees growing in our orchards as is actually the case. During a journey from the South to the North of England recently many hundreds of old fruit trees could be seen from the railway carriage, and as I have had the privilege of personally inspecting many orchards—some situated close together, others far apart—I was surprised that the owners should still remain so indifferent to their own welfare as regards fruit-tree culture.

The trees in some orchards were giants—as regards size of stem and height—but they only possessed small tops, which grew so close together that the branches of one were bruising those of others. Furthermore, even in good seasons the fruits are not of high quality, and rarely realise even moderate prices. The varieties are obsolete. As one gentleman remarked when passing a very neglected orchard, "Ah! another example of English fruit-growing."



CACTUS DAHLIA MINERVA.

A long-stemmed cactus variety raised by Mr. Charles Turner. The colour yellow in the centre passing to purple.

There has, from time to time, been simple and valuable instructions in the Gardeners' Magazine, available for all, respecting the good cultivation of fruit trees generally, and I have had ample evidence that numbers of persons are making good use of such hints. I found that new orchards were being planted in every direction; the trees being mainly standards and bushes. Very clean and healthy, too, the trees appeared to be; and a very pleasing feature near many farm-houses was a new orchard, principally composed of apples, pears, plums, and cherries. Small enclosures near farmsteads are used for young stock to graze in, and now these small paddocks are being turned into orchards, standard trees being planted so as to permit of young stock, such as calves, to graze there as usual. Even the farm buildings are being used to train fruit trees on. I know of pear trees so growing, and they are loaded with fruits, the trees being grand ones, quite 24ft. high.

The new plantations, I find, are being manured, and, in the majority of cases, carefully pruned, staked, and cleansed; all this promises well for the future. The good work should go on; old orchards grubbed up, and new ones established. It makes one almost envious to see the great possibilities—the splendid land in nicely-sheltered quarters littered with heaps of brushwood that might be made in a few short years fruitful land, at present neglected.

Geo. Garner.

Vallota purpurea.—Of bulbous plants that flower during the autumn this is one of the most accommodating, for either in the greenhouse or in the window of a dwelling-house it will, as a rule, bloom in a perfectly satisfactory manner. At the same time the flowers are not all of equal merit, and the old and best type with fine round flowers and a rather dwarf habit of growth is now much scarcer than it was. Within the last few years bulbs have been largely imported from South Africa (its native home), and these, as a rule, do not represent so good a form as those which used to be grown here.—W. T.

NOTES FROM ORCHARD LAND.

In this delightful Indian summer weather that is prevailing at the beginning of October there is a ruddy glow on the leaves of the trees in West Country orchards, and during the last few weeks the sunshine has done wonderful things in painting the colour on the cheeks of the apples. Very hard things have been said about the apple orchards in the West, and fruit experts never tire of holding them up as object-lessons to show how fruit should not be grown; but, in fairness to the West Country, let me say that there are good orchards as well as bad ones, though I will not say that the latter do not predominate; and while there are growers who do not treat their fruit seriously, there are others who do, and in their confidential moments they will not hesitate to admit that, taking one season with another, no part of the farm is more profitable than the orchard.

My remarks are confined to orchards which stretch away along the fertile vale of the Severn, and though crops, as a whole, are by no means heavy, there is more fruit than was at one time anticipated, and scenes of activity may be observed in the orchards on every side. At one tree you can see two or three tapering ladders, and men amongst the branches picking the fruit into the round pot baskets which dangle from the ladder staves; but under the next tree there is a waggon drawn up, and it is the duty of someone to go round every day, pick up the fallen apples, and put them into the vehicle. The difference in the processes is simply this: The apples that are being hand-picked into the baskets are what are known as "potting" fruit, i.e., they have a value in the market, while the others are cider apples, which are collected into big heaps, and later on, when the picking season is over, a travelling cider mill will come round, there will be a general grind up, and the juice of the apples will be converted into the popular West Country beverage.

In reference to cider making, one day last week I chanced to walk into a young orchard containing a hundred trees of cider apples in ten varieties. Two things struck me in connection with these trees, which have some educational interest. First, they were planted in December, 1908, and left till March, 1910, before they were pruned. I have never seen young trees make finer growth, and the question is, would the growth have been as good if they had been pruned immediately after planting? I think not. Secondly, when the planting was done the turf was buried in the holes, and the surface soil has since been kept hoed for a distance of two feet from the stems—with the exception of two trees of each of the ten varieties, and in these cases the turf was put back over the roots. The effect is that the heads of the trees where the turf was put back over the roots are not more than half as big as the others of the same varieties which have been kept cultivated. No further demonstration is wanted of the advantage of burying the turf when planting trees in grass orchards.

There is something so novel in these days about planting an orchard with cider apples alone that a word of explanation appears necessary. The orchard in question is only one of a number that have been planted in the West Country since 1908, and their establishment is carrying out one of the objects of the National Fruit and Cider Institute at Long Ashton, near Bristol, which, when it was originated, set out to collect all the best-known cider apples from different localities, propagate them, and distribute the trees in the contributing counties. Thus we have it that cider apples hitherto unknown outside Devon and Somerset are growing in Hereford and Gloucester, and varieties belonging to the latter countries have been transferred to other parts. Further, on account of the propagating and distributing work done by the Institute, under the able directorship of Mr. B. T. P. Barker, M.A., more cider apples have been planted in the Western counties during the past few years than has been known for a very much longer period before, and, it is assumed that the industry of cider making will be benefitted.

In passing through a typical West Country orchard when fruit picking is going on one cannot fail to note one of the mistakes made by planters, both in recent years and a long time ago. In going from tree to tree you will notice that they are most of them different varieties, some being of local origin, and others known in commerce, but different. What is the result? There is a basket of this, a basket of that and the other, but rarely a bulk of any one sort, and they have either to be put up in small lots, which salesmen do not care to handle, or else be jumbled together and sold at the reduced price which is the result of the mixing. It is usual for landlords to supply the trees which the farmers plant in their orchards, and it is characteristic of the latter, acting on the principle that if one variety does not bear another may, to safeguard himself by having a number, forgetful of the fact that the man who would make money out of his apples in these days must be able to consign to the market a quantity of fruit of just a few popular varieties.

Here and there, however, one sees an exception to this general order of mixing up, and I will mention a case in point. When Mr. Merryweather, of Southwell, first introduced his famous Bramley's Seedling, he described it as "the finest apple on earth," which might have been a smart bit of advertising, but it is literally true, for if there is a finer apple than this for orchard use I have not yet made its acquaintance. Well, the individual referred to above discovered Bramley's Seedling years ago, and, realising its possibilities, he not only planted it largely, but cut off the head of every doubtful apple tree he possessed, and grafted them with Bramley. They have done splendidly, the young trees are well established, and the old specimens have been made young again. The man picks Bramley's Seedling by the ton in an average season, and while he has never any difficulty in selling them, this year he is in a position to choose his buyers, and Bramley's will put a nice bit of money into his pocket.

Along with cider, perry is a favoured beverage in the West, and the pears from which it is made are all of local origin, and mostly named after the place where they were raised. Blakeney Red is a well-known perry pear in the Vale of the Severn, where it grows into an immense tree, is a reliable cropper, and the fruits, which are above the average size of perry pears, have rather a taking appearance. Last year pears generally were a big crop, Blakeney amongst the rest, and they were mostly allowed to fall to the ground before being ground into perry. This year, however, there is another tale to tell, and Blakeney Red has cropped well, while many much better eating pears have failed. This will explain the following experience: One day I saw some Blakeney Reds being hand picked and packed in hampers under the trees. A few days later I happened to be in London, and, seeing some rather nice-looking pears on sale, I was tempted to purchase. One bite was sufficient for me to recognise the variety; it was Blakeney Red, the despised pear in years of plenty, but this season valuable enough to be sent by rail to London.

Growing in solitary luxuriance in many a West Country orchard are to be found apples which are unknown in commerce, though some of them are infinitely better than many a variety included in up-to-date nursery collections. Many of these apples came up from the pips thrown out with the "must" from the cider mill, and somebody took the trouble to grow and fruit them, and honour them with a local name. The other day I noticed some finely-grown trees in an orchard, which were bearing large, firm apples, and as the variety was unfamiliar I asked the name of it. "Oh, that's what we call the Cow apple," replied the grower, and in answer to further questions he went on to explain that a previous tenant of the farm discovered the original seedling growing up through some cow manure in the orchard. In all probability the cow had eaten the apple, and the pip had passed through her system; but, be that as it may, the farmer grew the seedling in his garden, and, finding it to be a good variety, he raised a stock of it by grafting, and gave it the name it still bears, i.e., the Cow apple.

Even at this late period many of the orchards in the West bear traces of the "blight" which ravaged the district in the early summer, and they may be observed in the shape of lacerated foliage and leafless trees. As yet the West Country farmer is not a confirmed sprayer; he is sitting on the fence, waiting and wondering whether he will have to come to it or run the risk year by year of losing his crop. Some few, however, are not content with waiting, and one of the most enterprising farmer fruit growers in the West sprayed the whole of his orchards last spring with lime and salt. The whitened trees were the object of much comment, and some ridicule, though, strangely enough, the idea of lime appealed to the critics more than any other insecticide would have done. Some said that the first shower of rain would wash it off, but it didn't, and when I saw those whitened trees a few weeks ago they were simply laden to breaking point with magnificent apples. Perhaps the lime is not entirely responsible for this, but some credit may be given to it, considering that there are orchards round about with scarcely any fruit in them. I shall not be surprised to see more whitened trees next spring in that locality. H.

Dipladenia boliviensis.—Though decidedly less showy than many other dipladenias, this is an especial favourite of mine, as it is of free, yet neat, growth; the flowering season extends over a lengthened period, and the rich golden-yellow of the throat stands out in a most marked manner from the pure white of the rest of the flower. It will also thrive under somewhat cooler conditions than the rest of the dipladenias. As indicated by the specific name, it is a native of Bolivia, and it first flowered at Chelsea in June, 1868.—W. T.

CHIMNEY CAMPANULAS.

The great beauty and value of the varieties of Campanula pyramidalis have been set forth in these pages again and again, and, as occasion has offered, illustrations of notably good culture have been presented. Mr. G. Wythes, V.M.H., when in charge of the Syon House Gardens, grew these campanulas finely, and raised a vastly improved strain of them. The latest examples of high culture that have come under our notice were those staged at the meeting of the Royal Horticultural Society on August 16 last, by Colonel George Howard Trollope, of Fairmile Hatch, Cobham. Some of the specimens had six or more spikes that were each a fine column of blooms, and both blue and white varieties were represented. The specimens were remarkable for their great size, some of them, like the one illustrated herewith, standing six feet high. Colonel Trollope is to be congratulated upon the success he has obtained in the culture of a subject that is so often neglected, because, being easily grown, so few people take the little extra trouble necessary to grow it superlatively well.

WILD PLANTS ON WASTE LAND IN LONDON.

The waste ground between Aldwych and the Strand has, says "Nature," been colonised by a variety of plants, most of which show luxuriant growth. Many of the colonists have fruits or seeds adapted to wind distribution, as in the case of the winged fruit of the sorrel (Rumex acetosa), and of the plumed seeds of the hairy willow herb (Epilobium hirsutum) and French willow, or rose bay (E. angustifolium), by far the most conspicuous plant on the ground. It is of interest that E. angustifolium, which is absent in many of the waste places of London, occurs in the garden of Fountain Court, near the Strand. Among wind-distributed forms are also numerous Compositæ, the fruits of which are furnished with a pappus; these include the spear thistle (Cirsium lanceolatum), the groundsel (Senecio vulgaris) and its ally S. viscosus, the dandelion (Taraxacum vulgare), the butter bur (Tussilago petasites), and the Canadian fleabane (Erigeron canadense). Fruits and seeds of these various types might be blown with some readiness from neighbouring districts, or from one part of London to another. To a varying extent, wind may be also efficient in carrying the seeds of hedge mustard (Sisymbrium officinale), London rocket (S. irio), which appeared in quantity after the Great Fire of 1666, and shepherd's purse (Capsella bursa pastoris); and the same is the case with chickweed (Stellaria media), white campion (Lychnis alba), opium poppy (Papaver somniferum), a garden escape, frequently established in waste places, great plantain (Plantago major), pale persicaria (Polygonum lapathifolium), and scentless mayweed (Matricaria inodora). In several of the above the seed is small or flattened, but it is not elaborately adapted to wind dispersal, and it may be questioned whether wind alone will account for the presence of these plants. A probable auxiliary exists in the sparrow, through the alimentary canal of which various seeds and fruits no doubt pass, and it is not unlikely that others become attached to its feet by means of the sticky London mud. It will be remembered that Darwin in the "Origin of Species" describes eighty-two plants as springing from the earth obtained from the feet of a single partridge. This method of distribution no doubt accounts for the presence of Dutch or white clover (Trifolium repens) and of two balsams, the pink-flowered Impatiens glandulifera and a white variety. The explosive fruit characteristic of this genus could certainly not shoot its seeds across the traffic of a London street. Possibly cats may be effective as agents of distribution in this case, and they may also account for the presence of cleavers (Galium Aparine), the hooked fruits of which would readily cling to their fur. Among garden escapes, the marigold, nasturtium (equal Tropæolum), wallflower, and a species of prunus can be observed, as well as the opium poppy mentioned above; in connection with these, and with many of the wild species also, the neighbourhood of Covent Garden must be recalled.

A FINE SPECIMEN OF CAMPANULA PYRAMIDALIS.
Exhibited before the Royal Horticultural Society on August 16, by Colonel G. Howard Trollope, of Cobham.

The above list is by no means exhaustive, none of the grasses, for instance, having been mentioned: in one or two cases the identification had to be made from a distance and through the fence surrounding the waste ground.

A NOTABLE STAFFORDSHIRE NURSERY.

Mention of the Staffordshire Potteries is calculated to conjure up visions of a bleak, unlovely country, with many dowdy buildings and gaunt chimneys, a district practically barren, and endowed with extremely little of horticultural interest. It is, however, good to know that here, as in the case of many another manufacturing centre, one may, in a very short time, leave the dirt and grime, the rush and roar of the haunts of the moulders of clay behind, and enter a district as quiet and peaceful as one could wish, where the beauties of Nature may be enjoyed to the full, and where the earth is clothed with fresh green grass, and trees wave their spreading branches in the breeze.

Thus it was our pleasure awhile ago to quit Stoke-upon-Trent, and journey to Milton, a picturesque old village but a few miles distant, where, beyond the cluster of homely cottages, the pastures and wooded hills stretch away in lovely panoramic view. It is here, in this open country, that the nurseries of Messrs. Isaac Matthews and Sons, Lim., are established, a tour of which contitutes a pleasure and an education to anyone who takes a lively interest in horticulture. It is over three-quarters of a century since the firm came into existence, and during that long period their business has developed to such an extent that to-day the nurseries occupy an honoured position among the most extensive and representative establishments in the British Isles.

The five nurseries occupied by the firm cover an area of some 300 acres, and in one or other of the branches stock of almost any class of plant worth cultivating in Great Britain may be found. If asked to indicate their leading speciality Messrs. Matthews would probably reply that their endeavour is to maintain the stock of general or all-round nurserymen up to high-water mark, but that if one subject does take precedence it is rhododendrons. Of these no less than sixty acres are grown, and this huge stock embraces the whole family, from seedling ponticums for plantations and coverts, to the choicest hybrids that shall grace the lawns and shrubberies of the best-kept nobleman's estate. In size they range from young plants of a season's growth to fully-developed specimens capable of producing immediate effect, the latter being kept in capital condition for removal by periodical transplanting. To attempt to enumerate any of the varieties to be seen here would serve no useful purpose, for it may at once be said that the collection includes practically all varieties in commerce that are worth growing.

Equally noteworthy are the immense stocks of forest trees, the most serviceable timber trees, and such subjects as may be classed as the more ornamental forest trees being grown in huge breaks. Messrs. Matthews consider Pinus laricio, the Corsican Pine, one of the best trees for plantations, especially for hillsides or where sea breezes are wont to sweep with full force over the land, consequently this is very largely grown, and is strongly recommended when the firm's advice is sought by intending planters.

It may be remarked that the Light Oaks and Bagnall branches, where much of the forest stuff is grown, are situated on the top of a hill about a thousand feet above sea level, so that buyers need have little fear about planting in exposed positions, robustness and hardihood being well assured. Grand quarters of specimen hollies, yews, box, and choice coniferæ are still another feature of these resourceful nurseries, and for the convenience of those who cannot spare the time to ramble over the wide-spread area covered by the stock, a long show border near the chief office is effectively planted with representative specimens. This border is backed by a fine hornbeam hedge, and behind this are squares, divided also by hedges, in which young shrubs and ornamental plants of every description are coming along.

Roses are grown to the extent of about 70,000 per annum, as well as fruits of all kinds and shapes, sufficient to stock a respectable nursery in themselves, the batches of the more popular varieties running into many thousands of trees. A fine collection of herbaceous and alpine plants were a source of special interest to us, many things we are accustomed to see in small numbers being grown at Milton in great beds.

In an extensive range of glasshouses ferns, carnations, fuchsias, and a general collection of cool greenhouse plants are produced, whilst pot roses, clematis, ivies, and other climbing plants are turned out from the propagating houses in ceaseless succession. Considerable trade is done in floral designs and decorative work, and the seed and bulb warehouse is, in its season, a busy department of this extensive and many-sided establishment. From what we have written it will be apparent to our readers that within the compass of a brief article it would be impossible to go deeply into detail respecting particular subjects grown at Milton, but it will be equally evident that the nurseries are eminently worthy of review.

We would add that the firm extend a hearty welcome to all who are interested in horticulture, and we repeat our opening remark, that a visit of inspection proves both a pleasure and an education. As may well be imagined, a firm with so extensive and varied a stock at command publishes a comprehensive catalogue, a copy of which would undoubtedly prove to be of service to prospective planters.

PENTSTEMONS AT ALDENHAM.

As is now well known, Mr. E. Beckett has taken a keen interest in pentstemons, and has raised many new varieties each year for several years past; and when I say that he has taken the flower in hand seriously, it will be known that the varieties he has given names to for perpetuation are beyond the ordinary type. Lately I had the pleasure of inspecting the plants as grown at Aldenham, both the old and the newest batches of seedlings. The strain is now of exceptional vigour, several of the plants being fully three feet to four feet high, with flower spikes in proportion, and with extremely large blossoms.

The following few varieties I was especially interested in: Helen of Troy, the most perfect pentstemon I have ever seen, being strong in growth, with an enormous flower spike of exceptional colour, the tube and edge deep crimson, with a pure white throat. The blooms, 2½in. in diameter. Autumn Glory has a rose-coloured tube, with crimson edge and throat stripes; very showy. Clad In Beauty is scarlet in the tube, white with crimson stripes in the throat, and quite compact in spike. Murex has somewhat small flowers of a pleasing purple shade of colour. Aldenham Pride has pink bells, with a crimson throat. Bianca is white, faintly edged with pink. Fair To See is of a rich rose colour, with purple throat. Purple Emperor, as its name implies, is intensely purple in colour, with a bold, well-set spike. E. M.

Sedum Kamtschaticum variegatum.—Given a somewhat dry spot fully exposed to the sun, the leaves of this sedum acquire a brightness of colouring such as is to be found in very few variegated-leaved plants. It has a free, spreading growth, and the leaves, which are about an inch in length, and ovate in shape, are of a somewhat fleshy character. They are freely variegated with varying shades of cream, green, and red, so that a well-coloured specimen forms a very attractive feature. This sedum is quite hardy.—W. T.

MONTBRETIAS.

The montbretias have come to the front of late years, and certainly must take rank amongst the most valuable of hardy flowers. Many beautiful varieties have been raised that are a decided advance upon those previously in cultivation, and when seen in bold masses present a brilliant appearance. Further, they possess the fine quality of remaining long in bloom, and, provided they are not allowed to suffer from drought, will flower for six or eight weeks. Full exposure to the sun is essential to proper development, and it is useless to plant in a badly drained and waterlogged soil, as they will most assuredly succumb during the dull and winter season. Therefore, if the natural soil is tenacious, special preparation should be made by the removal of a couple of feet of the soil, replacing it with sandy loam or soil from underneath the potting bench.

It is a grave error to lift montbretias in the winter, either with a view to increase the stock or to transfer to a new site, as the bulbs do not become re-established until spring, and, in the meantime, a great many suffer appreciably. If it is thought desirable to increase the stock, the work should be done about the end of March, when the batches may be lifted, and a number of stolons taken off, which will be numerous in healthy plants, or a portion of the old bulbs with stolons attached, it matters not which.

The finest examples I have seen were growing in a narrow raised border facing south, and had not been disturbed for ten years. Every winter a heavy coating of cow manure was placed over them, for the purpose of protecting the roots and enriching the ground, and they were further assisted by occasional dressings of an approved artificial manure when in active growth.

The montbretias are of much value in supplying cut flowers of a lasting nature, and the branching spikes, from two to four feet in length, being both elegant and brilliant, lend themselves to artistic treatment. The colours found in these plants are delightful, and cannot fail to please. Yellows, reds, and bronze are represented in every conceivable shade, a great number being sweetly soft, and calculated to harmonise with almost anything.

A flower of more perfect form has yet to be raised than the old Rayon d'Or, or a more distinct form than Etoile de Feu. Coming later, and thanks to enthusiasts, who have taken a delight in improving the family, are Chrysolora, with large individual flowers of a beautiful shade of yellow; Germania, splendid scarlet, shading to brilliant orange; Fireworks, and Martagon, taking its name from the fact that the petals are reflexed similar to that section of lily, and this characteristic is seen in Westwick that is not yet common in our gardens. A rich golden variety, towering to three and a-half feet, and producing splendid spikes in profusion, is named after its raiser, George Davison, and certainly is second to none in that particular colour. The giant of the family is Prometheus, crimson and orange, while small forms are finely represented in Vulcan, M. Fleura Jaune, Tigridia, and Eldorado. Of those of medium growth mention should be made of Messidor, Anglia, and King Edmund, all vigorous, and free in blooming, and the last-named quality is applicable to all from the first introduction to the latest hybrid. Given liberal and correct treatment, they respond with a lavish display of flowers, which is repeated over a long term of years.

Walter H. Aggett.

DARWIN TULIPS.

The remarkable advances made with "Darwin" tulips during the last few years has given them a very prominent place among the bulbous flowers cultivated in English gardens.

The charming selection of first-rate forms evolved from the old-fashioned Breeder tulips, has undoubtedly taken the flower-loving world by storm. Undoubtedly the late-flowering tulips are "the flowers" to follow the narcissi when the reign of the latter is ended, and for that reason one feels that, now the Darwins have come to their own, their position will be assured for many long years to come. The splendid decorative effects rendered by these tulips, and their value for gentle forcing, makes them of value for all gardens, and where they can be freely planted, whether in formal beds or groups, or in informal sweeps of colour, they will be looked upon as one of the great features of the garden.

Readers are doubtless familiar with the standard varieties, and know full well the beauty and characteristic boldness of outline of such forms as King Harold, Henner, Fra Angelico, La Candeur, Margaret, Clara Butt, Europe, Zulu, and Antony Roozen, therefore there is no necessity for me to go into detail concerning these and many other varieties.

There are, however, newer and less-known varieties in cultivation, which have yet to make their appeal to the flower-loving public generally, and these and some of the rarer varieties I will refer to.

Viola is a large, bold flower, of bright attractive violet colour. Yolande should prove an acquisition, for its rich pink, salmon-shaded blossoms embody good size, form, and colourings. Velvet King is large, very tall, and carries a rich shade of purple, which is charming contrasted with paler hues. Sophrosyne, a fine tall variety, is of a pretty rose shade, shading to blush, with a deep, well-defined blue centre. Remembrance will be sought by many growers; it is a fine sturdy tulip, of medium height, and is rich lavender, shaded with rose, and inclining to a silver hue at the margins.

Deep-coloured tulips loom large among the novelties, for in addition to the already noted Viola and Velvet King, one notes the rich violet-purple Morales, a sterling gem of medium height, and the taller, finely-shaped Purple Perfection, a maroon-purple, combining size and vigour. Others in the same class of colourings are Grand Monarque, a very bold attractive tulip with plum-purple colouring, and Faust, one of the tallest of tulips, late in bloom, with maroon-purple colouring, very deep and decisive. Amor, with its cherry-carmine colouring surely deserved a better name, and certainly should become popular. Edmee, near to Amor in colour, being but little deeper in tone, with faint white marginal flushings, is an attractive form.

In Beethoven is noted a pleasing rose-pink shading, in a long erect flower, and Ariadne is a fine crimson-scarlet, tall in growth, and effective. The delightful flesh-pink Suzon will be remembered by many readers, and it should be secured wherever a collection is in the making. Prince Eugène, a study in reddish-bronze, and the rich rosy-scarlet Princess Elizabeth, should be given a trial, both being fine handsome tulips. Duchess of Westminster, one of the finest of all, partaking of the colouring of Clara Butt, save for an old rose shading, is very finely formed, and very attractive. Other tulips of note include Flamingo, a fine rich rose; Dream, a splendid variety, of a pale heliotrope shade; Bartigon, a brilliant fiery-red; Marc Micheli, extra large, rose-pink; Professor Trelease, soft pink; and the notable, though not new, Le Tulip Noire, the famous black tulip, completes a group of first-rate forms.

P. S. Hayward.

THE BLACK TULIP.

Among those May-flowering tulips grouped under the title of Darwin varieties there are several remarkable for the intensity of their dark colouring, and one of these has quite frequently been referred to as the Black Tulip. This is the variety correctly named The Sultan, and one that is fine for spring bedding, especially in association with orange, crimson, and yellow varieties, or grown over a groundwork of bright polyanthuses. It is sufficiently cheap to be planted freely, and it is a grand tulip, growing from 2ft. to 3ft. high, and carrying its shapely blackish-maroon flowers on stout, erect stems. The variety has obtained an Award of Merit from the Royal Horticultural Society, and was a conspicuous feature in the society's trials of tulips held at Wisley a few years ago. Zulu and Philippe de Caminet are other very dark varieties belonging to this class, but they are rarer, more expensive, and the colouring is purple-black.

TULIP THE SULTAN.

A May-flowering Darwin variety; deep blackish-maroon, the colour being very "solid."

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

Sobralias. — There is considerable variation to be found among the different species and hybrids of sobralias, now plentifully distributed in cultivation, and they are among the most tractable to cultivate. There is only one objection that may be raised against them, and that is the short duration of the flowers. Under hot-house treatment many of the varieties will only retain their flowers in perfection for a few hours, or a day at the most; but others are more durable. Where plants are grown in an intermediate house the flowers are much more durable, and there can be little doubt but that the greater duration may be attributed to the more robust growths obtained under the cooler treatment, and it will generally be found that the flowers are finer in colour and of greater substance than is the case when grown under warmer conditions. When raising an objection as to the fugitive nature of the flowers, it is well to bear in mind that a succession of flowers is produced from the same stem, so that some compensation is afforded in this way. They are exceedingly serviceable for exhibition purposes; nothing makes a finer background in groups of orchids than well-flowered plants of the commoner kinds of sobralias. The requirements of the plants are simple; a house where the temperature is about 55 degrees in winter, with ten degrees higher and more humid conditions as summer treatment.

POTTING.—The best time to attend to potting is during the autumn months, when the plants are producing their new roots. They are robust rooting subjects, and therefore soon fill their pots with roots when growing satisfactorily. Ample room should be provided when potting, so that they may remain undisturbed for a season or more. The pots used should be clean and filled to about one-third their depth with clean broken crocks. A good compost consists of equal portions of good turfy loam and fibrous peat, with sufficient silver sand and broken crocks added to render the compost porous. This compost should be made firm about the roots of the plants. It is a good plan to cover the surface of the potting compost with a thin layer of finely chopped sphagnum moss. The reed-like growths should then be neatly staked, thin bamboo canes being useful for this purpose, and more durable than deal ones. Give a thorough watering as soon as potting is completed, wetting the compost through. Shade carefully from the direct rays of the sun until the new roots have become established in the new compost, and syringe overhead in the morning and early afternoon.

PROPAGATION.—The stock may be increased by making divisions of the plants when potting. If small portions are removed, especially those consisting principally of old back growths, pot them into small pots, and give them every encouragement to produce new growth, and as the plants advance more root space can be afforded.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

SOUVENIR DE LA MALMAISON CARNATIONS.—Good plants for next season's flowering depend on the care and management during the next few months. They should be given a place as near the glass as possible, consistent with safety from extreme cold; above all, avoid overcrowding the plants on the stages. Should the weather continue mild, lose no opportunity of ventilating the structures freely, both at top and sides, during the day, and allow a free circulation of air at night time from wall ventilators. Damp is far more injurious to these plants than cold, and encourages the dreaded rust. As a preventive against this fungus, the plants should be sprayed on the under surface of their leaves with a fungicide at least once a fortnight.

ROSES.—All the plants should now be turned out of their pots to see that the drainage is in good order, and, at the same time, any plants which require repotting should receive attention. Roses thrive in a tenacious loam with some bone-meal added. The plants to be repotted should have the ball of roots slightly reduced. The potting must be firmly done, and the plants placed on a bed of cinders, plunging the later kinds to the rims of the pots, so that they may not be broken by frosts.

CINERARIAS.—The most forward plants should now be shifted into 6-inch pots, in which they will flower. A suitable compost is one formed of two-thirds loam and one-third consisting of leaf-soil and dried cow manure in equal quantities, with the addition of a little bone-meal and sand. They should be grown as cool as possible, syringing them on fine days. A look out must be kept for the disfiguring leaf-miners, and as a precautionary measure syringe the foliage with a solution of soft soap or quassia chips, which will render the foliage distasteful to the fly.

CYCLAMENS.—The earliest plants will now be showing their flower buds, and may be given frequent doses of weak liquid manure. Place the plants in a good position in a light, well-ventilated house. Unless it is intended to save seed from them, the flowers should be removed as soon as they show signs of fading, to encourage the plants to produce a succession of bloom. Seedlings raised during the present autumn are ready to be pricked off, and the largest may be put singly in thumb pots, using a light, porous compost, such as one composed of equal parts of loam and leaf-soil, with plenty of silver sand; press the soil firmly, and place the plants near the glass in a temperature of 55 degrees. Give shade from sunshine the first few days. Cyclamen should be fumigated to check red spider.

FUCHSIAS.—Cuttings should be now inserted to furnish shapely young plants to bloom next summer. As soon as the cuttings are rooted put them singly into small pots. Keep the plants steadily growing in an intermediate degree temperature. If the plants are well-grown and allowed ample room for development, they will form pyramidal plants without stopping the leading shoots. While not neglecting the newer varieties, we find that the old free-flowering Rose of Castile, and the large-flowering Phenomenal are indispensable. Gradually reduce the amount of water afforded the large plants which have finished flowering, so as to encourage thorough ripening of the wood before storing them in their winter quarters.

CHRYSANTHEMUMS.—Although it is advisable to keep the plants out of doors as late as possible, all must be housed at this date, except the very latest varieties. Before the plants are removed indoors cleanse the pots and spray the foliage with some suitable insecticide, such as a solution of sulphide of potassium or weak paraffin emulsion.—W. Staward, Preston Hall Gardens.

THE FLOWER GARDEN.

BORDER CARNATIONS that were layered during July or August may now be removed from the parent plant, and potted up, or planted in their permanent quarters, as may be desirable. Care should be exercised in removing the layers, disturbing as little of the soil attached to the roots as possible. The compost used for potting should be rich and porous. If the plants are placed in a frame—which is usual—see that the frame is clean, and a fresh dressing of ashes and soot inside the structure will assist in safeguarding the plants from the attacks of slugs, these pests having a special liking for carnations. Excessive moisture during the winter months, both overhead and at the roots, does more harm to these plants than extreme cold. This should therefore be specially guarded against, by giving abundance of air upon every favourable opportunity.

WINTER BEDDING will soon be in full swing, or as soon as the condition of the summer bedding plants will warrant their removal. Many varieties of bedding narcissi are already showing signs of impatience, and should be planted out as soon as possible. In many gardens dwarf shrubs enter largely into the winter and spring bedding, and these are certainly very effective if properly disposed about the beds or borders, and help to relieve the flat appearance of the beds, which is so frequently a drawback in spring bedding. Retinosporas, thujas, cupressus, aucubas, variegated hollies, and euonymus are all suitable subjects to use. Shrub and tree planting should be proceeded with as opportunity offers, for the earlier this is done the better.

IRISES.—If not already done, Spanish irises may now be planted; these may be placed fairly close together in the borders, their growth being small and slender compared with others of the same family. These bulbs can now be obtained so cheaply, and in so great a variety of shades, that they deserve to be used far more extensively than they are. As subjects for the wild garden they are excellent.

TIDINESS.—Constant sweeping and rolling will become necessary on the lawns if a tidy appearance is desirable. On the more conspicuous parts of the lawn mowing may yet require to be done, although it is not desirable to continue this very late in the season, it being better in every respect to roll the turf.

HERBACEOUS BORDERS are yet very gay with Michaelmas daisies, anemones, helianthuses, and other flowering plants. With such a variety of Michaelmas daisies now obtainable, these of themselves furnish the borders and shrubberies with colour, and are among the finest of September and October flowers. Japanese anemones, both white and coloured, have furnished a mass of flowers during the present season, and where flowers of this description are in demand, good cultivation will well repay the grower of these fine autumn flowers.—W. Hedley Warren, Aston Clinton Gardens.

HARDY FRUITS.

ROOT PRUNING.—Where it has been decided to carry out root pruning, this operation should be taken in hand at once, careful note having been previously made of the trees which make a superabundance of growth at the expense of fruitfulness; root pruning is undoubtedly a necessity where trees are planted and grown in a restricted space, as close pruning has to be resorted to, and consequently results in much useless growth, and little or no fruit. Where such circumstances exist, root-pruning, if properly carried out, will be found to produce a marked effect upon the fruitfulness of the trees. It should be borne in mind that if half as much attention were bestowed upon the roots as is given to the summer and winter pruning, a far better state of productiveness would be seen in many of our fruit gardens. At the same time, soils, situations, and locality have often a beneficial effect upon the continuous fruitfulness of the trees, and no necessity arises for root pruning. There is no need to perform this operation where the trees are making clean, healthy growths, and producing good crops of fruit. Young trees which are too vigorous can be lifted, and carefully replanted, keeping the roots near the surface, as this will materially check undue vigour and cause the formation of fruit buds next season.

THE ROOTS TO BE REMOVED.—All roots which grow in a downward direction should be cut off; prune back the strongest roots and bruised portions, using a sharp knife or chisel for this operation. Where large trees have to be dealt with, it will be necessary to take out a trench three or four feet from the main stem, three feet wide, and about four feet deep. As the work proceeds, shorten all the big roots that are found within the trench, carefully preserve all the fibrous roots, fork out the soil from the roots under the trees, severing all those which are growing in a downward direction, using a good sharp chisel for this operation. If the soil is of a poor character, it should be removed and a mixture of good loam and wood ashes used. As the work of refilling proceeds, carefully lay out all the fibrous roots, keeping them as near the surface soil as possible, and at the same time making the soil quite firm by treading it. Long rammers will be found useful to firm the soil under the base of the tree. When the filling operation is finished, a thorough soaking of water should be given to settle the soil. If the trees are in an exposed position they must be staked, and made secure with strong tying material. Where it is deemed advisable to undertake root-pruning with very large trees, it is a wise plan to carry this work over for a period of two seasons, pruning one-half of the roots at the present time and the remaining half next year; otherwise, if all the roots are cut off around the tree at one time, the check upon the flow of sap will be too great, and also, in all probability, difficulties will be experienced in keeping the trees in an absolutely perpendicular position. Orchard planted standard trees should on no account be root-pruned at any time; in fact, we have never found it necessary to perform this operation where the trees have received proper attention with regard to the careful thinning of the branches, and adding manurial stimulants to the roots.—Henry R. Farmer, Cardiff Castle Gardens.

GREAT FOUR NORTHERN COUNTIES
FRUIT CONGRESS AND
FRUIT EXHIBITION.
AT HEXHAM,
(¼-Mile from Station, in Town Hall Buildings).

THURSDAY, October 20 .. 2.30 p.m. to 10 p.m.
FRIDAY, October 21 ... .. 10 a.m. to 10 p.m.
SATURDAY, October 22 ... 10 a.m. to 5.30 p.m.

FORMAL OPENING BY
Mrs. J. C. STRAKER, F.R.H.S., and Captain J. H. CUTHBERT, D.S.O., F.R.H.S., at 2.45 on Thursday.

Presentation of CUP, MEDALS, etc., on SATURDAY, at 3.30 p.m., by Mrs. BAINBRIDGE, F.R.H.S., of Eshott Hall.

MUSICAL AND DRAMATIC ENTERTAINMENTS
Each Day at 4.15 and 7.15.

GOLD, SILVER, and BRONZE MEDALS at
SPRAYING DEMONSTRATIONS on FRIDAY, 11 a.m.

CHEAP RAILWAY FARES and EXCURSIONS.

KENT COUNTY CHRYSANTHEMUM SOCIETY.—The 23rd GRAND ANNUAL EXHIBITION will be held at the CONCERT HALL, BLACKHEATH, on WEDNESDAY and THURSDAY, November 2nd and 3rd, 1910. Schedules and all particulars of the Hon. Sec., F. FOX, The Gardens, The Cedars, Lee, S.E.

NATIONAL CHRYSANTHEMUM SOCIETY.
GREAT AUTUMN SHOW.
At the CRYSTAL PALACE,
On November 2nd, 3rd, and 4th, 1910.
Entries close October 26th. Write at once for Schedule (post free) to the Secretary, RICHARD A. WITTY, 72, Savernake Road, Gospel Oak, London. N.W.

YORK.
The 30th GRAND ANNUAL CHRYSANTHEMUM SHOW will be held on 15th, 16th, and 17th November. About £200 offered in Prizes. Groups, Cut Fowers. Fruits and Vegetables. (36 Japanese Cut Blooms £20 10s.) Medals for Trade Exhibits.
Entries due 12th November.
Schedules on application to the Secretary.
H. DALE, 26, Blake Street, York.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

The exhibition held at Vincent Square on Tuesday, October 11, must stand as one of the very finest yet held in the Royal Horticultural Hall. The hall was well filled with fine exhibits, and small exhibits of miscellaneous subjects were extremely few. Messrs. James Veitch and Sons secured two gold medals, one for fruit, and one for choice and new shrubs, while Mr. L. R. Russell also obtained the coveted gold medal with a very large and remarkable group of bamboos. Hardy flowers were much in evidence, and it was a rare day for Michaelmas daisies, the display made from the Aldenham Gardens standing first, both for quality, variety, and arrangement. There was a good attendance of Fellows and visitors, and in the afternoon the famous and veteran botanist and one-time Director of Kew—Sir Joseph D. Hooker, visited the show, and, notwithstanding his ninety-four years, took a keen interest in the display.

FLORAL COMMITTEE.

Gleichenias were very well shown by Messrs. J. Hill and Son, Barrowfield Nursery, Edmonton; the large group of elegant plants included good specimens of G. semivistita, G. dichotoma, G. Speluncæ, G. rupestris, and the fine old G. Mendeli. Right across the top of the hall Mr. L. R. Russell, Richmond, staged a large and wonderful collection of bamboos in pots and tubs. The collection consisted of about thirty-eight species and varieties, and a few that were particularly attractive were Phyllostachys Henonis, P. flexuosa, P. aurea, P. rubicunda, P. violescens, Bambusa Alphonse Karri, B. gracilis, Arundinaria japonica, A. anceps, and A. Simoni. The plants were in many cases of large size, and they were very well arranged.

A remarkable exhibit that filled all one side of the hall was composed entirely of ornamental shrubs from Messrs. Jas. Veitch and Sons, Chelsea, and a large number of the subjects being new ones from China. Besides hollies, in variety, eleagnus, coprosmas, euonymuses, ivies, and cratægus, there were such interesting plants as Berberis Knighti, Viburnum rhytidophyllum, V. coriaceum, V. Henryi, V. utile, Cotoneaster frigida, Ligustrum lucidum, Ilex crenata, I. Pernyi, Griselinia littoralis macrophylla, Ligustrum Henryi, Berberis polyantha with drooping racemes of coral-red fruits; Berberis Wilsonæ, a low-growing neat and free-fruiting species, Stransvæsia undulata, with orange-coloured berries, Desmodium penduliflorum with purple flowers, and Symphoricarpus mollis (A.M.), carrying crowds of pure white fruits. Messrs. J. Peed and Son, West Norwood, S.E., put up a bank of hardy flowers, comprising scabious and Michaelmas daisies. In another group the Messrs. Veitch showed standards of the blue and the white forms of Plumbago capensis, a selection of beautiful streptocarpus, and batches of the brilliant winter-flowering begonias Mrs. Heal and Elatior.

A fine batch of well-grown plants of Gesnera Orange King was shown by Mr. Dickson, gardener to Adeline Duchess of Bedford; this brilliant gesnerad, with its pyramids of orange-coloured flowers, was figured in our columns last year; it now obtained an Award of Merit. Some beautiful perpetual-flowering carnations were displayed in stands, tall vases, and bowls by Messrs. Stuart Low and Co., Bush Hill Park, Enfield, and among newer things they had Fire Glow, Marchioness Linlithgow, Mrs. C. W. Ward, Scarlet Glow, Lady Alington, and Mrs. T. M. Cook. Mr. J. T. West, Tower Hill, Brentwood, showed a few very effective pæony-flowered dahlias, such as Rembrandt, Van Dyck, Geisha, Turner, Liberty, and also his new big decorative yellow variety Brentwood Yellow.

An interesting exhibit of collarette dahlias was set up attractively by Mr. J. B. Riding, Chingford, and the varieties Meteor, Joseph Goujon, Mdme. L. Viger, Mdme. R. Schoffer, Mons. L. Ferrard, Mdme. R. Crozy, Diamante, and Mons. Porrier attracted a great deal of attention by reason of their bright colours and quaint form. A large bank of pæony-flowered dahlias from Messrs. Bakers, Wolverhampton, was ample evidence of the fine weather now prevailing. There were large vases of these showy flowers, and especially noteworthy were Germania, Mrs. Whineray, Codsall Gem, The Warrior, Ryton Roy, Mrs. R. Copeland, Red Indian, and Sunset.

Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, put up a wonderful exhibit of Michaelmas daisies, many of the varieties being of his own raising. The variety of form and colour displayed was remarkable. Each variety was represented by a very big stand of flowers, the sprays being so arranged as to show the effect and habit of each. Among large-flowered varieties we made special note of were Climax, Sirius, Stella, Dog Star, and Damsel, while among the smaller-flowered and very graceful varieties Cinderella, Coquette, Comeliness, Desire (very fine, white), Grace, Silvery Star, White Diana, and Little Boy Blue, and Perfection (A.M.).

Mr. H. J. Jones, Ryecroft Nursery, Lewisham, had a beautiful exhibit of Michaelmas daisies set up in vases and stands in sufficient quantity to show each variety to advantage. Very fine were Climax, Mrs. Southall, Chastity, Mrs. C. Davies, Keston Blue, Star Shower, Moonstone, Melpomene, and Mrs. Richardson. Mr. G. Reuthe, Keston, showed nerines, Michaelmas daisies, Magnolia grandiflora plena, Cimicifuga racemosa, and liliums. A beautiful set of cactus dahlias came from Messrs. Thos. S. Ware, Lim., Feltham, these being associated with pæony-flowered and decorative varieties; Debutante was very delightful among cactus varieties. Mr. H. F. Robson, Alexandra Nursery, Ham, brought up an effective display of early-flowering chrysanthemums. Messrs. G. and A. Clark, Dover, had the charming and graceful Cimicifuga simplex in splendid form, and they also showed Kniphofia corallina and Aster Climax finely.

Autumn coloured foliage was prominent in the display made by Messrs. J. Cheal and Sons, Crawley, and especially attractive were the sprays of Acer dasycarpus tripartitum, Ginkgo biloba, Rhus typhina ailantifolia, R. lacineata, Acer japonica variegata, Quercus rubra, Euonymus atropurpurea, Mollis azaleas, Corylus avellana aurea, Berberis Thunbergi, Prunus Pissardi, and Cornus Spathi. The Crawley firm also presented another of their effective displays of dahlias, and once more showed single and pompon cactus varieties finely. Mr. Maurice Prichard had the new Helenium Riverton Gem, H. Riverton Beauty, and H. Riverslea Beauty in a group of late hardy flowers.

Messrs. W. Cutbush and Sons, Highgate, had a very large display of Michaelmas daisies, these being put up in large batches. Some of the varieties were very beautiful, notably Climax, Perfection, Chastity, and the erect-growing Desire. A few poppies, heleniums, helianthuses, solidagos, and pentstemons added bright colour to the display. A bright and fragrant exhibit of perpetual carnations from the Highgate firm contained good vases of Victory, White Perfection, Lady Elphinstone, Mrs. Fortescue, Beacon, and Lady Miller, the latter a blush-coloured perpetual Malmaison variety.

Several varieties of the popular Begonia Gloire de Lorraine were submitted in quantity by Messrs. H. B. May and Sons, Edmonton, together with veronicas and the very beautiful Nephrolepis Marshalli. Messrs. B. R. Cant and Sons, Colchester, brought up a few finely-developed blooms of autumn roses, those of the new hybrid perpetual being especially noteworthy; and Messrs. William Paul and Son, Waltham Cross, filled a corner with Cratægus Lelandi, freely berried, and baskets of large, fresh, and otherwise excellent blooms of Pharisaer, Corallina, Madame Leon Pain, and Margaret roses.

Mr. James Box filled a large space in one of the annexes with a handsome display of Michaelmas daisies, gladioli, phloxes, gaillardias, early chrysanthemums, and Cimicifuga simplex. The central table in the annexe was filled with brilliant early chrysanthemums by Messrs. W. Wells and Co., Merstham, their varieties Leslie, Pollie, Wells' Primrose, and October Gold, standing out well, pentstemons and the new clove-scented white perpetual carnation named White House (A.M.) were also displayed. Messrs. Carter Page and Co., London Wall, filled one end of the annexe with a big and brilliant bank of dahlias in great variety. Mr. Frank Brazier, Caterham, had Michaelmas daisies, early chrysanthemums, pentstemons, phloxes, dahlias, very prettily disposed in large stands to form an attractive and extensive exhibit. Mr. C. Engelmann had one of his attractive groups of perpetual carnations, and in this he showed Harlequin, Carola, and the pink Rex freely and well.

ORCHID COMMITTEE.

Messrs. Charlesworth and Co.'s exhibit from Haywards Heath included a considerable batch of Epidendrum vitellinum majus, carrying quite tall spikes of brilliant flowers. With these were Dendrobium formosum giganteum, the lovely Lælia præstans alba, Cattleya Rhoda, C. Basil (A.M.), the handsome Odontoglossum Dora, Odontioda Bohnhofiæ, Eria stellata, and other good things. Messrs. Sander and Sons, St. Albans, had a quite brilliant group of orchids, and among many good things on view we noted Cattleya Bowringiana, Brasso-cattleya Thorntoni, Cattleya Hardyana, C. Fabia, C. Peetersi, Læliocattleya Walter Gott, L.-c. Phœnix, the quaint Bulbophyllum Medusæ, the wonderful B. Ericssoni, Cypripedium Niobe Westonbirt var., and C. Trafalgar.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, contributed a display in which Oncidium tigrinum, O. phymatochilum, O. pulvinatum, O. oblongatum, O. varicosum Rogersi, and O. divaricatum were well represented; other good things were Odontoglossum grande, Cypripedium Maudæ, C. Acteus, C. Chas. Richman magnificum, Pilumna fragrans, and Vanda Kimballianum. Messrs. Stanley and Co., Southgate, showed a large batch of the useful and beautiful Cattleya Minucia, Lælio-cattleya Walter Gott, and the fine Brasso-cattleya Maronæ. Mr. E. V. Low, Vale Bridge, Haywards Heath, showed Oncidium incurvum album, Cattleya labiata alba G. G. Whitelegge, Odontoglossum crispum Lady Jane, and a splendid cypripedium with very large bold and rounded green, rose and white dorsal sepal, named C. King GeorgeV. (F.C.C.)—this was greatly admired. Messrs. J. Cypher and Sons, Cheltenham, brought up Cattleya Bowringiana sanguinea, Odontioda Charlesworthi, Cattleya Mantini, C. Ashtoni, Cypripedium triumphans, C. Milo, C. Niobe, C. Olivia, etc.

Mr. Alexander, orchid grower to Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester, showed Lælio-cattleya Arthur (C. Harrisoniæ x L.-c. exoniensis), with a spike of ten beautiful flowers; L.-c. Ortrude magnifica (A.M.); and the showy L.-c. Golden Oriole superba (A.M.) Mr. J. Musk, gardener to Captain Laycock, Wiseton, Bawtry, showed Cattleya Adula Laycock's var., finely coloured. Mr. Black, gardener to H. G. Thwaites, Esq., Streatham, put up a very pretty group of orchids, these including Cattleya Adula, Brasso-cattleya Leemanniæ, Lælia præstans alba, Odontioda Charlesworthi, Cattleya Fabia, etc.

Mr. H. J. Chapman, gardener to Mrs. Norman Cookson, Oakwood, Wylam-on-Tyne, sent up Cypripedium Sibyl punctatum, C. Charlesworthi, and a richly-coloured Odontoglossum named O. Clive, parentage unrecorded. The pretty Cypripedium Venus, Park Lodge variety, was brought up by Mr. Carr, gardener to Edward Roberts, Esq., Park Lodge, Eltham. Sir W. S. Marriott contributed the curious Cattleya Pechaviensis, a cross between C. Acklandæ and C. Schilleriana. A fine plant of Cypripedium Pyrrha was contributed by Messrs. James Veitch and Sons, Chelsea.

FRUIT AND VEGETABLE COMMITTEE.

A magnificent exhibit of apples was arranged along one length of tabling by Messrs. Jas. Veitch and Sons, who staged no fewer than a hundred and thirty-four dishes and baskets, representing a hundred and thirty-four varieties. From such a splendid lot of fruit, clean, and finely-coloured, it is difficult to make a selection without leaving a large number of fine varieties unmentioned, but Cox's Orange Pippin, Gravenstein, Alfriston, Chas. Ross, Peasgood's Nonsuch, Newton Pippin, Ribston Pippin, Tyler's Kernel, Mère de Ménage, Reinette du Canada, Lord Derby, Golden Spire, Warner's King, Annie Elizabeth, the new Rev. W. Wilks, American Mother, Wealthy, Bramley's Seedling, King of the Pippins, Lane's Prince Albert, Cockle Pippin, Sandringham, King of Tompkin's County, and the useful Hambling Seedling. Christmas Pearmain, Claygate Pearmain, Cornish Aromatic, Baxter's Pearmain, and Golden Reinette and Egremont Russet were a few other dessert varieties of high merit.

Mr. C. Foster, The Times Experimental Station, Guildford, brought up fifty-two stocks of radishes, all from a sowing made on September 3, in the open. All were shown with their foliage so as to give an idea of their manner of growth, and indicate the need for thin or thick sowing; The Sutton. Long White, Wood's Frame, Crimson French Breakfast, French Breakfast, Golden Olive, White-tipped Forcing, Covent Garden Scarlet, Forcing Carmine, Red Forcing, and Turnip-Rooted White were among the best in this very interesting and instructive exhibit.

The Hailshamberry, a large fruit of the Loganberry type, and suitable, when cut back in spring, for autumn fruiting, was submitted by Mr. W. Knight, Hailsham, Sussex.

CERTIFICATES AND AWARDS.

First-Class Certificate. — To Cypripedium King Georve V., from Mr. E. V. Low, Vale Bridge, Haywards Heath.

Award of Merit.—To Lælia-cattleya Golden Oriole and L.-c. Ortrude magnifica, from Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester; to Cattleya Basil, from Messrs. Charlesworth and Co., Haywards Heath; to Catasetum fimbriatum aureum, from J. Gurney Fowler, Esq. (gardener, Mr. Davis), Glebelands, South Woodford; to Ligustrum Henryi and Symphoricarpus mollis, from Messrs. Jas. Veitch and Sons, Chelsea; to Carnations Scarlet Glow and Shasta, from Mr. C. Lange, Hampton; and to the former also from Messrs. Stuart Low and Co., Enfield; to Chrysanthemums Cranfordia and Miss F. Collier, from Mr. W. Roots, Holly Cot, Cranford; to Perpetual Carnation White House, from Messrs. W. Wells and Co., Merstham; to Gesnera Orange King, from Adeline Duchess of Bedford (gardener, Mr. Dickson), Chenies; to Chrysanthemum Mary Poulton, from Mr. H. Poulton, Huntleys, Tunbridge Wells; and to Aster ericoides Perfection, from Hon. Vicary Gibbs (gardener, Mr. Edwin Beckett).

MEDALS.

Gold.—To Messrs. J. Veitch and Sons, Chelsea, for choice shrubs, and a second medal for a collection of apples; to Mr. L. R. Russell, Richmond, for a collection of bamboos.

Silver-Gilt Flora.—To Mr. James Box, Lindfield, for hardy flowers; to Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, for Michaelmas daisies.

Silver-Gilt Banksian.—To Messrs. J. Hill and Son, Edmonton, for Gleichenias; to Mr. H. J. Jones, Lewisham, for Michaelmas daisies.

Silver Flora.—To Mr. Frank Brazier, Caterham, for hardy flowers; to Messrs. Carter Page and Co., London Wall, for dahlias; to Messrs. J. Cheal and Sons, Crawley, for autumn foliage; to Mr. C. Engelmann, Saffron Walden, for carnations; to Messrs. Wm. Paul and Son, Waltham Cross, for berried shrubs and roses; to Messrs. W. Wells and Co., Merstham, for chrysanthemums, etc.; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to R. G. Thwaites, Esq., Streatham, for orchids; and to Messrs. J. Cypher and Sons, Cheltenham, for orchids.

Silver Banksian.—To Mr. E. V. Low, Haywards Heath, for orchids; to Messrs. Stanley and Co., Southgate, for orchids; to Messrs. B. R. Cant and Sons, Colchester, for roses; to Messrs. J. Cheal and Sons, Crawley, for dahlias; to Messrs. Wm. Cutbush and Son, Highgate, N., for carnations, etc.; to Messrs. Stuart Low and Co., Enfield, for carnations, etc.; to Messrs. H. B. May and Sons, Edmonton, for begonias and ferns; to Mr. Robson, Ham, for chrysanthemums; to Messrs. T. S. Ware, Lim., Feltham, for dahlias; to Mr. Dickson, gardener to Adeline, Duchess of Bedford, for gesneras; and to Mr. Charles Foster, Times Experimental Station, Sutton Green, Guildford, for radishes.

Bronze Flora.—To Messrs. Bakers, Codsall, Wolverhampton, for pæony-flowered dahlias; and to Messrs. G. and A. Clark, Dover, for hardy flowers.

United Horticultural Benefit and Provident Society.

The above society held its twenty-fourth anniversary dinner at the Waldorf Hotel, Aldwych, W.C., on Thursday, October 6, under the presidency of Mr. Edward Sherwood, who was supported by Mr. N. N. Sherwood, Mr. W. A. Bilney, Mr. W. Sherwood, Dr. Boxall, Mr. Cox, Mr. Andersen, and the officers of the society. Altogether there were about eighty members and friends present. An excellent musical programme was provided by the kindness of the chairman, under the direction of Mr. Tonking. The speeches were commendably brief throughout, and a most successful and enjoyable evening was spent.

After honouring the loyal toasts, Mr. Edward Sherwood proposed "Continued Success to the United Horticultural Benefit and Provident Society," and in doing so pointed out the society was not a charity, but a mutual self-help and benefit society that encouraged thrift and independence among gardeners. It was the only benefit society of its kind, and was established as long ago as 1865. It had a small beginning, but had progressed steadily until now it had 1,382 members, including 56 added during the present year. The funds of the society were admirably and safely invested, and for the comparatively small sum of either 6d. or 9d. per week members provided for assistance during sickness, for chronic illness, for accident or calamity, and also in some measure for old age. To these charges there were added the small one of 3s. and 2s. 6d. annually for the benevolent and management funds respectively. The convalescent fund was not largely used, and he thought if members took advantage of its assistance more than they did it would be a good thing for themselves and the society, because if a man returned to business before fully recovered he not seldom suffered a relapse. The Chairman concluded by hoping that the influence of the society would extend, and expressed a wish to be enrolled as an honorary member.

The response to the toast was by Mr. Chas. H. Curtis, chairman of committee, who tendered to Mr. E. Sherwood the thanks of the committee and members for his kindness in presiding, and pointed out that the chairman was following in the footsteps of his father, Mr. N. N. Sherwood, V.M.H., who had presided on a former occasion, and who instituted the convalescent fund. Mr. Curtis said that the society's funds now closely approached £38,000, or nearly £28 per member, a position, he thought, not attained by any other friendly society. The progress in membership was very steady, but, considering the advantages offered, he considered young gardeners should join in larger numbers for their own benefit. Notwithstanding the kindness of the horticultural press and the notice of the society given in many a nurseryman's catalogue, it was evident the society did not reach all young gardeners, therefore the committee had on foot a movement for circularising the gardeners of the country, and bringing before them the advantages of membership; this was being done county by county, and an increase of membership was anticipated as a result.

Mr. E. F. Hawes proposed, "The Honorary and Life Members" and observed that these lent an added dignity to the society and also provided a welcome contribution to the benevolent fund. Mr. N. N. Sherwood said he was glad to hear such an excellent report of progress, and after an absence of several years he was pleased to be present once more at the annual dinner, and delighted to find his son occupying a position he had himself had the honour of filling. The society did not ask for money; indeed, did not need it; but he felt sure that its aims were so excellent, and its work so good that if at any time such a thing should be necessary the honorary and life members would not only lend the dignity of their names and give moral support, but would be ready to open their purses to afford substantial aid. He expressed great pleasure at the means now being taken to reach the young gardeners in the country, and said he should continue to subscribe annually to the convalescent fund, because he felt this would some day be of very great service to members.

Mr. Thomas Winter proposed "The Visitors," and Mr. E. Thomas very ably and briefly responded, observing that in these days it was a pleasure to find a body of men possessing the spirit of mutual friendliness and helpfulness, coupled with independence of governmental or charitable institutions.

Mr. W. A. Bilney proposed "The Chairman," and echced the sentiments of all present when he said how fine a thing it was to see Mr. Edward Sherwood following his father as a first-rate business man, as a kindly, considerate employer, and in the interest he was taking in the gardening charities and in the United Horticultural Benefit and Provident Society. The toast was enthusiastically received and with musical honours. When responding, Mr. Sherwood added a few words of thanks to those who had kindly contributed plants, flowers, and fruits for the dinner, and concluded by proposing the health of "The Secretary, Mr. Wm. Collins," who has now held that position for twenty-four years.

Bournemouth Gardeners' Association.

On October 4 Mr. F. W. Shrivell, Golden Green, Tonbridge, gave a most interesting and instructive lecture on "The Manuring of Market and Kitchen Gardens." There was a good attendance, the chair being taken by Mr. Geo. Garner.

Mr. Nippard, head gardener to J. J. Norton, Esq., exhibited, not for competition, six grand dishes of apples of the following varieties: Warner's King, Peasgood's Nonsuch, Lord Derby, Gascoigne's Scarlet, The Queen, and Cox's Orange Pippin. The dish of Peasgood's Nonsuch was a remarkably fine one, especially so when one realises that the trees are grown in a light Bournemouth soil. One specimen of Peasgood's Nonsuch weighed eighteen and a quarter ounces; the six fruits totalling six pounds five and three-quarter ounces.

Mr. Shrivell, referring to artificial and animal manures, said that the former prevented undue evaporation on light soils, and kept stiff, clayey soils warmer. Cow manure was recommended for light, and horse manure for heavy soils. The lecturer urged his audience to be extra careful in the use of artificial manures, and always to apply small doses often rather than large ones at a time and seldom. He advocated the use of animal manure as well as chemical manures. Such crops as celery, strawberries, parsley, beet, must have animal as well as chemical manures. If, said Mr. Shrivell, the leaves of plants assumed a yellow appearance, nitrogenous manures were required, and although nitrate of soda did not increase the crop of peas, it improved the flavour if applied judiciously. Used in a similar way it was beneficial to sweet peas, increasing the size of the flowers, and improving the colours. He spoke of the beneficial effects of lime in the garden, and said that when parsley and other crops began to die off it proved that lime was needed in the soil, especially when damping was the cause of the plants dying off. Brassicas, he said, could be well grown with the aid of chemicals alone; bush fruits required a certain amount of animal manure as well as chemicals. With the aid of chemicals alone, he said, it was possible to grow magnificent crops of cabbages, savoys, broccoli, cauliflowers, and kales on absolutely hard, clayey ground, as was proved by the experiments made in Kent. Referring to asparagus, he said salt only kept down the weeds. He recommended a light annual dressing of manure, put on late in winter or early in spring; also fourteen pounds of superphosphate and ten pounds of kainit per 100 square yards late in winter, with a top-dressing of five pounds of nitrate of soda in April, to be followed by a top-dressing of five pounds of nitrate of soda per 100 square yards of beds in May. The lecturer said it was a curious fact that nitrate of soda increased the yield when applied to dwarf beans, but was not similarly beneficial when given to scarlet runners.

One member asked the lecturer to explain how it was that basic slag increased the crop of clover to such great extent. The answer was that in poor ground the seeds do not germinate freely, but when basic slag is applied they find the necessary nutriment and grow freely, whereas before they only got a bare living. Many questions were put by the members and answered in a very interesting manner by the lecturer, who, with the chairman, was accorded a hearty vote of thanks at the close of the meeting.

Dundee Horticultural Society.

The annual general business meeting was held in the Y.M.C.A. Hall on the evening of the 7th inst., Walker S. Melville, Esq., the president, in the chair. The balance-sheet for the year showed a heavy loss occasioned by the inclement weather during the three days of the show. The statement showed expenditure to be £1,008 19s. 10d., and the income from all sources £785 11s., leaving a debit balance of £223 8s. 10d. The President, in formally moving the adoption of the accounts, referred to the policy of the committee in their endeavour to run the show on a sound financial basis, and made special reference to various items calculated to lower the expenditure. Unfortunately, the weather conditions on the days of the show had been against them, and was accountable for the reduction of the drawings at the turnstiles by £34 5s. from the total of last year. Their funds were reduced from £300 of last year to £95 credit at the present time. They were hopefully looking forward to a more successful year with a membership of 544, most of whom were enthusiastic supporters, the majority of them working men, who devoted their leisure time and energy to horticultural pursuits. He reminded them of the visit of the British Association which was to take place in Dundee in 1912, and urged the members to strenuously assist the committee to realise their cherished hope of making their exhibition of that year one of the finest that had ever been brought together in the country.

A SEASONABLE NOTE.

For practical guidance and valuable help the following Books will be found indispensable.

EASILY-GROWN HARDY PERENNIALS.
The Culture of Hardy Flowers, Outdoor Plants, &c. By GEORGE H. VOS, B.A. **Price 5/0 net.** By post 5/6.

BULBS AND THEIR CULTIVATION.
A complete Guide to the Culture in Garden or Greenhouse. **Price 2/6 net.** By post 2/10.

ROSES AND THEIR CULTIVATION.
Outdoors and under Glass. Description of over 1,660 varieties, &c. **Price 2/6 net.** By post 2/10.

Obtainable at all Booksellers or direct from
THE PUBLISHER, AMATEUR GARDENING,
148 and 149, Aldersgate Street, E.C.

The election of officers and committee resulted in an almost complete return of retiring members. The treasurer had the unpleasant experience of having his salary reduced from £20 to £15 to meet the demand to raise the ground manager's salary from £10 to £15. A motion was also made to allow an increase to the secretary, Mr. W. F. Hill, but this Mr. Hill magnanimously declined owing to the present financial position. The show for 1911 was fixed to be held on the Magdalen Green (usual place) on August 31 and September 1 and 2, the prize money being also fixed as usual at £300, although there was a movement to have it reduced to £230.

Agapanthus Mooreanus.—This is usually classed as a variety of A. umbellatus, but it is, as far as my experience goes, decidedly hardier than the typical form. In A. Mooreanus the flower scape is taller in proportion to the size of the plant than in any other kind. The flower head, too, is almost globular, while the blossoms themselves are deep blue. A notable feature of this form is that, unlike all the others, it becomes totally dormant during the winter.—W. T.

EDUCATIONAL VALUE OF KEW GARDENS.

The following interesting letter, published in "The Times" of October 10, was sent by Dr. David Walsh, of 27, Welbeck Street, W.:

"Amid the stress and struggle of modern life it is pleasant to think of the parks and museums and other places to which one may turn now and then for a brief period of restfulness. One such place is Kew Gardens, the home of scientific and in latter years also of practical and economic botany. As an ardent botanical student in my school and college days, it has been a privilege from time to time to visit the beautiful collection at Kew, and to remind myself of some of the many facts that appertain to the romance of plant and tree life. But, as often happens with those who have in youth made a study of a particular science, later life has brought with it pursuits that have long since elbowed early fancies into the background. Nevertheless, it is a real pleasure to be able to awaken former interests and associations by an occasional visit to Kew Gardens.

"Now, there must be many more in the same position as myself, and a still larger number ready and anxious to learn something about botany; and it is in the interests of all such that I write. It seems to me that the community hardly derives the benefit to which it is reasonably entitled from the large sums of money expended upon this public institution. Let me hasten to add that the work done in the Gardens is earnest and excellent, and the reputation of the scientific staff second to none in the world. If I may venture to say so, however, the popular, or shall I say the popularising educational, element appears to be lacking. The public want elementary information conveyed in an easy and simple manner. Labels, for instance, should be attached, as far as possible, to every important tree, shrub, and plant, or clump of plants in the Gardens. The labels should be legible, indestructible, and placed at such an angle as to permit of their being easily read. They should not be placed, as can be actually seen in one instance at the present moment, upon the trunk of a tree at a distance of eight feet from the ground, where the small lettering can be read only by persons possessing exceptional powers of vision.

"Further, in order to popularise the subject, would it not be possible for the curators to give demonstrations to parties of visitors desirous of learning something about the wonders of plant life? Such demonstrations might be made of fascinating interest. It might be possible to issue booklets dealing with such subjects as English ferns, cacti, orchids, lilies, roses, laurels, palms, oaks, cedars, English climbing plants, and so on. Perhaps some of your readers might furnish suggestions in other directions."

Our contemporary very reasonably observes that the obvious difficulty is "that the curators, who are indeed willing to give all the assistance they can, have their own proper duties. They can answer occasional questions, but could hardly undertake regular demonstrations, we imagine." Further, "The seasonal difficulty would probably be considerable in Kew Gardens. They are thronged in summer and on fine days, and we have no doubt that guide demonstrators would be extremely popular; but at other times there might be nothing to do. That, however, is not an insuperable difficulty. At any rate, the suggestion is worth discussing. There can be no doubt that a much more intelligent use might be made of the national collections and that this plan, if it proved feasible, would be of real value."

FORTHCOMING ENGAGEMENTS.

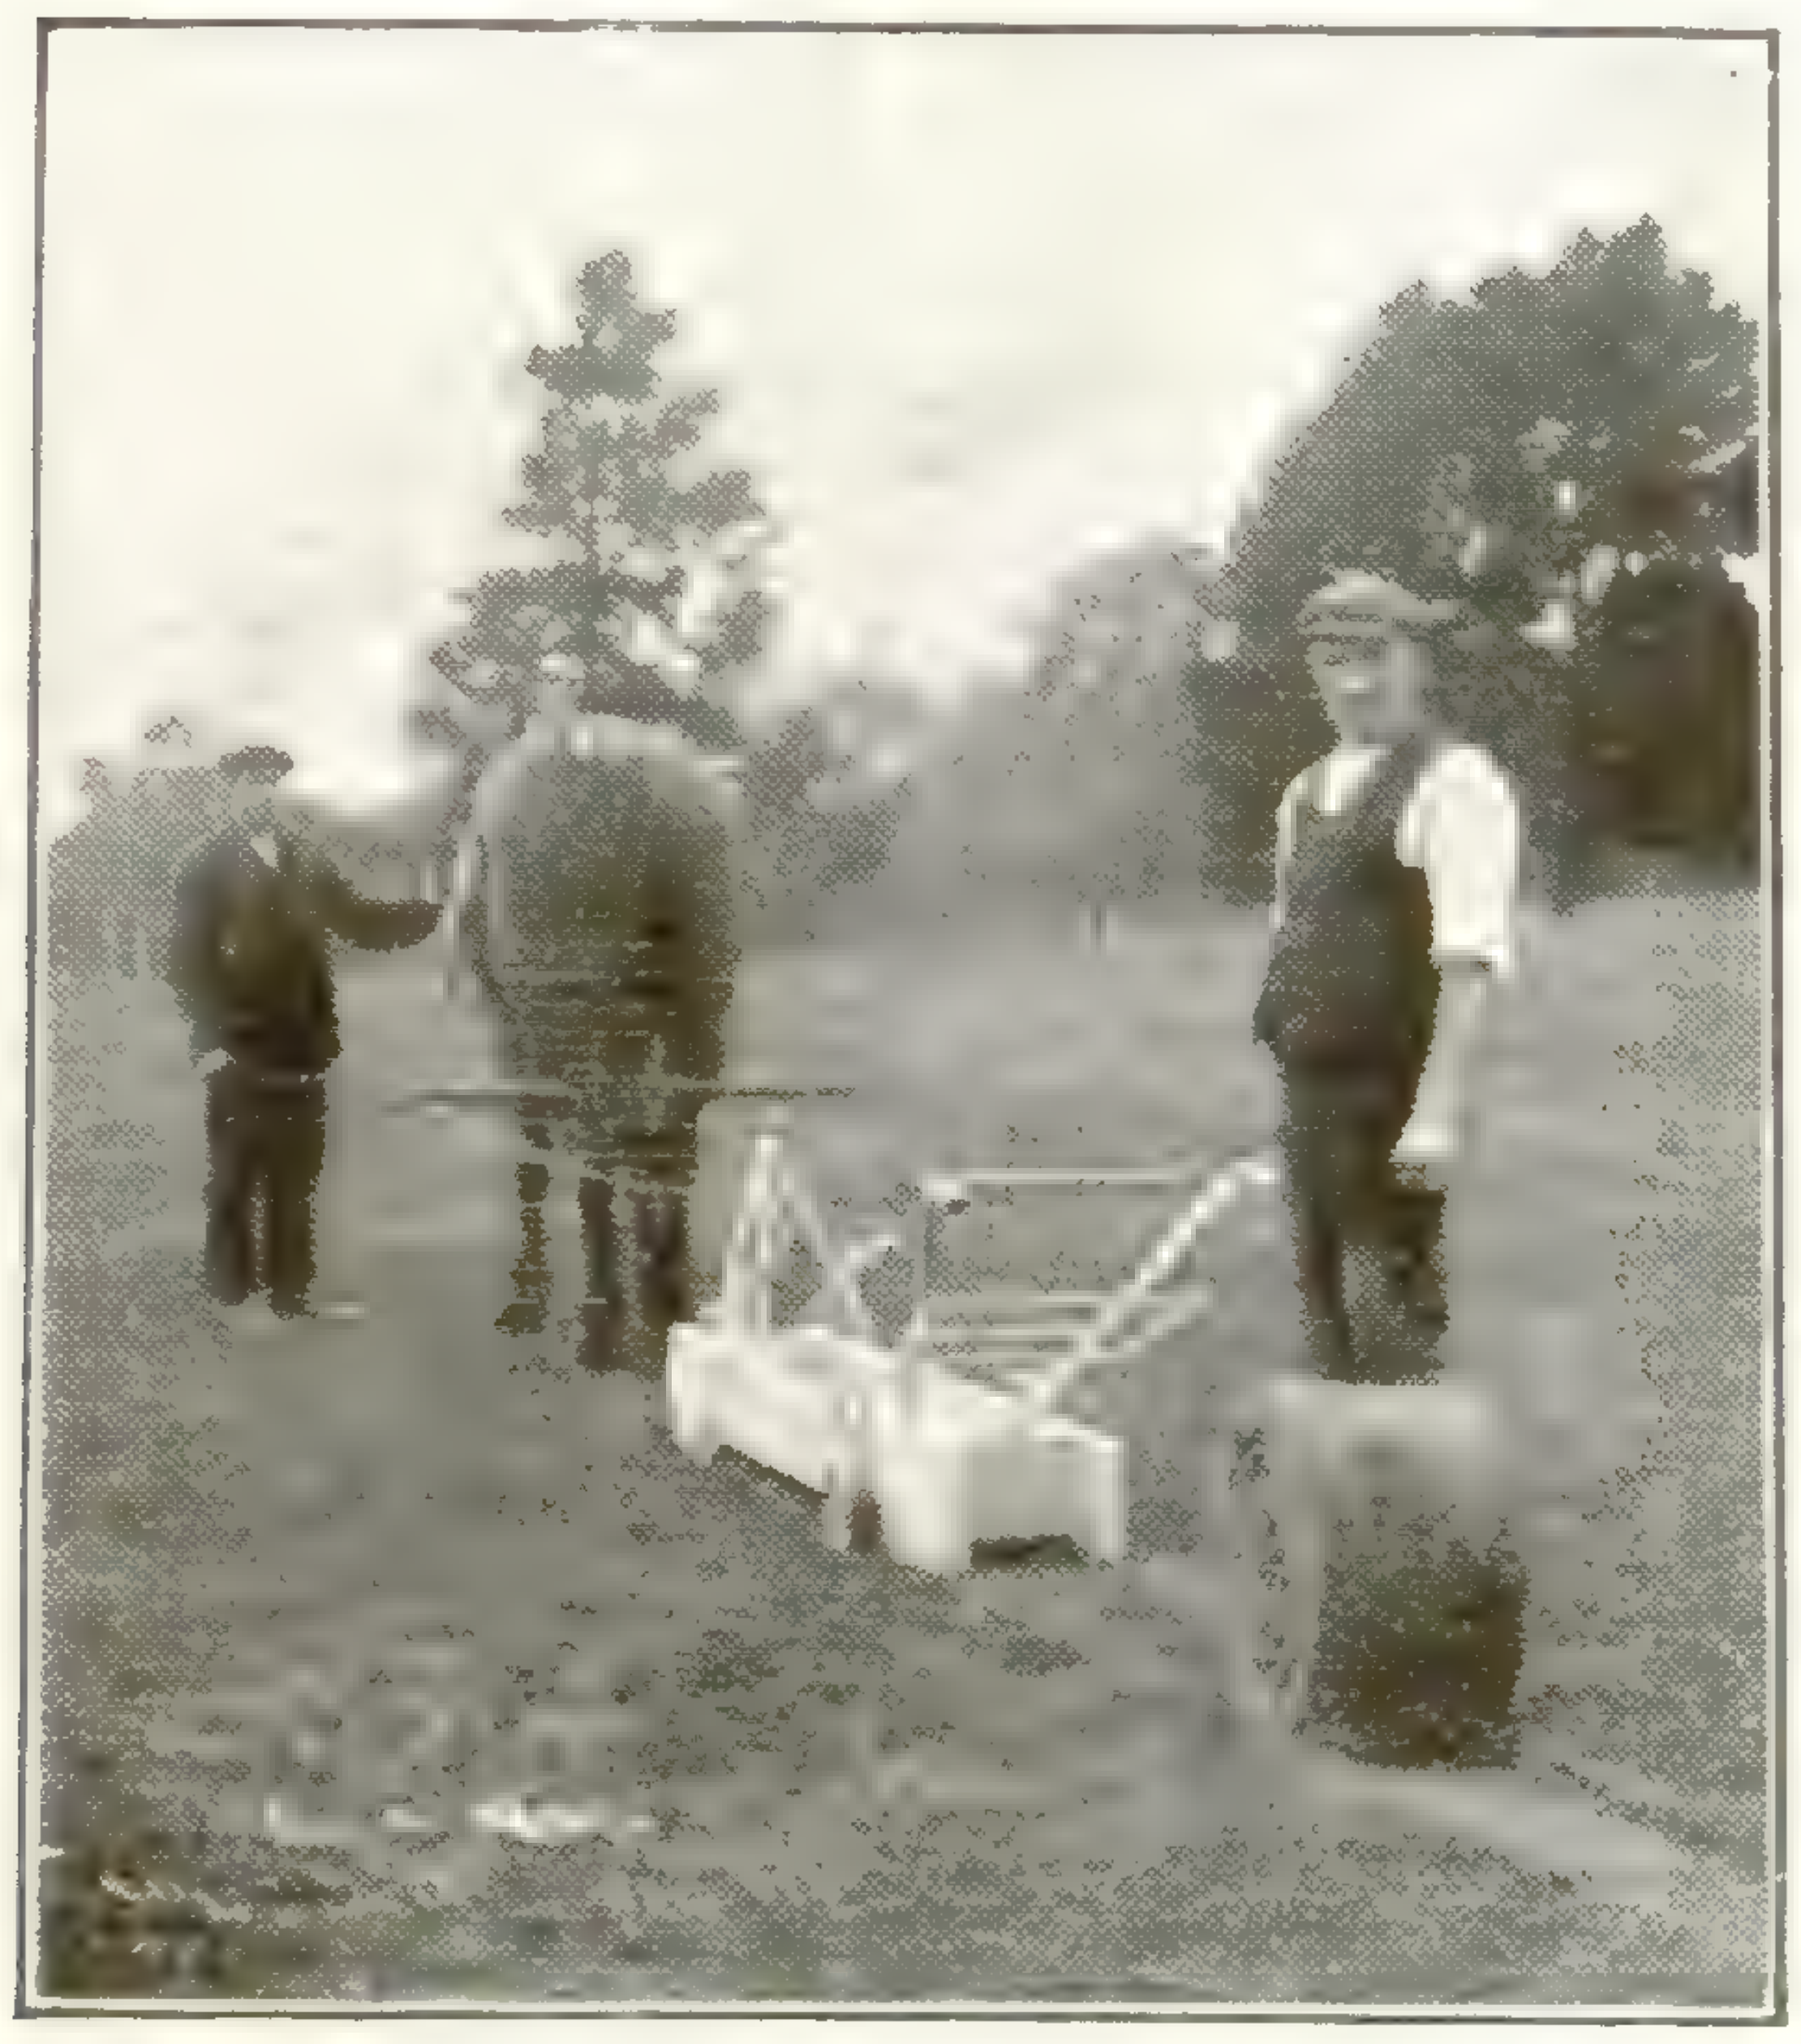
THURSDAY, October 20.—Fruit Show and Congress at Hexham; three days.

TUESDAY, October 25.—Royal Horticultural Society; committees meet at 12 o'clock; lecture at 3 p.m. on "Life—A Director of Force in Development and Evolution," by the Rev. Prof. G. Henslow, V.M.H. The society's Vegetable Exhibition will be held on this date.

WEDNESDAY, October 26.—Hereford Fruit and Chrysanthemum Show; two days.

NEW TURF PLOUGH.

We have had submitted to our notice by Messrs. Boulton and Paul, Lim., Norwich, a new machine for cutting turf that appears to be not less remarkable for its usefulness than for its novelty in construction. This turf plough is the outcome of much thought and practical experience, and is the invention of H. J. Muntz, Esq., of Hungerford. We are informed that with it an acre of turf can be easily cut in two hours; and it is a point of great practical importance that it will not only cut the turf at a uniform width, but slices it off in a manner that is practically impossible by hand. So accurate is the cutting that the thickness of the turf does not vary an eighth of an inch, which we need hardly say effects a material reduction in the labour of relaying. The plough is manufactured by Messrs. Boulton and Paul, Lim., of Norwich, and will be found of much value on estates, in parks, and to golf clubs and landscape gardeners. The illustration so admirably portrays the plough as to render detailed description unnecessary. It should, however, be mentioned that, as in the case of so many other inventions of merit, the mechanism has the advantage of simplicity.



MESSRS. BOULTON AND PAUL'S NEW TURF PLOUGH.

Wisley Students' Diploma Examination, 1910.—We are informed by the Rev. W. Wilks that the Wisley Diploma examinations in 1910 were held in March and July for those students whose two years' courses of instruction terminated in these two months respectively. Mr. John Fraser, F.L.S., acted as external co-examiner with the Laboratory Director on each occasion in both principles and practice of horticulture. The sets of questions given in March and July, though different, were of equal difficulty. In addition to this examination, the merits of an essay on a horticultural subject and of botanical and entomological collections made, together with the powers of intelligent observations shown, are adjudicated upon in awarding the diploma. The collated results show the following order of merit, those taking the examination in March being distinguished by an asterisk: 1, H. F. Clough; 2, J. W. McCaig; 3, R. McK. Robson; 4, W. Cartwright; 5, L. C. Dyer; 6, *R. L. Brazier; 7, *A. F. Leverett, 8, *E. Krumbholtz; 9, H. Lane. Two other students, failing to satisfy the examiners, the diploma has not been awarded to them. The following recognitions have also been given: The student demonstratorship mentioned in the syllabus has been offered to Mr. Clough. The Sutton prize has been awarded to Messrs. J. W. McCaig, R. McK. Robson, and W. Cartwright. The Nicholson prize of £2 2s. has been awarded to Mr. J. W. McCaig for observations. The £5 offered by Mrs. G. F. Wilson for collections has been awarded to: 1, Mr. H. F. Clough; 2, Mr. R. McK. Robson; 3, Mr. L.C. Dyer; 4, a special prize for a collection of fungi, Mr. J. W. McCaig.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

BUSH PLUM TREES.—L. G. W., Buckingham: We hope to publish an article on this subject in our next issue.

FAILURE OF PEACHES.—P. S., Swansea: After a careful examination of the fruits sent, and their stones, the conclusion arrived at is that the particular tree has some constitutional failing that will not give way to treatment. Your success with other trees in the same house also points to this conclusion, and we advise you to root out the tree, and, if possible, put in its place one of proved excellence from the wall outside. If the work is done at once there should be no loss of crop next year, especially if the house is shaded for a week after planting and the tree is syringed daily until the leaves fall.

EARWIGS.—W. C., Wadhurst: Earwigs may do a great deal of damage to dahlias, chrysanthemums, peaches, nectarines, etc., by biting the leafage, flower buds, or fruits, as the case may be. Trap them with hollow bean stems, pieces of hollow cane, or inverted pots partly filled with dry hay or moss.

SCALE ON GOOSEBERRIES.—O. H., Bury St. Edmunds: The best means of destroying or controlling such an insidious pest as the gooseberry and currant scale is to spray the bushes with a caustic solution early in February. The annual pruning and the removal of old interlacing branches should take place before spraying is done. A suitable caustic wash for the scale is composed of sulphate of iron ½lb., lime ¼lb., caustic soda 2lb., paraffin 5 pints, and enough water to make up ten gallons of mixture. The wash should be prepared as follows: (1) dissolve the sulphate of iron in about 9 gallons of water; (2) slake the lime in a little water, and then add more water to make a milky solution; (3) add "2" to "1," passing it through a piece of canvas so as to keep back any grit; (4) churn the paraffin into the mixture; (5) add the caustic soda, in powdered condition, just before the mixture is to be used.

PROPAGATING VIOLAS.—G. S., Southampton: Go ahead with the work at once. Cuttings should be plentiful now, and they strike root very readily at this season. Add a goodly proportion of road grit to the soil.

SINGLE - STEMMED MICHAELMAS DAISIES.—S. W. H., Gloucester: We entirely agree with you that many of the Michaelmas daisies or perennial asters are charming when grown as single-stemmed specimens, especially the more graceful and elegant varieties of the cordifolius and similar groups. It is a quite easy matter to accomplish, and a very economical way of proceeding is to lift a clump or two of each variety you propose to treat in this way soon after they have flowered; carefully pull the clump to pieces and pot each single growth that has roots attached in a 60-sized pot of good and fairly substantial soil. Plunge the pots to their rim in ashes in a rough frame where a little protection can be given in very severe weather. This will permit you to clear the border entirely and trench and manure it for the reception of a general collection of herbaceous plants. The plants in the pots should be set out where they are to flower in early April. A few may be potted in larger pots, and again plunged out of doors; and if they do not suffer from want of moisture, and are given liquid manure occasionally when the pots are full of roots, then they will provide some pretty specimens for conservatory decoration, or for grouping in connection with house parties and harvest festivals.

SOLANUM NIGRUM.—A. M., Cromer: An interesting account of the solanine in Solanum nigrum berries, and the conditions under which the fruits might possibly be non-poisonous when cooked, is given in our issue of October 9, 1909.

GREENING OF SEED POTATOES.—C. G. O., Saxmundham: A year or more ago a series of experiments was concluded at Kew on behalf of the Board of Agriculture, and those proved conclusively that the greening of seed potatoes was followed by many advantages to the grower. The cleverest growers have for many years advocated and followed the practice of greening their seed potatoes by exposing them to the light for a greater or less period. Many growers believe in selecting and greening their seed potatoes as soon as the crop is lifted; others keep their seed potatoes always exposed to light during the winter; while all are agreed that it is necessary to "up end" and expose the seed tubers to light early in the new year, so that the sprouts shall be strong and sturdy. In the report of the Kew experiments there appeared the following statement: The general opinion held at the present day is that it is essential to have a good, firm tuber that has not been partly exhausted by loss of moisture and continued formation of sprouts that are broken off when the tuber is planted. As the experiments indicate clearly, this result is better attained with "greened" seed than with seed not so treated. A potato not "greened" loses just over six times as much weight during the season as a potato of equal weight that has been "greened." A potato that is "greened" in spring loses twice as much in weight as a potato "greened" immediately after lifting in the autumn, other things being equal.

PRIMULA FORRESTI.—W. B., Leighton Buzzard: Primula Forresti is a Chinese species, discovered and introduced by Mr. E. Forrest when collecting for the Messrs. Bees, Lim. It has rich yellow flowers, and produces these freely, and is regarded as quite hardy. We described and figured the species in the Gardeners' Magazine of April 24, 1909, p. 325, on the occasion of its receipt of a first-class certificate from the Royal Horticultural Society.

NAMES OF PLANTS.

J. W., Glossop.—Athyrium filix fœmina Victoræ.

W. C., Wadhurst.—The flowers were badly smashed, but we think they represent Helenium striatum.

M. J. S., Hounslow.—1, Aster cordifolius; 2, Solidago altissima; 3, Cypripedium insigne; 4, Sedum spectabile.

F. R., Upminster.—1, Aira cæspitosa; 2, Begonia fuchsioides; 3, Linum trigynum; 4, not recognised, send when in flower.

T. H. B., Exeter.—1, Escallonia macrantha; 2, Vitis Coignettiæ; 3, Kochia scoparia; 4, Adiantum cuneatum grandiceps; 5, Stachys lanata.

D. B. D., Wellingborough.—1, Cattleya Trianæ; 2, Oncidium, not recognised from specimen sent; 3, Nephrolepis exaltata; 4, Adiantum gracillimum; 5, Adiantum fragrantissimum.

NAMES OF FRUIT.

G. N., Clitheroe.—Beurre Hardy.

A. J. G., Calne.—Your apple is American Mother.

G. B., Dublin.—The pears are: 1, Beurre Hardy; 2, Durondeau, and the apple Keswick Codlin.

No Name.—3, Beurre Diel, Marie Louise d'Uccle; 7, not recognised.

CATALOGUES RECEIVED.

KING'S ACRE NURSERIES, LIM., HEREFORD.—We have received two of the sectional catalogues issued by this firm; one is devoted entirely to roses, and the other to fruits, both are illustrated, the latter more freely than the former.

STEWART AND CO., 6, MELBOURNE PLACE, EDINBURGH.—A concise list of bulbs, flower roots, and sundries.

JOHN JEFFERIES AND SONS, LIM., CIRENCESTER.—A comprehensive and illustrated catalogue of roses, ornamental trees and shrubs and fruit and forest trees.

ALEX. DICKSON AND SONS, LIM., NEWTOWNARDS, CO. DOWN.—A very interesting descriptive and illustrated catalogue of roses. The "Hawlmark" novelties for 1910 are fully described, and there are coloured plates of four of them.

SOUPERT AND NOTTING, LUXEMBURG.—A freely illustrated and descriptive list of roses.

SHRUBS AND CONIFERS.

An extensive collection of Coniferæ and Deciduous and Evergreen Shrubs, bushy and well rooted plants in all sizes, also an immense stock of Yews, up to 6 feet in height, specially prepared for hedge planting.

STOVE AND GREENHOUSE PLANTS.

An extensive stock of Palms, Climbers and Decorative Plants generally, and also a large quantity of well grown Autumn and Winter Flowering plants.

FORCING PLANTS, ETC.

The collection of Plants for Forcing is considered the finest in existence, and a great speciality is made of Azaleas, Deutzias, Lilacs, Wistarias, Guelder Rose, Staphylea, and many other varieties of plants for forcing purposes. Large quantities of Plants and Roots can be supplied in retarded form, such as Lily of the Valley, Liliums, Azalea mollis, etc., for flowering at any season of the year.

ALPINE AND HERBACEOUS PLANTS.

An unique and up-to-date collection, including many GRAND NOVELTIES OFFERED FOR THE FIRST TIME. Nymphæas and other plants for the Aquatic, Bog, and Wild Garden being extensively grown.

HARDY CLIMBERS.

An immense quantity of Ivies, Honeysuckles, Wistaria, Ampelopsis, Clematis, Jasmines, etc., etc., in all sizes up to 10 feet high.

TREES.

A large and varied collection of Hardy Ornamental Trees; also grand stocks of Limes, Planes, Poplars, Elms, Sycamores, Birch, etc., grown singly, specially for Park and Avenue Planting.

CARNATIONS.

The finest stocks of Malmaisons, Tree or Winter Flowering and Border Varieties, in strong, clean, and healthy plants; also large collection of Pinks, Cloves, etc.

LANDSCAPE GARDENING AND PLANTING.

Plans and Estimates may be had for the Laying-out and Planting of New, or the Renovating of Existing Gardens in any part of the Kingdom.

SEED AND BULB DEPARTMENTS.

Special attention is given to the selection of the finest produce of the Dutch, French, American, and other growers, and being probably the largest importers in this country we are in a position to offer the finest quality Bulbs upon special terms. Every care is taken in the saving and selection of Seeds.

NOTE OF THE WEEK.

Human versus Natural Selection.

In considering the problems of that natural selection which underlies the evolution of organic life, and has led up to the wonderful diversity in the midst of which we now exist, there is always a tendency to draw a hard and fast line between it and that selection which is induced by man. Properly speaking, however, no line should be drawn, for man himself is as natural an outcome of evolution as any of the others, and the wonderful results which he produces are simply due to the extra evolution of his intellect, and his consequent greater power of comprehending and utilising natural laws. In Nature, it is entirely the law of the survival of the fittest, i.e., those most capable of surviving in the purely natural struggle for existence, which prevails. The reproduction, and consequent continuance of the race, is the main end in view, and all the contrivances which have been evolved have been developed to that end, viz., preservation of the individual, and security for a succession. Man, however, has other objects in view besides this, and probably the great majority of these objects tend rather to frustrate than to aid such survival under unassisted conditions. To counteract this, with the evolution of flowers, fruit, cereals, and other vegetable products of value, there has been simultaneously evolved the knowledge of manures, the construction of greenhouses and other protective contrivances, the study of temperature, and a thousand and one other interacting factors in development, without which there is no doubt whatever the great bulk of our horticultural and agricultural acquisitions would either die out or revert with greater or less rapidity to the original unsophisticated types or forms but little differing therefrom. Naturally, it is no advantage to the rose to be diverted from the robust and vigorous simplicity of the single wild type to the comparatively huge double forms, in which the great bulk of Nature's most precious product, the all-essential seed, is largely, or perhaps entirely, suppressed, or, where existent, is so pervaded by the conflicting tendencies of mixed ancestors as to be quite incapable of true reproduction of the parental type, and possibly only owes its vitality to a persistence of the old wild blood of the briar, which it will do its level best to reproduce, abjuring in this fashion the unnatural interference of man. Man, in pursuing selection, does so, as a rule, on perfectly arbitrary lines from Nature's point of view. His aim is to satisfy the eye with brilliant and delicate hues displayed as conspicuously and gracefully as possible, and allied with forms as attractive as he can conceive them, or to satisfy the palate by added sweetness and abundance of luscious pulp, and so long as he achieves this end he is quite content to propagate by cuttings or other asexual methods, and even in many cases regards the seeds as a nuisance which it is a merit to reduce to a minimum, or even a nullity. In the cereals, it is true, the precious seed comes to the front, but it is mainly because it happens to form his "staff of life" that he devotes so much of his energies to the improvement of it in size and yield. So far as Nature is concerned, the small original grass seed is equally valuable, and equally well plays its fundamental rôle of race continuance as the fat bloated grain of the finest pedigree wheat. It is, however, in the direction of hybridisation that man departs the farthest from Nature's course. She has invented a myriad subtle contrivances to prevent the world from being peopled with an infinity of mongrels. Difference of construction, subtle antipathies, and a thousand and one incompatibilities between race and race keep them from intermingling, and by so doing have secured the definition of innumerable orders, genera, and species of both plants and animals, and indubitably led up to the evolution of man himself, who could not conceivably have become differentiated and elevated had such barriers as we have alluded to been non-existent. Divergent, however, as is man's procedure in selection from that of Nature, he must, as we have said, be regarded as a natural factor. In Nature, there are other living selective agencies which, like him, select on purely selfish lines, the fertilising moths and bees to wit, to whom we owe our wild floral wealth, have performed their office solely for the love of nectar, and if he differs from these involuntary agents by the possession of a brain which enables him to work to definite ends, this brain is, after all, but another link in the general evolutionary chain, and is only differentiated by its unique development.

MR. F. DENNISON.

Mr. F. Dennison, of Cranford, Leamington, marches in the forefront of that army of clever and enthusiastic cultivators which owes allegiance to the Queen of Flowers. He is an ardent rosarian, and has for many years taken a very active part in the work of the National Rose Society, having a seat on its Council. He has been successful in winning a large number of prizes with roses at various exhibitions, but his ambition has been to win the Amateur Championship. However, he is not able to compete with Mr. Lindsell and the Rev. J. H. Pemberton in the leading amateurs' class at the metropolitan exhibition of the N.R.S., because the date is usually too early for him. But at the society's provincial show he invariably gives a good account of himself; and at Salisbury, in July last, he achieved one success for which he has made many bids, by winning the Provincial Amateur Championship and securing the Jubilee Trophy with a splendid lot of blooms, that was well ahead of the sets staged by other competitors, including even Mr. Lindsell, who had to be content with second place. In his set of flowers a bloom of C. J. Grahame was awarded the silver medal as the best amateur's H.T. rose in the show.

Dahlias and Chrysanthemums at the Wisley Trials, 1910.—A sub-committee of the Royal Horticultural Society visited the Wisley Gardens on September 15, and recommended Awards of Merit, which have been confirmed by the council, for the following: Chrysanthemums.—To Messrs. Wells and Co., of Merstham, for Elaine; to Messrs. Dobbie and Co., of Rothesay, for Abercorn Beauty, Flora, Miss Balfour Melville, Mr. Selby, Nina Blick, and Leslie. Dahlias.—To Messrs. Hobbies, Lim., Dereham, for Grenadier; to Mr. Pfitzer, Stuttgart, for Hohenstanfen; and to Messrs. Bakers, Codsall, for S. T. Wright. The sub-committee also visited the Wisley Gardens on September 29, and recommended Awards of Merit, which were confirmed by the council on October 12, for the following chrysanthemums: To Messrs. Dobbie and Co., of Rothesay, for Diana, Market White, Mrs. A. Thompson, Polly, Tapis de Neige, Fee Japonaise, Perle Chatillionaise, and Provence; to Messrs. Wells and Co., of Merstham, for Diana, Cecil Wells, and Gatton.

Proposed North of England Horticultural Society. An important meeting has been arranged for the discussion of a proposal to establish a North of England Horticultural Society, with headquarters at Leeds. This is to take place in the Town Hall, Leeds, on Tuesday, October 25, at 3 p.m., when the Lord Mayor, W. Penrose Green, Esq., will preside. All who are specially interested in this movement are invited to attend the meeting.

Fruit Congress at Hexham.—In our issue of October 29 we shall give a descriptive and illustrated account of the Fruit Show and Congress held at Hexham from October 20 to October 22. This exhibition and congress, designed to emphasise the importance of hardy fruit culture in the Northern Counties, is one of the most important meetings of its kind held during recent years, and we have, therefore, made special arrangements to record the proceedings.

Distribution of Plants from the Royal Parks and Gardens.—The surplus bedding plants that are available when the beds in the Royal Parks are cleared this autumn ready for bulbs and other spring-flowering subjects, will be distributed among the poor inhabitants of London. Clergy, school committees, and others interested are requested to make application at once to the superintendent of the park nearest their respective parishes, so that early intimation of the number of plants allotted to each applicant, and the manner of their distribution, may be given. The plants will be distributed from Hyde Park, Regent's Park, and Hampton Court Gardens.

A Fine Lilium.—During the past week there has been on view in a Stoke Newington shop a splendid example of Lilium speciosum rubrum, bearing five spikes and an aggregate of 110 flowers and buds. The bulb was purchased for 1s., and was cultivated in a Stoke Newington home.

Value of Cross-fertilisation in Apples.—Experiments made at the Oregon Agricultural College go to show that many apples cannot be fertilised with their own pollen. It was found that out of 87 varieties of apples no fewer than 59 were self-sterile, while 15 were self-fertile, and 13 partially self-fertile. The sterility or fertility of a variety may be influenced by climate, hence the need of careful examination and experiment in every locality. The varieties of apples found to be self-sterile, i.e., needing cross-pollination, at Oregon, were Bottle Greening, Canada Reinette, Gravenstein, Holland Pippin, Jonathan, King of Tompkins County, Monmouth Pippin, Rhode Island Greening, Summer Pearmain, Twenty Ounce, Winesap, and York Imperial. Among self-fertile varieties were Baldwin, Keswick Codlin, Duchess of Oldenburg, White Pippin, and Yellow Newtown, and among partially self-fertile varieties were Ben Davis and Canada Red.

Potatoes Resistant to Wart Disease.—Recognising that it is practically impossible for cottage gardeners and allotment holders to avoid planting potatoes on plots previously occupied by the crop, even though the latter was badly affected by wart disease, the Board of Agriculture arranged for experiments to be made for the purpose of ascertaining whether any potatoes were sufficiently disease resistant to produce good crops of sound tubers on infected land. In 1909 the experiments were conducted at five places, and the varieties, Langworthy, What's Wanted, Golden Wonder, Sutton's Abundance, and Findlay's Conquest, were found to resist the disease. During the present year, the experiments were conducted on land infected with wart disease at five centres. At the Holmes Chapel College the land was very badly infected, and only two varieties were entirely free from the disease, viz., Sutton's Discovery and Golden Wonder, though Langworthy and What's Wanted were but very slightly attacked. At the other centres results in conformity with those of 1909 were obtained. Findlay's Conquest, Golden Wonder, and Langworthy were planted at four places; Snowdrop and Sutton's Abundance at three places; and What's Wanted at one, and in all cases they showed no trace of wart disease. Other varieties that were grown at from one to four places and were not attacked were: Early Varieties.—Aberlady Early, Southern Queen, Southern Star; Second Earlies.—Favourite, St. Malo Kidney, Supreme; Maincrop.—Champion, Chiswick Favourite, Crofter, Laird, Prolific, Provost, Reading Giant, Rector, Schoolmaster, White City, and Peacemaker. Millcross Early was free from disease at two centres. Snowdrop was this year planted at three centres, at two of them on duplicate plots, and was not affected, although at Holmes Chapel, where but few varieties escaped, it was attacked.

Area under Potatoes in Great Britain. The area under potatoes this year in Great Britain is 35,777 acres less than in the previous year, or a reduction of about 6.2 per cent. This, together with the prospect of bad-keeping qualities in the crops harvested, further confirms the opinion that potatoes will be dear before the end of the winter.

Royal Horticultural Society's Trials at Wisley, 1911-12.—The Royal Horticultural Society have arranged for trials of the following subjects to be made at Wisley in 1911-12. Everything sent for trial must be named, and the name and address of the sender attached. Fruit.—Strawberries and raspberries, autumn fruiting; these trials will be continued. Flowers.—Fuchsias for bedding and for the conservatory; two plants of each to be sent in early March. Begonias (fibrous), including summer and winter flowering, and bedding varieties; two plants of each to be sent in March. Delphiniums, two plants of each in February. Dahlias (decorative), introduced into commerce since January 1, 1908; two plants of each in May. Primulas (hardy), for borders and rock work; three plants of each in February. Vegetables.—Carrots, half ounce of each early in February. Cucumbers, six seeds of each in February. Peas, half-pint of each early in February. Cabbages, savoy, one packet of seed of each in March. Potatoes, midseason and late; each variety must be labelled as being "midseason" or "late"; twenty tubers of each to be sent by February. If sent by post the address should be: The Superintendent, R.H.S. Gardens, Wisley, Ripley, Surrey. If sent by rail: The Superintendent, R.H.S. Gardens, Wisley, Horsley Station, L. and S.W.R., with advice by post to the superintendent.

The King and Irish Horticulture.—It is with very great pleasure we learn that his Majesty the King has graciously consented to become a patron of the Royal Horticultural Society of Ireland.

Fruit Growing in County Down.—Mr. Walter Smyth, of Belfast, writes: "In your issue of September 24 your reference to fruit growing in Ulster was very instructive, and for those interested in the subject I now send you a list of the apples which are most satisfactory in County Down. The ground is on a hill, and is gravelly, with a clay subsoil. We have found Lane's Prince Albert a most reliable constant bearer, one tree has not missed cropping for eight years. Next comes Bramley's Seedling, then Grenadier and James Welsh, and then Lord Grosvenor and Duchess of Oldenburgh. Cox's Orange Pippin is not reliable, the fruit being hard and scanty. Instead, I would recommend Allington Pippin, which gives large crops of fine fruit. I have found Hessle Pear and Victoria Plum satisfactory, and on a wall the Jargonelle pear comes to perfection. The trees grown on cultivated ground, as compared with grass land, have the largest crops and the largest fruit, 30 going to a stone, against 40 on grass lands."

The Hampton Court Vine.—A large number of the two hundred bunches of fine Black Hamburgh grapes produced this year by the famous old vine at Hampton Court have been distributed among the London hospitals, by the direction of his Majesty the King.

Ipomæa rubro-cærulea at Walmsgate. — Mr. Thomas Smith writes: Your correspondent's note on page 731 regarding Ipomæa rubro-cœrulea reminds me of the fine display it produced at Walmsgate this season. Raised from seed sown in February under glass, subsequently potted in a light soil, and eventually planted out at the foot of a low wall having a south aspect, the plants made marvellous growth, the bine extending some 15 feet along the wall top. The maximum point was reached by the first week of September, when I counted 50 fully-developed flowers open at one time. At its best, the colour is one of those shades of blue that appear too delicate for our English summers; as its purity is entirely dependent upon warmth and abundant sunshine for the transition from purple and magenta up to the point when the colour is faultless is extremely rapid, so that within the space of a few hours each stage can be clearly observed. Nevertheless, it is an annual climber that well merits a position in the garden, as, succeeding with it, we introduce an interest that is quickly noted and duly appreciated. It is a plant for favoured gardens and favoured positions and under these conditions we may generally regard its flowering as a certainty.

Colonial Fruit Show.—We are informed that the Colonial Fruit Show, to be held at the Royal Horticultural Hall, Westminster, on December 1, 2, and 3, will be opened by Sir Edward Grey, the Secretary of State for Foreign Affairs.

GREAT EXHIBITION OF BRITISH-GROWN FRUIT.

On October 13 and 14 there was a remarkable exhibition of British-grown fruit at the Royal Horticultural Hall, Westminster. There was such a grand display of splendid produce that it seemed to give the lie to the general assertion that fruits, especially apples and pears, are a small crop his year. The truth, of course, is, that in a year when the crops are moderate or thin, the fruits that do develop are able to do so without the severe competition that would exist in the year of full crops. Then, too, the splendid weather of late September and early October added materially to the size and colour of the fruits, so that the quality of the apples and pears displayed at Vincent Square was very high. There have been finer exhibitions and a larger competition, but, all things considered, the show of 1910 must be regarded as a remarkable one, and evidence of the skill of our cultivators under trying conditions. The outstanding feature of the exhibition was the high quality of the apples, for, although pears and plums were good, and so, too, were some of the grapes, these have been better shown on other occasions. There was a good attendance on the opening day, but the visitors were very largely composed of gardeners, market growers, salesmen, and others directly interested in the production and distribution of fruits. Ladies and society folk were chiefly noticeable by their absence—to use an Irishism.

CHOICE FRUITS.

There were two entrants in the class for a collection of nine dishes of ripe dessert fruit, to consist of at least six kinds, and here the silver cup and first prize fell to Mr. T. Pateman, gardener to C. A. Cain, Esq., The Node, Welwyn, Herts, for nicely-coloured Muscat of Alexandria and Alicante grapes, Hero of Lockinge melon, Pitmaston Duchess and Beurre d'Amanlis pears, Cox's Orange Pippin and Duchess's Favourite apples, Lady Palmerston peaches, and Coe's Golden Drop plums, Mr. S. Neal, gardener to J. A. Nix, Esq., Tilgate, Crawley, Sussex, second, his dishes of Doyenne du Comice pears and Nectarine peaches being very good. Neither collection was of extraordinary merit.

The best collection of six dishes of ripe dessert fruits, pines excluded, came from Mr. W. H. Cooke, gardener to Lord Belper, Kingston Hall, Derby, who had very fine bunches of Gros Colmar and well-finished Muscat of Alexandria grapes, Eminence melon, and excellent examples of Doyenne du Comice pears, Cox's Orange Pippin apples, and Gladstone peaches; Mr. S. Barker, gardener to the Duke of Newcastle, Clumber, Worksop, second, with well-finished Madresfield Court grapes, and a fine dish of Pitmaston Duchess pears; Mr. T. W. Birkinshaw, gardener to Sir C. E. Hamilton, Bart., Hatley Park, Sandy, and Mr. G. Richardson, gardener to H. St. Maur, Esq., Newton Abbot, were awarded equal third prizes.

GRAPES.

Only a second prize was awarded to Mr. H. Cornish, gardener to A. Benson, Esq., Upper Gatton Park, Merstham, Surrey, for his collection of four varieties of grapes, two bunches of each; he was the only exhibitor in the class, and his varieties were Madresfield Court, Muscat of Alexandria, Mrs. Pearson, and Mrs. Pince. Mr. J. Shelton, gardener to Lord Hillingdon, Sevenoaks, had the best pair of bunches of Black Hamburgh, Mr. E. Neal coming second. Mr. Shelton also scored for Mrs. Pince with shapely clusters; Mr. G. Richardson, second.

Out of six competitors, Mr. S. Barker scored for a pair of bunches of Alicante, with large-berried and highly-coloured clusters; Mr. H. H. Brown, gardener to W. G. Raphael, Esq., Castle Hill, Englefield Green, second with big bunches, but small berried; Mr. W. Lintott, gardener to Sir Walpole Greenwell, Bart., Marden Park, Surrey, third.

Mr. Barker also scored for Madresfield Court, with medium bunches of fine berries; Mr. W. H. Cooke, second; and Mr. J. Kidd, gardener to G. Miller, Esq., Newberries, Radlett, Herts, third; five entries. Mr. J. Gibson, gardener to the Duke of Portland, Welbeck Abbey, was the only exhibitor of Prince of Wales, and was deservedly awarded the first prize for well-set bunches. In the "any other black" class, Mr. S. Barker scored with huge bunches of Gros Guillaume; Mr. T. Pateman second with Appley Towers.

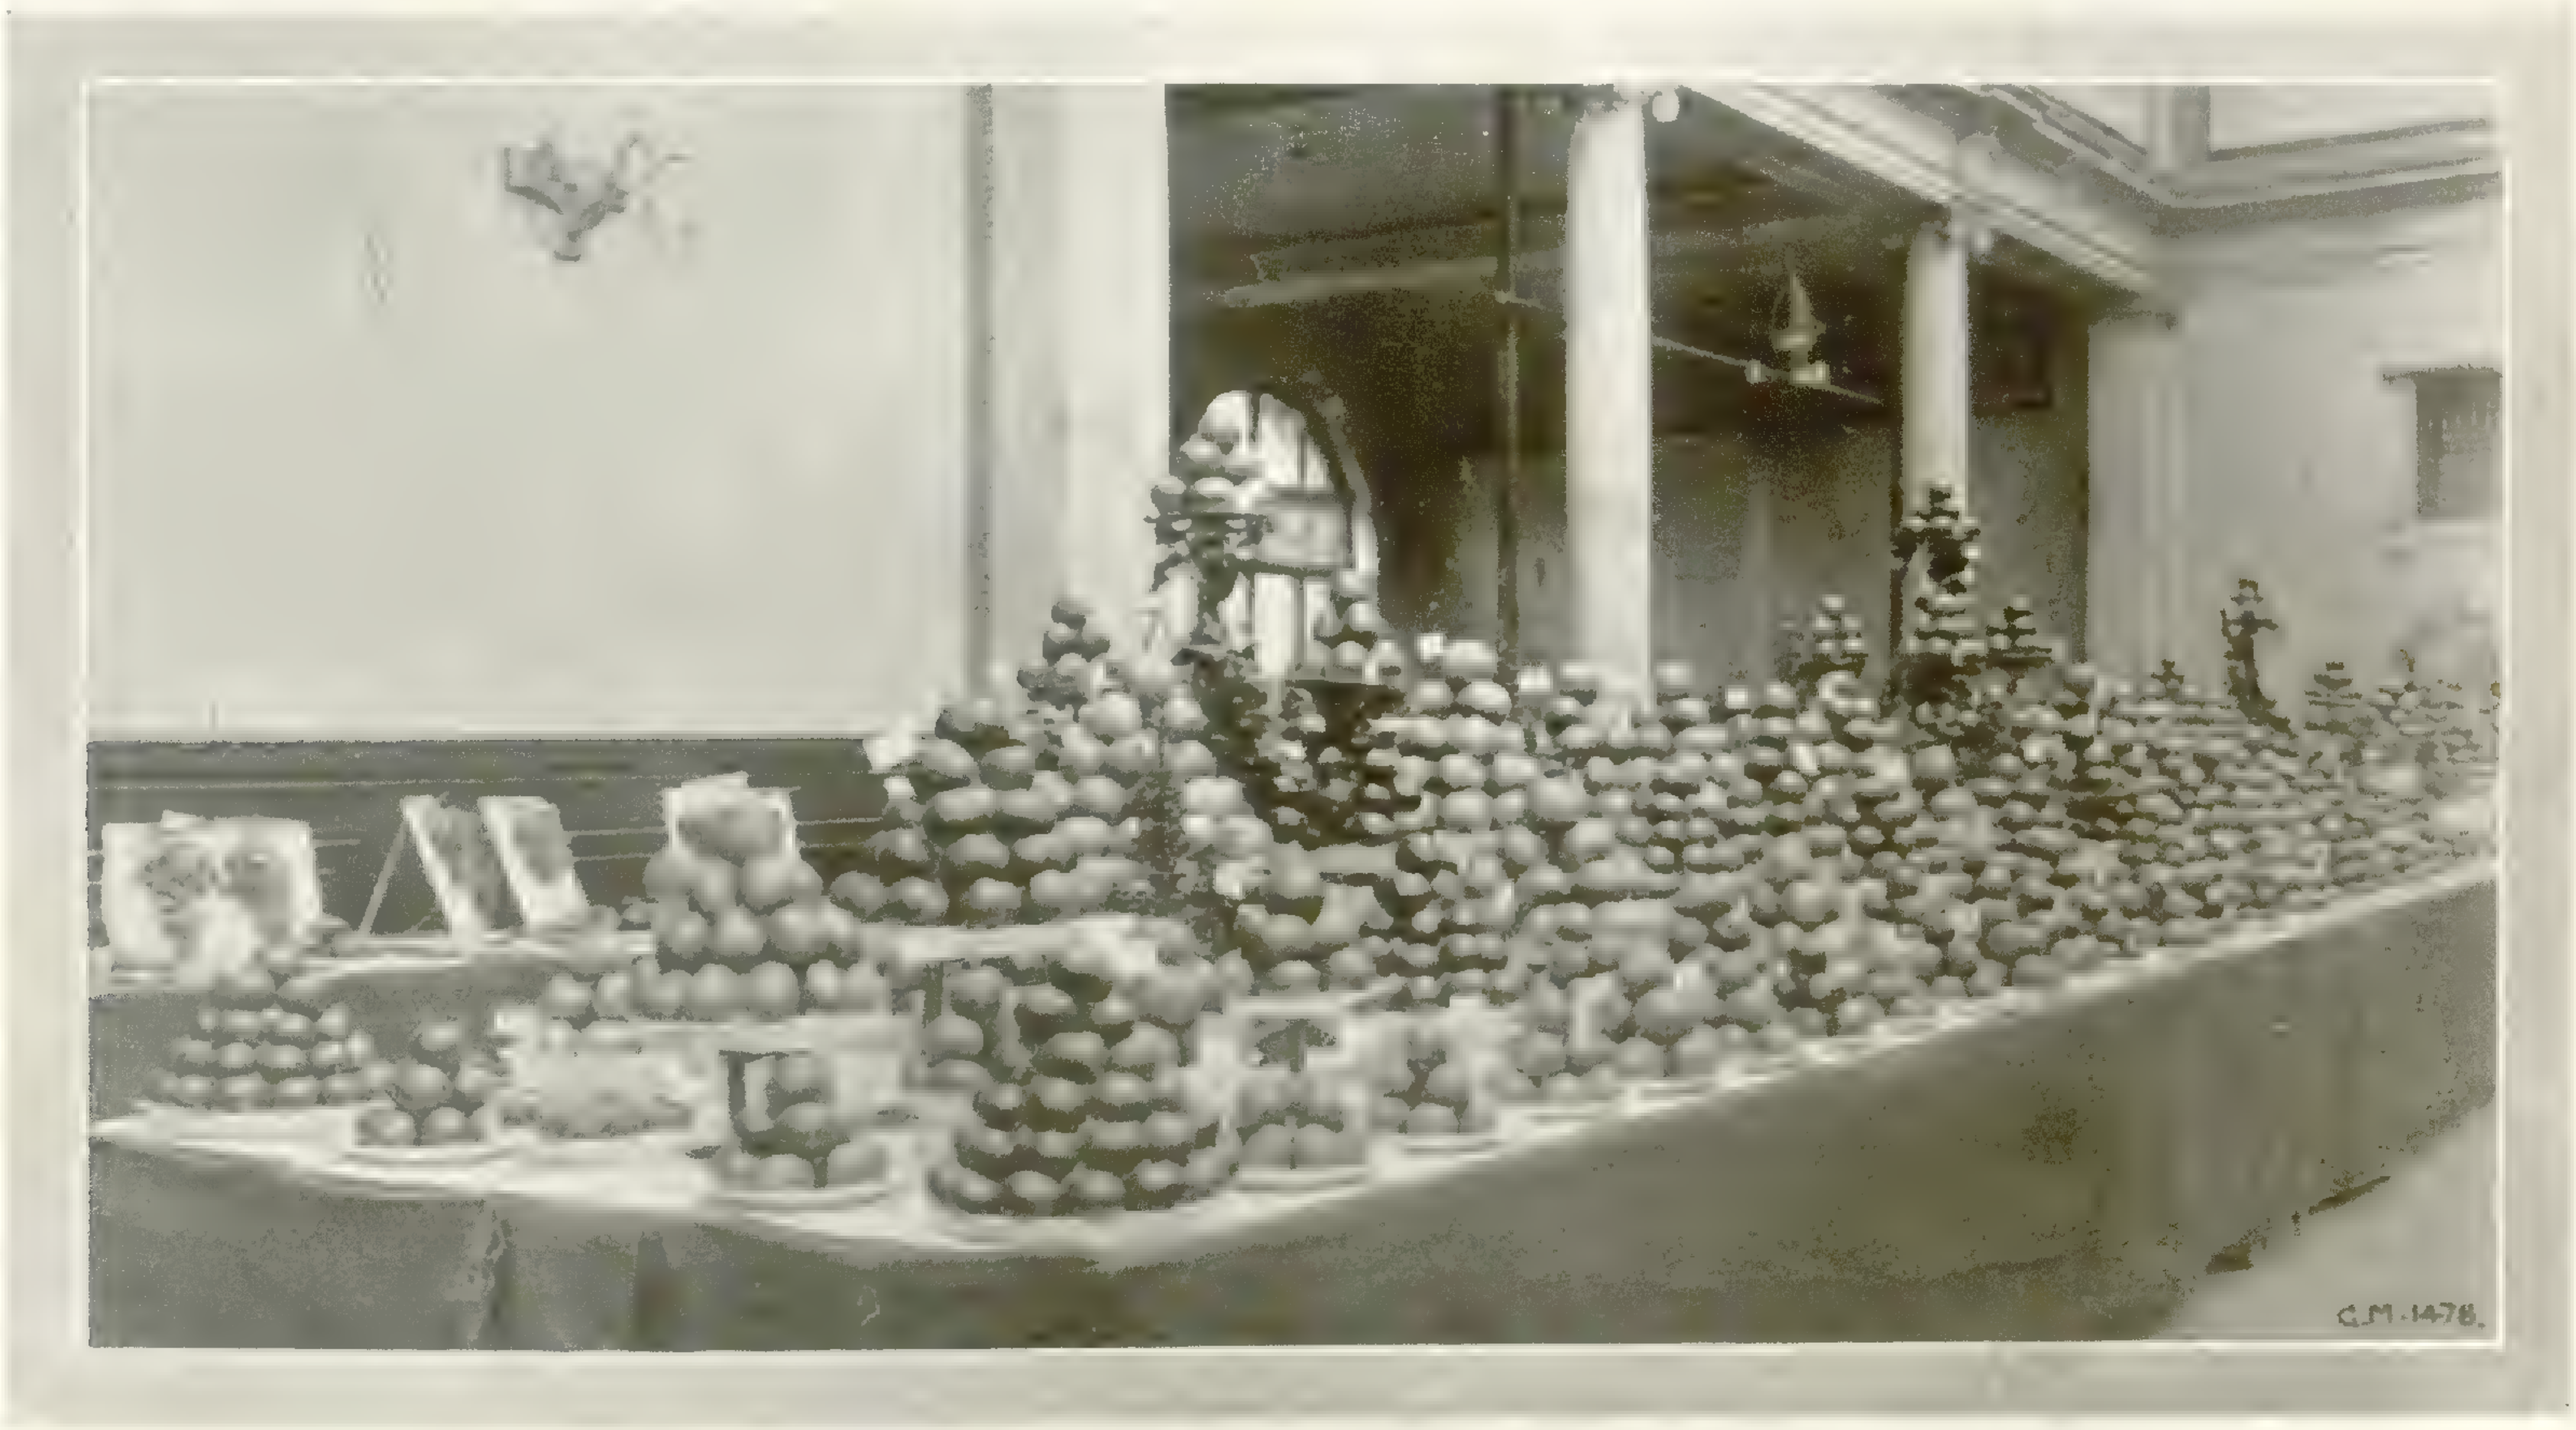
Mr. W. D. Pope, gardener to L. G. Pike, Esq., Wareham, Dorset, led for a pair of bunches of Muscat of Alexandria with fine clusters, admirably finished; Mr. T. Kidd, second; and Mr. H. Cornish, third; seven competitors. For any other white grape, Mr. Birkinshaw was first and Mr. Hyde, Norwood Hall, Sheffield, was placed second with Foster's Seedling, and Mr. Cornish third with Mrs. Pearson. Mr. W. Hyde, Norwood Hall, Sheffield, was given a second prize in the Frontignan class for narrow bunches of shrivelled berries of (possibly) Dr. Hogg.

COLLECTION OF HARDY FRUITS.

Mr. J. Whittle, Cheveney, Kent, scored for a collection of hardy fruits arranged on a space 12ft. by 3ft., and all grown out of doors. He had a very weighty set of cooking apples, good dishes of Allington Pippin and Cox's Orange Pippin apples, Conseiller de la Cour and Durondeau pears, Sea Eagle, Princess of Wales, and Walburton Admirable peaches, damsons, cobnuts, walnuts, blackberries, and quinces; Mr. F. Cornford, gardener to Major Powell Cotton, Quex Park, Thanet, second; and Mr. W. H. Bacon, gardener to Sir Marcus Samuel, Bart., Maidstone, third, the latter showing several dishes of plums, St. Joseph strawberries, figs, and raspberries.

NURSERYMEN'S GROUPS.

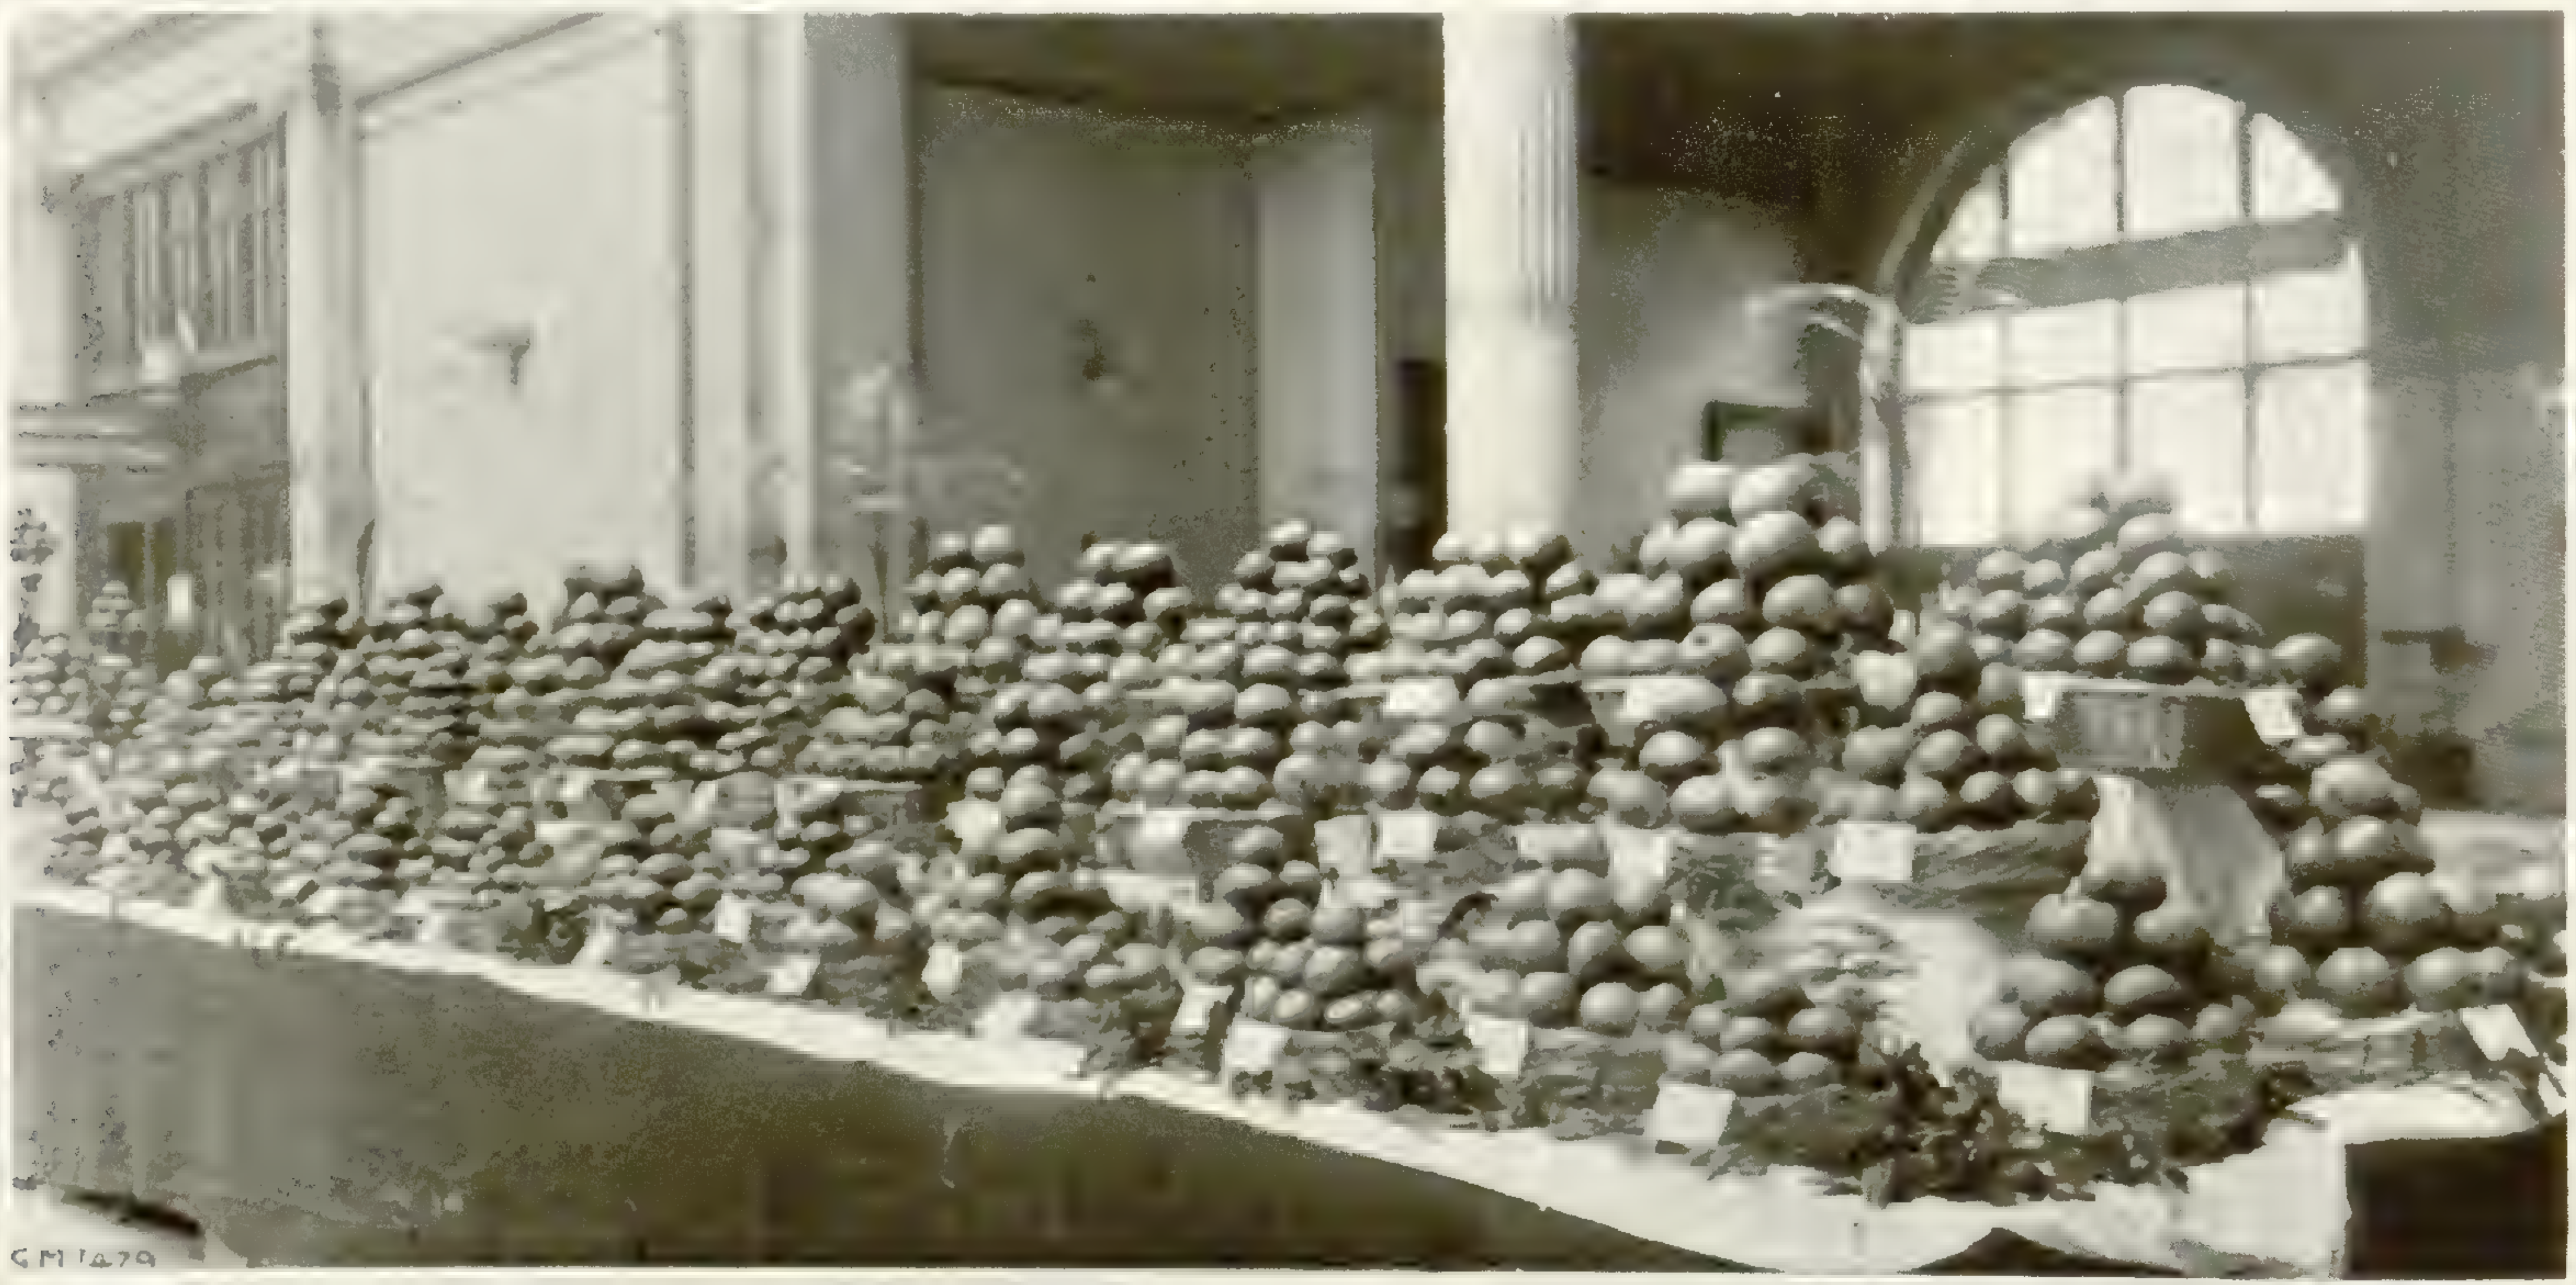
For a collection of fruit, to be grown entirely out of doors, arranged on a space 30ft. by 6ft., Messrs. G. Bunyard and Co., Lim., Maidstone, once again secured the premier position, and did so with a fine collection of about a hundred and forty varieties of apples and pears. The arrangement was excellent, three stands of highly-coloured apples being raised well above the rest of the group. Leading varieties were Newton Wonder, Gascoigne's Scarlet, Lane's Prince Albert, Golden Noble, Blenheim Pippin, Royal Jubilee, The Queen, Hollandbury, Brownlees Russet, Allington Pippin, Bramley's Seedling, Warner's King, Foster's Seedling, Brabant Bellefleur, Lord Derby, James Grieve, Bismarck, and Gold Medal



R.H.S. FRUIT SHOW—FIRST PRIZE COLLECTION OF HARDY FRUITS.
Occupying thirty feet run of table. Exhibited by Messrs. G. Bunyard and Co.

apples. The King's Acre Nurseries, Lim., Hereford, secured second prize with a fine set of fruit, their Pott's Seedling, Lady Sudeley, Tyler's Kernel, Cox's Orange Pippin, Peasgood's Nonsuch, Charles Ross, Rival, Wealthy, and Allington Pippin apples, and Pitmaston Duchess pears being particularly good. The third prize was awarded to Messrs. H. Cannell and Sons, Swanley, who had a brightly-coloured set of fruits, nicely arranged; Messrs. J. Cheal and Sons, Crawley, fourth.

Messrs. Seabrook and Sons, Chelmsford, gained the chief horours in the class for hardy fruits arranged on a space 20ft. by 6ft., and they put up a remarkably fine lot of apples and pears, staging these in dishes and in large baskets: The Queen, Bismarck, Allington Pippin, Blenheim Orange, Royal Jubilee, Peasgood's Nonsuch, and Cox's Orange Pippin apples were very fine, as also were the samples of Marie Louise d'Uccle, Beurre Fouqueray, Emile d'Heyst, and Catillac pears; Mr. R. C. Notcutt, Woodbridge, Suffolk, gained the second award, and had some very big examples of the more popular culinary apples; Messrs. Laxton Brothers, Bedford, were third with well-selected bright fruits, very prettily arranged; Messrs. Spooner and Sons, Hounslow, fourth.



R.H.S. FRUIT SHOW—FIRST PRIZE COLLECTION OF FRUIT.
Occupying fifteen feet run of table. Exhibited by Messrs. Seabrook and Son.

Mr. Will Tayler, Osborn Nursery, Hampton, led in the class for hardy fruit arranged on a space 12ft. by 6ft., with some splendid apples and pears, rather flatly arranged: Allington Pippin, King of the Pippins, Lord Derby, Newton Wonder, and Annie Elizabeth were finely shown; Mr. H. T. Mason, Millcote, Hampton Hill, came second; Messrs. J. Peed and Sons, Norwood, third; and Messrs. R. Veitch and Son, Exeter, fourth, the latter having fine dishes of Christmas Pearmain and Coronation.

MARKET GROWERS.

Mr. A. Poupart, Marsh Farm, Twickenham, was easily first in the market growers' class for fruits arranged on a space 18ft. by 6ft., and he was awarded the medal of the Fruiterers' Company; he showed fine baskets of Wealthy, Norfolk Beauty, King of the Pippins, Peasgood's Nonsuch, Lane's Prince Albert, Rev. W. Wilks, Bismarck, Allington Pippin, Cox's Orange Pippin, Charles Ross, Bramley's Seedling, Chelmsford Wonder, and Washington apples, and Conference, Beurre Superfin, Durondeau, Pitmaston Duchess, and Louise Bonne of Jersey pears; Mr. Startup, manager to the Kentish Fruit Growers' Union, Maidstone, second, the fruits being staged in boxes.

The premier collection of fruit arranged on a space 12ft. by 6ft. was the one staged by Mr. W. Stowers, gardener to G. H. Dean, Esq., Whitehall, Sittingbourne, who had splendid baskets of Mère de Ménage, Peasgood's Nonsuch, Sandringham, Warner's King, Bramley's Seedling, Gloria Mundi, Stones', Charles Ross, Alfriston, Cox's Orange Pippin, and Houblon; Mr. H. T. Mason, Hampton Hill, a close second; Horticultural College, Swanley, third.

The class for a dozen dishes of apples, half to be dessert and half to be culinary varieties was a good one, and there were five competitors. First prize was awarded to Mr. R. A. Whiting, Dargate, Faversham, who had beautiful specimens of Peasgood's Nonsuch, Lord Derby, Warner's King, Stone's, Ribston Pippin, Emperor Alexander, Cox's Pomona, Rival, King of the Pippins, Charles Ross, Cox's Orange Pippin, and Allington Pippin; Mr. A. E. Mason, Hampton Hill, a capital second; and Miss Courtauld, Knight's Farm, Colne Engaine, Essex, third.

ORCHARD HOUSE FRUIT.

Two fine exhibits were forthcoming in the class for a collection of orchard house fruit and trees, each arranged on tabling 24ft. by 6ft. Messrs. T. Rivers and Son, Sawbridgeworth, were awarded the first prize for a grand lot of finely-fruited trees and superb picked fruits. Buckingham, Melon and King of Tompkin's County apples, Beurre Bosc, Doyenne du Comice, Conference, and Pitmaston Duchess pears, and President plums were splendid as pot trees, while among the picked fruits a few of the best dishes were Ribston Pippin, Jas. Grieve, Peasgood's Nonsuch, Cox's Orange Pippin, Chas. Ross, and Cox's Pomona apples, Late Orange, Grand Duke, President, and Coe's Golden Drop plums, and Conference, Beurre Alexandre Lucas, Pitmaston Duchess, and Magnate pears. Messrs. G. Bunyard and Co., Maidstone, came second, and they also contributed a grand lot of picked fruits, though their pot trees were not quite up to previous exhibits.

COLLECTIONS OF APPLES AND PEARS.

In the class for two dozen dishes of apples, grown entirely out of doors by amateurs, eight of the dishes to be dessert varieties, there were four competitors, the premier award falling to Mr. J. Whittle, gardener to Lieut.-Colonel A. C. Borton, Cheveney, Hunton, Herts, for a fine, clean set of Emperor Alexander, Lord Derby, Bismarck, Mère de Ménage, Belle Dubois, Peasgood's Nonsuch, Bramley's Seedling, Warner's King, Lane's Prince Albert, Newton Wonder, Hambling's Seedling, Belle Pontoise, Annie Elizabeth, Gascoigne's Scarlet, The Queen, Stone's, King of the Pippins, Melon Apple, Cox's Orange Pippin, Ribston Pippin, The Rival, Wealthy, Chas. Ross, and Allington Pippin; second prize fell to Mr. A. Carlisle, gardener to C. Gurney, Esq., Biggleswade; and third to Mr. W. A. Cook, gardener to Sir Edmund Loder, Bart., Leonardslee, Horsham.

For a dozen dishes of cooking apples, and six dishes of dessert varieties, the leading award fell to Mr. T. G. Gerrish, gardener to J. G. Williams, Esq., Pendley Manor, Tring, for a clean, even set, in which the leading dishes were Tyler's Kernel, Cox's Orange Pippin, Chas. Ross, Rival, Warner's King, and Newton Wonder; Mr. G. H. Bacon, gardener to Sir Marcus Samuel, Bart., Mote Park, Maidstone, second; and Mr. T. Cornford, gardener to Major Powell Cotton, Quex Park, Thanet, third; four entries. Mr. A. Basile, Woburn Park Gardens, Weybridge, led for eight dishes of cooking, and four dishes of dessert apples, with a splendid set; Mr. E. Neal, second.

There were five entries in the class for six dishes of culinary apples, and here Mr. J. Whittle scored with very weighty clean fruits of Peasgood's Nonsuch, Lord Derby, Warner's King, Mère de Ménage, Lane's Prince Albert, and Bismarck; Mr. A. Carlisle, gardener to C. Gurney, Esq., Henlow Grange, Biggleswade, second. Mr. J. Whittle also scored for six dishes of dessert apples, his very even, bright set consisting of Wealthy, Allington Pippin, King of the Pippins, Christmas Pearmain, Cox's Orange Pippin, and Calville Rouge Precoce; Mr. A. Carlisle second; five entries.

Mr. W. H. Bacon won the Hogg Medal and first prize for the best collection of eighteen dishes of pears, scoring with a beautiful set of Conference, Marguerite Marillat, Beurre Baltet Père, Pitmaston Duchess, Marie Benoist, Beurre Bosc, Doyenne Boussoch, Durondeau, Triomphe de Vienne, Fondante du Thirriott, Directeur Hardy, Beurre Fouqueray, Doyenne du Comice, Marie Louise, Princess, Beurre Hardy, Beurre Superfin, and Louise Bonne of Jersey; Mr. W. J. Finch, gardener to F. A. White, Esq., East Grinstead, second, and Mr. J. Whittle third; five entries. Mr. Basile scored for a dozen dishes of pears, and he had noble specimens of Chas. Ernest, Durondeau, and Duchess d'Angoulême; Mr. F. Cornford, second; and Mr. G. Mackinlay, gardener to the American Ambassador, Wrest Park, Ampthill, Beds, third.

(Continued on page 837.)

PLANNING AND MAKING A HERBACEOUS BORDER.

Of the many phases of gardening none is of greater interest than a well-situated and properly-managed herbaceous border. For nine months of the year flowers are produced, affording much interest to lovers of hardy plants. It is a moot point among many persons as to what constitutes a herbaceous plant; sufficient for my purpose to say that "plants which make an annual growth from the base, flower, and die down," is not a bad definition.

In planning a border there is no reason why we should strictly adhere to any one idea. Grow what is the most suitable for the site, and for personal requirement and taste, is the advice I give. The most effective method of planning is that of a combination of hardy subjects—not shrubs—annuals, and half-hardy plants, as the latter should be added at any time to suit convenience and to fill gaps, thus obtaining a continuation of flowers, or a mass, at a particular season, as required. In fact, there seems to be no limit as to what can be grown in a herbaceous border when we remember how effective sweet peas, rambler roses, and Michaelmas daisies are when judiciously arranged, not to mention summer-flowering chrysanthemums, and the various dahlias, all, happily, improved in the matter of variety in each section.

THE HERBACEOUS BORDER AT SUTTON PLACE, GUILDFORD,
The residence of Lord and Lady Northcliffe.

The advantage of a good herbaceous border for providing quantities of flowers for room decoration is now so well understood that I do not intend taking up valuable space with this phase of the subject, but I would say, in passing, that much might yet be done to make the herbaceous border more interesting, showy, and useful during the earlier months of the year, before there are many of the regular occupants in flower, by the aid of bulbous plants, as narcissus and tulips. It is surprising how well bulbs succeed, even at the back of the border, giving quantities of flowers in April.

The most suitable site for a border must be decided on the spot, as so many considerations have to be thought of. Room on each side of a central path in the kitchen garden is often chosen. Wherever the border is to be, some consideration should be given to its width. Twelve feet wide affords much the best opportunity for effective planting; a border less than six feet wide does not convey a good idea of the true value of herbaceous plants, although, from a utilitarian point of view, such a border has its value. In any case, the site should be quite an open one, away from overhanging trees or tall hedges, as the former rob the plants of their due share of light, while the latter deprive the roots of nutriment.

Hedges, evergreen or otherwise, may provide a good background for the plants in flower, or give protection from winds, but it is surprising what a source of trouble the roots are as they ramble over much of the border in search of food. There are two remedies available for this encroachment: Repeated trenching of the border, thus severing all roots at a given distance from the hedge; and the other remedy is the making of a narrow concrete wall a little distance from the hedge in such a manner that the roots cannot go beyond it. In the arrangement of a site it sometimes happens that a hedge, or screen, is required at the back of the border. The most easily made hedge is one of rambler roses, mainly of the Wichuraiana type, but if other varieties are employed, such as Crimson Rambler, Félicité Perpétue, Euphrosyne, and Aglaia, for example, an earlier crop of flower is assured, and this before the ordinary occupants of the border are in blossom. The most simple supports for the roses are larch tops, eight feet long, cut with the spurs on where available. These, made fast in the ground, two feet apart, make a useful, as well as a rustic-looking, support for the roses.

The preparation of the border is an important item in its future success. No matter the kind of soil, deep digging or trenching is imperative, especially where the soil is of a heavy retentive nature with a waterlogged base. It should be trenched three feet deep, the bottom soil being left in its original position, but worked so as to assure the quick percolation of water away from the roots, and for the warming of the soil by the admission of air. Manure is an important item in the successful culture of herbaceous plants. Such subjects as helianthus, phloxes, and solidagos are gross feeders, and cannot make satisfactory growth without aid, and if stout shoots are not forthcoming full-sized blossoms cannot be expected. For stiff soil manure from the stable is the best, and, if somewhat long, it has the advantage of assisting the porosity of the soil, which is important. In trenching, manure should be added to every layer of soil, and in time, when the border requires replanting, as it will do, the soil, when turned over again, will be thoroughly incorporated with the manure. Where the soil is of a sandy character, it does not need trenching so deeply, but manure from the cow house, if possible, should be added freely. For all kinds of soil a compost of decayed vegetable refuse, leaf-mould, wood ashes, and old potting soil is an excellent addition. If a three-inch covering of this can be spread over the surface after trenching, and before planting, it will add considerably to the success of the plants, giving them a more rapid start.

The best time to plant is undoubtedly early in the autumn, choosing dry weather for the planting. The trenching should be done fully a month before, if possible, to allow the soil to settle down. Autumn planting in stiff soil may entail more attention to the plants during the winter, to prevent slug attacks, and nothing is so good a preventive as finely sifted coal ashes spread on the surface close about the plants.

The question of how to plant the herbaceous border needs much consideration. There is the time of year when the best display is required, such as during the shooting season, from September onwards. Then, again, there is the tendency of the present day to favour flowers of certain colours in special parts of the garden, as pink, blue, yellow, or white. Where broad and long borders are available the massing of several plants of one kind or variety produces much the best effect: for instance, the effect produced by Lychnis chalcedonica in a mass of at least a dozen plants, as compared with single plants dotted here and there over the same border, is wonderful. There is, however, an objection even to the massing principle, i.e., that of having bare places in the border over a long period after flowering is past. For this even there is a remedy in the hands of persons with unlimited scope and means, and it consists of providing material in pots to replace, temporarily, those past flowering, such as chrysanthemums, herbaceous lobelias, gladiolus, and so on.

There is another aspect to consider in planning. A person with a medium-sized border, who takes a deep personal interest in all subjects, and who wishes to see something fresh as he strolls along the border side discussing the various plants with visitors, must follow the mixed system of planning, as constant surprises are then forthcoming, whereas if massing is followed the various plants are so clearly seen from a distance that some of the interest is lost, although there is a gain in colour effect. Some persons, too, prefer quite an even sloping bank from the back to the front of the border. I prefer this plan to a certain extent, but not so rigorously as some. I plant single specimens, like the Hon. Edith Gibbs aster, three feet from the front here and there down the border, with an occasional summer-flowering subject, like Campanula bononiensis alba. Such plants break up the level surface, and do not interfere with the growth of other plants near, as long as their growth is confined to just a single stem or two. To all methods of planting objections can be raised, but the owner can arrange to suit his personal taste.

Staking the plants is an important item in the appearance of a herbaceous border; very often this is neglected too long, and the plants, for want of support, fall down, commence to grow upward at the ends, and when staked they are crooked, and have an unkempt appearance. Too often also the plants are drawn together in broom-like fashion, with a tie around the middle, and attached to one stake. This fashion prevents many of the plants showing their natural habit of growth. The side branches of many subjects, such as Michaelmas daisies, are the most beautiful portions of the plants, and this method of staking quite robs them of their natural beauty. It is also a mistake to allow too many stems to remain on a clump; phloxes and perennial asters grow weakly for want of space. To each clump of such subjects place several stakes, spreading outwards. In this way the plants grow naturally, developing their side shoots fully, and thus each clump becomes a specimen in itself.

Watering the plants when necessary during a spell of hot dry weather in June or July is time well spent. Phloxes, for example, cannot flourish if the leaves are continually flagging for want of moisture at the roots. A compost of leaves, decayed vegetable refuse, old potting soil, and wood ashes spread over the surface after watering will do much to arrest evaporation. The application of manure—which is perhaps, the best form of mulching, to the surface of the border—may be objected to an account of its appearance. If so, draw back the soil from the surface round such plants as phloxes and apply a two-inch covering of half-rotted manure, and return the soil over the manure; such aid as this will materially assist the development of the flower stems and blooms.

In the autumn a mulching three inches thick of a similar compost will be of great service, not only in protecting the plants from frost during the winter months, but in encouraging the growth of surface roots, and the production of sucker-like shoots in the spring from the base of the plants.

E. Molyneux.

Swanmore Park.

AN ORCHARD FOR A PRIVATE GARDEN.

At this season, when the planting of fruit trees occupies attention, those intending to form new plantations to meet the ever-increasing demand should lose no time in settling what is to be done. It is first of all necessary to get the soil thoroughly prepared, and everything, as far as possible, in readiness for the reception of the trees immediately they arrive from the nursery. In many gardens, owing to the introduction of hardy herbaceous plants, whole lengths of borders are now devoted to flower culture in the kitchen garden, and room for fruit trees is out of the question in this department. It is therefore necessary, to keep up a lengthy supply of choice apples, pears, plums, etc., that a new position outside must be provided, and of sufficient dimensions to meet the requirements of the establishment.

Some owners may desire orchards of standard trees, but there are others who may wish to form a fruit garden of bush trees only, and this, if properly prepared and suitable varieties are planted, will more than satisfy by a quick return of clean choice produce. Of course, a far greater number of trees are required than is the case for orchard standards on the same extent of ground, but the dwarfs are cheap, and commence fruiting in a comparatively short time, and astonish the inexperienced.

With the object of assisting anyone about to plant this autumn I would urge that when selecting a site preference should be given to a sunny, open position, with a gradual fall to the south. The land should be well drained, and thoroughly trenched from two to three feet deep, excepting parts where it is intended to have grass walks of a suitable width. Trenching the plot may at first appear to be a rather tedious and costly matter, but it will more than repay for the extra attention and labour bestowed on it. Remember that what is worth doing is worth doing well. If the soil is of the best character for fruit growing very little extra preparation will be needed, but if, on the contrary, it is poor and light, then add a good dressing of manure and some heavier loam, if procurable, so that the trees may have a good start. Heavy clayey soil can be greatly improved by a liberal dressing of grit, such as road scrapings free from tar.

There are different methods of laying out a private orchard, and each may have something to recommend it. I have seen capital mixed fruit bushes planted in squares divided by grass walks; in long parallel beds trenched seven or eight feet wide with four or five feet grass walks between, and in this way the trees can be easily attended and managed; in a large square, and the land between the bushes kept clean and free from weeds. Whichever way is adopted, the bushes ought to be set out from twelve to fourteen feet apart, so that they may have ample room for development.

It is very desirable when forming a new plantation of fruit trees, should the situation be exposed to the north and east winds, to plant a belt of damson trees to form a shelter to the more tender kinds. If planted six or nine feet apart they quickly form a capital screen, and one which is much needed in spring time. Gooseberries and currants may occupy a position between the apple bushes, etc., for a time. I am no advocate of planting for the sake of variety, but would choose good healthy young trees of sufficient varieties to produce fruits to last for several months without a break in the supply, and for this purpose there are numerous kinds to select from, many of which, if properly attended to, will be fit for use in August, while others keep sound till May and June.

A few dependable varieties of apples, pears, and plums are the following: Dessert Apples.—Beauty of Bath, Devonshire Quarrenden, Kerry Pippin, Worcester Pearmain, Ribston Pippin, Cox's Orange Pippin, Egremont Russet, Scarlet Nonpareil, Allington Pippin, Lord Hindlip, Duke of Devonshire, Lord Burghley, and Sturmer Pippin. Kitchen Apples.—Lord Grosvenor, Lord Derby, Lord Suffield, Bismarck, Warner's King, Stone Apple, Peasgood's Nonsuch, Lane's Prince Albert, Bramley's Seedling, Newton Wonder, Byford Wonder, Hawthornden, Wellington, and Alfriston. Pears.—Williams' Bon Chretien, Beurre d'Amanlis, Conference, Madame Treyve, Doyenne du Comice, Marie Louise, Marguerite Marillat, Pitmaston Duchess, Beurre Bosc, Durondeau, Beurre Alexander Lucas, Nouvelle Fulvie, and Josephine de Malines. Plums.—Rivers' Prolific, Victoria, Kirk's, Coe's Golden Drop, Jefferson's, Monarch, Sultan, Greengage, Oullin Golden Gage, Comte d'Althan's Gage, and Pond's Seedling. Damsons.—Bradley's King and Farleigh Prolific. Nuts.—Early Prolific, Kentish Filbert, Kentish Cob, and Pearson Prolific.

H. Markham.

Wrotham Park Gardens.

Cucumbers.—Plants that have commenced to bear fruit, and are intended to afford a winter supply, should be very lightly cropped, and have their growths well thinned, though not quite so closely stopped as is usually done in the case of summer-fruiting plants. The roots will be less active as the days shorten, and will require to be more carefully watered, but light top-dressings of loam, mixed with decomposed horse manure and flaky leaf-soil, should be added as they appear upon the surface. Carefully ventilate the pit when the weather is favourable, but avoid creating excessive atmospheric moisture, especially in dull or wet weather. The night temperature should range from 65 to 70 degrees, and that for the day be 10 degrees higher.—T. Coomber.

Kelway's Delphiniums

The
Beautiful Blue
of
Kelway's Delphiniums

FOR a display of blue in all the loveliest shades there can be nothing so pleasing in a garden as a selection of Kelway's Beautiful Blue Delphiniums. The range extends from lightest turquoise to deepest sapphire, and a selection of Kelway's named varieties will afford great pleasure wherever planted. Note the broad, open well set up flowers in the specimen (much reduced) shown here. Collections of choice named varieties from 15s., 42s., and 60s. per doz.

Now is the time to plant.

KELWAY & SON,
The Royal Horticulturists,
Langport, Somerset.

BY APPOINTMENT.

Wm. Paul & Son, Waltham Cross
LTD.

Respectfully invite attention to the following Specialities of their Nurseries.

HARDY TREES AND SHRUBS

of all kinds, including

Deciduous Trees for Park, Roadside, and Garden Planting, such as Limes, Planes, Elms, Oaks, Beech, Chestnuts, Birch and others.

Ornamental Flowering and Foliage Trees and Shrubs, such as Almonds, Cherries, Peaches, Crabs, Lilacs, Thorns (Pauls' Crimson and others), Purple Beech, Golden Oak, Silver Maples.

Flowering Shrubs prepared for forcing under glass, including Peaches, Almonds, Crabs, Cherries, Laburnums, Thorns and others.

Evergreen Trees and Shrubs of all kinds, including large stocks of Aucubas, Hollies, Yews, and Conifers of the best varieties.

Cheap Evergreen and other Shrubs for Woods, Coverts, and Hedges, such as Spruce Firs, Laurels, Privet, Quick, etc.

Rhododendrons (from loam), for Garden, Park, and Wood Planting.

Hardy Climbing Plants, for Walls, Buildings, Pergolas, and other picturesque planting.

Hardy Herbaceous Plants, in great variety.

Priced Descriptive Catalogue on application.

FRUIT TREES

of all kinds, including

Standard Trees for Orchard and Garden Planting: Apples, Pears, Plums, Cherries, and others. Extra strong fruiting trees are available of many kinds.

Bush and Pyramid Trees for Gardens: Apples, Pears, Plums and Cherries. Extra strong fruiting trees are available of many kinds.

Upright Cordon Trees, for Walls, Pergolas, and Arches: Apples, Pears, Cherries, and others.

Horizontal and Fan-trained Trees, for Walls, Fences, and Espaliers: Apples, Pears, Plums, Cherries, Peaches, Nectarines, and Apricots. Extra strong fruiting trees are available of many kinds.

Standard Trained Trees for Walls and Buildings.

Orchard House Trees in Pots: Peaches, Nectarines, Apricots, Apples, Pears, Plums, and Cherries.

Grape Vines and Figs in Pots.

Nuts and Filberts, Gooseberries and Currants.

Raspberries, Strawberries, and other berries.

Priced Descriptive Catalogue on application.

Inspection of stock invited. The principal Nurseries are twelve miles from London; the South entrance is four minutes' walk from the Waltham Cross Station, Great Eastern Ry.; and the West entrance, five minutes' walk from the tramway terminus.

SOLE POSTAL ADDRESS:

PAULS' ROYAL NURSERIES, WALTHAM CROSS, HERTS.

BY APPOINTMENT. BY APPOINTMENT.

CHEAP OFFER TO CLEAR.

We beg to inform our numerous clients that we have secured a large tract of land adjoining one of our principal Nurseries, and that it is our intention to clear the Stocks off some of our outlying branch Nurseries at a sacrifice.

Everything has been grown with our usual care, and offered in Lots, subject to being unsold; we guarantee the numbers and quality of each Lot offered.

Particulars of above, together with our General Catalogue, will be sent on application.

JAMES SMITH & SONS (Nurserymen to H.M. THE KING), **DARLEY DALE NURSERIES, near MATLOCK.**

Inspection cordially invited. Visitors met by appointment at Darley Dale or Matlock Stations.

RASPBERRIES AND BLACKBERRIES.

Few fruits, perhaps, are more highly esteemed in their respective seasons than raspberries and blackberries, especially the former, as in many high-class establishments a dish of raspberries for dessert is a daily need over as long a period as possible, while for kitchen and preserving purposes blackberries are invaluable, maturing, as they do, when other small fruits are past. Both, therefore, should be included in every well-ordered garden.

Raspberries.

Raspberries, like all other subjects, if worth growing at all are worth growing well, but we often see them in a neglected condition, and an inferior variety is grown, whereas great improvement might be made in each respect. To produce the best results it is important to thoroughly work the ground for planting, as no fruit pays better for good culture. The ground should be trenched not less than two and a-half feet, and plenty of manure incorporated as the work proceeds. Planting may be successfully undertaken any time during the autumn or winter, when the plants are in a dormant state.

If planting be carried out at an early date, and extra-strong canes are purchased, these may be expected to yield a small supply of fruit the first year under favourable conditions. An open position should, of course, be chosen for these, as it is impossible for the plants to thoroughly mature their growth and ripen fruit when densely shaded. An excellent plan, especially in small gardens, is to plant in single rows, but if more are grown together a distance of at least six feet should separate the rows, and two feet between the canes. Avoid planting too deeply. Make thoroughly firm, and shorten back the growth to within a couple of feet or so of the ground to induce the plant to throw a number of suckers for the following season's crops. Give a good mulching of well-decayed farmyard manure to the new plantation, and also to any established beds at this season of the year. Fruiting canes should be cut out as soon as the fruit has been gathered to allow the current season's growth to become thoroughly matured.

Of red varieties I know of no raspberry to equal Superlative, for cropping, size, and flavour of fruit; it is excellent both as a dessert variety and for preserving. The Guinea, as a yellow variety, is perhaps the best of its class, while Large White and Yellow Antwerp are each prolific and good.

Blackberries.

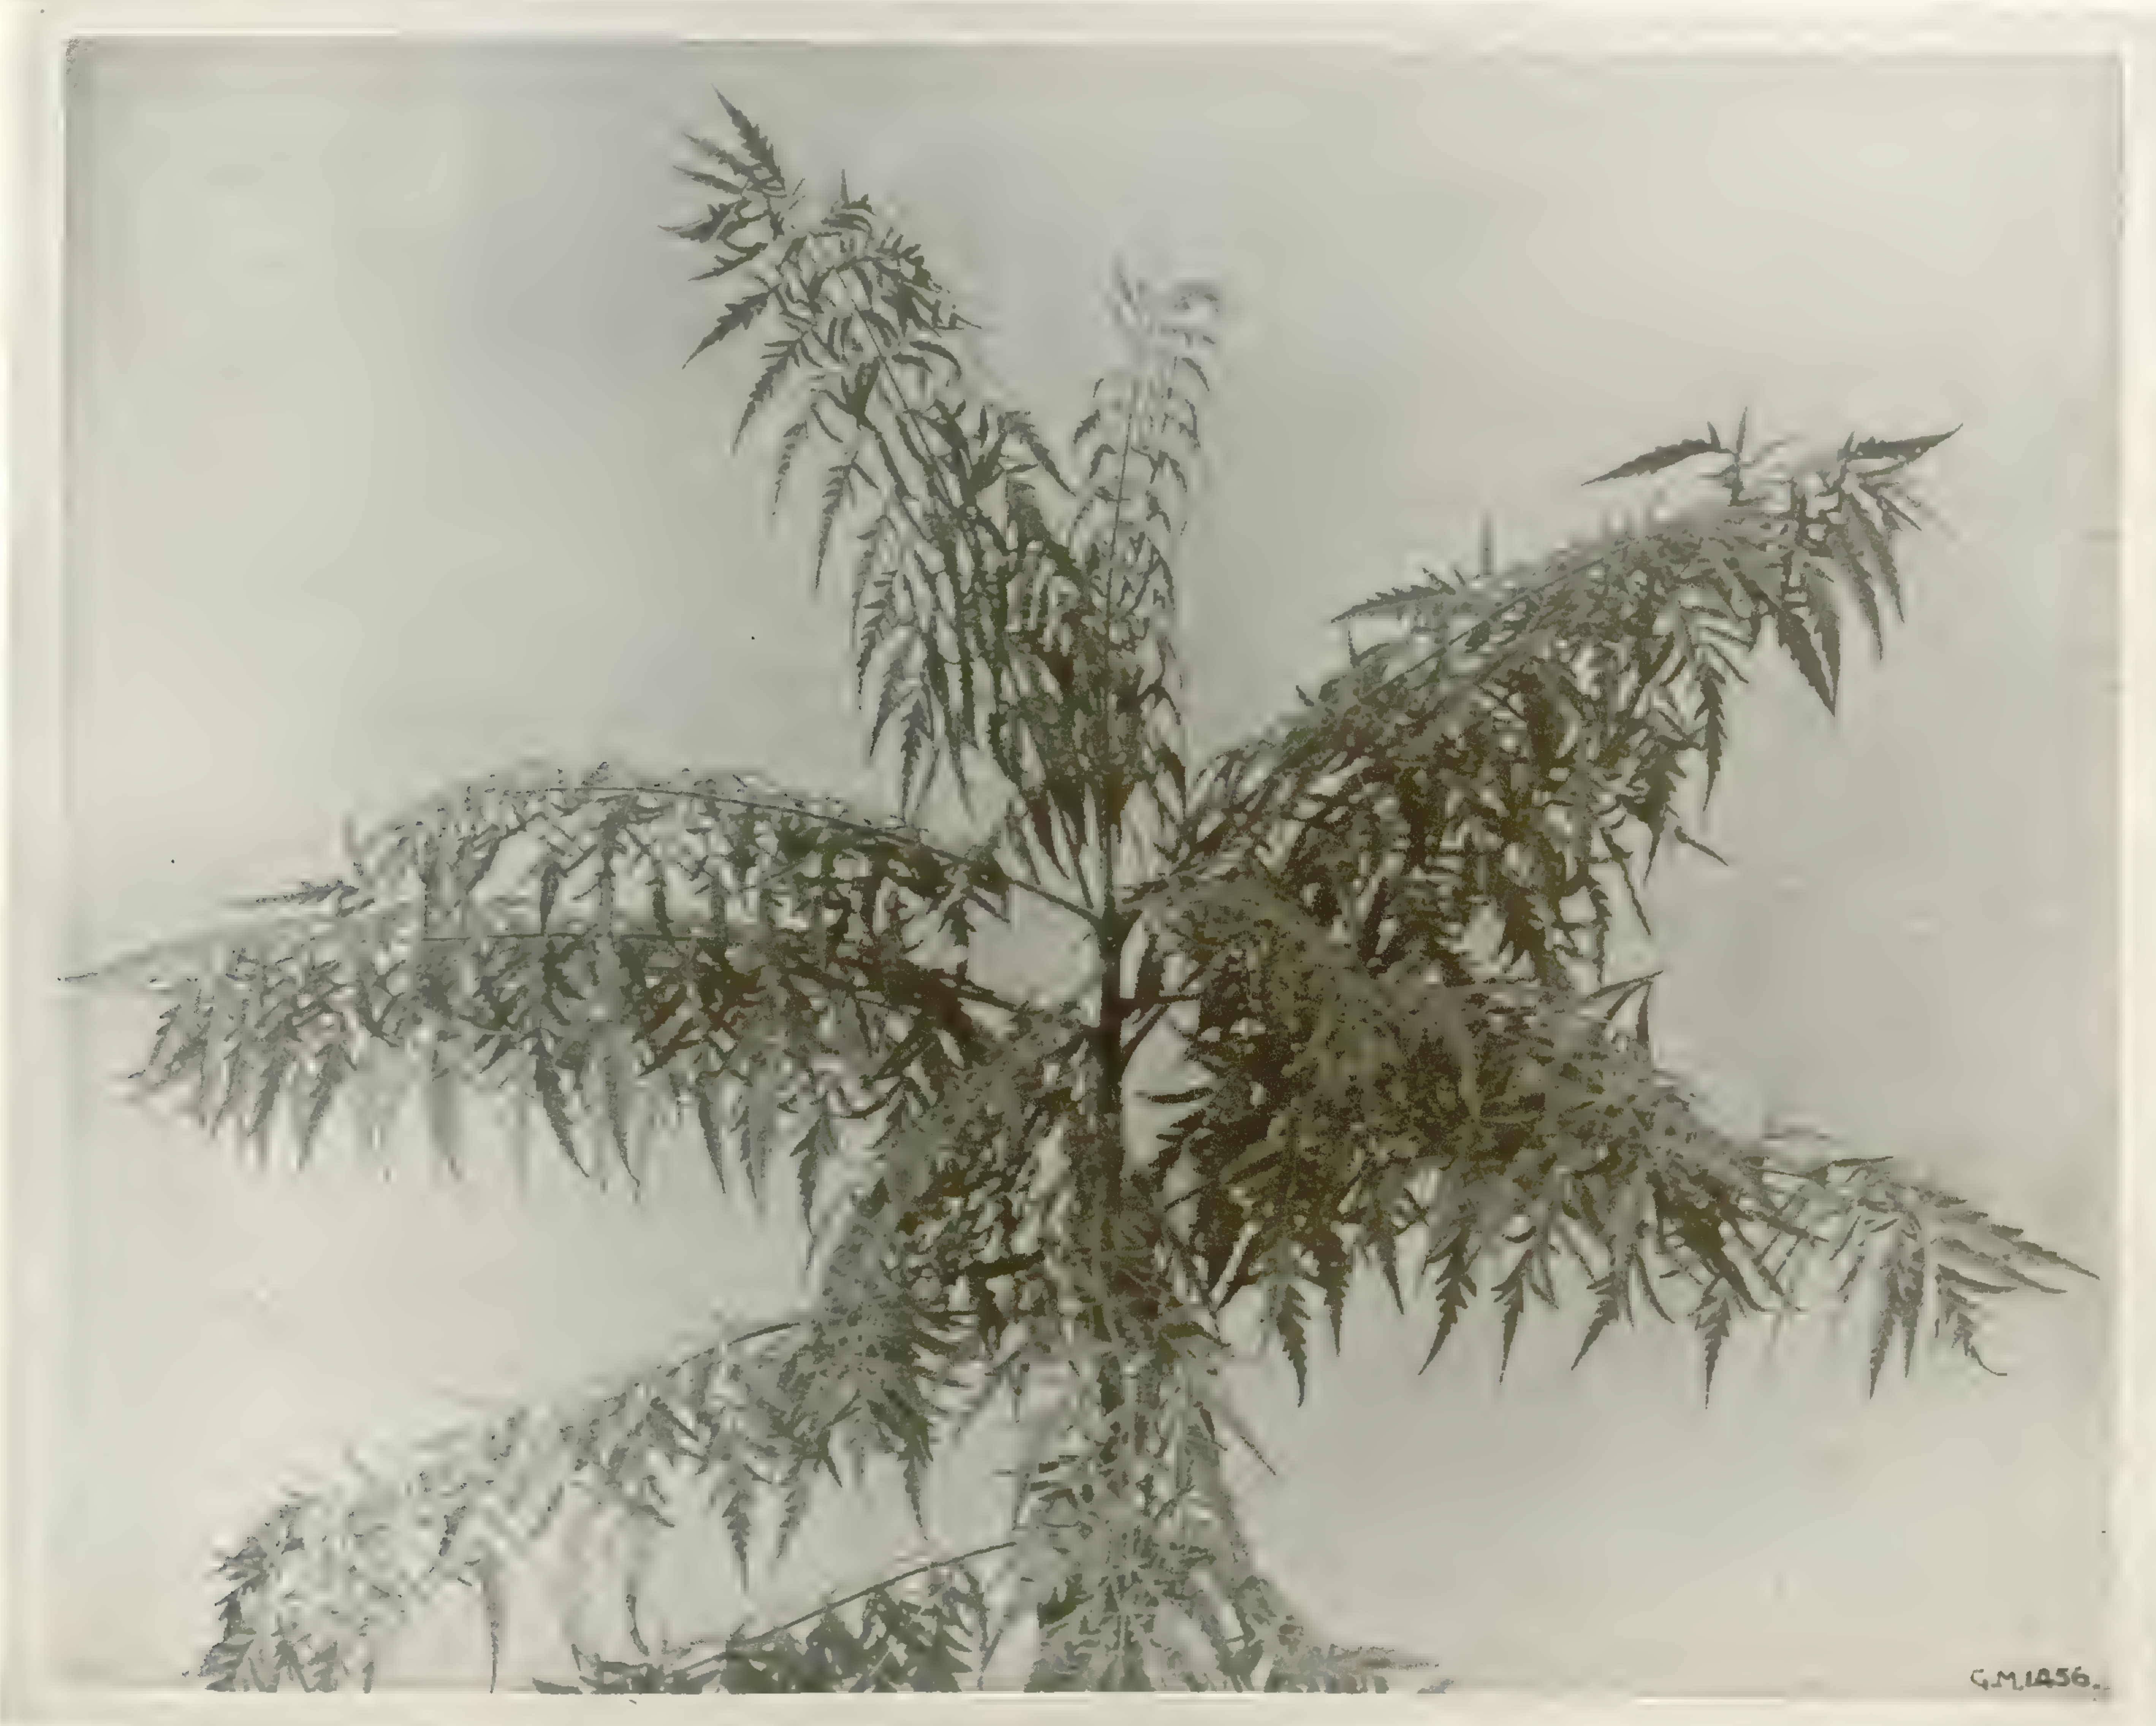
Though not perhaps generally treated the blackberries are worth a place in all gardens, and will be found to prove a remunerative crop. We have grown Rubus laciniatus here for upwards of twenty years, and it has never failed to produce a crop, and though it cannot be said to be quite so delicious in flavour as the wild blackberry, its freedom and larger berries amply recommend it. The plant is of remarkably easy culture, and produced either from seed or suckers. No attention is required beyond an annual top-dressing and keeping the beds free from weeds, thinning out the old growth in the winter, slightly reducing the length of the young canes, and thinning out completely where too thick. An ideal place for planting is on a sloping bank, with a path at top and bottom to allow of easy reach of the fruit. For trellises, too, the blackberry will be found useful, and treated in this way the fruits ripen to perfection. Curiously enough, blackberries have been immune from the attack of birds this season. There are several varieties of American origin, but I have found the above quite superior to any I know.

E. Beckett.

Aldenham House Gardens.

RHUS TYPHINA LACINIATA.

The merits of this elegant foliaged shrub are very high, for not only is the plant attractive all through the summer season, but during autumn its finely cut leafage assumes brilliant colouring, its crimson and gold shading then compelling attention. The variety has not long been in cultivation, but it has already secured for itself a position in all good collections of shrubs, and those who are planning schemes of planting for the present autumn should not omit it from their consideration. The long, deeply cut leaves are well shown in the accompanying illustration, while in general habit it otherwise resembles R. typhina. It has been exhibited frequently during the last year or two at meetings of the Royal Horticultural Society, especially by Messrs. J. Cheal and Sons, Crawley, and Messrs. Paul and Son, Cheshunt, and it is to the latter firm we are indebted for the opportunity of figuring this fine introduction.



RHUS TYPHINA LACINIATA.
A handsome shrub, the large and elegant leaves turning crimson and gold in autumn.

THE NEWER HELENIUMS.

Fair Helen, the wife of Menelaus of Sparta, who eloped with Paris, and is renowned in ancient history and fable, has given her name to the genus Helenium, although the old plant called after her was probably Inula helenium. However this may be, the genus which bears the name of this fair cause of strife is a valued and valuable one in our gardens, and it is to it that they owe much of their brightness in summer and autumn. Some of the species and their varieties are too well known to be embraced under the title of this article, but there are others which, if not absolutely new, are deserving of inclusion for the sake of those not well acquainted with the heleniums.

It is unnecessary to do more than refer to H. autumnale, one of the best known, but its variety pumilum magnificum is so worthy of cultivation that every grower of border flowers ought to cultivate it. It is finer than either H. autumnale or its variety pumilum, and grows to about three feet high, giving in autumn a long succession of large ornamental flowers of a bright yellow, with a disc which harmonises well with the brighter yellow of the ray florets. In the border it is bright and useful, while, when well arranged, it is delightful as a cut flower, and has done much yeoman service on the exhibition table. Thoroughly hardy, it is invaluable for lovers of late summer and autumn bloom.

Helenium Bigelovi, a useful species, is not much grown now, but deserves a little more consideration. Its deep yellow flowers, contrasted with the brown disc, and on a plant about two feet high, render this a useful border flower.

Many are well acquainted with the fine H. Bolanderi, a useful border plant, only a foot and a-half high, or little more, which affords us in autumn yellow flowers with a darker disc, but there is in addition a new variety, called Golden Gem, which has very deep golden flowers with tubular florets, and is about the same height as the typical plant. Its tubular florets and its colour constitute this one of the most interesting of the newer varieties.

Helenium Hoopesi, an early-blooming Rocky Mountain helenium, is now fairly well known, and is appreciated by those who grow it for its large deep yellow blooms of effective appearance. Its early flowering is also a feature which appeals to a number. It is some two and a-half feet high.

Some years ago there was introduced a fine helenium with flowers distinctly striped with yellow and brown. This was sent out as grandicephalum striatum, but it is now generally agreed that it is a variety of the variable North American H. nudiflorum. This is a valuable helenium on account of its colouring and its late blooming. It is some four feet or so high, and the varieties which are offered under various names, such as striatum, and cupreum, which is deeper in shade, and of almost self-copper colour, are all worth possessing for the border, cut flowers for the home, or exhibition.

Understood to have been derived from the foregoing, is a garden variety called Riverton Beauty, which promises to take a good place in the garden. It is only about three feet high, and gives us a supply of handsome brown and yellow flowers.

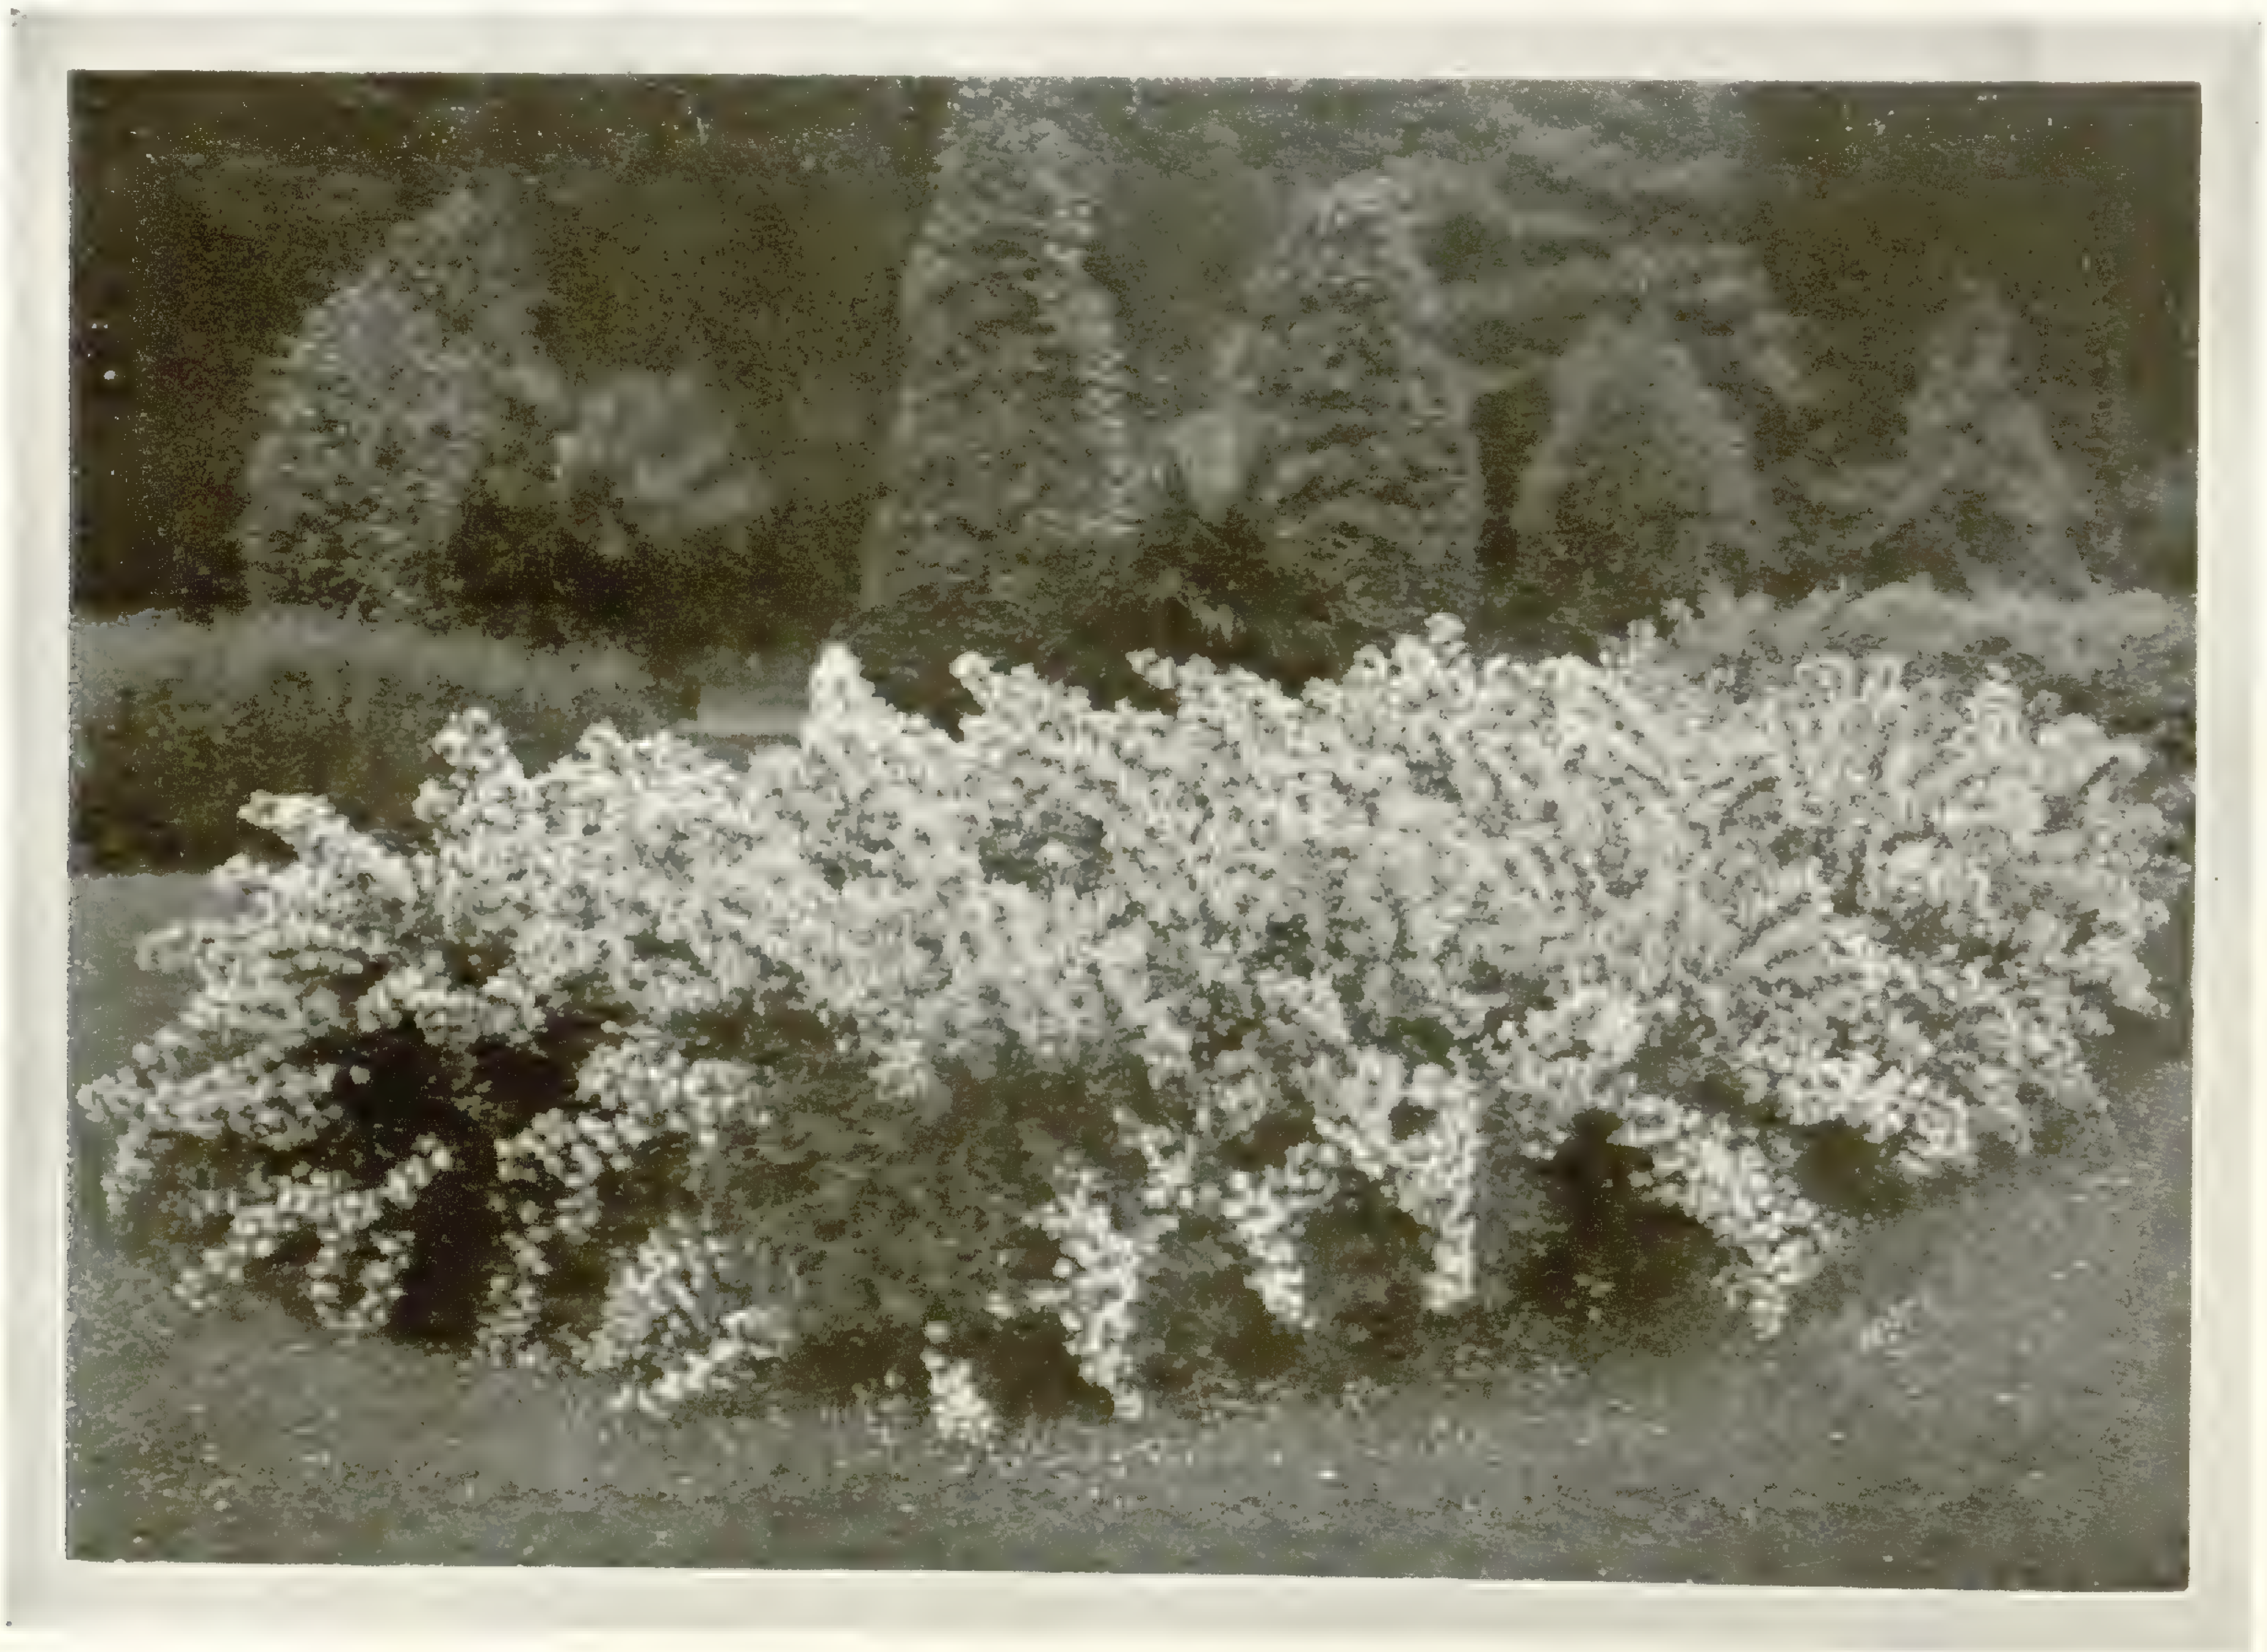
A sister flower is Riverton Gem, which is one of the most beautiful of all, and which is worthily named Riverton "Gem." About the same height as the preceding one, it is decidedly the best of the new varieties, and yields us, on stems about three feet high, lovely flowers of a fine crimson-brown. As a late border plant, especially where hardy flowers are set out in autumn-flowering borders, this choice plant is exquisite.

The cultivation of these heleniums is easy in the extreme, as they are hardy, and give good results on any good, well-manured soil. They can be divided in spring, and will flourish best in sun, although useful in semi-shade also.

S. ARNOTT.

THE MOCK ORANGES.

The Philadelphuses or Mock Oranges include several of our most popular garden shrubs, and it is probable that one or more kinds will be included in most collections of shrubs which are planted during the present season. With this in view, it may not be out of place to review the genus in order that attention may be directed to those kinds which are most worthy of cultivation, for there are several which are distinctly inferior to the remainder for general purposes. The common one, P. coronarius, requires no recommendation, for it is well known everywhere, and it is absent from very few gardens of note, while not a few suburban villa gardens include it amongst their few shrubs.



PHILADELPHUS LEMOINEI.
A well-furnished bed in the Royal Gardens, Kew.

The Philadelphuses, as a whole, may be easily cultivated, providing good soil is given in the first instance, and some attention is directed to feeding at a later date, for, though they will grow in comparatively poor soil, it is only in that of fairly good quality that the best results are obtained. For the strong growing kinds, if the soil is poor, holes 6ft. in diameter, and 1½ft. deep ought to be excavated and filled in with good loamy soil, while for the dwarf growing sorts it is advisable to prepare beds 10 to 15ft. in diameter, for they always look better as a mass than as isolated plants. Feeding should take the form of applying a top-dressing of well-rotted manure at least every second year, for the Mock Oranges are rank feeders, and quickly impoverish the soil.

The larger growing kinds require very little in the way of pruning, except it be that any of the wood is deteriorating, a condition which calls for a vigorous thinning out of old branches to make way for young wood. The dwarf-growing, hybrid kinds, on the other hand, call for rather severe pruning, if the best results are anticipated. This pruning, in all the sorts typified by P. Lemoinei, should take the form of cutting away all the old flowering wood in June, as soon as the flowers have fallen. The result will be the production of a new set of shoots from the root stock, which will have plenty of room for development and be able to obtain the maximum of air and light for ripening purposes. The wisdom of this will be seen the following year, for branches 2 to 2½ft. long will be clothed with flowers from end to end, while if an unpruned bush has been left for purposes of contrast, it will be found to have formed much shorter shoots and to have a less graceful appearance.

PHILADELPHUS GRANDIFLORUS FLORIBUNDUS.
A handsome variety of strong growth.

Propagation of all the species and hybrids is easy, for if cuttings of half-ripe wood are inserted in pots of sandy soil and placed in a close frame, or if similar cuttings are placed in sandy ground under a handlight, they root with ease. Cuttings of fully ripened wood may also be rooted if they are made in a similar manner to currant cuttings, and inserted in a shady border out of doors.

Of the taller growing species the following, in addition to P. coronarius, are worthy of more than passing attention:

P. grandiflorus—perhaps the strongest growing of all. It attains a height of 15ft. and upwards, while its spread is quite as great. The flowers are larger than those of the common Mock Orange, and have not the cream shade which attends them. They are fragrant and borne freely a week or two later than those of the commoner kind. It is a native of the United States, and has been cultivated in England for about a century. Of several well-marked varieties, those called floribundus and laxus are the best for general cultivation. The former, as the name implies, is remarkable for its free flowering propensities, while the latter has a somewhat looser habit, but is not a whit behind the other for free flowering qualities.

Another free flowering, tall growing species is P. Lewisi. This is a native of Western North America, and is distinguished from the last-named, and also from P. coronarius, by its smaller leaves and flowers. The blossoms are white in colour, and are borne in fairly large clusters. P. inodorus may find favour with some people, more especially those who do not like very fragrant flowers. The great point about the species is that its flowers are practically scentless. It also is a native of the United States, but is confined to the southern part.

Turning from the tall-growing species we find a very interesting and showy shrub in one of the smallest members of the family. This is P. microphyllus, a native of Colorado, which rarely grows more than 3ft. high, and is usually met with a foot lower. The leaves are very tiny, scarcely half an inch long, and greyish in colour by reason of a multitude of tiny silvery hairs which are present on both surfaces. The flowers are white, about three-quarters of an inch across and powerfully fragrant. It is a useful sort for planting in a bed where a dwarf, rather dense-growing shrub is required, while it may also be effectively placed in groups in the forepart of a shrubbery. Considerable interest attaches to it, inasmuch as it is one of the parents of the numerous hybrids which have arisen during the last twenty years, and for which M. Lemoine, of Nancy, is famous. P. coronarius, crossed with this species, resulted in a number of showy hybrids. Two of the first to be named were P. Lemoinei, and P. Lemoinei erectus, and these are still two of the best; in fact, the last-named may be considered as one of the twelve best flowering shrubs for general planting. Other kinds have, however, continued to appear, some with single, and others with double flowers. All are very floriferous, while some of the later kinds, such as Rosace, have very large flowers. Good hybrids are Boule d'Argent, Candelabra, Gerbe de Neige, Rosace, Avalanche, Pavillon Blanc, Manteau d'Hermine, and Mont Blanc.

A plant very similar in habit but different in the colour of the flowers, was introduced a few years ago under the name of P. purpureo-maculatus. It is distinguished by having a purple blotch at the base of each of the four petals which compose the flower. Allowed to grow naturally, many of these hybrids will, eventually, attain a height of four feet or more; but they are not, as a rule, so satisfactory under this condition as when pruned as previously recommended. Branches from pruned plants, especially from the double-flowered kinds, are excellent for cutting for decorative purposes, especially when mixed with some kind of light greenery.

The hybrid kinds may be utilised for forcing with fairly good results, though they will not stand excessive heat.

Kew. W. Dallimore.

GREENHOUSE MANAGEMENT.—The Amateur's Greenhouse, the popular book by T. W. Sanders, not only treats of the selection and cultivation of greenhouse plants and flowers, but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the management of the plants and flowers grown in it. The price of this book of 416 pages is 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

THISTLES IN THE GARDEN.

No true gardener can tolerate a thistle in the garden if he knows there is one. But I know a gardener who had much trouble with them owing to the manure supply from a farm near by being the source of the introduction of many seeds every year. Also, when the corn was threshed and the wind in a certain direction, the thistle seeds blew into the kitchen garden—which was about six acres in extent—in showers resembling snow. This condition showed what kind of farming was done.

But I want to point out that soil in which thistles grow luxuriantly is invariably very good, and will, if well cultivated, grow nearly all kinds of crops well. I have heard of a blind farmer and his son who both went to inspect a farm with a view to becoming tenants. During a walk through the fields the son remarked, "I can't see a single thistle"; the father replied, "Let us go back home then, we won't take the farm." Personally, I know many farms where thistles grow freely, and are difficult to keep in check, and the land produces grand crops of grass and corn. It was the same in the case of the gardener who was so pestered with the thistle seeds in his manure, the soil would respond to good cultivation, and produced grand vegetable crops as well as thousands of young thistles. But has any reader of the Gardeners' Magazine ever succeeded in growing thistles in flower pots? The farm bailiff of one estate where I had charge of the gardens brought me some fine thistle seeds, asked me to sow them in pots, and try to raise some young plants. I did so, and treated them in several ways, in warm, cool, shaded, and fully exposed positions, but I could not get a single plant. The bailiff told me he had never heard of any being so raised, as all attempts had failed. He also asked me when was the best time to kill thistles in grass fields. I told him to cut them off deeply when the flowers commenced to open. This he did, and found the plan successful. In gardens, however, this should only be the course where there has been neglect, as good gardeners destroy them when in the seedling stage.

G. B.

CEANOTHUSES IN BEDS.

The species and varieties of Ceanothus are the most generally regarded as suitable subjects for training to the warmer aspects of walls, and for forming bold groups in the shrubbery border, and for these two purposes some of them are unquestionably of much value. But to confine all of them to sheltering walls is to greatly limit their usefulness as aids in beautifying the flower garden. As so well exemplified in the Royal Gardens, Kew, the later-flowering kinds are well adapted for cultivation in beds; and in these provided the conditions generally are favourable, they form fine masses of flowers and foliage, and present a highly attractive appearance from early in July until the end of September or even later when, as was the case this year, the weather is during the last-named month favourable to continued growth.

CEANOTHUS GLOIRE DE VERSAILLES.
An attractive bed of this fine blue-flowered form.

The later-flowering ceanothuses are useful in all gardens for furnishing beds that occupy positions where soft colouring will be in harmony with the surroundings; but they possess much value from the economic point of view for gardens where the family is not in residence until the summer is well advanced. They remain in a vigorous state for several years after they are planted, and as they require but little attention, a few beds will relieve the gardener of some of the work incidental to flower gardening, and at a time when he has much to engage his attention. The best of the ceanothuses for beds are the varieties that have originated from the inter-crossing of C. americanus and C. azureus, two attractive species, but not equal to their descendants for growing in beds. The best of these are Gloire de Versailles, an elegant variety bearing a profusion of light blue flowers; Albert Pittet, an excellent variety, with rose-lilac flowers; Bijou, deep-blue, the flowers borne in large trusses; Céres, bright rose, free and good; and Perle Rose, a very free blooming variety, that is dwarf and compact in growth and best suited for small beds.

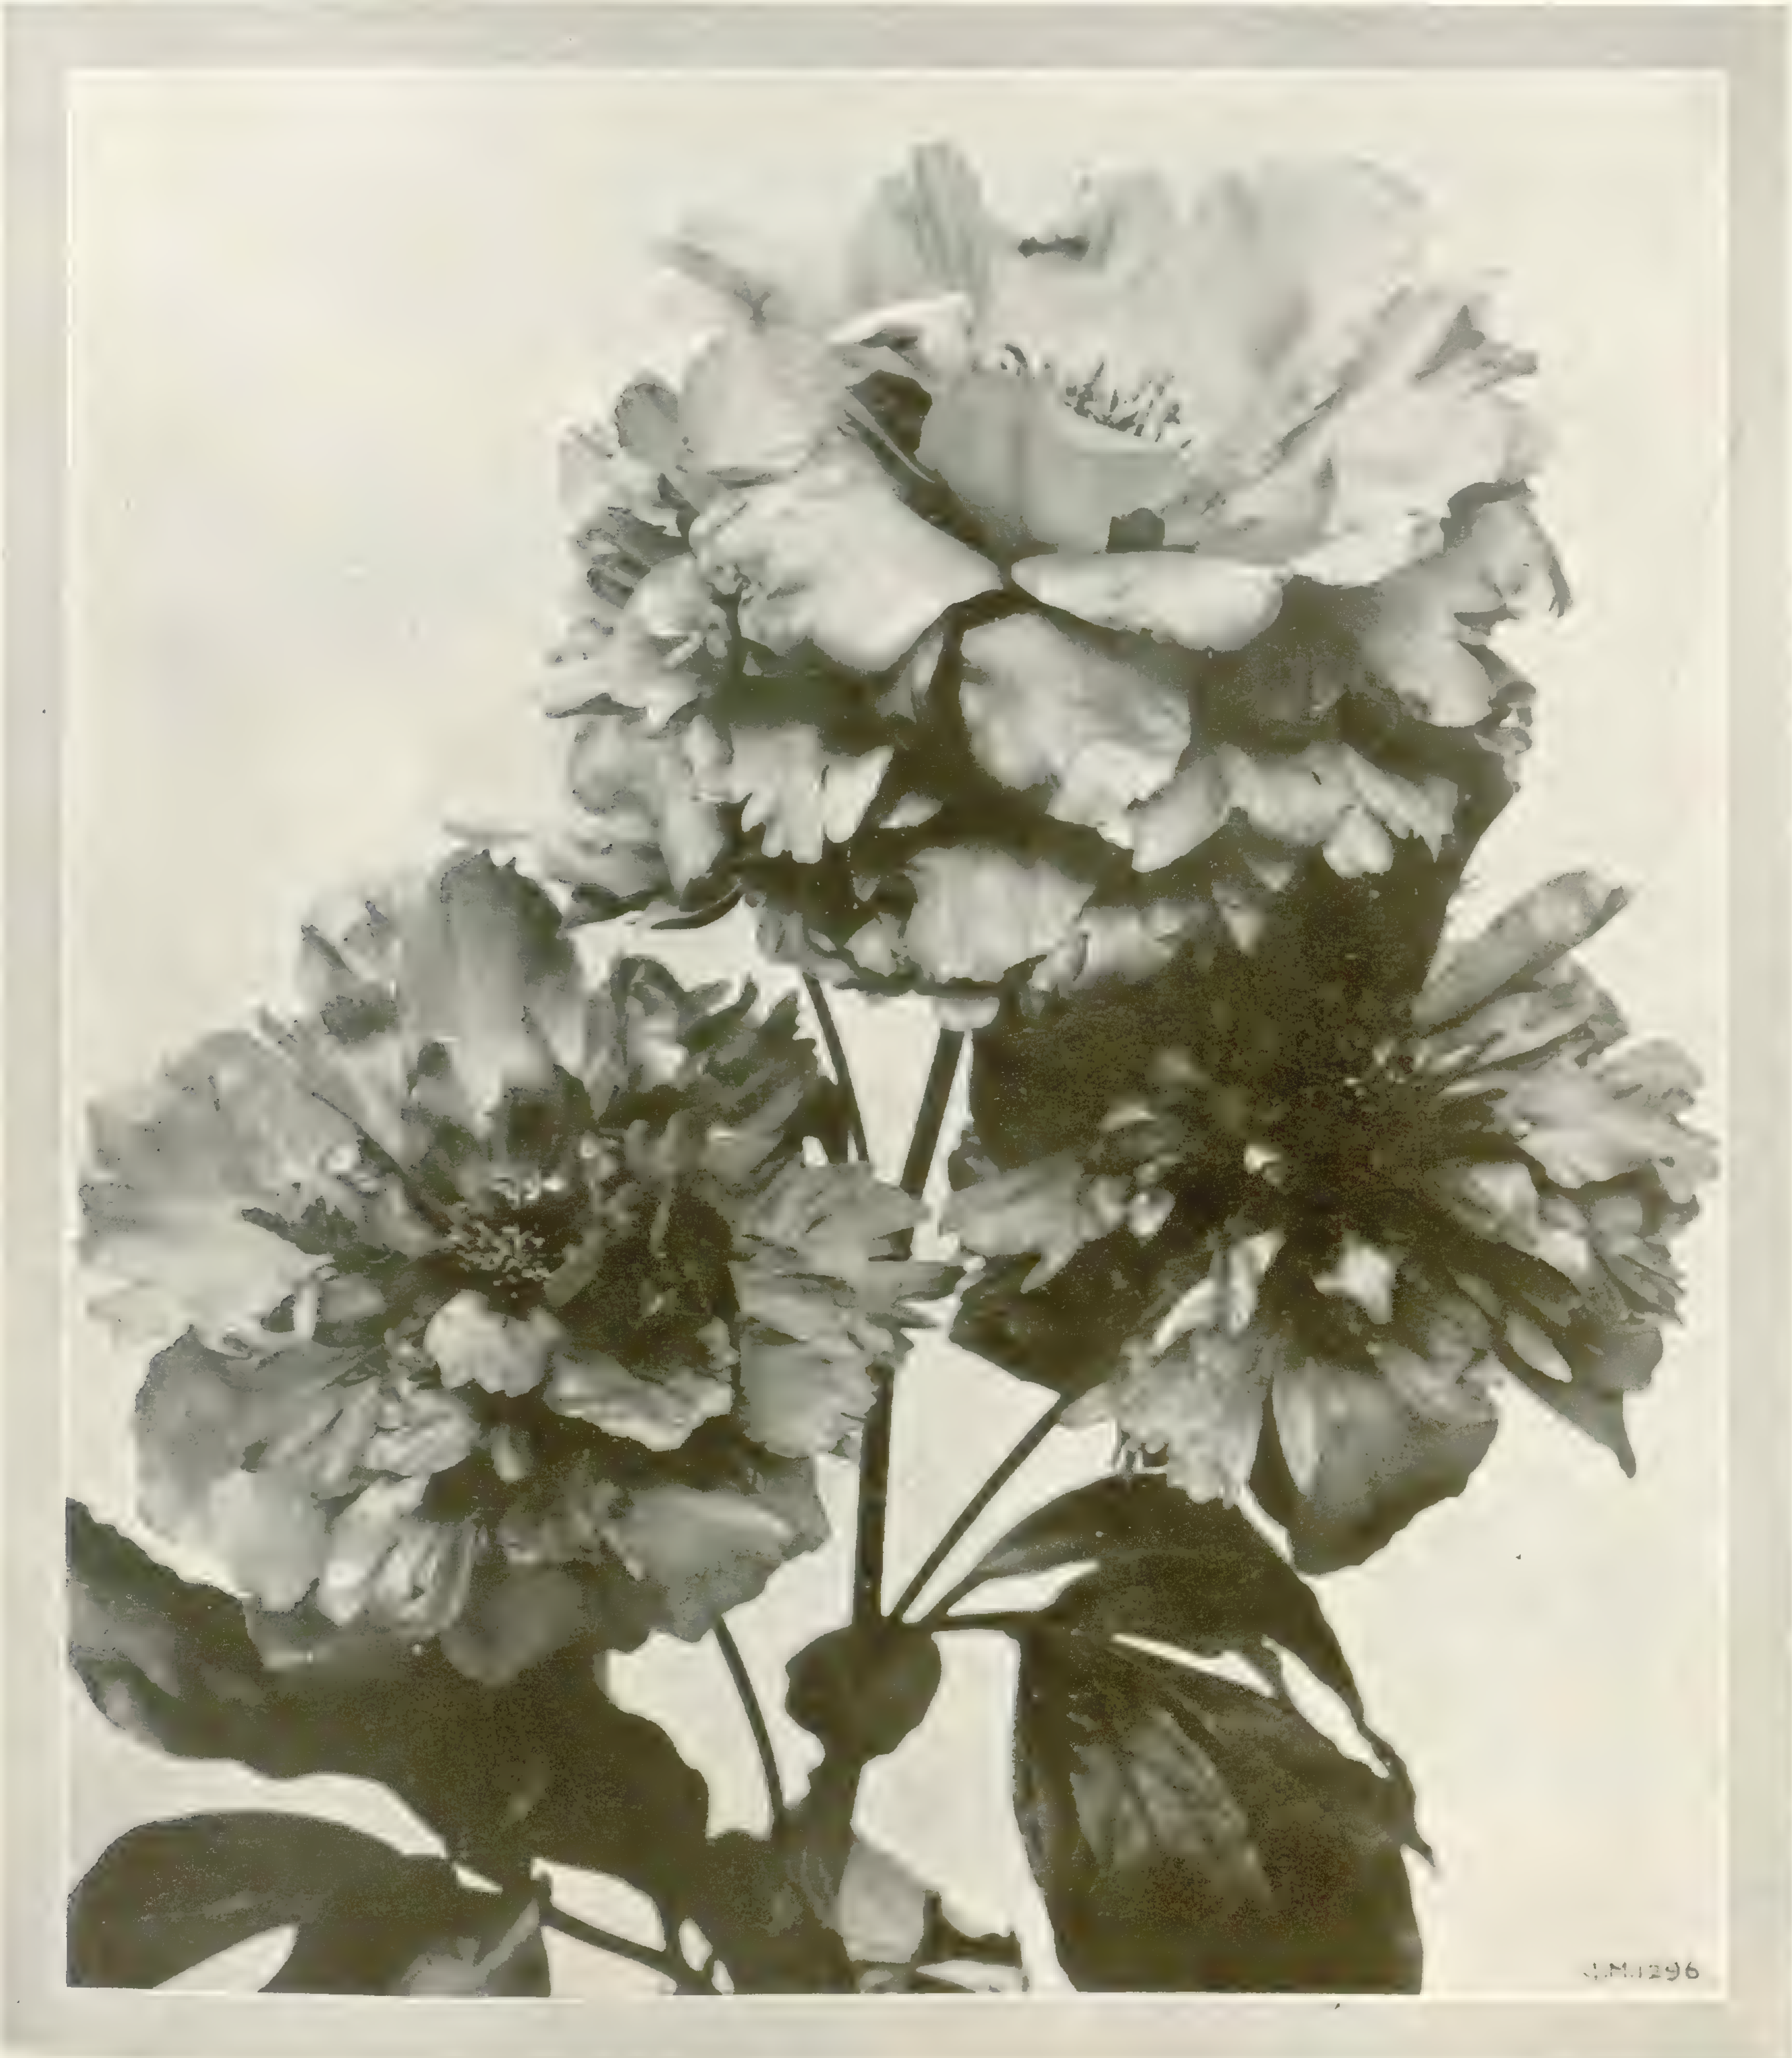
The cultural details are simple, and may be stated in a few words. The ceanothuses are less hardy than are the majority of the deciduous shrubs grown for their flowers, and should, as far as practicable, have a warm position. A well-drained and comparatively light soil is the most conducive to a vigorous growth and abundant flower production, and where the soil is heavy and tenacious in texture it should be improved by the addition of decayed vegetable matter, coarse grit, and other materials that will help to lighten it. The plants should be put from eighteen to twenty-four inches apart, according to the character of the growth, and only one variety should be planted in each bed, as the effect produced by a mixture of varieties is seldom satisfactory. One other detail of importance is the annual pruning, which should be done in February or early in March, and the best method of procedure is to cut the strong shoots back to about the sixth or seventh bud from the base and the less vigorous growths to the second bud.

R.

"CHRYSANTHEMUMS AND HOW TO GROW THEM FOR EXHIBITION," by J. B. Wroe.—Full details on timing and stopping for Northern, Southern, and Midland growers, selections of the best varieties, illustrated instructions on taking the buds, cuttings, staging, etc. Prices 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

HERBACEOUS PÆONIES.

Pæonies are the most beautiful of all the showier hardy perennials, and should be in every garden, large or small; in beds, borders, shrubberies, or drives, in park, grass walk, or woodlands. Many of the new forms include very delicate tints, as well as the bolder colours. They should therefore be planted near at hand for close enjoyment of their beauty, as well as in masses for distinct colour effect; in lines, straight and curving, on the margins of shrubberies, and in groups between shrubs, in large and small beds in the midst of turf, and in mixed borders at frequent intervals.



NEW HERBACEOUS PÆONY, MISS COREY.

A remarkable distinct and handsome variety raised by Messrs. Kelway and Son; the flowers are large and of a rich crimson colour.

There is no other plant that will make such a magnificent display of colour, or give so much satisfaction in return for the trouble involved in its cultivation. Whether the old kinds or the lovely new varieties, like the one shown in the illustration, introduced by the Messrs. Kelway, are cultivated, they will thrive in practically any position, and there is hardly one in which they will not flourish to perfection. They are amenable to the simplest treatment in any soil, and so perfectly hardy they need not the slightest protection, for neither frost not biting wind does them any harm. They produce their flowers in great profusion, and in an almost endless variety of lovely tints, and in many cases with the fragrance of the tea rose. They are of extreme beauty for decoration, particularly in vases and bowls, and no flower is richer or more handsome, while for large decorations the blossoms are invaluable.

Another useful feature of the herbaceous pæony is its beautiful foliage, which causes it to be almost as attractive in its young growth, and when coloured in autumn, as when in flower. The vivid carmine colour of the stems and leaves as they push through the earth in early spring is delightful, and in autumn the colours are very beautiful, the tinted leaves being much in request for harvest festivals and other decorations.

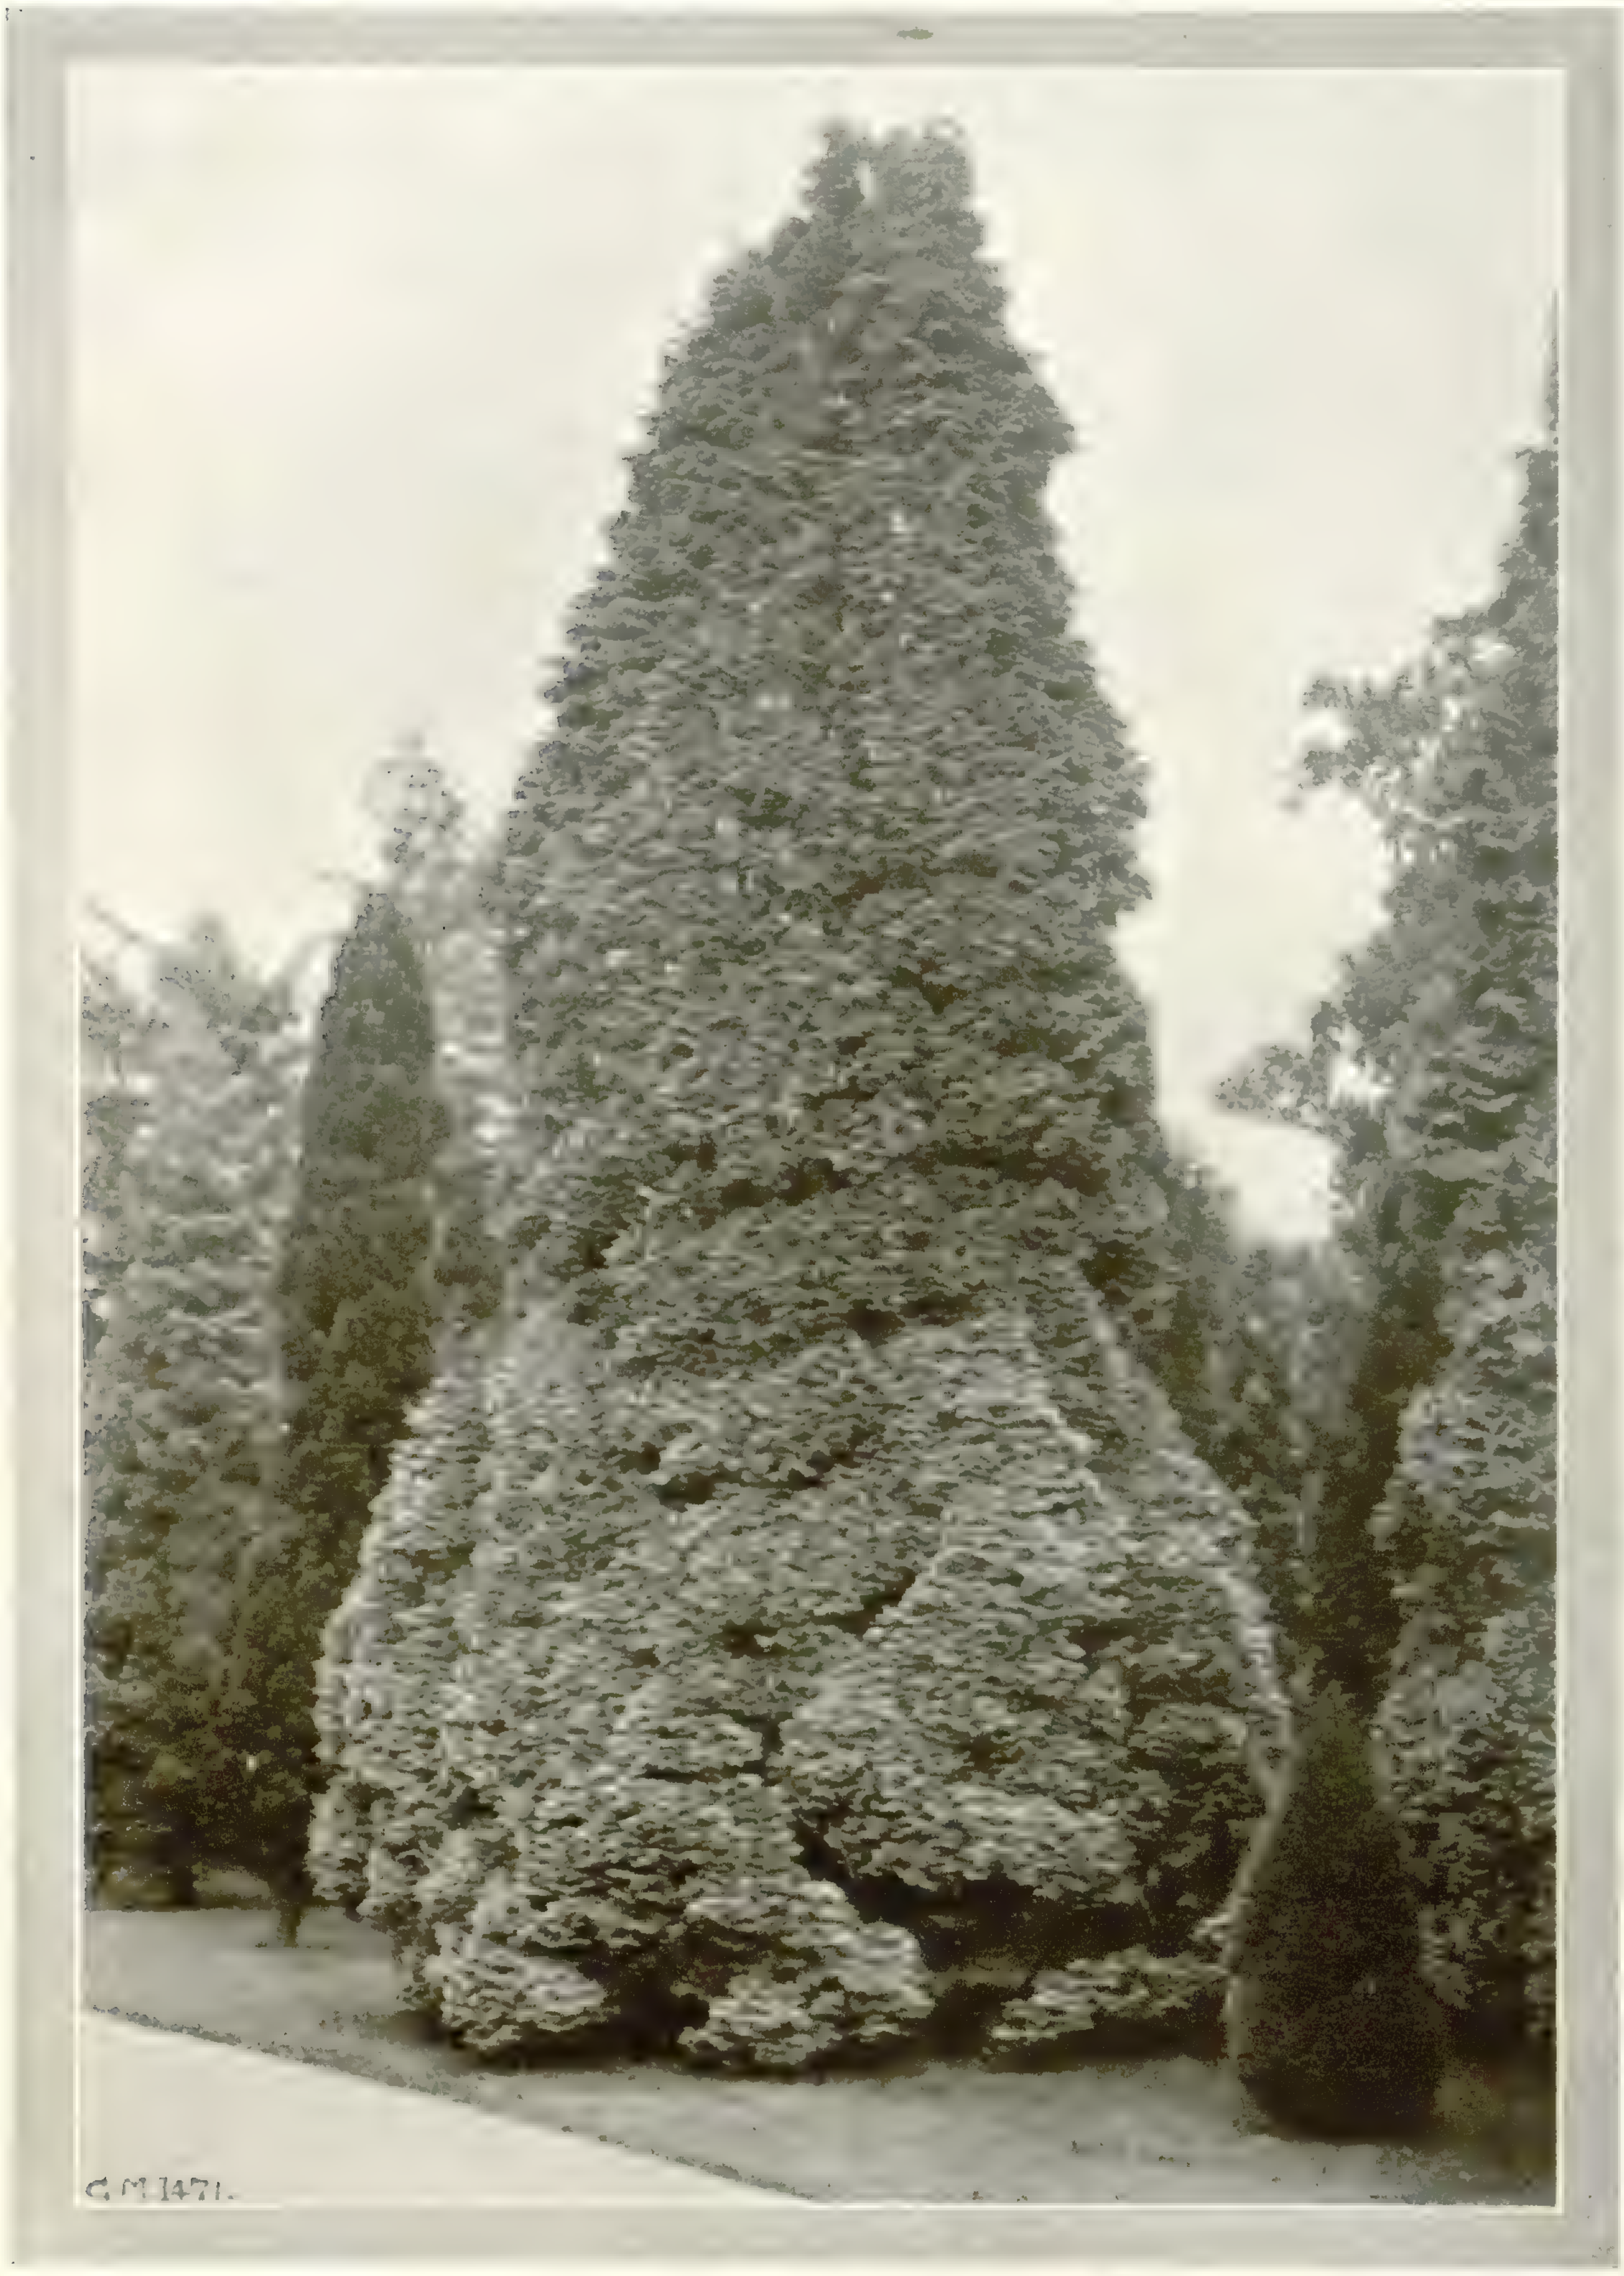
The herbaceous pæony can lay claim to the title of "Everybody's Flower," and, indeed, in one form, it actually is everyone's flower, for the old double crimson pæony (P. officinalis rubra-plena) gladdens with its glow every second garden one passes by, but the cottager is not aware of the more delicately tinted varieties of recent introduction which are so much more delightful in their sweet fragrance. The old red pæony is a charming subject in its proper place, but there is now a host of aristocratic relatives, which have become favourites, and are quite as easily grown.

Early autumn is the best time to plant, as the sooner they are planted the sooner will flowers be obtained from them; strong plants can easily be obtained from the nursery, which should ensure flowers next season. Planting may, however, be done in winter, or in spring, right up to April. Water them well and keep them moist in very dry weather. Where the plants have become well-established the flower stalks should be carefully staked before their own weight or summer rains bring them to the ground. At the same time, the stalks without flower buds should be cut away, and the superabundant foliage removed. When the plants are left in an untidy prostrate state many of the flower buds never open. As there is a tendency for the stalks to multiply at the crown of the roots, and so to spindle and become barren, I recommend that the plants be lifted and divided every five or six years, trenching the soil, and adding some turfy loam and half-decayed leaves before replanting. The strongest roots, with two or three eyes, should be replanted at once, and the weaker ones put in rows in the reserve ground, where, after a season or two, they will supply plants for further planting.

The following list contains twelve of the best and most useful varieties, all quite within the reach of those who love hardy flowers: Agenoria, white, sulphur centre, with red blotch, lasts in flower a long time; Alonzo, deep crimson; Cognita, tinged pink; Cyclops, purple-crimson; Don Juan, purple; General Bideau, fragrant; Gloire de Patrie, fragrant; Grant Allen, very beautiful; Hesperides, white; Lottie Collins, deep purple; Mrs. Chamberlain, rosy-pink; and Pearl, white, shaded flesh.

T. B. Field.

Ashwellthorpe Gardens.



CUPRESSUS LAWSONIANA GLAUCA.
A silvery-leaved form of this handsome cypress.

THE CYPRESSES.

Of the dozen or more species of cupressus in cultivation several of them are too tender to be thoroughly depended upon out of doors in all parts of the country. On the other hand, there are some on which our coldest winters have no effect whatever. The premier place as an ornamental subject must undoubtedly be given to Cupressus Lawsoniana, which is represented in our gardens by a great number of well-marked varieties, that differ from each other, and from the type, in habit, size, colour, and other particulars. They are all perfectly hardy, and among them selections may be made suitable for rockwork planting, for small geometrical gardens, for the pleasure grounds, or for the woodland. The ordinary form also bears cutting well, and it makes a fine quick-growing evergreen hedge.

In its native country, Northern California, Cupressus Lawsoniana is said to reach a height of 200 feet, but generally it is found to range from 120 to 150 feet. In many parts of Britain it is of fairly rapid growth, though as yet in no ways approaching the height attained in its North American home.

When the Conifer Conference was held at Chiswick, nineteen years ago, statistics were published of the largest conifers in the British Islands. At that time the tallest specimen of Cupressus Lawsoniana was one in the grounds of Dupplin Castle, Perth, whose height was then 55 feet, but, of course, by now it will be greatly exceeded in many parts of the country.

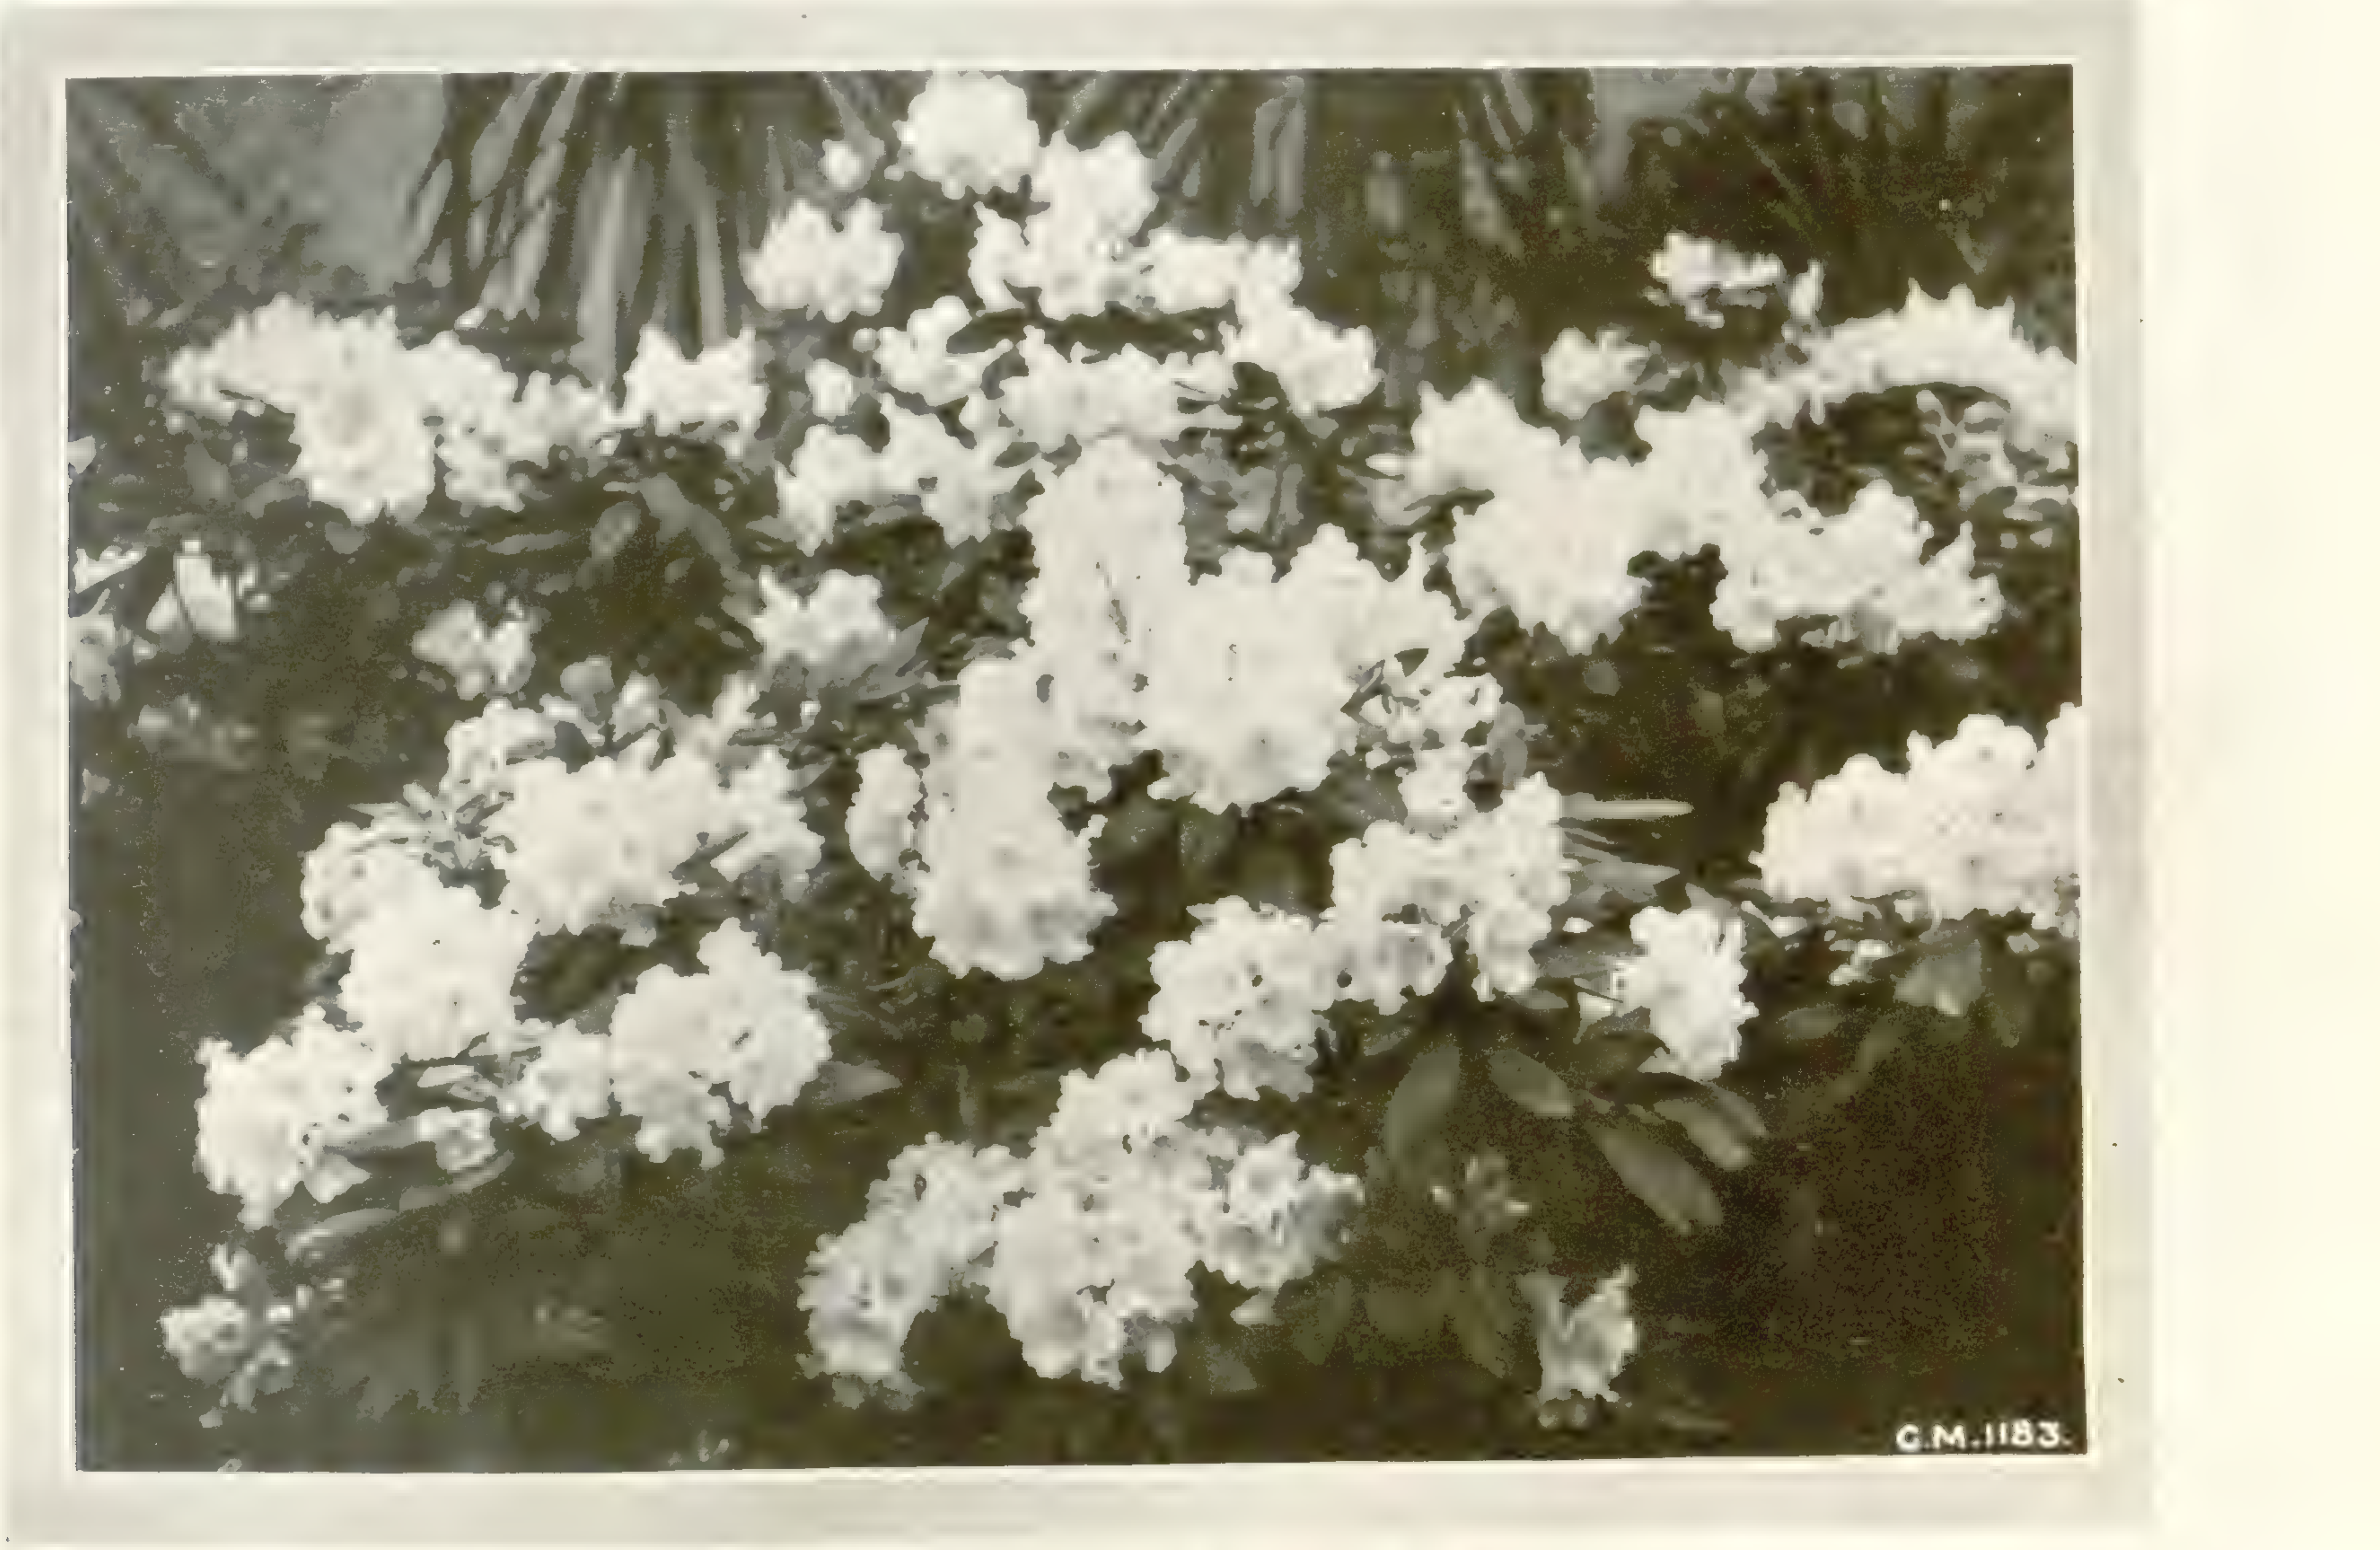
Turning from the typical form to the garden varieties, one is really confused with their numbers, and the difficulty of making a selection therefrom. An exceedingly handsome variety is glauca, which is herewith illustrated from a specimen at Kew. In this, instead of the leaves being of the normal green tint, they are of a markedly glaucous hue. Some individuals have this character more pronounced than others, one of the most noteworthy of them being Triomphe de Boskoop, perhaps the bluest of all. Other varieties are: alba spica, which has the tips of the young shoots quite white, but the second season they become of the normal green tint; Allumi, a dense columnar form, with short branches, and rigid erect branchlets clothed with peculiar steely-blue leaves; compacta, a dense compact form of the type; erecta viridis, an upright specimen with bright grass-green foliage; filifera, whose terminal shoots are very long, attenuated, and drooping; gracilis, from the pendulous character of the slender branchlets, this forms a very graceful specimen; gracilis aurea, a golden-tinted form of the preceding; intertexta, of a peculiarly coarse, loose habit of growth; lutea, a good golden-leaved form; nana, quite a diminutive shrub, of a deep green tint; nana glauca, a glaucous counterpart of the last; patula, the branches of which are spread out in a peculiar fan-like fashion; Smithi, a columnar growing plant of a glaucous-green hue; Wisseli, of a dense plumose habit, the branchlets being peculiarly tufted; and Westermanni, of graceful growth, tipped with yellow.

These are a few of the well-marked varieties, but Cupressus Lawsoniana is so variable that when raised in quantity from seed it is often quite possible to select some pretty and distinct forms.

Closely allied to Lawson's cypress is Cupressus nootkatensis, a native of British Columbia and adjacent regions. It forms a specimen of a broadly conical outline, and of a deep green colour. There are but few varieties, the principal being compacta, pendula, and lutea, whose prominent characteristics are indicated by their respective names. This cupressus is often met with in gardens under the name of Thuiopsis borealis.

Cupressus thuoides, the White Cedar, is not much planted, though perfectly hardy. In a native state it occurs principally in moist ground, being, in fact, often met with associated with the deciduous cypress (Taxodium distichum) in swampy districts. If the ground is at all dry the white cedar becomes bare and unhappy looking, for which reason it is not generally met with. There is a glaucous and a variegated variety, and a little upright form, generally grown as Retinospora leptoclada.

Cupressus sempervirens is the cypress of the poets and writers of all ages. It is said to have been introduced into England previous to 1548, in which year it was included by Turner in his "Names of Herbes." It is a native of the South of Europe and Asia Minor, and the fastigiate variety especially forms a very notable feature of the landscape, brought into particular prominence by reason of the striking contrast with the surroundings. There are two distinct types of this cypress, one with spreading branches, and the other of quite a columnar habit of growth. These have been by some writers regarded as two distinct species, but they are now considered to be varieties of one. There are many cypress trees on the southern portion of the continent of quite historic interest, but in this country it does not always succeed, an exceptionable winter being often too much for it



NEW HARDY RHODODENDRON PRINCESS JULIANA.

An extremely beautiful variety; the flowers white suffused rich pink. Gold Medal, Haarlem, 1910, as the best new plant in the Show. F.C.C., R.H.S., May 24, 1910. Messrs. J. Waterer and Sons, Bagshot.

Cupressus macrocarpa, often referred to as the Monterey cypress, is a native of California, and is in many parts of this country liable to be injured by very sèvere winters. These, however, as a rule, occur but seldom, and the tree grows so quickly that fine examples are to be met with all over the country. As a rule, it thrives best in parks and gardens near the sea, especially in the South and West. When in good condition it forms dense pyramidal or columnar specimens of the brightest green. There is a distinct golden-leaved variety of this cypress known as lutea. So quickly and so dense does C. macrocarpa grow that in some districts near the sea it is often employed as a hedge or shelter plant.

Other species of cupressus are C. arizonica, of quite recent introduction; C. Benthami, a little-known species; C. funebris, the most graceful of all, but too tender for general cultivation; C. Goveriana, but seldom met with; C. lusitanica, too tender for general planting; C. Macnabiana, of slow growth, and on this account rarely planted; C. thurifera, a tender species from Mexico; and C. torulosa, a Himalayan kind, that needs a particularly favoured district. A variety of this last, known as kashmiriana, whose long pendulous branchlets are clothed with glaucous green leaves, is even more tender than the type, but it forms a delightful and uncommon feature in the greenhouse.

This brings us to two Japanese species long grown in gardens as retinosporas, but they are now included in the genus Cupressus. The first, Cupressus (Retinospora) obtusa, though naturally a tree from 70 to 100 feet in height, is a great favourite with the Japanese for dwarfing purposes. A visit to the White City will show numerous examples of dwarf and contorted specimens of this cupressus, many of them being very old. Well-marked varieties, some of which used to be regarded as distinct species, are aurea, compacta, filicoides, lycopodioides, pendula, and pygmæa.

The other Japanese species is Cupressus (Retinospora) pisifera. It is, as a rule, a less ornamental tree than the preceding, but there are some pretty and distinct varieties. Like the forms of C. obtusa, some of these were at one time looked upon as separate species. The best are aurea, filifera, filifera aurea, plumosa, plumosa aurea, and squarrosa. For small or medium gardens these varieties are very desirable. W. Truelove.

A GOOD NEW RHODODENDRON.

A handsome new rhododendron that promises to be extremely popular in southern gardens is Princess Juliana. We saw this at the Jubilee Show at Haarlem in March last, when it was exhibited by Messrs. C. B. Van Nes and Sons, of Boskoop. It is somewhat similar in character to the magnificent and highly popular Pink Pearl, but differs from that variety in having its flowers finely frilled at the margin, and of a deep brilliant pink hue during the earlier stages of development. It is said to have originated as the result of a cross between Rhododendron Aucklandi and a hybrid. Princess Juliana was awarded the gold medal offered at Haarlem for the best new plant in the exhibition. When fully opened the flowers of this variety are quite white, and just before they fall they assume a blush tint. At the Temple Show held in May last Messrs. J. Waterer and Sons, Bagshot, exhibited a fine plant of Rhododendron Princess Juliana, and an Award of Merit was then made in its favour by the Royal Horticultural Society. The habit of the plant is good, the flowers of large size, and widely expanded, and the trusses are splendid.

CHOICE PLUMS AS BUSH TREES.

The desire of the man who grows plums for market is to get varieties which, under average conditions, will grow freely and bear heavily, and, consequently, there are plums which are prized in the private garden alone for the excellence of their flavour, and also appearance, that are never seen inside a market plantation. The conditions are different; the market man has one idea, i.e., profit, but in the private establishment plums are grown to eat, and the object of growing what are called choice varieties is to have fruit on the dessert table over as long a period as possible. Again, the market grower chooses the type of tree which is the most suited to him, namely, half standards, because they need less attention in the way of pruning, and the heads being well above the ground other crops can be grown beneath until the trees occupy the whole space above.

The bush type of tree, which does not in a general way commend itself to the market grower, is better adapted to the conditions of the private garden where a piece of ground can be devoted to plums, and the object is to grow a selection of dessert varieties to form a succession. Perhaps it would be well, in discussing bush plums, to consider dessert varieties first, to serve the purpose mentioned above.

Can Rivers' Early Prolific be classed as a choice dessert variety? Personally, I think it is quite good enough to make one of four for late July and early August, and for the rest we must fall back on the Gage type. Denniston's Superb is true to its name, its yellow fruits being of good flavour, while the tree is a prolific bearer. Early Transparent Gage is one of the best of the early garden dessert plums, and Oullin's Golden Gage is a very handsome fruit of good flavour. For early September picking Belgian Purple is well worth a place, and I am tempted to put it before the very handsome Kirke's Blue, as the latter is a shy bearer; but what man who likes plums would be without the old Greengage, the best and richest of them all, though not so prolific a bearer in its early years as some others. Jefferson is another September plum that is well known, and much too good to be overlooked. So much for the second four, and now we want a few late plums to make up the dozen. First I will mention Reine Claude de Bavay, a fine late gage, which extends the season of this class of plum, and the late Transparent Gage is another variety which crops well, and is of good flavour. Coe's Golden Drop must necessarily have a place amongst late plums, and it needs no description, but in some places it is necessary to pick its fruits and lay them out under glass to finish the ripening process. Lastly, there is the Golden Transparent, a handsome fruit of good flavour, and very late. This completes the dozen, and apologies are tendered to other good plums that are left out.

In considering the question of soil the nature of stone fruit prompts one to ask this question before any other: Is there any lime in it? If there is any doubt on the point lime should be applied before the planting is done, either by digging in some old mortar rubble or applying a dressing of ground lime at the rate of about half a ton per acre, and treating it in the same way. An ideal type of bush plum is one that has been furnished in the nursery with a compact and well-shaped head close to the ground, and the object to aim at is to grow the tree so that by the time it is well established it will be well supplied with fruiting wood, but make new growth enough each year for the purpose of extension. It does not necessarily follow that every variety must be treated alike, and the intelligent grower gets to know his fruits as he goes on, but, after planting in the late autumn, at, say, ten or twelve feet apart, the first pruning the following spring should consist of cutting back the strong growths to about half their length with the object of laying the foundation of the tree, and creating new branches for this purpose. H.

(To be continued.)

MOON DAISIES.

The handsome and useful Chrysanthemum maximum is a near relative of our wild English plant (C. leucanthemum) known as the Ox-eye or Moon Daisy, more commonly, perhaps, of recent years as the Marguerite, and it and its numerous varieties are often spoken of by the same names. It is supposed to be a variety of this which Luther Burbank claimed to have originated and so widely advertised as the Shasta Daisy, a name now often applied to the whole class. The species, a native of the Maritime Alps, is a plant growing about 2½ft. high, producing an abundance of large white flowers in July and August.

Moon daisies have only come into general use in comparatively recent years, and William Robinson, in the 1900 edition of his "English Flower Garden," says, in a spirit of very faint praise: "Varieties have been raised which have some value as border plants and for cutting." Many varieties have been introduced since then, and they are now recognised as most desirable plants in the herbaceous borders, coming into flower for the most part in June and July, and lasting for a couple of months, whilst rivalling some other members of the compositæ in the length of time they last in water when cut.

The uses of these plants in the border are too obvious to need enlarging upon to any extent. One of the prettiest ways of using them I ever saw was in mixture with Gypsophila paniculata, the latter being staked sufficiently to prevent them being smothered. The effect of the large white blossoms intermixed with the myriad little points of the gypsophila as a foil and a background was better than one would imagine who had not seen it. There was the further advantage that the plants were partially concealed when they began to get untidy. But one must beware of letting them be too much overgrown by other plants during the late summer and autumn as this is a frequent cause of their loss.

It is not necessary to grow many varieties as the general effect of all in the distance and in the mass is very similar. Those who want size will grow King Edward, with enormous flowers four or five inches across, which are borne on very rigid stems. Some will regard these as coarse, and will prefer smaller varieties, such as the Munstead, Prince Henry, or W. H. Gabb, the latter coming into flower rather earlier than most, though it is rather taller in growth, the flowers being borne on long single stems. The most distinct of all the varieties is William Robinson, the petals, or ray florets, of which are finely divided and waved, making it one of the most beautiful for table decoration. The species is also worth growing, but C. m. grandiflorum has larger flowers, and is more vigorous in its growth.

Alger Petts.

JAPANESE MAPLES.

Although considerable attention has been directed of late years to the Japanese maples, the all-important question of their value for garden decoration has not been discussed so fully as these charming shrubs deserve. In dealing briefly with the decorative character of the far-famed maples of Japan, I shall endeavour to leave the discussion of the varieties alone, and merely render a slight appreciation of their beauty.

It must be borne in mind that the acers, or maples, of Japan are not always a thorough success, and the sight of bushes covered with battered leafage as one ofttimes sees, is only another evidence of unsuitability of position. Now, I wish to press upon our garden lovers the idea of the splendour of Japanese maples in the rock garden. What are more effective during the autumn days than masses of bright red foliage, spreading forward over the dark weathered rocks? Masses of those sterling varieties of A. palmatum, such as sanguineum, Seigen, rubrifolium, Osakasuki, and Chiso, which form clouds of shining brilliancy against the dark-hued stones, are glorious indeed. Group them among the rock breaks, and let them crown some of the higher ledges, and you will have an autumn effect most pleasing to behold, and if you have the additional charm of pool or waterway at the base of the rocks, then the rich-hued scarlet maples, photographed, as it were, in the water, will give double beauty to the scene.

The Japanese, imbued with the love of those picture masses of maples in their native glory on the hillsides, have utilised them with fine effect in many of their garden schemes, and the richness of colouring and the grace of outline is certainly notable. Grouped in sunny spots on the banks of the wild garden the maples will contribute much to the beauty of the scene, and a free use of the better forms is to be warmly advocated. For forming lawn specimens, or for giving a touch of gaiety to the shrubbery, the maples are of the utmost value, while in many places they are grown in pots for conservatory decoration, a purpose they serve very well indeed.

Although I have noted the scarlet forms the reader will assuredly realise the decorative character of the whole group. The diverse form of the foliage of the many varietal forms of A. palmatum and A. japonicum, with the wondrous colour range, which embraces white, green, gold, pink, red, purple, and many intervening shades, will appeal to all lovers of the beautiful.

Rock crests and water margins, mossy banks and sloping dells, may be rendered the more charming by these maples of Japan. Glorious they are during the summertide, but it is in the autumn, when the floral year is waning, that the maples reach the zenith of their brilliancy. They are then exquisite, and the rocks seems to glow again with their burden of shining gold and fiery crimson.

Soil and situation have much to do with success in maple culture. Many growers make a practice of using peat for the maples, but good results may be obtained by planting them firmly in a mixture of fibrous loam and leaf-soil, which can be lightened by the addition of a little sand. For position, choose, if possible, one that is sheltered somewhat from north and east. Not because of any lack of hardiness in the maples, but for the reason that sometimes the keen winds and frosts of early spring may materially damage the foliage, and thus spoil the beauty of a whole season.

P. S. Hayward.

BY SPECIAL APPOINTMENT

BOULTON & PAUL, LTD

MAKERS, NORWICH

MODERN GLASSHOUSES

Designed and Built by us, comprising the Latest Improvements in Construction, Ventilation, Heating, etc., will give continued satisfaction and profit.

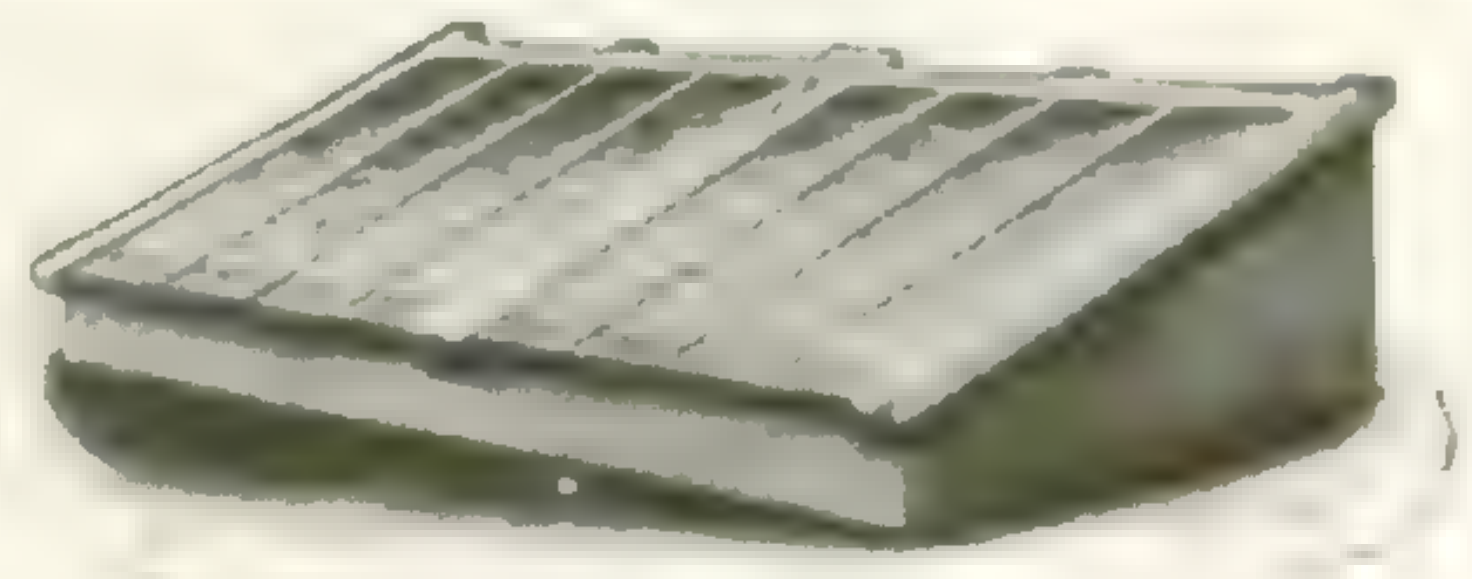
Enquiries invited for

WINTER GARDENS, CONSERVATORIES, VINERIES, PEACH HOUSES, MELON HOUSES, GLAZED PORCHES.

Representatives sent to take particulars in any part of the Country.

HEATING APPARATUS installed in Country Houses, Churches, and Horticultural Buildings in the most economical manner.

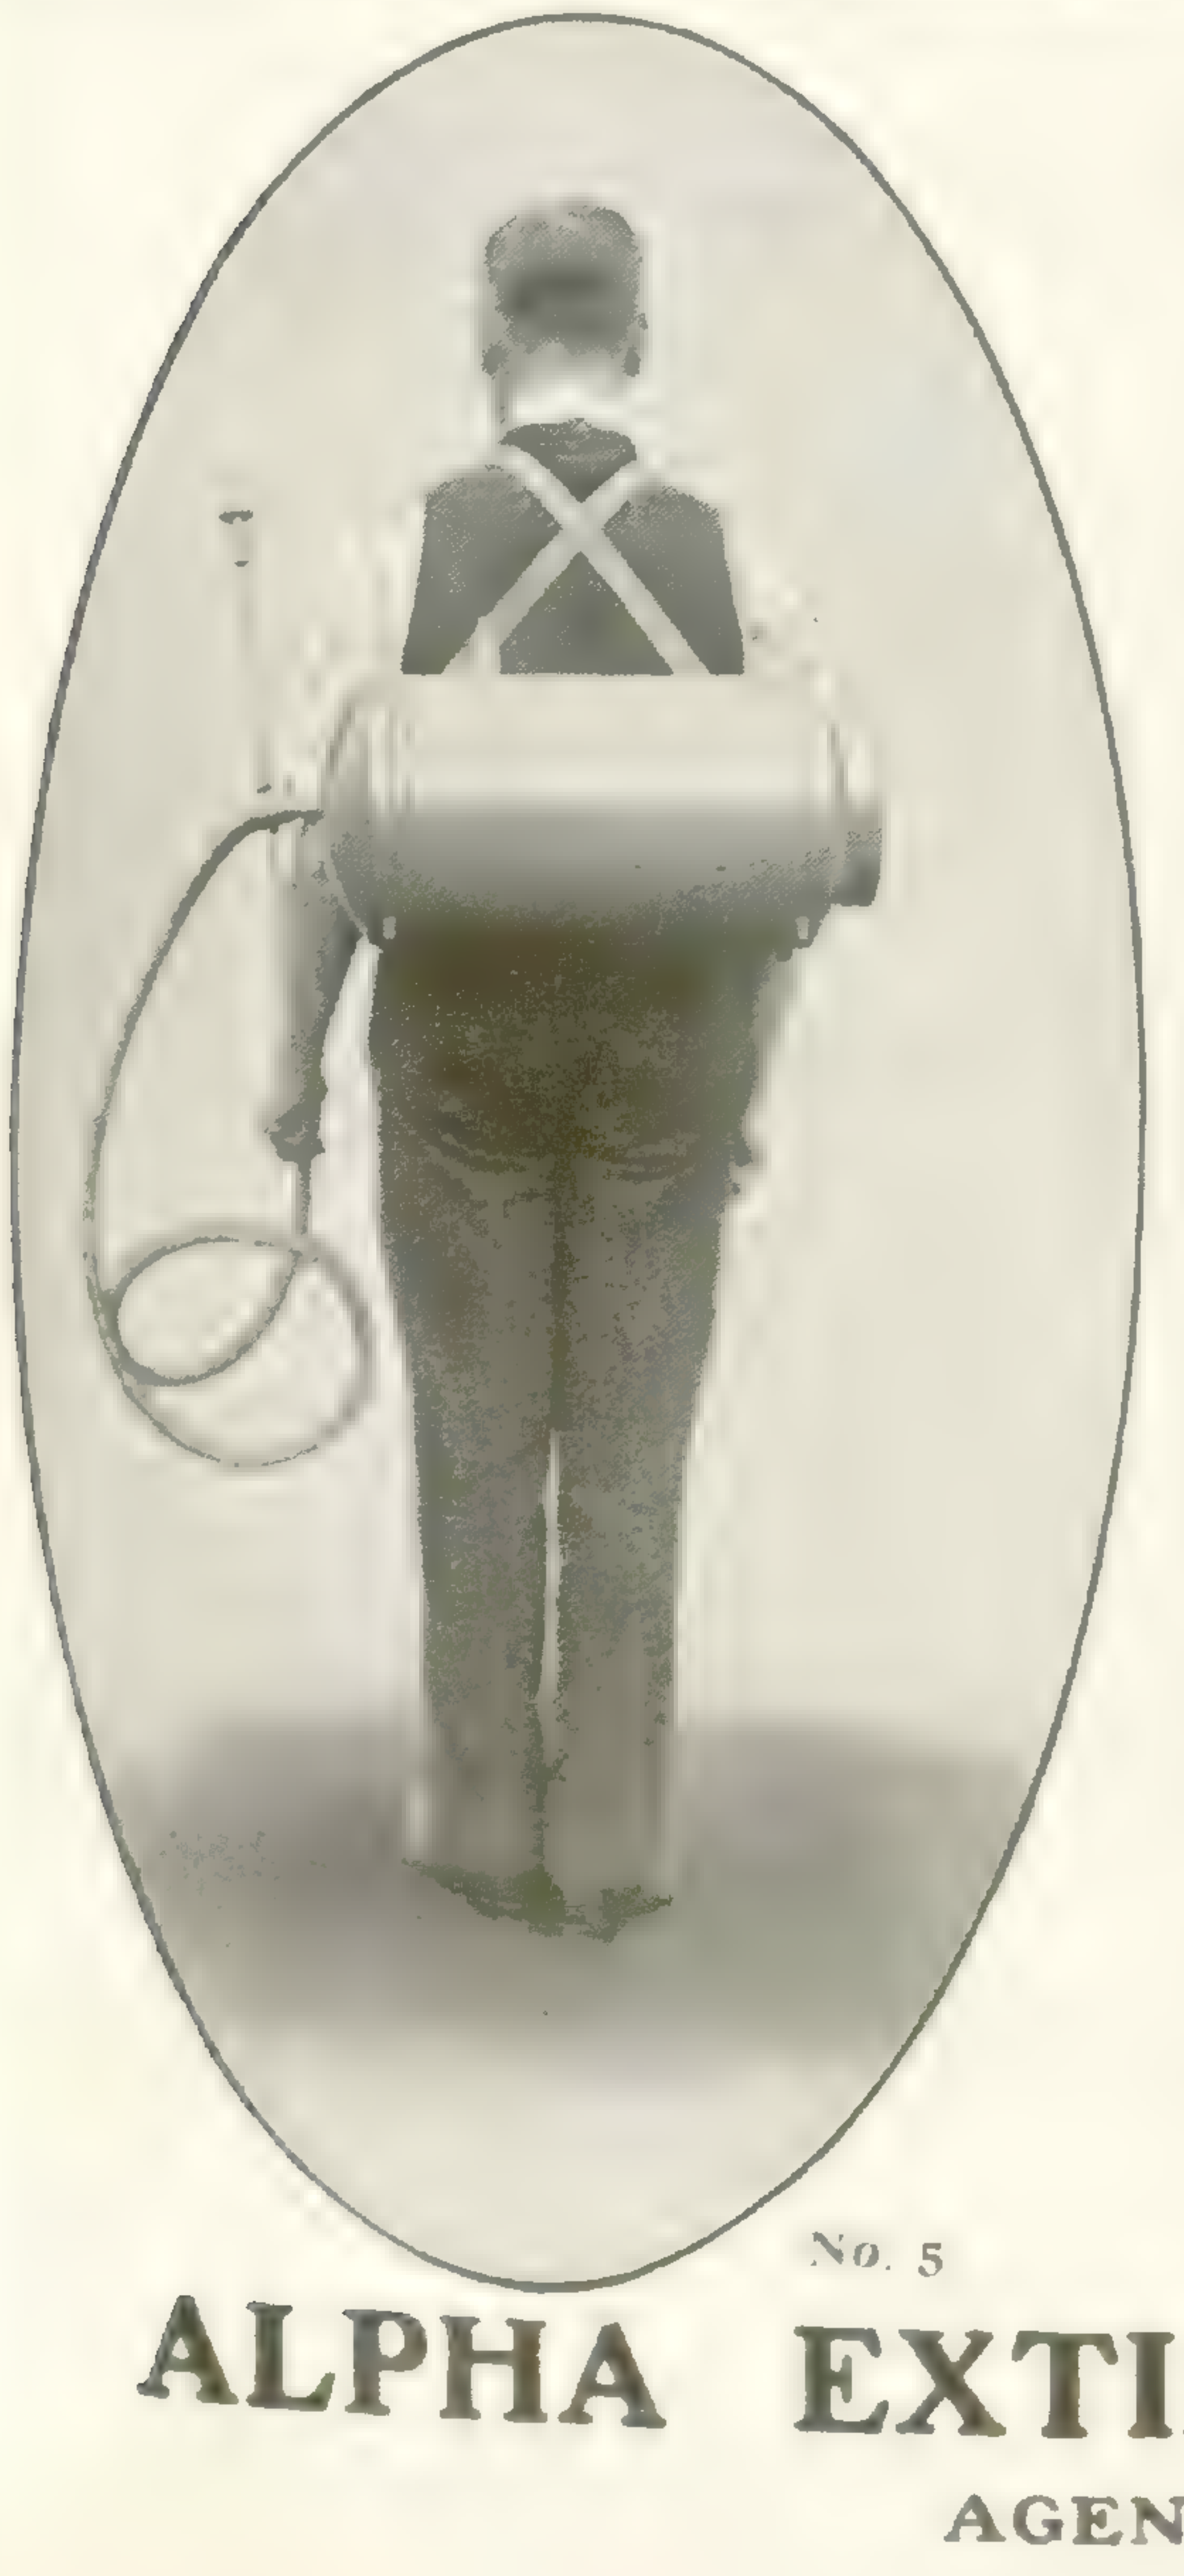
GARDEN FRAMES in great variety, always in stock.



Send for latest Illustrated Catalogues, free on Application.

ARCHITECTS DESIGNS CAREFULLY CARRIED OUT.

THE ALPHA, King of Sprayers.



No. 5

Awarded 11 Medals and Diplomas.

No other sprayer can be compared with it for efficiency and simplicity; no work, no trouble, never gets out of order, no continuous pumping. One person only required to use any size machine.

Charged with compressed air by means of an ordinary bicycle foot pump.

What the Royal Horticultural Society think of this Sprayer:—

"We consider this to be one of the finest Sprayers on the market."
From R.H.S. Report in JOURNAL, March, 1910.

For use in ORCHARD, GARDEN, GREENHOUSE, CONSERVATORY.

Can be used for Lime and Whitewash Spraying, Disinfecting, &c.

The Knapsack, 3½ gallons, awarded First Diploma in open competition, complete with powerful foot pump, 60/0.

MADE IN SIX OTHER SIZES, DIFFERENT PATTERNS.

1 quart, 15/0; 2 quarts, 16/6; 3 quarts, 17/6; 1½ gallons, 47/6; 3½ gallons special Lime and Whitewash Spraying Machine, 58/6; 5-gallon Sprayer, suitable for any purpose, 75/0.

Any Tree-Spraying Solution or Insect-Killer may be used with wonderful effect in these machines.

APPLES AND PEARS IN POTS.

A great incentive has been given to the culture of apples and pears in pots by their exhibition at the summer and early autumn exhibitions, these fruits being staged finely by several firms, and from a few private gardens. It may be said, and perhaps rightly so, that apples and pears are given glass room only in the best-appointed gardens, where the luxury of having such out-of-season fruits is permitted or demanded. It is true that buildings inexpensive in their appointment will readily meet the requirements of orchard fruits. This is proved yearly by the great trade houses, who regularly appear at the leading shows with fruit-bearing trees in pots, and perhaps no name is more familiar in this phase of fruit culture than that of the Messrs. Rivers, of Sawbridgeworth, who have been engaged for so many years in pot-tree culture.

In the garden situated in a southern or other favoured locality, it may not be necessary to cultivate either apples or pears in pots, because from August onward there are four sheltering walls, and open air trees giving a succession consistent with the season and its demands. It is in districts where the sun has less power and the rainfall is considerable that the value of the orchard house is found, for here poor quality, deficiency of colour and size, to say nothing of uncertain crops, becomes often a disappointing experience. Those, therefore, who are victimised by climate derive the greater benefit from a system of pot culture.

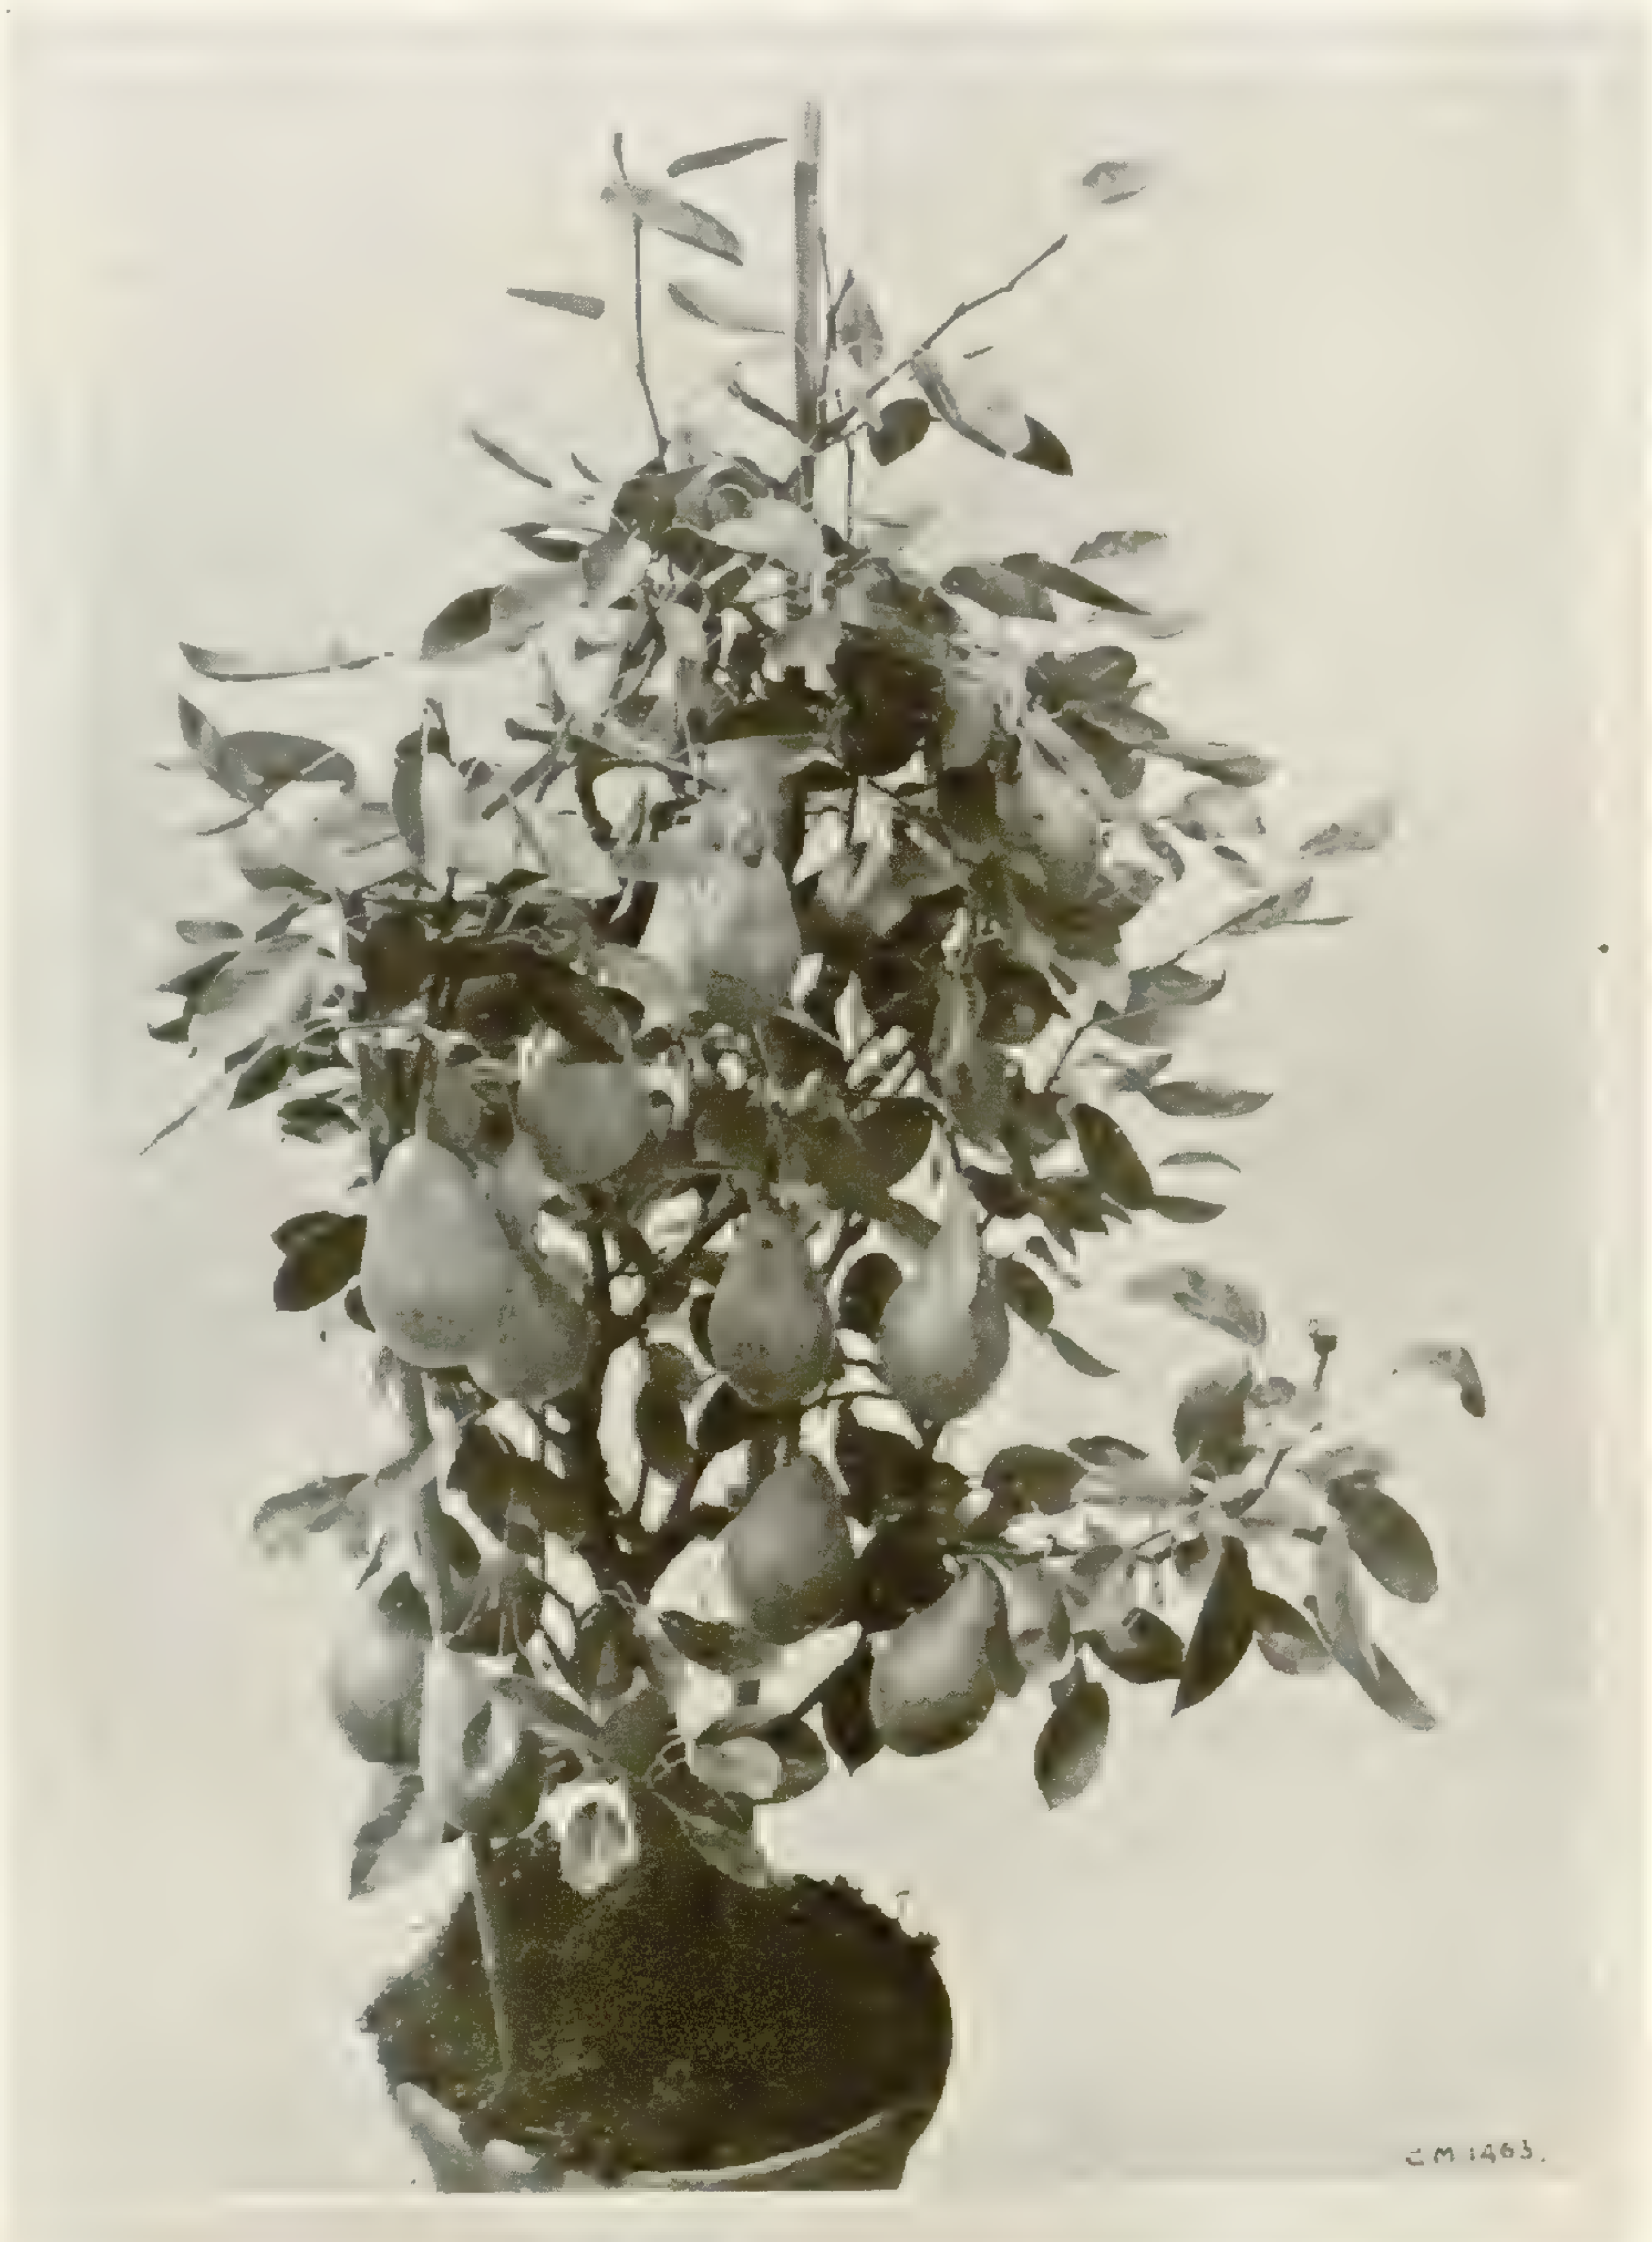
Only the best and most rational practices are likely to satisfy, and though these may be simple, close study and watchful application alone ensures success. It is truly remarkable what perfection of fruit follows skilful practice in pot culture. One has only to reflect for a moment on the large and grandly coloured apples and pears contributed by Messrs. Rivers, Bunyard, Veitch, or William Paul, at the shows of the Royal Horticultural Society, or those seen at summer exhibitions staged by the Messrs. Gibson, Barnes, and Goodacre.

Unlike the peach and nectarine, neither apples nor pears will respond to hard forcing, especially in the early stages of their spring growth. An attempt to force them into unduly early growth and flower will result in disappointment, therefore one may avoid excessive expenditure on fuel, and depend more largely on solar aids to progress. Trees well prepared in their early days, having their pots well filled with active roots, and their summer growth kept in subjection, are those best calculated to give a crop of fine fruits, either for home use or exhibition. Perfect maturity is an all-important necessity, but is one by no means difficult to bring about, because the influence of root restriction should be distinctly reflected in the summer shoots and leaves.

Great importance is attached to the ramming stick in the potting, or even top-dressing of pot-grown trees, as its use assists in the matters already reviewed. Willow-like shoots in summer are by no means the pride of the man in charge, for he knows only too well that it is a bad augury for the future. Potting and top-dressing is commonly advised in early autumn while there is yet foliage unmatured. So long as there is foliage there is a corresponding activity of roots, and the importance of healthy, active roots in late autumn cannot be overrated, as on these largely depend the extent and certainty of prospective crops. The month of October is claimed to be a most suitable period to repot, when this is necessary, or to pot up trees lifted from the open ground. As, however, trees established in pots are regarded as the best form of investment further remarks are unneeded.

When the home stock needs renovation experience demands a reduction of the soil ball by a careful combing out of the tangled roots, to an extent admitting of the return of the reduced ball to the same sized, or slightly larger, pot, as the case requires. Fibrous loam, with sparing additions of lime rubble, burnt refuse, and some form of concentrated artificial manure, will give the right kind of soil. The drainage must be ample, without in any sense inclining to excess. Too much stress cannot be laid on firmness in potting, assuming the compost to be in a good workable state. During the autumn the trees are best outside, with their pots plunged in ashes.

In regard to varieties much need not be written, because a long list is unnecessary, and the choice will naturally fall on those kinds that serve the particular purpose of the undertaking. In apples, Washington, Ribston Pippin, Cox's Orange Pippin, Peasgood's Nonsuch, Gascoigne's Scarlet, Bismarck, Emperor Alexander, and Tyler's Kernel may be mentioned as favourites, while in pears Clapp's Favourite, Souvenir du Congres, Triomphe de Vienne, Doyenne du Comice, Pitmaston Duchess, Conference, Beurre Diel, Charles Ernest, Marie Louise, and Beurre Hardy may be cited as good candidates among many others whose names are familiar.



POT TREE OF MARIE LOUISE PEAR.

A finely fruited specimen grown by Messrs. William Paul and Son, of Waltham Cross.

Feeding with liquid stimulants has a wonderful influence on the size of pot-grown fruits, the congested state of the rooting area calling for this support, but this must be withheld until the crop is safely set, and thinned to reasonable extent. Overcropping is a fatal policy; one fruit to the square foot is a useful guide in estimating quantities. W. **Strugnell.**

Rood Ashton Gardens, Wilts.

INDIAN AZALEAS IN OPEN BORDERS.

I recently visited a large garden in the New Forest, Hampshire. The carriage drive, leading from the highway to the mansion, is a long one with fairly high banks on both sides which are clothed with flowering shrubs chiefly. I was quite prepared to see some nice specimens, but not to see such grand ones of Azalea indica. Some of the latter measured five feet in diameter, were very robust and flowered freely. The rooting medium was composed of sandy soil, gravel and peat—the natural formation. On the lawn were other large beds entirely filled with azaleas in variety and all growing in the same kind of compost. For many years past these plants had been growing in the open borders without any protection, and had proved very satisfactory. Judging from what I have seen, I should quite expect Azalea indica to do remarkably well in open borders in many districts in the southern counties.

G. B.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

CATTLEYA HOUSE.—There are several species and varieties among the cattleyas, lælias, and the bigeneric hybrids that are advancing their flower buds at this season of the year. Such plants should be liberally treated and placed in the best positions available to assist them in developing and expanding their flowers. Much depends upon the conditions under which the plants are cultivated; in some districts, where the light is obscured by impure atmospheric conditions outside, the plants should be placed in a position within a reasonable distance from the roof glass, so that they may have the full benefit of the available light until the flowers have become expanded. Plants that are still in an active state of growth should be placed at the warmest end of the house, where they may have the necessary assistance to enable them to mature their growths.

LÆLIA ANCEPS and its varietal forms will now be displaying their flower scapes. It is well to keep all flowering plants of this species together, and remove those which are not flowering and have completed their growth to a structure in which they will enjoy cooler conditions, unless it is desirable to repot at this season. The plants usually commence rooting as soon as growth is completed, and this is the stage at which to repot where they require it. It is not desirable to disturb L. anceps at the roots more frequently than is absolutely necessary. Indeed, unless they have outgrown their receptacles, or the potting compost is in an advanced state of decay, they should not be disturbed, and as they are about to enter upon a prolonged season of rest, top-dressing may be deferred until the spring. All flowering plants should now be exposed to the benefit of full sunlight and the necessary encouragement must be given to assist them to properly expand their flowers. It is quite soon enough to place the plants in their resting conditions after the flower scapes have been removed.

VANDA CÆRULEA.—It is a pity this lovely blue-flowered orchid cannot be induced to grow satisfactorily for many years after it has been imported, there are a few exceptions to the rule, but these exceptions are in cases where houses are set apart for their culture, and in which plants are grown successfully. There is no plant that I have had to deal with for which a pure atmosphere has greater benefits. In the neighbourhood of London, or even in its atmosphere for a few hours, the blue pigment becomes bleached out, and the flowers are practically white. This is what is generally contended with in unfavourable atmospheric conditions of other large towns. Where plants are developing their flower scapes, and expanding their flowers, they should be placed in a position where they may obtain full benefit of the available light, and ample moisture must be afforded.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

CUTTINGS of crotons, panax, coleus, panicum, etc., that were put in the propagating frame early in September should, after a little judicious airing, be ready for removal. The young crotons will be best placed on a shelf, where they will receive a maximum of light, but be well out of the draught from the ventilators. In this position they should keep sturdy, and of good colour, during the winter, but as they will only get syringed occasionally on the under part of the leaves, they should be taken down now and again and dipped, or syringed, with insecticide, to keep thrips or red spider in check. This applies to many classes of plants that may be on shelves during the winter, as the greater amount of fire heat and less syringing make them more liable to the attacks of insect pests.

YOUNG DRACÆNAS that may have been raised from "toes," several in a pot, should be potted off as quickly as possible into a very light compost of peat, leaf-soil, and sand, using very small pots for the purpose. These, with careful attention during the winter, should make nice stuff for potting quite early in the year, and thus provide good-sized table plants a month or two earlier than those raised in the spring.

PENTAS CARNEA.—This is another winter-flowering stove plant of bushy habit, which is well worth growing, especially where buttonhole bouquets are in demand, the flesh-coloured flowers being well adapted for the purpose. It has the very useful habit of continuing in bloom for several months; plants coming into bloom now should be given all the light possible.

RUELLIA MACRANTHA and varieties of justicia I have referred to in previous calendars, and if a house could be devoted to these and the other flowering plants that I have mentioned, they would be found to do well together, and would provide a much better show than when cultivated with other stove plants during the winter months, the heavy dampings and occasional syringings being very detrimental to plants that are opening their flowers.

BRIGHT DRACÆNAS.—Where a good batch of the highly-coloured dracænas are grown it may be wise to place them altogether on one side of the stove, and in a position where they will not be much syringed overhead, as the better coloured they are the more liable are the points of the leaves to turn brown through excess of moisture, so, instead of syringing them overhead, damp well beneath the pots, and give them an occasional sponging with well-diluted insecticide to keep them clean.—Thomas Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

PLANTING PEACHES AND NECTARINES.—Those who intend planting this season should no longer delay in ordering the trees, as the best time for planting is near. Good varieties to select from are plentiful, but as ordinary growers have not space at command for many, a comparatively short list only will be given, and this includes some of both new and old varieties. Peaches.—Amsden June, Hales' Early, Duke of York, Early Grosse Mignonne, Bellegarde, Royal George, Dymond, Peregrine, Noblesse, Violette Hative, Barrington, Raymackers, Princess of Wales, Thomas Rivers, and Late Devonian. Nectarines.—Cardinal, Early Rivers, Dryden, Violette Hative, Humboldt, and Pineapple. These varieties can be relied upon under glass. When young trees are received from a nursery they should be carefully unpacked, and have the jagged ends and other damaged portions of roots removed by a clean cut, and if the roots are dry plunge them for a short time in water. Then plant without delay, and in doing so take out a hole in the border (the making of which was dealt with in a recent calendar) of adequate dimensions, in which to regularly spread the roots in a horizontal position, and sufficiently deep to allow the stems being covered to the same depth as before the trees were lifted. When covering the roots place some of the finest of the compost in immediate contact with them, and make the whole of it quite firm. Finish the work by loosely securing the largest branches to the trellis, mulching the border with stable litter, and well watering it. It is an excellent practice, provided it can be sufficiently foreseen that they will be required, to plant and train trees upon an outside wall, and keep them root pruned for a year or more in readiness for planting under glass. By this means, if the planting is skilfully done and the trees are not early forced, there need be no loss of a crop of fruit. We usually adopt this practice, and are successful in moving large trees.

TOMATOES.—Keep the atmosphere of the house containing winter-fruiting plants circulating both by night and day, and keep it moderately dry and warm by the aid of artificial heat, thus preventing the fruit from splitting, and also assisting it to set. Secure the leading growths to the trellis, keep the laterals regularly removed, and the blossoms daily pollinated by the use of a rabbit's tail. Top dress the pots or ridges of compost when they become filled with roots with loam mixed with finely crushed mortar rubble and wood ashes, and when the plants develop and become heavily cropped with fruit give them an occasional top-dressing with bonemeal or a suitable artificial fertiliser. Regularly gather the fruit as it becomes ripe. If seeds have not been sown for raising plants for fruiting early in spring there should be no delay. Sow thinly in pans, pot the plants singly as they become fit, and keep them near the glass.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

THE FRAME YARD.—In all gardens there should be a portion of ground well sheltered from the north and east winds devoted to frames for gradually forcing a few vegetables of various kinds. It is here gentle hotbeds can be regularly made up, commencing now, as there is material in plenty in the way of fallen leaves, stable litter, and often late cuttings of aftermath from the orchard and other parts of the grounds. These, if judiciously mixed, form ideal beds of a lasting character. The beds that remain from last year will be found most useful for late plantings of parsley, lettuce, cauliflowers, and sowings of spinach, and other beds not required will form most excellent manure for kitchen garden plots as well as mulching and top-dressing. When the frames are brought into use on the newly-made beds, ventilate with freedom during all open weather to cause a free circulation of air among the occupants, thus assuring a strong and healthy growth.

CUCUMBERS.—Very much care, and suitable structures, will be necessary to maintain a regular supply during the winter months. The August-sown plants now coming into fruiting will need every care and encouragement to form stout growths before winter sets in. Do not overcrop the plants, but keep them perfectly clean. Keep up a steady heat and moist atmosphere according to external conditions, and top-dress very lightly with sweet loam and leaf-soil, with a little spent mushroom bed manure added. Cut the fruits as they are large enough. These will keep many days if the ends are placed in water in a dark and warm place.

RHUBARB.—The prepared stools of early varieties have ripened off completely during the late fine weather we have experienced, and these will make excellent material for forcing. It is a good plan to lift the stools entirely by working away all the soil from around them and leaving them exposed to the weather for a week or ten days; this will cause a complete rest, the results of which will be a more vigorous growth when planted in a genial temperature. Later on place the crowns at the warm end of the mushroom house, and keep the whole surroundings moist and dark.

SEAKALE.—This can be treated as advised for rhubarb, and if the crowns have been well grown and ripened it will be surprising what good dishes can be obtained by the middle of November. When taking up the crowns, if some of the leaves still remain, let them lay on the ground and wilt, after which they can be cut fairly close to the crown previous to placing them in the mushroom house or like structure. Later batches will be found to shed their leaves easily and freely.

RUNNER BEANS.—The late-sown batch is still producing very serviceable pods, and will continue should the weather remain fair. All pods when large enough should be gathered.—Geo. Ellwood, Swanmore Park Gardens.

GREAT EXHIBITION OF BRITISH-GROWN FRUIT.

(Continued from page 824.)

Mr. E. Neal was the only exhibitor of nine dishes of pears, and was awarded the first prize. Mr. J. E. Hathaway, gardener to J. Brennand, Esq., Baldersby Park, Thirsk, won the chief award for six dishes of pears with Chas. Ernest, Beurre Bachelier, Louise Bonne of Jersey, Durondeau, and Doyenne Boussoch; Mr. B. Craydon, East Street, Sittingbourne, second. Mr. B. Craydon had the best three dishes of pears, and showed General Todleben, Catillac, and Beurre Clairgeau; Mr. F. Cornford, second.

PEACHES AND PLUMS.

Mr. Brock, gardener to the Duke of Richmond, Goodwood, Chichester, led for a dish of outdoor peaches with grand examples of the handsome Salway; Mr. Markham, gardener to Viscount Enfield, Wrotham Park, Barnet, second with Princess of Wales; twelve entries. Mr. Mackinlay and Mr. Cornford, were first and second for nectarines with Victoria.

R.H.S. FRUIT SHOW—A TASTEFULLY ARRANGED COLLECTION OF HARDY FRUIT.
Exhibited by Messrs. Laxton Brothers.

Plums were fine. Mr. J. Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden, was first for three dishes of plums grown under glass, and his varieties were Coe's Golden Drop, Decaisne, and Coe's Violet; Mr. J. Hill, Kingston Lacy, second. For three dishes of outdoor-grown plums, Mr. Messenger, gardener to C. H. Berners, Esq., Wolverstone Park, Ipswich, led with Coe's Golden Drop, President, and Reine Claude de Bavay in fine condition; Mr. Vert second. Mr. Messenger was first, and Mr. Vert second for a dish of Coe's Golden Drop, out of twelve entries. For any other dessert plum, Mr. Seale, gardener to the Marquis of Northampton, Castle Ashby, Northampton, led with Late Transparent Gage Mr Messenger coming second with Reine Claude de Bavay.

For a dish of cooking plums Mr. Messenger scored with very magnificent examples of President Mr. Vert second with Monarch. Mr J Williams, Pendley Manor, Tring, was the only exhibitor of Morello cherries, and he was awarded first prize for plump fruits.

COUNTY CLASSES.

In the district county classes prizes are offered in each set for six dishes of apples (four cooking and two dessert), and six dishes of pears, distinct varieties in each case. In the apple classes the first prize was 20s., and single third-class rail fare from the exhibitor's nearest railway station to London, and the second prize 15s., and single rail fare. For the pears the cash prizes were 30s. and 20s. respectively, plus single rail fare, but in the event of a competitor winning prizes in his county class for both apples and pears only one railway fare is paid.

In the division for Kent growers Mr. J. Bond, gardener to W. E. S. Erle Drax, Esq., Wye, Kent, led for apples, and he had fine dishes of Peasgood's Nonsuch and Charles Ross; Mr. F. King, Wellington House, Westgate, second. For pears, Mr. Bond was a good first, and Mr. J. Shelton, Sevenoaks, second.

In the district including Surrey, Sussex, Hants, Dorset, Somerset, Devon, and Cornwall there were four entries of apples, and Mr. F. Brock, Goodwood, led with Warner's King, Peasgood's Nonsuch, Lane's Prince Albert, Lord Derby, Rival, and Cox's Orange Pippin; Mr. T. Turton second. In the pear section there were three entries, Mr. Turton coming first, and Mr. A. Tidy, gardener to C. H. Combe, Esq., Cobham Park, Cobham, Surrey, second.

The next division was open to growers in Wilts, Gloucester, Oxford, Bucks, Berks, Beds, Herts, and Middlesex, and here there were four sets of apples, Mr. A. R. Allan, Hillingdon Court, coming first with fine dishes of Peasgood's Nonsuch, Lord Derby, Emperor Alexander, Warner's King, Ribston Pippin, and Cox's Orange Pippin; Mr. C. Page, Dropmore, second. Mr. A. R. Allan scored also for pears, with Mr. H. Markham, Wrotham Park, Barnet, second, the latter having very highly coloured fruits.

There were two sets of apples in the division open to growers in Essex, Suffolk, Norfolk, Cambridge, Hunts, and Rutland, and here Mr. Davison, Westwick, Norwich, secured the chief award with a noble set of Bramley's Seedling, Mère de Ménage, Gascoigne's Scarlet, Stone's, Ribston Pippin, and Cox's Orange Pippin; Mr. W. A. Voss, Rayleigh, second. For pears Mr. Davison was a capital first with heavy dishes of Pitmaston Duchess, Durondeau, Conference, Doyenne du Comice, Triomphe de Vienne, and Marie Louise; Mr. W. Messenger, Wolverstone Park, Ipswich, second.

The counties of Lincoln, Northampton, Warwick, Leicester, Notts, Derby, Staffs, Shropshire, and Cheshire contributed two sets of apples, Mr. W. H. Divers, gardener to the Duke of Rutland, Belvoir Castle, Grantham, coming first, and Mr. John Lee, Higher Bebington, Cheshire, second. In the pear section premier award fell to Mr. James Gibson, Welbeck Abbey Gardens, for a fine set of Charles Ernest, Emile d'Heyst, Pitmaston Duchess, Marie Benoist, Beurre Diel, and Doyenne du Comice; Mr. J. Taylor, Hardwicke Grange, second.

Another division was open to growers in Worcester, Hereford, Monmouth, Glamorgan, Carmarthen, and Pembroke, and here Mr. Denis Best, Worcester, led for apples, followed by Mr. J. Rick, gardener to G. H. Hadfield, Esq., Moraston House, Ross. Mr. Rick was the only exhibitor of pears, and was awarded first prize.

All other counties of Wales were grouped to form a district, and here Mr. G. Aitkens, gardener to P. Yorke, Esq., Erddig Park, Wrexham, was first, and Mr. H. Forder, gardener to Colonel Cornwallis West, Denbighshire, second. The same competitors were similarly placed for pears.

The six northern counties presented two sets each of apples and pears. Mr. J. E. Hathaway, gardener to J. Brennand, Esq., Baldersby Park, Thirsk, was first for apples, and Mr. W. E. Hyde, Norwood Hall, Sheffield, second, the same competitors coming first and second respectively for pears.

From Scotland one set of apples was brought, and this, from Mr. J. Duff, gardener to Colonel Gordon, Threave, Castle Douglas, was given a first prize, and deservedly so, for his dishes of The Queen, Hawthornden, Peasgood's Nonsuch, Gascoigne's Scarlet, King of the Pippins, and Worcester Pearmain, were of good size and finely coloured.

Irish growers sent two sets of apples, Mr. Tomalin, gardener to the Earl of Bessborough, Piltown, Co. Kilkenny, scoring with fine fruits of Stone's, Peasgood's Nonsuch, Hambling's Seedling, Warner's King, Cox's Orange Pippin, and King of the Pippins; Mr. C. P. Broad, Aghern, Conna, Co. Cork, Ireland, second.

There were no competitors from the Channel Islands.

DESSERT APPLES—SINGLE DISHES.

We can only afford space for the first prize-winner in the single dish classes; two prizes were offered in each case, these being 7s. and 5s. respectively.

Adam's Pearmain, six entries; Mr. A. R. Allan, gardener to Lord Hillingdon, Hillingdon Court, Uxbridge. Allington Pippin, fourteen entries; Mr. T. Stevenson, Woburn Place Gardens, Addlestone. American Mother, six entries; Mr. A. R. Allan. Ballinora Pippin, one entry; Mr. J. Shelton. Belle de Boskoop, four entries; Mr. Barnes, Bearwood Gardens, Wokingham. Ben's Red, three entries; Mr. J. Bond, Wye, Kent. Blenheim Orange, ten entries; Mr. King, gardener to Rev. H. A. Bull, Wellington House, Westgate. Charles Ross, eight entries; Mr. G. Crayden, Sittingbourne. Christmas Pearmain, four entries; Mr. F. Brock, Goodwood Gardens. Claygate Pearmain, three entries; Mr. Edwards, gardener to C. A. Morris Field, Esq., Beechy Lees, Sevenoaks. Coronation, four entries; Mr. F. Brock. Cox's Orange Pippin, fifteen entries; Mr. Denis Best, Worcester. Duke of Devonshire, four entries; Mr. W. A. Voss, Rayleigh, Essex. Egremont Russet, seven entries; Mr. J. Bond, Wye. Fearn's Pippin, three entries; Mr. W. Barnes.

Golden Reinette, no entries. Houblon, one entry; Mr. G. Richardson, Newton Abbott. James Grieve, nine entries; Mr. Jas. Vert. King of Tompkin's County, three entries; Mr. Jas. Vert. Lord Hindlip, one entry; second prize to Mr. W. Paulley, Thornton Heath. Margil, four entries; Mr. J. Shelton. Ribston Pippin, thirteen entries; Mr. A. R. Allan. Rival, six entries; Mr. F. Brock. Scarlet Nonpareil, one entry; second prize to Mr. F. W. Herbert, Nutfield. St. Edmund's Pippin, five entries; Mr. F. Landsdell, Desford Industrial School, Leicester. Wealthy, eight entries; Mr. C. O. Walter, Ickleton House, Wantage. Any other variety, fit for use, fifteen entries; Mr. A. R. Allan, with King of the Pippins. Any other variety, for late use, ten entries; Mr. W. Barnes, with Cornish Gilliflower.

R.H.S. FRUIT SHOW—A FINE DISH OF APPLE MERE DE MENAGE,
Included in the first prize collection in the Affiliated Societies' class, which was exhibited by the East Anglian Horticultural Society.

COOKING APPLES—SINGLE DISHES.

Annie Elizabeth, eleven entries; Mr. H. Smith, gardener to B. Henderson, Esq., Little Berkhamsted. Beauty of Kent, four entries; Mr. J. B. Lowe, gardener to G. Lubbock, Esq., Broadoaks, Byfleet. Bismarck, six entries; Mr. Denis Best, Worcester. Bramley's Seedling, thirteen entries; Mr. J. C. Sutton, gardener to Earl Stanhope, Cheveney Park, Sevenoaks. Byford Wonder, two entries; Mr. R. Edwards, Beechy Lees, Sevenoaks. Dumelow's Seedling, five entries; Mr. A. Smith, Roehampton Lane, S.W. Ecklinville, five entries; Mr. T. Stevenson, gardener to E. G. Mocatta, Esq., Addlestone. Edward VII., one entry; Mr. F. Lansdell, Leicester. Emneth Early, no entry. Emperor Alexander, two entries; Mr. F. W. Herbert, Nutfield. Encore, one entry; Mr. R. M. Whiting, Credenhill, Hereford. Gascoigne's Scarlet, five entries; Mr. J. Bond, Wye. Golden Noble, five entries; Mr. Paulley, gardener to Dr. Jackson, Thornton Heath.

Grenadier, five entries; Mr. C. Page, Dropmore, Maidenhead. Hambling's Seedling, seven entries; Mr. G. Richardson, Newton Abbott. Lady Henniker, three entries; Mr. F. Brock, Goodwood. Lane's Prince Albert, twelve entries; Mr. Denis Best, Worcester. Lord Derby, twelve entries; Mr. Denis Best, Worcester, with a grand dish. Mère de Ménage, five entries; Mr. Davison, gardener to Colonel Petre, Westwick, Norwich. Newton Wonder, ten entries; Mr. W. Barnes, Wokingham. Norfolk Beauty, four entries; Mr. W. Allan (the raiser), gardener to Col. the Hon. C. Harbord, Gunton Park, Norwich. Peasgood's Nonsuch, ten entries; Mr. H. B. Davies, Ashford, Middlesex. Potts' Seedling, three entries; Mr. Turton, gardener to T. B. Wingfield, Esq., Sherborne Castle, Dorset. Rev. W. Wilks, no entry. Royal Jubilee, eight entries; Mr. F. Brock, Goodwood. Stirling Castle, four entries; Mr. Denis Best, Worcester. The Queen, eight entries; Mr. W. Voss, Rayleigh. Tower of Glamis, seven entries; Mr. T. A. Tomalin, gardener to the Earl of Bessborough, Piltown, Co. Kilkenny. Warner's King, thirteen entries; Mr. Denis Best, Worcester, with a very fine dish. Any other cooking variety, sixteen entries; Mr. A. Smith, Roehampton Lane, S.W., for a finely-coloured dish of Tyler's Kernel.

PEARS—SINGLE DISHES.

Beurre Alexander Lucas, two entries, Mr. T. Turton, Sherborne Castle. Beurre d'Amanlis, two entries; Mr. F. King, Westgate. Beurre d'Anjou, two entries; Mr. C. Page, Dropmore. Beurre d'Avalon, no entries. Beurre Bose, three entries; Mr. Jas. Vert. Beurre Dumont, Mr. J. Shelton. Beurre de Naghan, no entries. Beurre Hardy, three entries; Mr. A. R. Allan. Beurre Perran, no entries. Beurre Superfin, five entries; Mr. W. Messenger. Blickling, one entry; Mr. W. Allan, Gunton Park. Charles Ernest, four entries; Mr. James Gibson, Welbeck Gardens. Comte de Lamy, four entries; Mr. C. Page, Dropmore. Conference, seven entries. Mr. Davison, Westwick. Doyenne du Comice, twelve entries; Mr. Davison, Westwick; very fine. Durondeau, six entries; Mr. Davison, Westwick, with a grand dish.

Emile d'Heyst, two entries; Mr. W. Allan, Gunton Park. Fondante d'Automne, two entries; Mr. W. Allan, Gunton Park. Fondante de Thirriot, four entries; Mr. W. Messenger. Glou Morceau, two entries; Mr. G. Davison, Westwick. Josephine de Malines, six entries; Mr. T. Turton, Sherborne Castle. Le Lectier, four entries; Mr. James Vert, Saffron Walden. Louise Bonne of Jersey, three entries; Mr. J. Taylor, gardener to F. Bibby, Esq., Hardwick Grange, Shrewsbury. Marguerite Marillat, one entry, Mr. G. Davison, Westwick. Marie Benoist, one entry; Mr. T. Turton, Sherborne Castle. Marie Louise, three entries; Mr. G. Davison, Westwick. Nouvelle Fulvie, five entries; Mr. J. Hill, Wimborne, Dorset. Olivier des Serres, six entries; Mr. T. Turton, Sherborne. Pitmaston Duchess, nine entries; Mr. B. J. Mercer, gardener to H. G. Kleinwort, Esq., Wierton, Maidstone.

President Barabe, two entries; Mr. W. Allan, Gunton Park. Thompson, four entries; Mr. T. Turton, Sherborne. Triomphe de Vienne, three entries; Mr. A. R. Allan, Hillingdon. Winter Nelis, seven entries; Mr. J. Reynolds, gardener to R. F. Bristowe, Esq., Mildenhall. Any other early variety, four entries; Mr. W. A. Voss, Rayleigh, with a grand dish of Doyenne Boussoch. Any other late variety, ten entries; Mr. T. Turton, Sherborne, with Easter Beurre, and Mr. J. Hill, Wimborne, second, with a splendid dish of Beurre Diel.

AFFILIATED SOCIETIES' CLASS.

In the class open to affiliated societies there were four entries, and the silver cup and silver-gilt Knightian medal offered for the best set of six dishes each of dessert apples, cooking apples, and pears, were won by the East Anglian Horticultural Society, secretary, Mr. Wallis, Royal Arcade, Norwich, with a fine set of Warner's King Norfolk Beauty, Lane's Prince Albert, Mère de Ménage, Bramley's Seedling, Stone's, Worcester Pearmain, Allington Pippin, Tyler's Kernel, Adam's Pearmain, Cox's Orange Pippin, and Ribston Pippin apples and Marie Louise, Conference, Hacon's Incomparable, Doyenne du Comice, Durondeau, and Pitmaston Duchess pears; The Colchester and District Gardeners' Association were placed second, but it was difficult to understand how this set beat the one staged by the Addlestone, Chertsey, and Ottershaw Gardeners' Association.

Celeriac.—This crop should by now have completed its growth, and the roots should therefore be carefully lifted and the foliage trimmed, and then be stored away in finely sifted ashes or sand, and kept just free from frost.—George Ellwood.

Origanum Tourneforti.—A few of the dittanies, or origanums, are hardier than O. dictamnus, the dittany of Crete, and among them one of the best is sold in nurseries as O. Tourneforti, although it is just possible that the name may be erroneous, although the plant has come through a good source. It is an excellent flower for the rock garden, especially as it is one of the few autumn-flowering plants we have which are of real value for the rockery at this season. No one can call it showy, but it is distinctly interesting, and owns many points of quiet beauty, apart from the charm of comparative rarity. The sessile leaves are rather rounded in form, and the whorls of little flowers are in heads, resembling in general appearance those of the hop, the pink blossoms, which are small in size, emerging from the top of these. The whole aspect of the plant is quietly pretty. It is from six inches to a foot high, and seems to be a little more vigorous than O. hybridum, which is slightly better known. This origanum, which is sometimes called the dittany of Amorgos, from the place of its origin, is hardy as far north of the Tweed as Edinburgh, at least. It likes a sunny position and a sandy soil.—S. A.

CAMBRIDGESHIRE HORTICULTURAL SOCIETY
AUTUMN SHOW,
CORN EXCHANGE, CAMBRIDGE, Nov. 9 and 10.
Open Classes for Chrysanthemums and Vegetables.
For Schedules apply to F. E. FORDHAM, Asst. Secretary, 8, North Terrace, Cambridge.

KENT COUNTY CHRYSANTHEMUM SOCIETY.—The 23rd GRAND ANNUAL EXHIBITION will be held at the CONCERT HALL, BLACKHEATH, on WEDNESDAY and THURSDAY, November 2nd and 3rd, 1910. Schedules and all particulars of the Hon. Sec., F. FOX, The Gardens, The Cedars, Lee, S.E.

NATIONAL CHRYSANTHEMUM SOCIETY.
GREAT AUTUMN SHOW.
At the CRYSTAL PALACE,
On November 2nd, 3rd, and 4th, 1910.
Entries close October 26th. Write at once for Schedule (post free) to the Secretary, RICHARD A. WITTY, 72, Savernake Road, Gospel Oak, London, N.W.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

The Horticultural Club.

On Tuesday, the 11th inst., at the Hotel Windsor, the Horticultural Club commenced its winter series of monthly dinners, the chair being occupied by Mr. Peter Veitch, of Exeter, and a good number of members and guests being present. In accordance with the long-established custom of the club, the dinner was followed by the reading of a paper for discussion, and on this occasion Mr. George Bunyard, V.M.H., very kindly gave an account of his visit to Carnac, in Brittany, under the title of "Impressions of Carnac (Brittany), its Menhirs, Dolmons, and Alignments," illustrated by a considerable number of lantern slides, showing the remarkable number and arrangement of the large granite monoliths, which are there assembled. In opening this subject Mr. Bunyard, referring to the evolutionary side of human handwork, in the way of tools and architecture, of both which Carnac has supplied much material for study. He alluded to his near neighbour in Kent, Mr. Benjamin Harrison, of Ightham, who had been the pioneer in establishing the existence of far more primitive and more ancient tools than the so-called palæoliths, which had been previously assumed to be the oldest of all. Of these older and ruder implements Mr. Bunyard exhibited several specimens, a careful examination of which showed indubitably that they had been artificially chipped into certain forms which were practically impossible to impute to other than design, which, of course, means human design, no conceivable natural force of erosion or wearing being capable of producing them, especially as many hundreds of like forms have been found. Their immense antiquity, as compared with the more highly worked and symmetrical palæoliths had been established by their discovery in situ in gravels now forming the caps of the highest hills in the Weald of Kent, the presence of which gravels proved beyond cavil that these hill tops were at one time valley bottoms of a mountain range of considerable height, now utterly denudated. Following up the chain of evolution, Mr. Bunyard referred to the third stage of tool or weapon manufacture, viz., the neoliths which were highly finished, polished, and even artistically shaped, and were found under conditions which indicated their co-existence with bronze implements at a period when the metals began to figure as fitter materials than flint.

Turning now to Carnac, as presumably contemporary with this last period, since neoliths and bronze implements have been found during the excavations which have been made there, Mr. Bunyard showed on the screen and by photographs handed round, how the immense granite stones which appear to constitute the rocks of the locality generally, have been exhumed, transported, and arranged in such a way as to form mile-long avenues, as it were, the stones in the majority of cases being reared on end at fairly equal distances from each other, but in perfectly straight rows, while in other cases rude temples have been formed of them by using extra huge monoliths for the roof, with minor ones for the supporting walls, or in some instances, immense stones were shown nicely poised upon only two pointed supports, somewhat on Logan stone lines, but, in this case, obviously due to human agency.

Considerable speculation has arisen as to how these mighty masses were moved and handled. Mr. Bunyard suggested that the upper stones were raised by continued oscillatory tilting, and insertion of wooden supports at each stage, which were ultimately burnt away, but in the subsequent discussion it was suggested that earthen mounds were first made, up which the masses were dragged, the supporting stones being subsequently introduced beneath them, in the same way as buildings are underpinned, the soil being eventually dug out and distributed. As a rule, the stones are as rough as Nature made them, but in some cases their surfaces are elaborately sculptured, waving corn ears, suns, and carving resembling the grain of wood appearing on the most marked specimens. The object of all this gigantic work is not clear, being imputed to memorials of victories, or similar motives by some, and to sun worship by others who study the orientation of the alignment, and the ornamentation which is here and there in evidence.

An interesting discussion followed the lecture, and a very hearty vote of thanks was given in conclusion to Mr. Bunyard for his interesting address.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, October 11.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair), Dr. A. B. Rendle, F.R.S., Messrs. R. H. Curtis, J. Fraser, W. E. Ledger, A. Worsley, J. W. Odell, W. Hales, R. H. Pearson, G. Gordon, J. Douglas, W. C. Worsdell, W. Fawcett, and F. J. Chittenden (hon. secretary).

BUDS ON LEAVES.—Mr. W. C. Worsdell showed leaves of Verbascum nigrum affected by some disease which is being investigated, and which caused the production of numerous adventitious buds around the margins of the leaves. Masses of small buds had also been produced around the base of the stem.

LYCORIS AUREA, ETC.—Mr. A. Worsley showed a flowering spike of the Chinese Lycoris aurea, which he found succeeded and flowered well when planted out in a house. He also showed flowers of the South African Composite, Cryptostemma calendulaceum, which is very sensitive to frost, but which ripens seed early, and so succeeds in maintaining itself.

MODIFIED FLOWERS OF ERICA CINEREA.—Mr. Bowles showed on behalf of Mr. L. R. Russell, of Richmond, a form of Erica cinerea in which the flowers were replaced by deep red groups of closed, packed leaves arranged in fours, as in the flowers of normal plants, not in threes, as the foliage leaves are usually. The case was similar to that described and figured in the "Journal of Botany," 1909, pp. 437-9, by Dr. Rendle, from wild plants collected near Axminster, except that in that instance ordinary flowers were also produced. Although no stamens were produced, carpels and apparently good ovules were borne in the centre of the groups of leaves.

FASCIATION IN PYRETHRUM ULIGINOSUM.—Dr. D. H. Scott sent specimens of this plant with fasciated stems, in some cases separating before producing flower heads, and in others remaining fasciated until the flowering stage was reached, so that the head appeared as of two or three joined.

DOUBLE-FLOWERED TROPÆOLUMS.—Mr. J. L. Arkwright, of Lyonshall, Herefordshire, sent flowers of some double tropæolums which he had raised. One or two of the plants were climbers, and there were among the plants more than a dozen distinct variations in colours. The flowers were regular and had no stamens or carpels.

East Anglian Horticultural Society.

There was a full attendance of members at the October meeting of this society, held at the Boar's Head Hotel, Norwich. Mr. J. Clayton was elected to the chair. Mr. Edward Peake delivered a lantern lecture upon a holiday spent in France, and also displayed a series of pictures of local gardens and their gardeners, touching upon the speciality of each garden. This was most interesting, for one was able to see, as it were, his friend at work among his flowers. Mr. Peake is very good with the camera, and his pictures upon the screen were beautifully reproduced.

A hearty vote of thanks was accorded to him upon the motion of the President.

A fine feature of the exhibition tables was the display of beautifully coloured strawberries and extra large raspberries, shown by Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford. This same gardener also won for the second time the Dawson Paul silver challenge bowl, with a splendid concluding exhibit of six varieties of fruit. Mr. F. Williams, gardener to Louis J. Tillett, Esq., Catton, had a grand plant of Cypripedium insigne carrying over twenty perfect flowers. The exhibit of apples was most creditable for so poor a season. Pot plants, flowers, and vegetables were also well staged. Messrs. Daniels Bros., Lim., Norwich, made a display of H.T. roses of the best pink kinds. Mr. Frank Neave, Lingwood, staged violets well, and Mr. T. Notley, Catton Hall Gardens, showed a fine improved Miss Willmott verbena.

It was announced during the meeting that the society had sent an exhibit for the British-grown Fruit Class, open to affiliated societies, in London, at the R.H.S. Many members had sent of their best, and the Selection Committee were able to send a grand lot. When it became known that the society had "won the cup" each wanted to shake his fellow member's hand, for in Norfolk they think it a great honour to be able with such an adverse season to win a cup open to the United Kingdom.

Reading Gardeners' Association.

The fortnightly meeting of this association was held in the Abbey Hall, on Monday, October 10, the president, Mr. Alderman Parfitt, being in the chair. There was again a very large attendance.

After the minutes of the last meeting had been read and a number of new members elected, the President informed those present that the Small Town Hall had been engaged for Wednesday, November 23, in view of the forthcoming exhibition, and he hoped that members would make such efforts as would ensure the show being even a greater success than last year. Mr. Parfitt also reminded the younger gardeners of the advantages which it would shortly be their privilege to enjoy in the educational class to be conducted by Mr. Drew, by arrangement with the University College authorities.

The lecturer for the evening was Mr. F. G. Drew, horticultural instructor at the college, and his subject, "Outside Peaches and Nectarines." In a very able and lucid paper which the lecturer explained he had endeavoured, for the benefit of the younger members, to put into as simple language as possible, Mr. Drew dealt most thoroughly with the treatment of peaches and nectarines as wall fruits. He remarked that failure was frequently associated with indifference on the part of the gardener to both tree and fruit, and said that if only a tithe of the trouble lavished on trees under glass was expended on those found on walls the result, in most cases, would be surprising.

Information with regard to walls, aspect, first and second year treatment, training, lifting, soil, manures, pests, diseases, systematic attention, etc., was most thoroughly and clearly given, and when Mr. Drew resumed his seat, having spoken an hour and a quarter, he was greeted with much applause. An excellent discussion followed the lecture.

Mr. F. Townsend, gardener to the vice-president, exhibited a very pretty group of Sutton's Miniature White nicotiana, which was greatly admired.

National Hardy Plant Society.

A meeting of the Provisional Committee of the National Hardy Plant Society was held at the Royal Horticultural Society's Hall, Vincent Square, on Thursday, October 13, Mr. Macself in the chair.

Rules and bye-laws were adopted subject to approval by a general meeting of the society which will be held on Thursday, November 3, at 3 p.m., at the Hotel Windsor, Victoria Street, Westminster, for this purpose, and for the election of officers and council for the ensuing year. Members, and anyone interested in hardy plants, desirous of joining the society are cordially invited to attend.

British Gardeners' Association.

The first monthly meeting of the winter session of the London Branch took place at Carr's Restaurant on Ocober 13. The chair was taken by Mr. North, and, after the general business had been dealt with, an address was delivered by Mr. E. Feltham on "The Policy of the B.G.A., and its Future Work." In dealing with the work of the branches of the association that have been formed at various centres, the speaker thought there was a great danger of the association developing into a mutual improvement society. He did not think this was fulfilling the purpose for which the B.G.A. was founded, and he suggested that a much broader policy should be adopted. For instance, they should combine with other societies, such as the London Trades' Union. They should also have a voice in such matters as The Sweated Labour Bill, the new land taxes, and the Town Planning Bill. These things should all be investigated with a view to ascertaining how far the gardening profession is likely to be affected by them. He said the land tax was having an adverse influence upon gardening because of the decrease in the amount of labour employed, therefore all the pressure possible should be brought to bear upon the Government to provide suitable work to compensate for the loss of employment in other directions. Several useful schemes might be started for this purpose, such as State afforestation, reclaiming waste and marsh lands, and converting them into small holdings on co-operative lines. Gardeners as a whole, continued the speaker, have been very reluctant to take any active part in politics, but it is well to remember the fact that, whether we feel disposed to interfere in politics or not, politics at times are bound to interfere with us, and sometimes they hit the gardener very hard. The best advice he could give the B.G.A. with regard to its future policy was to urge upon gardeners the necessity of combining for their common good, as it is only by this means that they will be enabled to effectively look after their own interests, and reap the benefits of co-operation enjoyed by men of other professions.

The address was followed by an animated discussion, and a good deal of opposition to Mr. Feltham's remarks was brought forward. The general views expressed were to the effect that gardeners are placed in very different circumstances to men employed in large industrial centres, and that, owing to the many difficulties in the way, a trades union for gardeners was out of the question for the present. Mr. Hawes pointed out that the association had already done a great deal of good work in a quiet way, and he urged upon members to be content for the present with a moderate policy. Mr. Feltham having made a suitable reply to his critics, the meeting terminated with a vote of thanks to the speaker.

Beckenham Horticultural Society.

The first lecture of the session, "Alpines," was given on Friday, the 14th inst., by Mr. E. H. Jenkins, of the Queen's Road Nursery, Hampton Hill. Canon Arnott, president of the society, occupied the chair, there being a full audience.

The lecturer opened his discourse by first asking, "What is an alpine?" and then went on to say that most people's idea of alpines was that they were a diminutive race of plants, but he pointed out that there were trees and shrubs of large dimensions that had claims to the title of alpines, though it was not of these he proposed to speak upon. A graphic account of alpines generally in their native habitat, and salient points in the propagation and culture of many of them were given. It was urged that quite the best method of increasing stock of many alpines was by sowing seed. Omphalodes lucida propagates freely by cuttings taken with a "heel." Manure is fatal, but very gritty soil essential.

For an hour and a half the lecturer held his audience, and then, before hurriedly leaving to catch his train, was heartily applauded.

From Kelsey Park Gardens (Mr. Mark Webster) came a fine dish of Pitmaston Duchess pears, the six fruits weighing in the aggregate 6lb. 1oz.; not less remarkable was the beautiful colouring of the vine leaves of Gros Maroc.

Dundee Horticultural Association.

The opening meeting of the session was held on the 13th inst., in the new Technical Institute, Bell Street. Mr. William Grant presided, and Mr. William Christeson gave his presidential address.

In a racy and interesting address, the President traced the history of gardening among the civilised nations of the world, and discussed popular phases and crazes, while many practical suggestions were made regarding the methods we employ and the use and abuse of modern gardening. The latest fad of French gardening would not make much progress in this country owing to various circumstances which he clearly defined. Flower shows and their management came in for scathing criticism. An animated discussion ensued, after which the President was cordially thanked for his address.

OBITUARY.

MR. P. H. NORMAND.

Scottish and other readers of this journal who were acquainted with him, will grieve to learn of the death of Mr. Patrick Hill Normand, of Aberdour, Fifeshire, which took place on Saturday, October 15, at his residence at Whitehill, Aberdour. Mr. Normand was for many years one of a band of Scottish amateur cultivators of alpine and other hardy flowers who were interested in these subjects long before they attained their present popularity, and he did much to promote and extend their cultivation by his readiness to assist beginners and others. The proximity to Edinburgh of Aberdour gave him frequent opportunities of keeping in touch with new plants introduced into the Edinburgh Botanic Gardens and nurseries, and his correspondence with private growers of similar tastes was productive of much pleasure to him in exchanging plants and information regarding their needs. Mr. Normand was most courteous, and his garden at Whitehill was frequently visited by cultivators of alpines, who always found some plants to interest them, either from the excellent culture they received or from their rarity. It is understood that Helianthemums Jubilee and Old Gold, two fine double varieties, originated at Whitehill, besides other good flowers.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

VIOLETS.—P. A. D., Haslemere: There is no evidence of disease in the specimen sent, and we suggest that the damage is due to red-spider, and to excessive fumigation to get rid of the latter.

MONTBRETIAS.—M. S., Derby: As soon as the growth has begun to die down, clear the bed of weeds, leaves, and decayed stems, and mulch all over with two or three inches of old, well-rotted manure, or a mixture of old manure and leaf soil.

INSECTS ON GRAPES.—J. G. W., Stoke: The grapes are suffering from an attack of mealy bug, and you can do little to clean the vines and house until the leaves have fallen, and the vines are at rest. Write us again, and, meantime, promptly burn the leaves as they fall.

ALLAMANDAS FOR ROOF OF STOVE.—F. E. H., Lyme Regis: The allamandas are very suitable subjects for training along the roof of a large stove as there are no more gorgeous plants than these, when grown under a rational course of treatment. To have them in perfection, plant in a moderate-sized bed of well-drained soil, and allow the growth to extend freely over the roof. When this cannot be done grow in well-drained pots, and train the shoots up the pillars or under the rafters of the plant stove. The growth should be thinned, if necessary, by the complete cutting away of the superfluous shoots, those remaining to be allowed to grow unchecked. The practice so frequently adopted of stopping the shoots at intervals during the spring and summer months cannot be too strongly condemned, for it renders the production of an abundance of blooms impossible. A thorough season of rest, a moderately rich soil, liberal supplies of water when in full growth, and a light position are the chief essentials. A. grandiflora, A. Hendersoni, A. magnifica, A. nobilis, and A. Schotti are all excellent kinds.

SWEET PEAS.—F. E. F., Bristol: Sow a few seeds of each variety, in pots, and place them under the shelter of a cold frame. Afford abundance of air; indeed the light need only be used to give protection from heavy rains, snow, and severe frost. Sweet peas are quite hardy, and sowing them in pots is but a means to secure early flowers and prevent loss from slugs, birds, and very wet weather, such as would be likely to occur if the seeds were sown in the open.

ACHIMENES.—R. P. S., Glastonbury: These useful plants are not so popular as they once were, but they are well worth cultivation. Their varied hues, comprising brilliant scarlet, bright blue, and rich purple and mauve, produce a tasteful effect, and are capable of contributing materially to the attractions of the conservatory and plant stove during the summer months. The several varieties may be successfully grown in pots, pans, and baskets, but the use of pans cannot be recommended unless exhibition specimens are required. When starting the corms early in the New Year prepare shallow pans or boxes by spreading a layer of drainage material over the bottom, covering with some loose material, and then filling to within an inch of the rim with a mixture of loam, leaf-mould, and sand; lay them rather close together, cover with half-an-inch of fine soil, and place in a structure in which a brisk temperature is maintained. Maintain the soil in a moderately moist state, and when the young plants are about two inches high transfer them to the pots or baskets in which they are to bloom. The receptacles must be well drained, and the

HORNE'S GREAT SALE.

CLIFFE, NR. ROCHESTER, KENT.

MESSRS. PROTHEROE and MORRIS are instructed to SELL BY AUCTION by Messrs. HORNE and SONS, at Perry Hill, Cliffe, near Rochester, Kent, on WEDNESDAY, NOVEMBER 9, 1910.

200,000 FRUIT TREES and BUSHES,

including several thousand **STANDARD APPLES AND PLUMS**; also a very Fine Lot of 40,000 Pyramid Apples, 1, 2, and 3 year, on English Paradise, about 50,000 Half-Standard and Bush Apples on Crab-stock; about 10,000 Black Currants, Gooseberries (including May Duke), Red and White Currants, several thousand Raspberries, several thousand Cabbage Plants.

Free Luncheon at 11 a.m. Sale at 11.30 a.m.

NOTICE.—The Auctioneers desire to call the attention of Fruit Growers, Market Gardeners, and intending Planters to this important Sale. Fourteen days will be allowed to clear and settle accounts. Messrs. Horne and Sons will lift and cart all lots and put them on rail after the Sale free of charge. Catalogues free of Messrs. HORNE and SONS, Cliffe, near Rochester; and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

ALL SWEET PEAS ENTHUSIASTS

SHOULD GROW MAORI BELLE, New Zealand's Premier Sweet Pea; purest Lavender yet offered: 40 per cent. fours; 10 seeds 1s. Cole's LORD ALTHORP, a refined and incomparable bloom with Earl Spencer-orange standard, orange-carmine wings WITHOUT THE GLARY CRIMSON of latter day favourites, 8 seeds 1s. Cole's MRS. W. S. BIRCH, a giant, but refined mauve-pink on yellow ground, A PERFECT NOVELTY, 10 seeds 1s. Cole's EARL SPENCER, without doubt the deepest orange self Sweet Pea on the market, 10 feet high in our trials, 9 seeds 1s.; 4 seeds 6d. List ready November-December—cannot get particulars before—*it will again be unique.* Every S. Pea of merit will be stocked.

SUBSCRIBER'S ORDER FORM

Every Saturday THE GARDENERS' MAGAZINE. Twopence.

To W. H. AND L. COLLINGRIDGE,
148 AND 149, ALDERSGATE STREET, LONDON, E.C.

I request you to send me the GARDENERS' MAGAZINE by post every week until countermanded, and I enclose ________ for ________ months in advance.

Name ____________________

Address ____________________

Date ____________________

1 Year, **10/6** post free; 6 months, **5/6** post free; 3 months, **3/-** post free; to Foreign Countries, **15/-** per annum.

, If a receipt is required for amounts under 10s. a stamped envelope should be forwarded.

compost should consist of fibrous loam four parts, and leaf-mould, powdery manure, and sand, one part each; dibble the plants over the surface at a distance of about two and a-half inches apart, and supply rather liberally with water after they have become established. They may be grown in the stove or in an intermediate house, but in either case they should have a position near the glass, and be shaded lightly in sunny weather. A good selection of varieties includes Ambrose Verschaffelt, Admiration, Azurea, Carl Wolfarth, Diadem, Firefly, Grandiflora, Longiflora alba, L. major, L. rosea, Margaretta, Madame Ambrose Verschaffelt, Mauve Perfection, Pink Perfection, and Rosea magnifica.

CINERARIAS FAILING.—G., Norton: Excess of moisture or a strong dose of liquid manure is answerable for the failure of the cinerarias; the crown or neck of the plant has suffered and begun to rot.

LEAN-TO HOUSE FOR TOMATOES.—W., Llanelly: Under the circumstances you had better make the house about 10ft. wide and about 10ft high where it reaches the wall. There should be 1½ft. or 2ft. of glass in front, and so arranged that front ventilation may be given freely, because with such an exposure as yours front ventilation will be a necessity for tomatoes. One 4in. flow and return pipe, running right round the house will provide sufficient heat, and you will probably find that for your purpose a boiler of the Loughborough type will be the most serviceable and convenient. Arrange for top ventilation, and have a door at each end of the house, as this will save a great deal of time and labour when soil is being carted in or out of the house.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

F. F. J., Oswestry.—1, Trachelium cœruleum; 2, Hibbertia dentata.

W. S. P., Englefield.—1, Symphoricarpus racemosus; 2, Ligustrum lucidum.

G. D., Newcastle.—1, Oncidium Marshallianum; 2, Cattleya labiata; 3, Cypripedium Actæus.

E. T. B., Moreton.—1, Bambusa palmata; 2, Leycesteria formosa; 3, Rodgersia podophylla; 4, Tiarella cordifolia.

NAMES OF FRUITS.

When sending fruits for naming will our readers be good enough to send good specimens, as without these it is not possible to accurately determine the varieties. Pack firmly, using light tin or wood boxes, and send not more than six varieties at once. Label each specimen and enclose letter with the fruit, whether a separate notification is sent or not. Address the packages to the Editor, GARDENERS' MAGAZINE, as advised in the notice at the head of "Answers to Correspondents."

H. T. S., Godalming.—1, Alfriston; 2, Marie Louise; 3, Beurre Rance.

F. B. W., Lancaster.—1, Beurre Superfin; 2, Lord Suffield; 3, Fearn's Pippin; 4, Lane's Prince Albert.

D. J. S., Wantage.—1, Golden Noble; 2, Stone's; 3, Newton Wonder; 4, Dumelow's Seedling; 5, not recognised.

M. E. N., Bedford.—The specimen was not a good one; send a fair-sized characteristic specimen, and we will do our best to name it for you.

FORTHCOMING ENGAGEMENTS.

TUESDAY, October 25.—Royal Horticultural Society; committees meet at 12 o'clock; lecture at 3 p.m. on "Life—A Director of Force in Development and Evolution," by the Rev. Prof. G. Henslow, V.M.H. The society's Vegetable Exhibition will be held on this date.

WEDNESDAY, October 26.—Hereford Fruit and Chrysanthemum Show; two days.

Croydon Chrysanthemum Show; two days.

SATURDAY, October 29.—Brussels Flower Show; five days.

TUESDAY, November 1.—Brighton Chrysanthemum Show; two days.

Reg. at the G.P.O. as a Newspaper.

SATURDAY, OCTOBER 29, 1910. (10/6 per Ann. Post Free. To Foreign Countries, 15/-.) **Twopence**

AWARDED TWENTY-SEVEN GOLD MEDALS.

BARR'S "GOLD MEDAL" DAFFODILS. Descriptive Illustrated Catalogue of all the finest sorts in cultivation, for Pots, Exhibition, Flower Borders, or Naturalising, and including the finest selection of New Seedling Narcissi ever offered. Sent free on application.

BARR'S GENERAL BULB CATALOGUE contains a full list of the best Spring and Summer-flowering Bulbs, including Hyacinths, Tulips, Irises, Lilies, etc., for forcing and bedding. Sent free on application. BARR and SONS, 11, 12, and 13, King Street, Covent Garden, London.

GISHURST COMPOUND is harmless in use; its soluble Sulphur, etc., has for 40 years cured blight and fungus on plants, and is good for washing unhealthy dogs. Gishurstine keeps boots dry in all weathers; they will polish. Good for harness. Wholesale from

PRICE'S PATENT CANDLE CO., LIM., LONDON.

JAMES GRAY, HORTICULTURAL BUILDER, CHELSEA, S.W., advises gardeners to watch their Hot-Water Heating Apparatus this month. If boilers show signs of wear, it would be wise to have them examined at once. Attention can be obtained by means of a postcard, telephone call (201 Western), letter, or wire to Gray, Chelsea, London.

Wm. CUTBUSH & SON,

PLANTING SEASON.

Inspection Specially Invited.

ROSES.

An immense stock of Standards, Dwarf and Climbing Roses, and also many thousands grown in pots.

FRUIT TREES.

Grand perfect trees in Standard, Pyramid, Dwarf, and Horizontal-Trained and Cordon form, and also a quantity grown in pots for indoor culture. The Peaches, Nectarines, and Apricots are especially fine, and include many extra-sized trees for this season's fruiting; also Fruiting and Planting Vines, Figs, Mulberries, etc.

CUTBUSH'S CUT BUSHES.

An immense quantity of Yews and Box clipped in many curious shapes, such as Birds, Ships, Tables, Spiral Columns, Dogs, etc.; also an exceedingly fine stock of Box and Yew Trees in pyramid form and Standard and Pyramidal Bay Trees in perfect condition established in tubs.

SHRUBS AND CONIFERS.

An extensive collection of Coniferæ and Deciduous and Evergreen Shrubs, bushy and well rooted plants in all sizes, also an immense stock of Yews, up to 6 feet in height, specially prepared for hedge planting.

STOVE AND GREENHOUSE PLANTS.

An extensive stock of Palms, Climbers and Decorative Plants generally, and also a large quantity of well-grown Autumn and Winter Flowering plants.

FORCING PLANTS, ETC.

The collection of Plants for Forcing is considered the finest in existence, and a great speciality is made of Azaleas, Deutzias, Lilacs, Wistarias, Guelder Rose, Staphylea, and many other varieties of plants for forcing purposes. Large quantities of Plants and Roots can be supplied in retarded form, such as Lily of the Valley, Liliums, Azalea mollis, etc., for flowering at any season of the year.

ALPINE AND HERBACEOUS PLANTS.

An unique and up-to-date collection, including many GRAND NOVELTIES OFFERED FOR THE FIRST TIME. Nymphæas and other plants for the Aquatic, Bog, and Wild Garden being extensively grown.

HARDY CLIMBERS.

An immense quantity of Ivies, Honeysuckles, Wistaria, Ampelopsis, Clematis, Jasmines, etc., etc., in all sizes up to 10 feet high.

TREES.

A large and varied collection of Hardy Ornamental Trees; also grand stocks of Limes, Planes, Poplars, Elms, Sycamores, Birch, etc., grown singly, specially for Park and Avenue Planting.

CARNATIONS.

The finest stocks of Malmaisons, Tree or Winter-Flowering and Border Varieties, in strong, clean, and healthy plants; also large collection of Pinks, Cloves, etc.

LANDSCAPE GARDENING AND PLANTING.

Plans and Estimates may be had for the Laying-out and Planting of New, or the Renovating of Existing Gardens in any part of the Kingdom.

SEED AND BULB DEPARTMENTS.

Special attention is given to the selection of the finest produce of the Dutch, French, American, and other growers, and being probably the largest importers in this country we are in a position to offer the finest quality Bulbs upon special terms. Every care is taken in the saving and selection of Seeds.

& CO., LTD.,
Royal Nurseries,
MAIDSTONE.

PLANTING SEASON.

BY APPOINTMENT.

WM. PAUL & SON,
WALTHAM CROSS, LTD.

Nurseries twelve miles from London; South entrance four minutes' walk from Waltham Cross Station (Great Eastern Railway); West entrance five minutes' walk from Tramway Terminus.

SPECIALITIES:

ROSES in all forms, from open ground and in pots. Roses in pots, both dwarfs and climbers, extra fine this season.
FRUIT TREES for the Orchard, Garden and Forcing House.
HARDY TREES, for Street, Park and General Planting.
SHRUBS, Evergreen and Deciduous, for General Planting.
HARDY CLIMBING PLANTS for all purposes.
RHODODENDRONS, CAMELLIAS, and AZALEAS. Rhododendrons from loam, extra fine this season
HERBACEOUS PLANTS in great variety.
BULBS and SEEDS and all Garden Sundries.

Price Lists on Application. Inspection Invited.

Upwards of 1,000 Gold Medals, First Prizes, and other Awards at leading Exhibitions during the past [illegible] years.

Sole Postal Address—

MERRYWEATHER'S
ROSES.
All Strong and Home-grown Plants.

COLLECTION "I" of NEW ROSES.
WONDERFUL VALUE.
EVERY ONE A GENUINE NOVELTY.

This superb collection of the **Best 18 New Roses** in dwarf plants. The price of this wonderful collection is **27/6**, carriage and packing free for cash with order (with Acme Labels, **29/6**). The varieties are:—

Queen of Spain.
Andre Gamon, H.T.
Arthur R. Goodwin, P.
Avoca, H.T.
Chateau de Clos Vougeot, H.T.
Florence E. Coulthwaite, H.T.
Grace Molyneux, H.T.
Jessie, Dwarf Poly.
Joseph Lowe, H.T.
Lady Ursula H.T.
Lyon, H.T.
Madame S. Weber, H.T.
Marquis de Sinety, H.T.
Molly Sharman Crawford, H.T.
Climbing Liberty.
Renee Wilmart Urban, H.T.
Souv. of Stella Gray, T.
White Killarney H.T.

FRUIT TREES
OF ALL KINDS TO SELECT FROM,

A GRAND STOCK OF
SHRUBS & ORNAMENTAL TREES.

Our **DESCRIPTIVE CATALOGUE** of SPLENDID BULBS (100 pages in English), containing FULL CULTURAL DIRECTIONS, will be sent post free on application to our Agents, as above, or ourselves direct at
OVERVEEN, HAARLEM, HOLLAND.

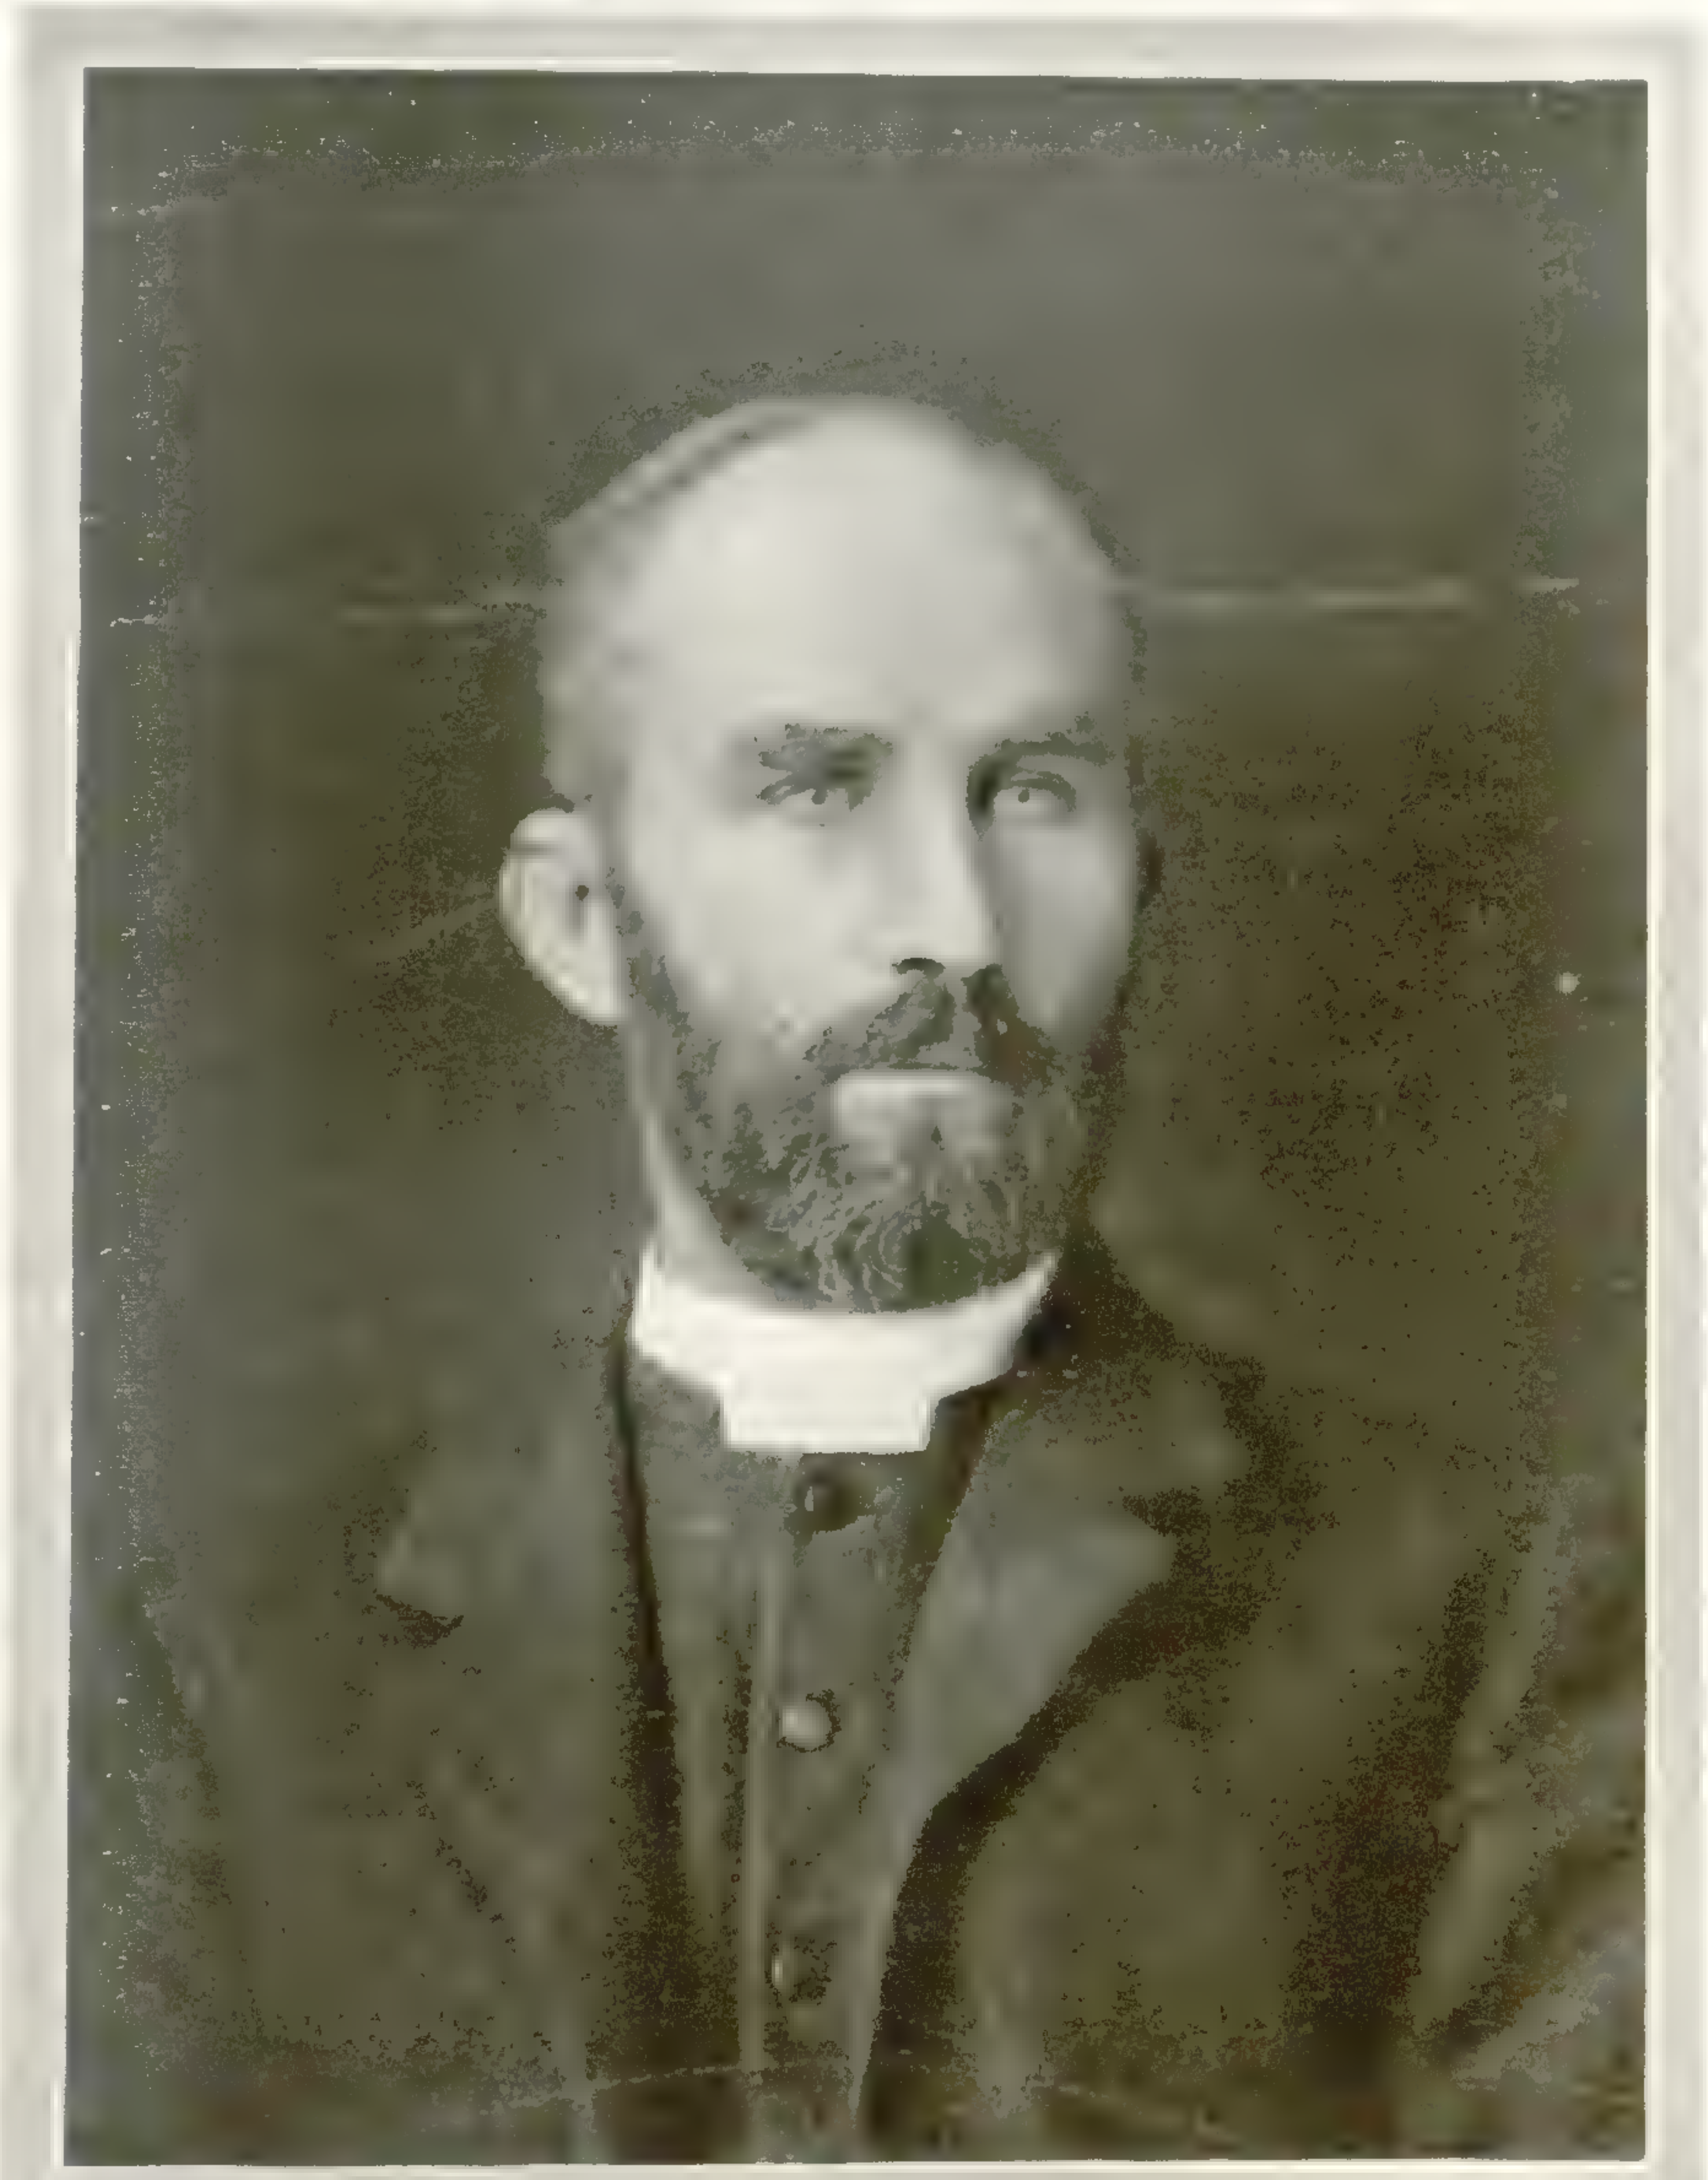
VOL. LIII.—No. 2,974. SATURDAY, OCTOBER 29, 1910.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

The Chrysanthemum.

Amongst all the multitude of beautiful, and even resplendent, flowers with which our eyes are regaled at the great floral shows of the present day, the chrysanthemum stands pre-eminently as the outcome of a normally insignificant flower, without the aid of admixture with a different species to induce, by crossing, that variability which is the outcome of hybridisation. In the begonias we see a marked example of this latter class, in which at first two comparatively small-flowering species of different makes and tints were successfully crossed, and so set the ball rolling for the selective cultivator's behoof, a third species, B. socotrana, eventually coming in as an adjunct to produce a different habit of growth, coupled with a different style of inflorescence, such as we see in the Gloire de Lorraine types. This, however, is but a matter of yesterday, so to speak, compared with the comparative antiquity of chrysanthemum selection, an antiquity which deprives us of exact knowledge of the genesis of the first sports, which were of Oriental origin. In any case, we know that even if more than one species were involved, they were so far akin as probably to be merely modifications of one and the same species, C. indicum, due to different climates and environment, and, in any case, presented no such structural differences as characterise the begonias in question. The original chrysanthemum resembles a Michaelmas daisy, about the size of a sixpence, as has more than once been evidenced by its exhibition by way of contrast at our horticultural shows, and hence it is difficult to credit that by mere high culture and constant selection of such variations as have presented themselves, such immense flowers can have been developed as at present exist, or that so many distinct forms and modes of petal arrangement, allied with such a wide range of brilliant colouring, could have been produced. In the direction of size, well over a foot in diameter, and many inches in depth to boot, as compared with a tiny bloom less than an inch across, and but a fraction of an inch in depth, the chrysanthemum must stand absolutely alone as an example of floral possibilities. It is true that these mammoth flowers may legitimately be regarded as due to the condensed vigour of many suppressed ones, since they are only arrived at by rigorous disbudding and high feeding, but we have only to see what a vigorously grown non-disbudded bush can produce in the way of smaller, but resplendent flowers, to appreciate the advance which the original "weed" form has made in response to man's persuasion concentrated upon its descendants for centuries. Originally a simple star, possessing, like its composite relations, a centre of inconspicuous fertile florets, surrounded by a close-set ring of more conspicuous barren ones to attract the insect world, we now see veritable balls of ringlets, snowy white, glowing crimson, brilliant gold, and all intermediate shades and combinations, as constituting but one type of many. The incurved, in which these petals are symmetrically imbricated, form balls of a different appearance altogether. In others, we see a partial reversion to the composite star, but with beautiful raised central florets fringed with more foliose ones on varied lines, and again of variedly brilliant hues. Even the surfaces of the petals have broken out into superficial adornments, as we see in the hairy section, and every now and again a "curio" turns up with thin spidery-looking blooms, or other oddities, indicating further possibilities if carefully followed up. Selection, too, of what may be termed constitutional differences, has so extended the time of flowering, that in case we needed chrysanthemums all the year round, the florist could certainly supply them, though, as naturally a late autumn bloomer, when summer flowers are on the wane, the chrysanthemum is mostly preferred at that season when it has fewer competitors, and is therefore the more esteemed. Whoever they were who in far distant days began to devote attention to the unpromising little wild flower, presumably owing to some attractive spontaneous sport, they could certainly have never conceived the idea that in the days to come that flower would attain to such magnificent proportions, and its culture become of such absorbing and widespread interest as to form, as it now does, the foundation of innumerable important societies all over the world, and become, as it undoubtedly has done, a very important item in the list of the world's commercial products, and that solely as a means of decoration minus a shadow of economic value in other directions.



THE REV. J. BERNARD HALL.

The Rev. J. Bernard Hall, whose portrait we have the pleasure of giving in this issue, displayed such remarkable judgment, energy, tact, and courtesy, in carrying out his duties as honorary secretary of the Northern Counties Fruit Congress, that he could hardly have failed in winning golden opinions from those who were present, and in a position to fully appreciate the immense amount of work involved in bringing a meeting of this kind to a successful conclusion. Mr. Bernard Hall is not an autocrat, but he fully understands the necessity of discipline, and recognises the desirability of all the arrangements being carried out in accordance with the programme; and possessing tact of high order, all who were associated with him in the management readily fell into line and gave close attention to the details entrusted to them. Accordingly the clearing of the hall of exhibitors, the work of judging, the affixing of prize cards, the opening proceedings, the conference meetings, and the musical entertainments, were commenced or accomplished as the case may have been at the proper time. The success achieved in carrying out the details is all the more remarkable from the fact that no such gathering had previously been held in the North of England, and neither the exhibitors nor the members of committee had had the advantage of previous experience. Mr. Bernard Hall was not only the honorary secretary, but he was the originator of the movement which resulted in the holding of the exhibition and congress. Residing at Dalston, Cumberland, he was not slow to recognise the possibilities of hardy fruit culture in his own and the three other northern counties of England, or to give expression to his views. Mr. Bernard Hall saw that while the hardier kinds of fruit might be grown with success, but little attention was being given to fruit production for home use or market supplies. He addressed the members of various gardeners' associations, and having created a considerable amount of interest in the subject, he proposed some months ago that a congress should be held at Hexham this autumn. The proposition was accepted, a scheme was formulated, prize and guarantee funds raised, and the congress held. The results are set forth in our report. A very pleasant episode occurred on the second day of the Congress. On the announcement of the awards made at the spraying demonstration, a member of one of the firms presented Mr. Bernard Hall, on behalf of himself and the other firms who had taken part in the demonstration, with a silver cigarette case, as a mark of their appreciation of his courtesy.

Chief Officer of the London Parks.—At the meeting of the London County Council on Tuesday next the appointment of the Chief Officer of the Parks under the control of the Council will be made. We understand that three names will be recommended to the Council by the General Purposes Committee, and that two of these are military officers and one an Indian forest official. It is surprising that the experienced officers in the Parks Department of the Council, and of the great provincial towns, who are candidates should have been passed over in favour of candidates who, by reason of the nature of their avocations, cannot have had a practical training in park management.

R.H.S. Exhibition at the Olympia.—We are informed that, owing to the grounds of Holland House being no longer available for the purpose, the summer exhibition of the Royal Horticultural Society will be held at Olympia, West Kensington. The dates of the exhibition are July 4, 5, and 6, and on the first two days it will remain open until 10 p.m.

Canadian Fruit Crops.—According to the report on the fruit crops that we have received from the Ontario Department of Agriculture, it has been a poor fruit season in Canada, more particularly in the case of desirable winter apples, and the quality of much of the fruit is not up to the standard. Wet and backward weather when the fruit was setting is given as the chief cause of the remarkably light yield. Plums have borne unevenly—from poor to good—according to the degree of spraying practised. Pears have been better than apples, although they have not given a full yield.

Nature Study and Photography.—During the few days we were at Hexham we had the pleasure of meeting Mr. Britton, of Langworthy, who is a gamekeeper, and a keen student of natural history. His knowledge of both plant and insect life is remarkable, and he has achieved much success in the photography and the making of lantern slides of natural history objects. The value of his skill as a maker of lantern slides was evidenced on the second day of the Northern Counties Fruit Congress, when Mr. Avery read his paper on bees in relation to fruit production. Mr. W. B. Little, who had taken a leading part in conducting the experiments on which the paper was based, had photographed some of the apple trees that had been utilised. A few hours before the meeting the negatives were shown Mr. Britton, and regret was expressed that lantern slides had not been made from them for illustrating the paper. With a remarkable fertility of resource Mr. Britton went into the town, purchased a box of plates and borrowed a camera, and a small wooden box, and long before they were required the slides were made, and bound up ready for use, and very fine slides they were.

American Gooseberry Mildew.—The Board of Agriculture has made orders under the Destructive Insects and Pests Acts regulating the removal of bushes in the Evesham and Spalding districts.

Floods and Lily Bulbs in Japan.—We gather from an American contemporary that, owing to the floods in the bulb districts in Japan, growers are predicting a large shortage in Lilium longiflorum, giganteum, and multiflorum bulbs this fall. In the Saitama district, where giganteums are grown, seventy persons were killed, 277 missing, 759 houses collapsed, and 41,261 were submerged. In the Gumma district, where multiflorum and giganteum are grown, 153 persons were killed, 50 injured, twenty-two missing, five houses destroyed, thirty-three washed away, 26,372 submerged, etc. Other districts have been affected in a similar way. It was reported on August 15 that the lily fields were still covered with water, and that thousands and thousands of bulbs have been annihilated in the fields. The damage to bulbs is still unknown, but will undoubtedly be heavy. The storms were severe, causing landslides everywhere, with much damage to crops of all kinds.

"**Kew Bulletin.**"—The most recent of the issues (No. 8) of this publication for the current year, contains an interesting account of the Arnold Arboretum, near Boston, U.S.A., from the pen of Mr. W. J. Bean, who visited America in June last. Mr. Bean describes the history and origin of this famous arboretum, and refers at some length to its characteristic features and the many fine trees that have found a home within its boundaries. Several excellent illustrations accompany the letterpress. Highly interesting also are the notes on the tomb in Kew Churchyard of William Aiton, who was in charge of the Royal Gardens from 1759 till his death in 1793.

Sweet Peas.—At the monthly meeting of the Dulwich Chrysanthemum and Horticultural Society, there was a large muster of members to hear a lecture on these flowers by Mr. T. Stevenson, so well known for the success he has achieved in their cultivation. It need hardly be said that the lecture was essentially practical, and that Mr. Stevenson dealt fully and clearly with the various details that require the attention of cultivators. Mr. Stevenson urged the importance of liberal manuring and deep digging, the raising of the plants in the autumn or early in the spring, and the removal of the flowers immediately they have lost their freshness and beauty.

Gift to Kew Gardens.—We are informed that the replica at the Japan-British Exhibition of Choku-shi-mon, "the Gate of the Imperial Messenger" at the Buddhist temple of Nishi Hongwanji, has been presented to the Royal Gardens, Kew, and will be erected there after the close of the exhibition.

An Old Horticultural Society.—The oldest Horticultural society in the world is probably the Royal Horticultural Society of Bruges, for according to "La Tribune Horticole," it was founded in the reign of Albert and Isabella when the art of gardening in Belgium was held in high estimation. From the interesting historical sketch of the society given by our excellent contemporary, we learn that the society owed its foundation and much of the success achieved in its earlier years to Mgr. Antoine Triest, who was for some years Bishop of Bruges, and subsequently Bishop of Ghent. He was an ardent amateur horticulturist, and cultivated with much success various plants and flowers in his beautiful gardens at Akkerghem.

Arboriculture in New Zealand.—The Department of Lands in New Zealand is responsible for the management of the State nurseries and plantations and for the operations connected with scenery preservation, for which separate reports for the year 1909-10 have been published. The output of five nurseries amounted, according to "Nature," to 12,000,000 young trees, of which 8,000,000 were planted, largely by prison labour, on seven plantations. It is surprising to find that nearly all of these are European trees, chiefly the larch, Pinus laricio, the spruce, and Pinus ponderosa; of the eucalypts, Eucalyptus Stuartiana has proved to be a fast grower and is being planted, while the only reference to indigenous conifers states that, owing to failures, it has been decided to discontinue raising plants of Podocarpus Tobira. It is also noted that deciduous trees and mixed plantations have for the most part proved unsuccessful. The report on scenery preservation indicates that additional areas amounting to 1,500 acres were reserved during the year.

Fine Trees and Shrubs at Cambridge.—In the annual report made by Mr. R. Irwin Lynch, M.A., curator of the Cambridge Botanic Gardens, on behalf of the Botanic Gardens Syndicate one section is of special interest, as it relates to the fine trees and shrubs in the famous gardens attached to Cambridge University. It is pointed out that the Botanic Garden has been established on its present site for 64 years, and during this time a number of the trees and shrubs have grown to a size that is unequalled elsewhere in Britain. A well-known authority on this group of plants, having seen the list, writes to the curator: "It is really a wonderful assemblage of trees and shrubs." The following are deserving of record, and all are apparently unequalled, with the exception of those marked with an asterisk: *Acer creticum, 16ft. high, 14ft. 6in. through; there is a larger specimen at Syon House, but it is not in good health. Asimina triloba (the North American Papaw), 14ft. 2in. high, 16½ft. through: of great interest and importance. *Betula papyrifera (the Paper Birch), 47ft. 6in. high. Biota pendula, 23ft. 6in. high. Cercis siliquastrum (Judas Tree), 27ft. 6in. high, 51ft. broad. *Crataegus tanacetifolia, 25ft. high. Ephedra nebrodensis, var. procera, 7ft. 8in. high, 19ft. 6in. through in one direction, and 15ft. through in another. Garrya elliptica, 11ft. 1in. high, 29ft. in width, and 18ft. through. Larix dahurica, var. pendula, 15ft. 6in. high, with spread of 43ft. in one direction. Pinus Gerardiana, 14ft. 2in. high; of great interest and importance. Pinus montana, var. uncinata, 41ft. 6in. high. *Pterocarya caucasica, 61ft. high, 41ft. through, with several stems from 4½ft. to 7ft. 4in. in circumference; one of the three finest specimens. Quercus obtusata, 39ft. high, 35ft. through. Rosa macrophylla, 16ft. 9in. high, 24ft. 2in. through. *Tilia petiolaris, 62ft. high, 40ft. through, circumference of stem 5ft. 5in. Juniperus excelsa, 32ft. 5in. high (recorded height 40ft.), and Xanthoceras sorbifolia, 21ft. 10in. high, stem 16½in. circumference 1ft. from ground. There are many other fine specimens, as, for instance, the Paulownia imperialis, 23ft. high, with a spread of 27ft., and Hippophaë angustifolia var., 42ft. 10in. high, 32ft. and 34ft. through.

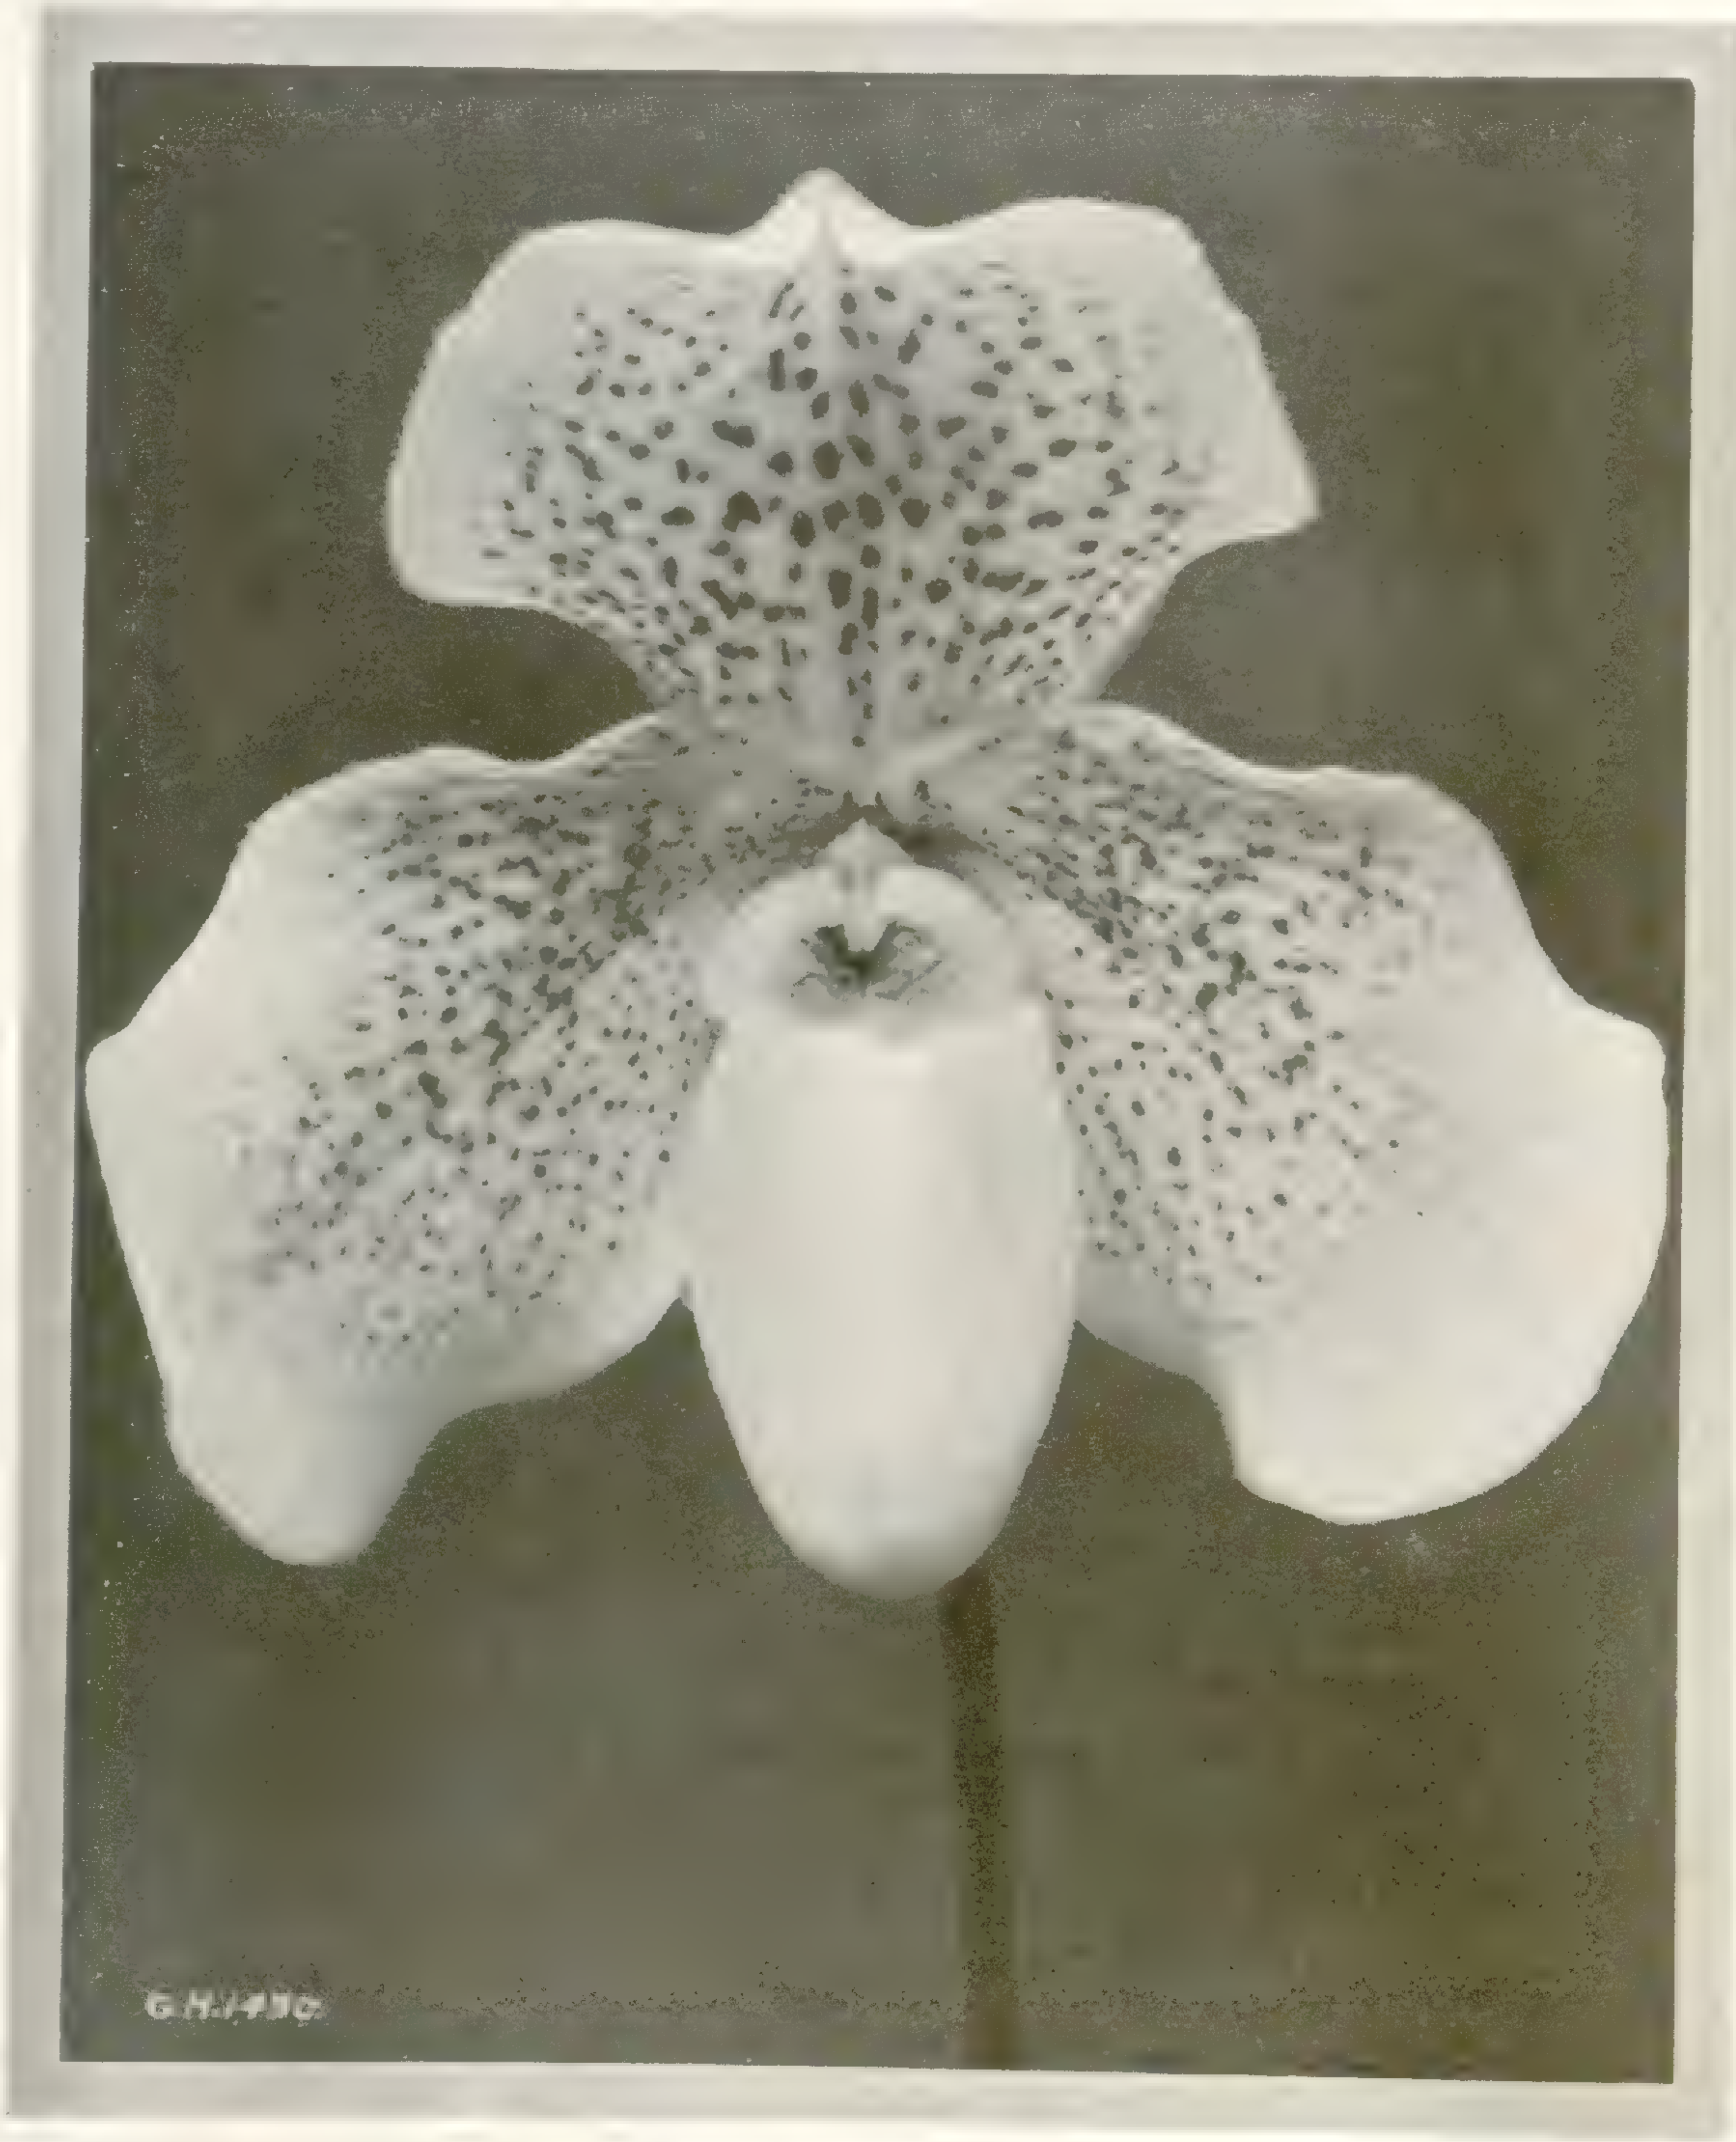
Injurious Fumes from Stokehole Chimneys.—In the "Commonplace Notes," in the new issue of the "R.H.S. Journal," the above subject is very rightly brought forward. It is stated that on several occasions during the past few years, the writers have seen bad results due to the stokehole chimney being erected too near glass structures. The fumes of sulphur dioxide and other gases penetrate into the houses and do much damage when the wind is blowing so as to drive them over the glass, particularly when the ventilators are a little open. Not long ago they saw both vines and peaches with severely scorched foliage and fruit partly scalded, the whole appearing as if the ventilation had been grossly mismanaged, while other houses under the same man's charge and only a short distance away were in excellent condition. On investigation it was found that the chimney was at the end of these damaged houses, and its top almost level with the ridge, and whenever there was a south or south-west wind the fumes were blown right in. In this case the evil was aggravated by the position of the chimney, as the weather was always warmer and ventilation necessary when the wind was in the directions mentioned. As it would have been very costly to have moved the stokehole and rearranged the heating apparatus, the chimney was raised twenty feet, with satisfactory results. An almost similar instance occurred with a range of plant houses where the chimney was at one end of the range, the damage always being worst in the winter, when extra firing was necessary and when flowers were most precious. In spite of well-glazed houses the fumes found an entrance when the wind was in a quarter that drove them over the glass. Raising the height of the chimney in this case improved matters, and only occasionally was any injury done. But all danger would be avoided if the chimneys were placed a little distance away and built sufficiently high to carry the fumes away and above the glass.

ROYAL HORTICULTURAL SOCIETY.

On Tuesday, October 25, there was a fine display at the Royal Horticultural Hall, Westminster, orchids, stove plants, dahlias, carnations, and vegetables being all greatly in evidence. There was a vegetable exhibition as part of the display, classes being provided and prizes offered. Some excellent material was forthcoming, but the competition was not especially keen. The trade displays of choice and well-grown vegetables were very good.

FLORAL COMMITTEE.

Right across the top end of the hall a magnificent group of stove foliage plants and orchids was finely arranged by Messrs. Jas. Veitch and Sons, Chelsea. In front of a background of palms were arranged finely-grown specimens of Dracæna Sanderiana, D. Godseffiana, D. Goldieana, Heliconia illustris rubricaulis, Filicium decipiens, Croton B. Comte, C. Thomsoni, C. Emperor Alexander III., C. Resplendent, C. Prince of Wales, Phyllotænium Lindeni, and numerous alocasias and marantas. Very prominent and finely grown were the nepenthes, notably N. Mastersiana, N. Dr. J. Macfarlane, N. mixta, N. ventricosa, N. Hookeri, N. nobilis, and N. Curtisi superba, very richly coloured. In the immediate foreground were groups of Oncidium oblongatum, Cypripedium insigne Sanderæ, Odontoglossum crispum, O. grande, Cattleya labiata, Cypripedium Charlesworthi, C. Fairrieanum, and C. Arthurianum. It was a grand exhibit.



CYPRIPEDIUM PRINCESS MARY.
Flowers silvery-white, with rose-purple markings. F.C.C., R.H.S., October 25; Messrs. Sander and Sons.

Chrysanthemums in pots, decorative plants, charmingly grown, were also displayed by the same firm; especially good were the freely and finely flowered examples of Caprice du Printemps, White Caprice, Purple Caprice, Greening's Caprice—beautiful plants with from fifteen to twenty good blooms from a 48-sized pot—and Kathleen Thompson. There were also large exhibition blooms of Mrs. David Syme, Alice Lemon, etc. Very bright also were the winter-flowering begonias from Chelsea, especially B. Mrs. Heal, B. Julius, and B. Elatior, the latter crowded with bright carmine flowers.

Mr. Frank Brazier, Caterham, filled one table with sheaves of Climax, Star Shower, White Diana, and other Michaelmas daisies, as well as fine stands of Miss Mary Pope, Ethel Blick, Mrs. A. Thompson, Perle Chatillonaise, J. Bannister, and other useful outdoor chrysanthemums. A large and bold group of late hardy flowers and shrubs, staged by Messrs. W. Cutbush and Son, Highgate, N., contained numerous Michaelmas daisies, notably Climax, Rapture, and Chastity; with Senecio glastifolia, pentstemons, Polygonum amplexicaule, and P. a. album, gladiolus, and a few outdoor chrysanthemums. The Messrs. Cutbush had also a charming lot of perpetual carnations, and here Miss Winnie Pryor, white splashed with red, was very good, as was the new crimson variety Lord Rothschild; besides the carnations there were a few greenhouse flowering plants.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, contributed winter-flowering begonias, and a bright and fragrant lot of perpetual carnations in considerable variety, including several of the newer introductions. Messrs. Barr and Sons, Covent Garden, contributed Lilium nepalense, Nerine flexuosa alba, autumn crocuses, various Michaelmas daisies, and kniphofias, physalis, hardy cyclamens, and other hardy flowers. Messrs. J. Cheal and Sons, Crawley, submitted a charming and bright set of single dahlias, the varieties Lady Bountiful, Glencoe, Stromboli, Miss Roberts, Columbine, and Peggy being very fine; Pæony-flowered varieties, and also good sets of pompon and pompon cactus varieties were also staged, but the singles were the feature.

Messrs. W. Wells and Co., Merstham, set up a large corner full of chrysanthemums, and made a handsome and imposing exhibit of single, decorative, outdoor, and exhibition varieties. Conspicuous were the single varieties Altrincham Yellow, Florrie Stevens, Bronze Pagram, J. H. Greswold Williams (yellow), Sylvia Slade, Mrs. Sam Nash (A.M.), Mary Richardson, Addie Mason, and Crimson Mary Richardson. Among exhibition varieties Mary Loomes, Wells' White, Leviathan, Henry Poulton, Mrs. Thorne, Mrs. G. C. Kelley (A.M.), and Splendour. Messrs. H. B. May and Sons, Edmonton, displayed veronicas of the Andersoni group, and a fine selection of gymnogrammas, davallias, nephrolepis, and winter-flowering begonias.

A fine specimen of the rare and very interesting Stapelia gigantea was shown by Mr. Reynolds, gardener to Leopold de Rothschild, Esq., Gunnersbury Park, Acton; this carried seven flowers, two of which were in perfect condition, one in bud, and the others just past their best. The big five-pointed tawny and hairy flowers were a source of great attraction.

Messrs. W. Crisp and Sons, West Bergholt, Colchester, brought up a few bunches of late rose blooms. Nerines were very well shown by Mr. Frank Lilley, Guernsey, the varieties named Herm, Pink Star, Purple King, Elegans, Bowdeni, Coruscans major, and Salmon Queen being very delightful.

Mr. W. Howe, gardener to Lady Tate, Park Hill, Streatham, put up a very large group of big ferns; the examples of Nephrolepis exaltata, Woodwardia radicans, Pteris Summersi, Asplenium caudatum, Polypodium Mayi, and P. Knighti being very good. Messrs. Bakers, Codsall, Wolverhampton, contributed a long table of pæony-flowered dahlias, showing varieties we have enumerated on previous occasions, the colours were brilliant, and the flowers were of good size for the end of the season. Messrs. J. Carter and Co., Holborn, showed a miniature cactus dahlia suitable for bedding or pot culture; this is about fifteen inches high, and has neat, soft scarlet flowers of true cactus shape. A brave show of perpetual carnations was made by Mr. C. Engelmann, Saffron Walden, and his deep crimson Carola was very prominent.

ORCHID COMMITTEE.

In the display made by Messrs. Sander and Sons, St. Albans, we were especially attracted by Cypripedium insigne Sanderæ, very fine, C. Britannia, with a very big dorsal sepal, Cattleya Black Prince, C. Fabia, Brasso-cattleya Thorntoni, the pretty little Phalænopsis Esmeralda, Cycnoches Chlorochilum, and Bulbophyllum Dearei. Messrs. Sander and Sons had also a beautiful cypripedium named C. Princess Mary (F.C.C.), a cross between C. niveum and C. Helen II., silvery-white, with rosy-purple spottings.

A very bright little group of orchids from Messrs. Mansell and Hatcher, Rawdon, Leeds, contained good plants of Odontoglossum grande, Cattleya Armstrongi superba, C. labiata varieties, C. Fabia, C. Mantini, C. Mrs. Pitt, Lælio-cattleya Luminosa, and the beautiful Brasso-cattleya Thorntoni and B.-c. Digbyana-Mendeli. Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, showed Sophro-cattleya Veitchi var. Eros, with very brilliant crimson-scarlet flowers.

Messrs. Charlesworth and Co., Haywards Heath, put up a quite large group of orchids, and made a charming display with Oncidium tigrinum, O. oblongatum, Odontoglossum grande, O. Pescatorei, O. armainvilliersense, O. Wilckeanum, O. Circe (A.M.), a cross between O. Cervantes and O. Pescatorei, Vanda cærulea, a charming lot of Lælia præstans, and Cattleya Luegiæ. Messrs. Stanley and Co., Southgate, contributed good forms of Cattleya labiata and C. Fabia, as well as several cypripediums. Cypripedium Reginald Young (C. Elmireanum x C. insigne Harefield Hall), a bold flower, with heavily-spotted dorsal sepal, was shown by Mr. H. J. Bromilow, Rann Lea, Rainhill, Lancs.

Mr. Alexander, grower to Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester, showed Odontioda Bradshawiæ Westonbirt var. (F.C.C.), a brilliant red and rose-coloured variety; and Lælio-cattleya Barbaressa superba. Mr. F. Wellesley (gardener, Mr. Hopkins), showed Cypripedium Germaine Opoix Imperalis -very pretty. Messrs. Stuart Low and Co., Bush Hill Park, Enfield, presented an attractive group of orchids, in which Oncidium varicosum, O. oblongatum, O. Forbesi, O. tigrinum, and O. undulatum figured largely. Other things staged were Cypripedium triumphans superbum, Odontioda Seymouri, Lælio-cattleya Ophir, Cattleya Miss Williams, C. Fabia, C. Dowiana aurea, and Miltonia vexillaria Leopoldi.

Mr. E. V. Low, Vale Bridge, Haywards Heath, showed such white varieties of Cattleya labiata as C. l. Vale Bridge var., C. l. Empress, C. l. Cooksoniæ, C. l. Amesiana, and other good things. Messrs. Armstrong and Brown, Tunbridge Wells, presented a magnificent form of Cypripedium insigne, Cattleya Armstrongæ, and C. Fabia. Mr. J. Gurney Fowler, Glebelands, South Woodford, sent Cypripedium Priscilla, and C. Troilus Gurney Fowler's var., the latter a fine thing, and well shown. Messrs. J. and A. McBean, Cooksbridge, showed Cattleya Dowiana aurea, and Miltonia vexillaria Leopoldi. Mr. Collier, gardener to Sir Jeremiah Colman, Bart., Reigate, contributed several very interesting orchids, including Calanthe densiflora (A.M.), with a dense head of yellowish flowers. Vanda Floyiæ, from Mr. H. A. Tracy, Twickenham, with white, purple-lipped flowers, is probably a natural hybrid with V. Roxburghi as one parent.

FRUIT AND VEGETABLE COMMITTEE.

From Mr. R. W. Green, Wisbech, came a good collection of potatoes, arranged in baskets. The tubers were clean and bright throughout. A few of the most prominent baskets were Highlander, Herd Lassie, King Edward VII., Dalmeny Beauty, Edgecote Purple, and Cigarette. A small collection of apples came from Mr. C. B. Broad, Aghern, Conna, Co. Cork, Ireland, and very good they were, too, both in size and colour; fine examples of Charles Ross, Emperor Alexander, Gascoyne's Scarlet Seedling, Peasgood's Nonsuch, and Worcester Pearmain.

From Messrs. Sutton and Sons, Reading, came a table of tomatoes grown in the open-air. The most striking were: Abundance, Magnum Bonum, Princess of Wales, Sutton's A1, and Winter Beauty; while the large collection that was arranged on the side of the hall was a veritable feast for vegetable lovers and growers. The celery, red cabbage, onions, and beet forming the background were simply wonderful, as were also the splendid examples of beet, tomatoes, onions, carrots, leeks, etc. All were up to the exhibition size and quality, while the extent of the exhibit and its arrangement could only call for the highest praise.

From Messrs. Jas. Veitch and Sons, Lim., Chelsea, came a fine display of vegetables, the collection of gourds being much admired; while the tomatoes, peas, cauliflowers, onions, and celery were all outstanding features. The arrangement was generally admired. Messrs. Dobbie and Co., Edinburgh, staged two large baskets of The Factor and Dobbie's Favourite potatoes, which were superb in shape and finish, while pots of Dobbie's Exhibition parsley lifted from the open ground formed a fine setting. Mrs. V. Banks, 102, Park Street, W., exhibited some fine examples of bottled fruits and vegetables, all of which were of good colour and in perfect condition.

CERTIFICATES AND AWARDS.

First-Class Certificate.—To Cypripedium Princess Mary, from Messrs. Sander and Sons, St. Albans; to Odontioda Bradshawiæ Westonbirt var., from Lieut.-Col. Sir George Holford (grower, Mr. Alexander), Westonbirt, Gloucester.

Award of Merit.—To Cypripedium Reginald Young, from Mr. H. J. Bromilow, Rann Lea, Rainhill; to Cypripedium Britannia, from Messrs. Sander and Sons, St. Albans; to Odontoglossum Circe, from Messrs. Charlesworth and Co., Bradford; to Calanthe densiflora, from Sir Jeremiah Colman, Bart. (gardener, Mr. Collier), Gatton Park, Reigate; to Chrysanthemums Mrs. G. C. Kelley, J. H. Greswolde Williams, and Mrs. Sam Nash, from Messrs. W. Wells and Co., Merstham; to Chrysanthemum Miss Mary Pope and Aster Novelty, from Mr. Frank Brazier, Caterham; to Chrysanthemum Joan Edwards, from Mr. Phillip Ladds, Swanley Junction; to Chrysanthemum Hilda Blick, from Mr. C. Blick, Hayes; to Croton Golden Ring, Lynwood var., from Mr. A. E. Bainbridge, Newcastle; to Nerine Mansell Seedling, from Mr. Frank Lilley, Guernsey; to Perpetual Carnation Regina, from Mr. C. Engelmann, Saffron Walden; and to Nepenthes nobilis, from Messrs. Jas. Veitch and Sons, Chelsea.

MEDALS.

Gold.—To Messrs. Jas. Veitch and Sons, for stove plants and nepenthes—this display was also recommended for the Lawrence Medal. To Messrs. Sutton and Sons, Reading, for vegetables.

Silver-Gilt Knightian. — To Messrs. Jas. Veitch and Sons, Chelsea, for vegetables.

Silver-Gilt Flora. — To Messrs. W. Cutbush and Son, Highgate, for hardy flowers and carnations; to Mr. Howe, gardener to Lady Tate, Park Hill, Streatham, for ferns.

Silver-Gilt Banksian. — To Messrs. W. Wells and Co., Merstham, for chrysanthemums.

Silver Knightian.—To Mr. Green, Wisbech, for potatoes.

Silver Flora.—To Messrs. Jas. Veitch and Sons, Chelsea, for begonias and chrysanthemums; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids.

Silver Banksian.—To Messrs. Armstrong and Brown, Tunbridge Wells, for orchids; to Messrs. Mansell and Hatcher, Rawdon, Leeds, for orchids; to Mr. E. V. Low, Haywards Heath, for orchids; to Messrs. J. and A. McBean, Cooksbridge, for orchids; to Messrs. Bakers, Wolverhampton, for dahlias; to Mr. Frank Brazier, Caterham, for hardy flowers; to Messrs. J. Cheal and Sons, Crawley, for dahlias; to Mr. C. Engelmann, Saffron Walden, for carnations; to Messrs. H. B. May and Sons, Edmonton, for ferns and begonias; to Mr. L. R. Russell, Richmond, for bertolonias and anæctochilus; to Mr. F. Lilley, Guernsey, for nerines; and to Mr. Broad, Conna, co. Cork, for apples.

Bronze Flora.—To Messrs. Stuart Low and Co., Enfield, for carnations, etc.

Bronze Banksian.—To Messrs. Barr and Sons, Covent Garden, for hardy flowers.

Cider Apples.—According to the monthly report of the Agricultural Instruction Committee of the Somerset County Council, 5,000 stocks were budded during the past summer at the National Fruit and Cider Institute, with about 100 varieties of cider apples. There was a good crop of apples in the old orchard, but in the plantations the crops were rather poor.

SOME IMPRESSIONS OF THE NEWER ROSES.

A very large number of rose novelties are introduced annually; many from the Continent and America, while in late years the number of really good roses from the British Isles has increased so rapidly that we now have quite a show of British-raised novelties, and these are generally of greater merit than those from foreign sources. One reason of the superiority of our home-raised varieties is doubtless the severe test they undergo before being awarded any recognition or award by the National Rose Society.

This year alone there were ten gold medals awarded, all, with one exception, to British-raised roses. There is no higher prize for a new rose than this coveted medal, which has now been awarded to seventy-four varieties, Souvenir de Pierre Notting and Rayon d'Or being the only two recipients not raised in Great Britain or Ireland. In addition, a large number have received other awards from the society.

My object is to give a few personal impressions of some varieties that have been with us long enough to show their characteristics and merits, and that are genuine improvements upon an already grand collection of roses.

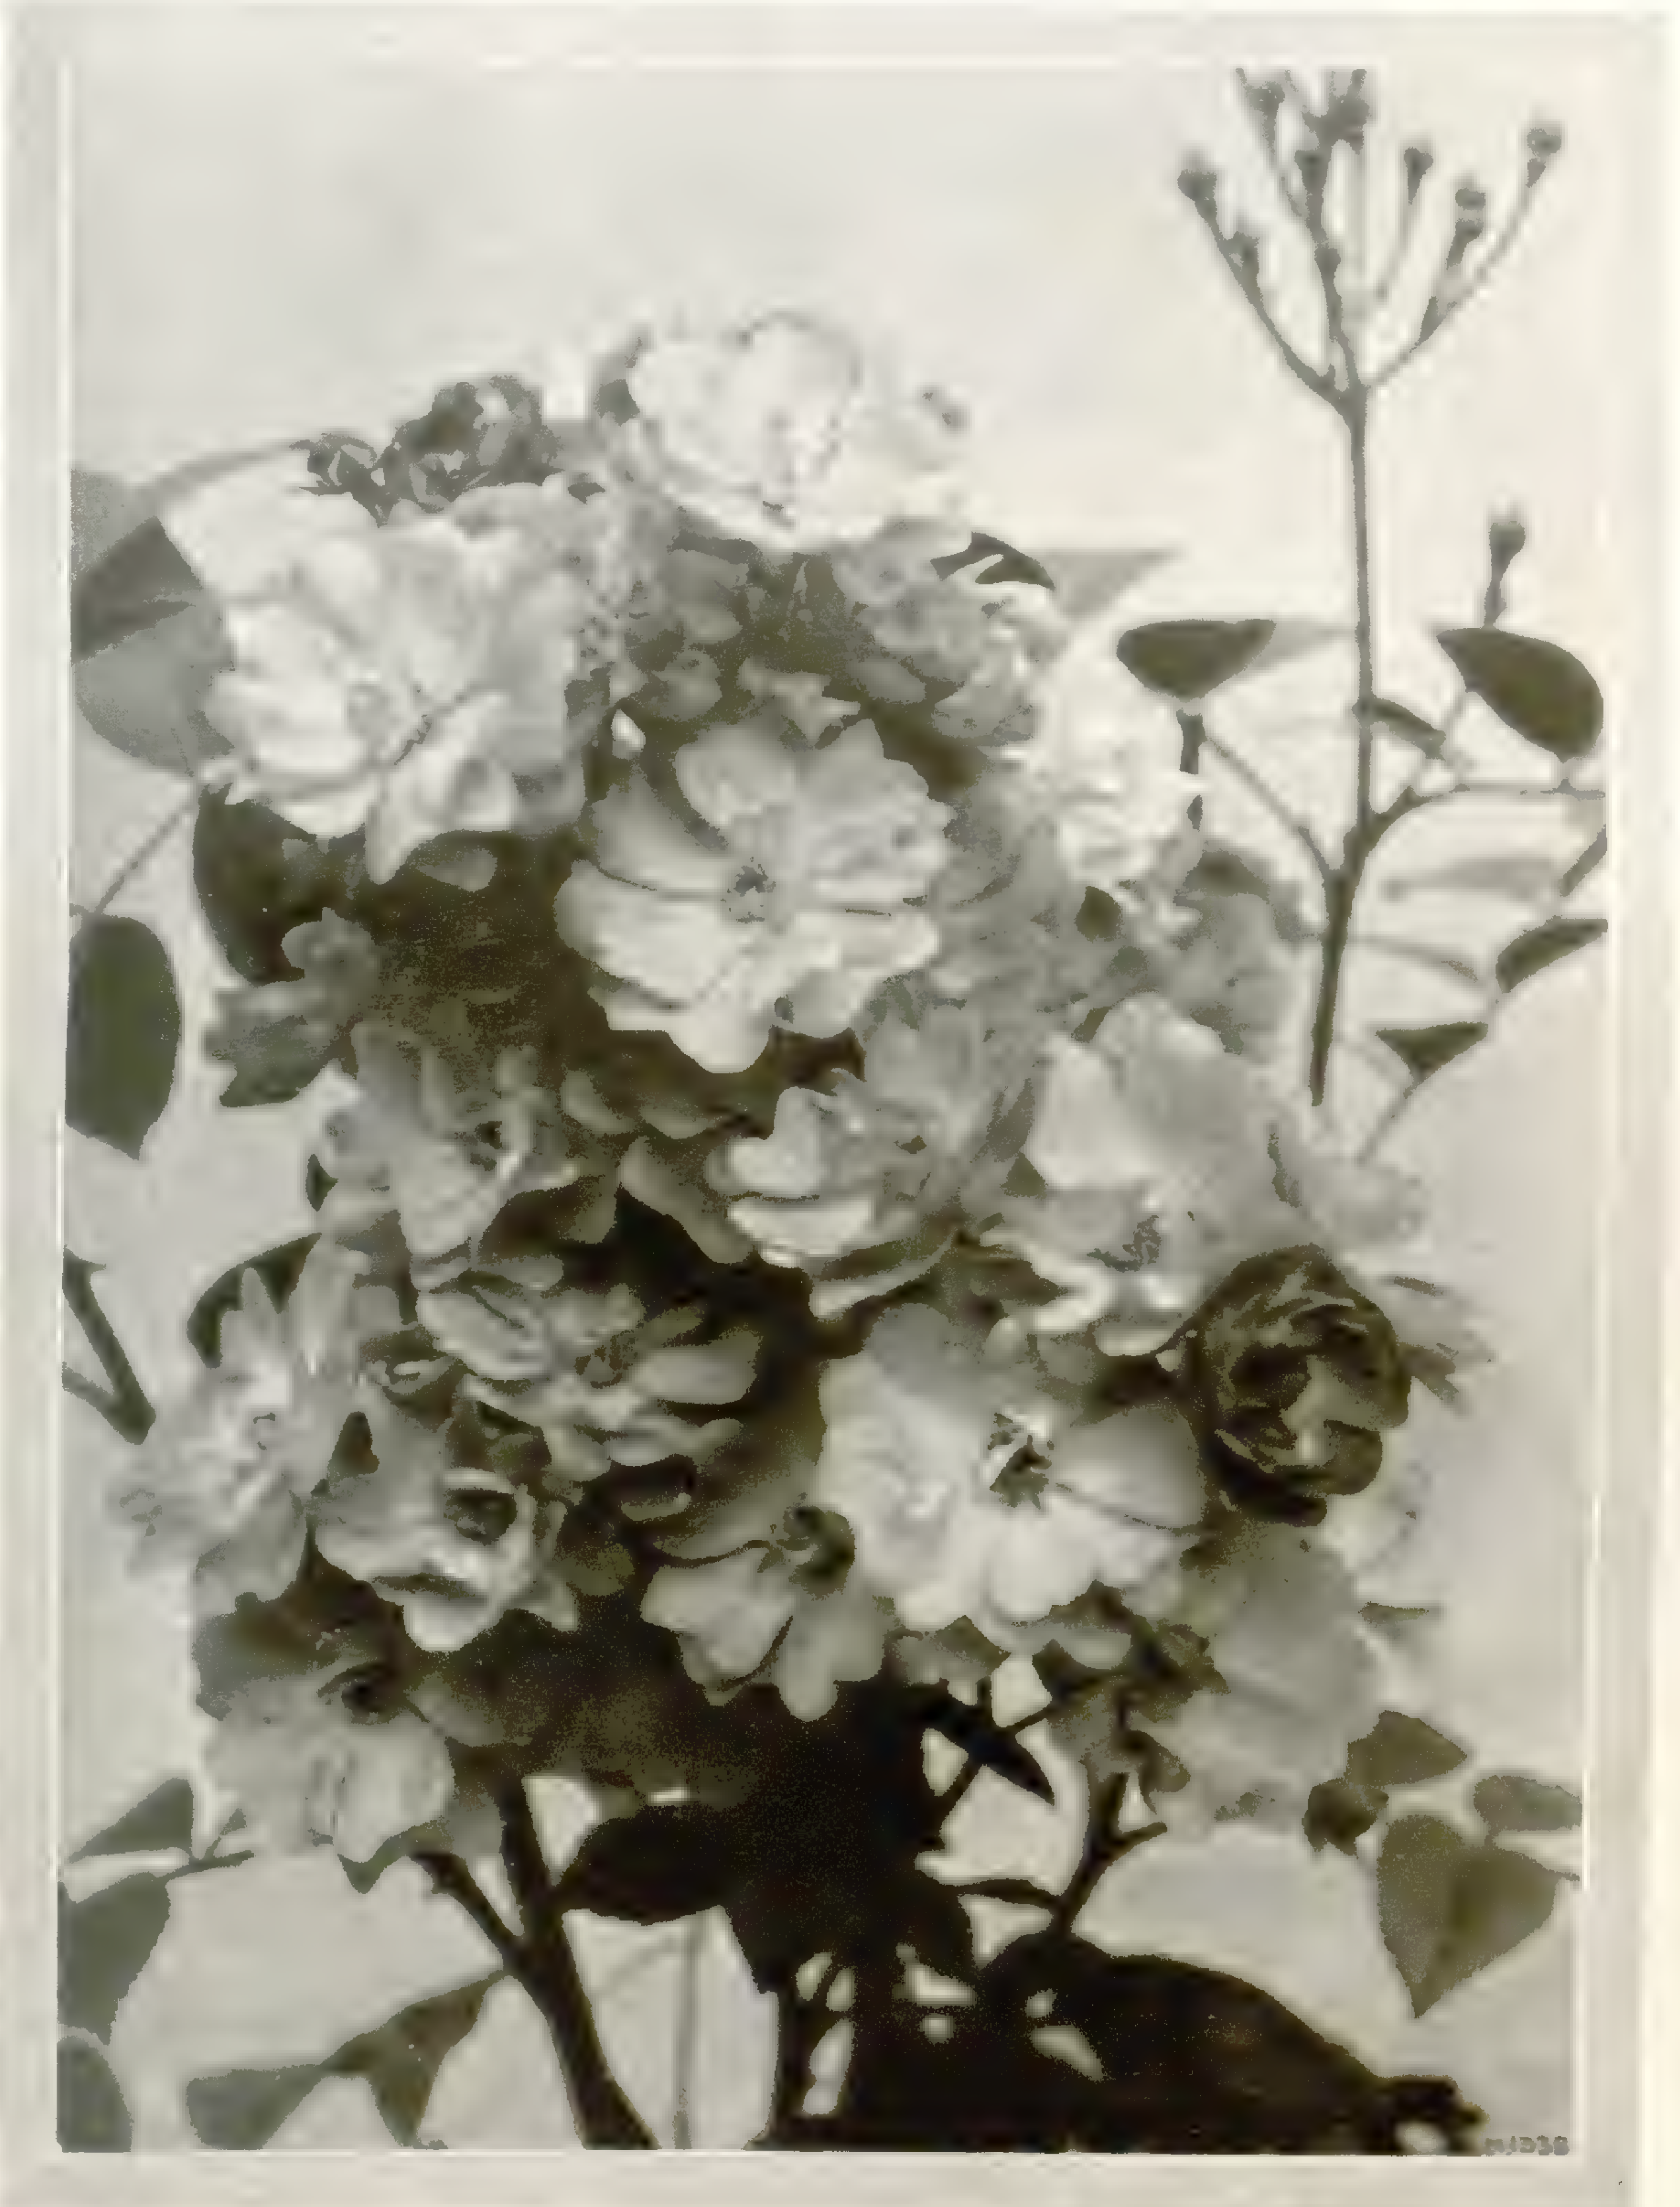
Among the Polyanthas or Fairy Roses we have Jessie, one of the brightest and best of its class. This is a clear cherry-crimson that never fades, and is in constant flower, both in the open and under glass. Jessie and Orleans Rose are decided acquisitions and worthy of all praise. The last-named is also serviceable for both purposes, and as a bedder. Orleans Rose is a clear geranium-red, with a lighter centre, clear at all times, and flowering in immense trusses.

Chateau de Clos Vougeot will prove one of the best dark crimsons. It is not a very vigorous grower as seen here, but is very free-flowering, and has the advantage of never fading or losing the intensity of its deep fiery red, with dark velvety scarlet shadings. It will make a good bedder, and is continuous. Commandant Jules Gravereaux may be described as a vivid scarlet form of Frau Karl Druschki, and all are aware how useful such a rose must be; it is also sweet-scented. George C. Waud is a sterling rose that is certain to be popular for a long time. It is a glowing orange-vermilion that does not fade; flowers large, well shaped, and very free. There is a slight tendency to drooping, and we have found it most effective in standard form. W. R. Smith is a grand creamy-white, with a flush of rosy-pink; will prove a good exhibition flower, and is also free enough for the garden. White Killarney stands up well, is a trifle more double than the pink variety, and is capital under glass for early forcing, as well as a bedder. Then we have a beautiful new yellow in Lady Hillingdon, with a long, well-formed flower, carried singly upon stout stems. This was a recognised market rose for some time before its introduction, so that we know much more of it than is the case with most roses during their first season. James Coey is another really good yellow, also carried well, and will make a useful bedder; deep yellow tinged with gold when young.

A very deep blood-red Tea rose is found in Friedrichruhe, which is large and free, quite an addition to our bedding teas. If Miss Alice de Rothschild fulfils its promise, we shall have the nearest approach to a dwarf Maréchal Neil up to the present. Mrs. Foley-Hobbs will be invaluable to the exhibitor, and is an ivory-white, with a slight flush on the edge of its petals. This rose had rather an unique experience during the last summer. It was only awarded a silver medal at the Royal Botanic exhibition of the National Rose Society, but on being staged later at the Westminster meeting, gained the much-desired gold medal.

Excelsa is about the best new Wichuaraiana that we can speak of with confidence. This is a very bright scarlet form of Dorothy Perkins, and sure to be appreciated.

Arthur R. Goodwin has been pretty, and is a distinct decorative variety; coppery-orange and yellow, veined with old gold, the back of the petals splashed with carmine; of branching habit and very free-flowering. Duchess of Wellington has long, pointed flowers of saffron-yellow, stained with lemon-yellow and crimson; altogether a most showy rose. His Majesty is not so satisfactory as I had expected. It is large and of good form and substance, but its deep crimson shadings do not stand a strong light sufficiently. A good garden rose not mentioned often enough is Jacques Vincent. The buds are long, coral-red, with a shade of deep yellow, not many petals, but very free in growth and flower. Madame Andre Porcher has been described as a deeper-coloured Mrs. W. J. Grant, but it is larger and more globular than that variety here. Another grand new rose of the Mrs. W. J. Grant type is Mrs. Philip le Cornu, a seedling from Mrs. W. J. Grant, and fully partaking of all the good qualities of that well-known rose. This is a deep and clear cerise, quite distinct, and a much better grower; certain to be in demand when better known. Miss Cynthia Forde is a brilliant rosy-pink, lighter on the reverse side of the petals, large, and of exquisite shape.



THE ORLEANS ROSE, A NEW POLYANTHA VARIETY.

This fine rose has been well shown by Messrs. Wm. Paul and Son. Flowers of good size and freely borne in large clusters; bright red, carmine, and white-centred.

One of the sweetest-scented roses we have is My Maryland, a large and well-shaped flower, carried nicely upright, and beautiful under glass. It also promises well as a bedder, being very free and yet even in growth, and the flowers carried well above handsome foliage. The colour is clear flesh, veined and splashed with bright carmine, altogether one of the best. Theresa is good, both in pots and as a bedder. Not much more than semi-double; a deep orange-apricot, splashed with carmine. Climbing Lady Ashtown is a great help among pillar roses, and appears to produce even better flowers than the type; its tendency to droop is an advantage rather than not when grown in climbing form, and I am much pleased with this rose. Goldfinch makes a very pretty yellow rambler, and is quite an improved Electra and much hardier; very free-flowering, and one of the first to open.

A very large number of others might be mentioned, and are really good, but the above have been tried, and are about the best of the recent introductions. One cannot speak with any confidence of a rose until trying it more than one season.

A. Piper.

NEGLECTED SPRING BEDDING PLANTS.

Spring is the season of the best beloved, if not of the fairest flowers; after winter's long, almost colourless reign, it is a joy indeed to see flaming tulips and crocuses, rainbow-tinted hyacinths, and golden daffodils decking the garden. No wonder that the vivid bulbous flowers are chiefly popular, yet it is a pity that better use is not made of the countless lovely spring-blossoming perennials for bedding.

Experiments were made last autumn with various herbaceous plants as bedding subjects, with wonderful success; they were put out in October where required to bloom in March, April, and May, and, after giving their harvest during those months, were removed to give place to the more fragile beauties of summer. Critics prophesied that good flowering could not be expected from October moved plants, also that the roots would suffer by being lifted in May; both predictions proved wrong. The perennials were rather more than a year old when used, and in the rich deep soil given them they produced sheaves of blossom. This autumn they are fine clumps, and no doubt will excel their former triumphs next spring.

There is a secret about removing plants of this size and kind. It is to water them the day before, and give afterwards a further soaking with weak liquid manure or soot water. If the spade cuts them out next morning, with a square of solid soil all round the roots, there will not be the slightest flagging. Needless to say the holes must be dug ready to receive them at once. Geum Heldreichi is a glorious subject, beginning in April in sunny gardens. A bed of this, planted alternately with Narcissus poeticus, and widely edged round by Myosotis alpestris Victoria, will give a copper-orange, white, and blue mass that will be regretfully remembered during summer. Another orange-scarlet Avens that will blossom early is Geum chiloense miniatum.

A bed of the Bleeding Heart Flower is beautiful indeed; the clumps can be removed to a semi-shady bit of reserve ground afterwards, and bedded out once more next winter. If desired, the small reddish-crimson Dicentra eximea can be used as a border to Dicentra spectabilis, or double arabis combines well with the latter. For a perfectly harmonious edging plant nothing can rival Aubrietia Leitchtlini. Double red daisies tone well with the pinks if preferred. A good display of auriculas is always admired, especially in a front garden, and experience shows that they can be lifted without injury. For a tall centre mass the common purple honesty is suitable, while the latter should be tried in a semi-shady bed by itself all but for a belt of Alyssum saxatile.

Uncommon but charming are the fumitories, Corydalis alba, and Corydalis lutea. No gardener would regret giving these a trial, perhaps around a centre mass of fine columbines. The white and yellow will tone with all the aquilegia colours, and, although the plants will begin in April, they will be still fair in June. If the columbines are replaced by heliotrope the corydalis will continue as a floral edging until September. The old-fashioned Double Yellow Rocket, Barbarea vulgaris plena, commences also in April, and the fragrant rich gold blooms arouse much interest, so completely has the plant died out of popularity. It has an exquisite effect if given a surrounding belt of the Pasque Flower, Anemone pulsatilla, another April bloomer. Aubrietia deltoidea Columnæ is an attractive lilac-mauve edging subject for this bed, or, if the Pasque Flower is not used, all the surrounding might well be of Alyssum saxatile citrinum, the lemon of which shows up the rich gold of the rocket. Then there is the Bugle, one of the familiar woodland spring flowers. Ajuga osmafera has evergreen foliage, a spreading habit, and such a hardy nature that it can do with light or heavy soil, sunshine or shadow, but in shade it grows tall. Many gardeners are confused between this plant and Ajuga reptans, but the latter creeps over the soil, and does not begin until May to give the blue blossoms, which, unlike those of the other, are flushed with rose. The variegated form is of considerable value also, but it reaches a foot high instead of the six inches of the green-leaved type. The mass of deep blue that Bugles offer is of real value in the spring lawn beds.

Alyssum Benthami is little known. The blossom is white, and has a much softer effect than that of the arabis, the height varying from nine to twelve inches. Achillea millefolium Cerise Queen, cherry-red, and often two feet high, is one of the perennials that may be used as a spring bedder, then removed to a sunny border to continue in bloom all the summer and autumn. Nepeta italica is a tall purple flower that attracts notice because it supplies a needed note of colour in the April garden. Dwarf yellow wallflowers could accompany this, and the edge might be of Lamium maculatum, also purple, whose white-striped dwarf foliage has a neat appearance.

MESSRS. T. RIVERS AND SON'S COLLECTION OF ORCHARD HOUSE FRUIT AT HEXHAM.
With outdoor fruit for comparison.

Alyssum spinosum. — The madworts, or alyssums, are generally associated in our minds with the possession of yellow flowers, although there are some with white blooms which are not so much appreciated as those with flowers of a brighter hue. Yet a few of the white alyssums are worthy of our consideration, and for the alpine garden probably the best of these is Alyssum spinosum, occasionally named by some Koeniga spinosa. Its main charm does not, however, lie in its flowers, but in its foliage, as it makes a charming bush of small silvery leaves which are covered with little hairs. In a good position it looks well indeed, but the flowering adds little to its attractions. It blooms very freely, however, when established, and well-nigh covers itself over with many small, rather dull white flowers. In young plants the reason for the name of spinosum is not apparent, but as they grow older little spines appear on the branches. The best position for this alyssum is well up on the rockwork, and in a place which is dry and fully exposed to the sun. In such a situation the leaves are more silvery than when in shade. A light, rather dry soil, is suitable for A. spinosum. Propagation is easily effected by cuttings or by seeds.—S. A.

FRUIT TREES, ROSES and HARDY PERENNIALS

offered by

THE BARNHAM NURSERIES Limited.

for planting NOW.

The following are all good reliable plants, well grown, true to name, and will please everyone. We have made a speciality of Fruit Trees, and can offer upwards of 500,000 well-grown trees, in great variety, for every purpose—Miniature Fruiting Trees on dwarfing stocks, for pots or tubs, to Large Orchard Standards.

DESCRIPTIVE CATALOGUES FREE.

HERBACEOUS BORDERS

Original Schemes designed by our Border Expert. Choice mixed Borders. Colour Schemes. Borders flowering through the Season from Spring until Winter. Borders to flower over a given period. Existing Borders renovated or remodelled. Advice freely given. Terms strictly moderate. Plans and Estimates submitted.

ROCK GARDENS

Estimates given for Constructing Rockeries, Furnishing Plants. All kinds of Natural stone supplied to any Station. Clients interviewed in all parts of the Kingdom by appointment. No enquiry too large or too small to gain our prompt attention.

ROSES, FRUIT TREES

Roses—Hybrid Perpetual, Hybrid Teas, Standards, Dwarfs, Climbers, Ramblers in choicest variety.
Fruit Trees—Standards, Pyramids, Dwarf Trained up-to-date sorts. All clean, well grown and sturdy.
Hardy Evergreen Trees and Shrubs, Climbers and other Plants for Greenhouse, etc.
Delphiniums, choice varieties, 6/- to 18/- doz.
Phloxes, superb colours, 6/- to 9/- doz.
Pæonies, grand selection, from 10/6 doz.
Tree and Border Carnations, great variety, from 5/- doz.

THE BEST PEACHES FOR OUTDOORS.

Outdoor peaches make a most valuable addition to the dessert for several months of the year, if suitable varieties are successfully cultivated. In cases where natural conditions are favourable success means little more than painstaking attention to ordinary routine management; and even in cases where natural circumstances are adverse, unless of a nature impossible to surmount, the returns usually to be obtained well repay the trouble involved.

Under whatever conditions however the outdoor culture of the peach is attempted, there is one thing connected with it in common to all cultivators, viz., the selection of varieties, and it is with a view to render assistance in this particular that this note is written. Though space at command is limited, the list will include enough varieties to produce ripe fruit during the most of the time that it can be obtained from outdoor trees.

G.M. 1490.

COLLECTION OF FRUIT, ETC., SHOWN BY MR. W. B. LITTLE AT HEXHAM.

Amsden June, originated in America, is the best of very early peaches, and has gained the R.H.S. First Class Certificate. Its fruit is handsome, above medium size, and possesses good flavour. The tree is a good grower and free cropper. Hales' Early, an early large-flowering variety, should be included in every collection. The fruit is round, above medium size, and brightly coloured on the exposed side. The flesh is juicy, richly flavoured, and readily parts from its stone. The tree grows freely, and is very hardy. This also has been awarded the R.H.S. First Class Certificate.

Early Grosse Mignonee has refreshing and richly flavoured fruits, above medium size, and beautifully coloured. It is one of the best second early varieties, and well deserves to be generally grown. Rivers' Early York, a second early variety, possesses a good constitution, and must not be confounded with Early York, which, in many respects, it much resembles. It is a richly flavoured, free bearing variety, that should find a place in all outdoor collections. Alexandra Noblesse is a highly flavoured, pale large round variety, of much value for midseason use. It has white flesh that easily separates from the stone. It was raised from Noblesse, to which it is in many respects similar, though it possesses a better constitution than the old favourite.

Crimson Galande has very highly coloured fruit, above average size, and of first-rate flavour. Its flesh is reddish, and quite distinct. It is a well known old variety, with small flowers that set freely, the fruit ripening at the middle of August. Belle de Doue is a midseason variety that deserves to be better known. The fruits are round, of medium size, with a crimson cheek next the sun. It has white, richly-flavoured flesh, and the tree is a good grower and free cropper. Royal George is a well known old variety that still deserves the high position it has held for many years. Its fruit is highly coloured, large, and round, ripens about the middle of August, and is of first-rate flavour. It sets its fruit well, as is the case with many other small-flowered varieties.

Grosse Mignonne, like the preceding, is an old and well-known variety, that ripens its fruit with it. The fruit is large, downy, and coloured red on its exposed side, with red-tinged, highly-flavoured flesh. Were I asked to name the best peach for outdoors it would be Bellegarde. It seldom, even in our low, moist position, fails to yield a full crop of excellent fruits, which are dark crimson, fairly large, and very richly flavoured. Dymond is another of our most highly-prized peaches, handsome in appearance, and deliciously flavoured. The tree is hardy, and grows freely, requiring in our case occasional root pruning. I would advise anyone forming even a small collection to include this variety.

Barrington, a well-known moderately late and free fruiting variety, has large, deep, finely flavoured fruits, which are nicely coloured on the exposed side. The tree is a strong grower and of good constitution. Here there is a tree of this variety in excellent condition that was planted upwards of forty-six years ago. Late Devonian is a free fruiting late peach of much merit. It has fairly large and handsome fruit, of good flavour, that lasts a long time in good condition. It has been awarded the R.H.S. First Class Certificate.

I had almost overlooked Violette Hative, though it is one of the best grown here. Its fruit is large and handsome, of good flavour, and ripens in September. The tree is hardy, and a good cropper. Exquisite is a late yellow-fleshed variety, valuable for its free bearing quality. Its fruits are large and handsome, crimson on the exposed cheek, bright yellow on the shaded side, and of moderately good flavour. The tree has an excellent constitution.

The Hendre Gardens. T. Coomber.

GRAPE ALNWICK SEEDLING.

The editorial footnote to Mr. Lintott's communication on Prince of Wales Grape (page 731), referring to the setting of the berries of that variety, induces me to briefly give my experience of the setting of the berries of Alnwick Seedling. Although I have not grown the variety Prince of Wales, my treatment of Alnwick Seedling may prove of interest to persons who are growing it. Having some difficulty in inducing the berries to set well, I wrote to Mr. William Taylor, then at Longleat, and asked his advice. He very kindly advised me to gently pass my hand over the bunches about nine o'clock every morning, thus removing the caps and the sticky substance which adhered like a minute dew-drop to the pistil. "At noon," said Mr. Taylor, "use the camel-hair brush when the pistil is quite dry and you will have a good set." I did follow this advice and with much success; bunches so treated were considered good enough for a silver medal award at an international exhibition at Earl's Court. I found that in the case of Alnwick Seedling the pistil did not become dry enough for fertilisation, except on very hot days, and then not until the afternoon; and midday I found to be the best time for the setting to be done.

I was pleased to see Mr. W. G. Pirie's favourable reference to Appley Towers. It is all he claims for it. I am growing the variety and intend to plant Lady Hutt also.

Geo. Garner.

GREASE BANDING OF FRUIT TREES.

In the "Journal" of the Board of Agriculture for October there appears an article from the pen of Professor F. V. Theobald, of Wye, upon this subject. The article is so remarkable in many respects, and few gardeners or fruit growers, I am afraid, see this publication, that I venture to call attention to a few of the most salient points for the benefit of the readers of the Gardeners' Magazine.

The article is based upon experiments and observations carried out during the last six years, though more particular reference is made to the last two seasons, 1908-09 and 1909-10.

The writer first details the insects it is expected will be caught on the grease bands, i.e., the moths with wingless females, and then goes on to give a list of those which were actually caught, month by month, on bands on three apple and three plum trees in 1908--1909, and three apples, three plums, and three nuts in 1909-1910.

Of these various wingless females that of the ordinary Winter Moth (Cheimatobia brumata), was caught in far the larger numbers. The Mottled Umber (Hybernia defoliaria), often called the Great Winter Moth, whose large size distinguishes it when on the bands from the ordinary one, was only found in very few cases. This moth goes up about the same time as the Winter Moth, principally in October and November.

Strange to say, the March Moth (Anisopteryx œscularia), about which so much has been heard, did not appear nearly as plentifully as the Early Moth (Hybernia rupicapraria) in 1908-1909, though much more numerous in 1909-1910, probably owing to some local influences. Both, however, occurred in sufficient numbers in January, February, and March to show that it is absolutely necessary to keep the grease bands "tacky" till quite the close of the latter month, if not well through April.

The principal interest though for the practical grower, centres in the experiments which were carried out to determine the proper height at which to place the bands, the minimum width they may be consistent with efficiency, and the best class of grease to use. If I mistake not, Professor Theobald has always been an advocate of low-placed bands on the ground that many of the moths laid their eggs on the trunk or stem of the tree beneath the band if the latter were placed high, and that there was a danger of these eggs hatching, and the larvæ reaching the top of the tree, presumably over the smooth dry band. He fully recognises this danger now, but it has given place to a greater, viz., that if the bands are placed too low (2ft. or under from the ground), it is possible for the winged male to carry the female this short distance, and deposit her upon the trunk of the tree, so that she evades the band. The fact that there was this danger was conclusively proved by experiments where trees were double banded, and several female moths were caught on the higher of the two bands.

Now this gives food for serious reflection to a good many of us growers, for far from being at 2ft. height, many of our bands are from 12in. to ground level on bush trees, and if 2ft. does not prove an efficient height, it seems quite probable that we are wasting our time and money in grease-banding bush trees, especially seeing that we have an absolutely certain remedy for all leaf-eating caterpillars in the arsenate of lead spray fluid. At any rate, since I have banded my bush trees now for the present season, I intend to keep a careful watch to see how many are caught and what damage results in the spring from the attack of Winter Moth larvæ.

Another disturbing factor is that a less width than 6in. failed to stop the moths, or, as the writer puts it, "formed an imperfect barrier"; presumably this also was proved by double banding, though the fact is not stated. "For good quality British and German greases, a 7in. band is undoubtedly wide enough, but the grease must cover most of the band. If the grease is a thin, inferior one, the band must be at least 10in., and a good 2in. of paper left below to catch the run of the grease."

Up to this year almost all the greases which I have used have been liable to run, but I have never used 10in. paper, probably nearer 7in., with 5in. of grease, and it is distinctly disturbing to read that this forms "an imperfect barrier." As I said just now, it is to be presumed that this fact has been proved by double banding, though it is rather strange that such a width of grease should be necessary, seeing that almost all the moths one finds on the bands are on the lower two inches, and very few, indeed scarcely any, on the top two inches.

It would be interesting if Professor Theobald, in his future experiments, would give us the numbers caught in this way, viz., on the lower two inches, the middle, and the top two inches. The idea in allowing a certain width of paper for the run of the grease has been, of course, to prevent it getting on to the bark of the tree, lest there should be any harmful ingredient in the grease which would injure the health of the tree. Even with the absence of any positively harmful ingredient, it is inadvisable to allow much grease to get on the bark, as the effect is often harmful in the extreme.

An interesting point was discovered in the trials with various thicknesses of paper, it being found that several greases lasted "tacky" much longer on special thick grease-proof papers than on the ordinary thin grease-proof. Another point which is also particularly interesting is that numerous Winter Moth larvæ were caught on these experimental grease bands. At the first sight this seems to point to something wrong with the banding, but it appears from the explanation that these bands put on to test various greases were applied very late in the season after a good many of the moths had gone up. It is explained that in all instances these larvæ were caught after a heavy storm of rain or wind, which had dashed them to the ground, and that they were caught in reascending the trunk. The author mentions it merely as an interesting fact and not as suggesting that banding should be used for this purpose, though he goes on to point out that not only are larvæ of these wingless female moths caught in this way, but larvæ of moths which, owing to their possessing wings cannot be dealt with by grease banding, such as the Tortrix and Clouded Drab Moths. It certainly seems a good point if we can get greases to keep moist during the months in question, May and June, even if the trees have to be artificially shaken or jarred in the absence of any storm sufficient to cause the fall of the larvæ.

Some tables are given, showing the behaviour of certain British and German greases, together with one American preparation, all with the exception cf the latter being represented by a letter and not by name. These tables are very interesting, showing as they do the condition of the bands, (1) at the end of October, November, and December for 1909-1910, and (2) at the end of January, February, March, and April, also for 1909-1910.

For the first three months most of the greases acquitted themselves well, being described as "moist" or "fairly moist," though some failed lamentably, and are classed as "dry" or "dry on wind-side." In the second case, for the last four months, however, the results prove the weakness of many of the greases. By the end of February almost all the British and German greases were out of action, only one section, the Raupenleims, being described as "moist."

The greatest success of all, and the one which the author uniformly praises in high terms, is the American Bird-lime grease "Tanglefoot." In a footnote it is stated that this grease was put direct on to the trees, and remained "tacky" for ten months, and in another instance for "over a year." For this "grease" bands 3in. wide are considered sufficient, as it does not run, and is absolutely unchanged with any change in the weather. It seems a great pity that this product is at present at such a price that prohibits its use to any great extent; at any rate, in commercial plantations. It is to be hoped that some of our enterprising horticultural chemists will take up the manufacture of this article, so that we may perhaps obtain it at more reasonable rates.

Since this substance is at present beyond the means of most of us, it is abundantly clear that any attempt at grease banding must be followed up during the winter and spring. The bands must be brushed up when they show signs of drying, so as to keep the grease "tacky" till the end of March, at any rate. It is the worst of folly to spend pounds upon grease, and then to have the moths cross the bands for the sake of a few shillings spent on labour for this purpose. I have always found it best to have the grease put on thickly in the first place, and, as far as possible, evenly, not one tree thick and another thin, otherwise one is compelled to examine nearly every tree to make sure that none of the bands are dry and inactive.

Such experiments as are detailed in this article are the sort which British fruit-growers need, practical and businesslike, and some little approach towards the sort of help which is given to the industry in Canada, Australia, and the United States, and which, up to the present, the authorities in the old country have been very backward in supplying. If we are to hold our own, the Board of Agriculture and the various County Councils concerned must do a great deal more along these lines to help in elucidating some of the very knotty points and difficulties with which modern fruit-growing is faced.

Fred W. Hammond.

Pilgrim's Hatch.

Tydæas and Gesneras.—These two closely allied flowering plants are very useful subjects when grown for winter flowering, many of them being equally beautiful either in or out of bloom, the foliage, in many instances, being particularly ornamental. A very high temperature is not really necessary for their cultivation, a warm pit during the summer being very suitable, but from now onwards they should be placed in a house with a temperature of from 55 to 60 degrees at night; they like a fairly cool, moist base to grow on, but the atmosphere of the house should be fairly dry, the foliage keeping in better condition, and the flowers lasting much better than when growing in a more humid atmosphere. Like the gloxinias, they prefer a very light rich compost to grow in, and when the pots become full of roots they will take any quantity of liquid manure, cow manure being probably what they most appreciate.—Thomas Stevenson.

CHOICE PLUMS AS BUSH FRUITS.

(Concluded from p. 834.)

Unlike the formal pyramid or the trained wall tree, the bush has no conformed shape; it is merely what it is a bush, and the branches should be so dispersed as to allow for the development of spurs and those short young shoots which bear fruit.

The object of the first pruning is to encourage the tree to commence its career in the garden by growing; but, unfortunately, some young plum trees have a tendency to make a superfluous quantity of wood the first few years after they are planted, but do very little in the way of fruiting. To merely cut back the shoots on such trees is only encouraging them to grow harder still, and it is the root action which needs checking. In short, there is only one course with an over-exuberant young plum tree, and that is to lift it after the leaves have fallen in the autumn, shorten back the strong roots, and replant it, but the desirability of this operation is only governed by the nature of the growth. By this I mean that in a collection there may be included varieties that show a tendency to run clean away to wood the first few years, and others which do not display half as much vigour. In fact, the latter may need some encouragement in the form of fertilisers to help them to make growth, whereas the former will probably require root pruning to check the excessive vigour of branch growth.

There is no one theory that will apply to the branch pruning of all varieties of plums, unless it is the first hard cut after planting for the purpose of forming and shaping the tree, and consequently hard and fast rules are not desirable. There is a good deal to be said in favour of doing most of the plum pruning at the end of the summer or early in the autumn, before the leaves fall, and where it is desirable side shoots may be shortened back with advantage at this season, but I think the cutting back of extension growths is best left till the spring. One point in favour of summer pruning is that the trees are not so apt to exude gum as when the whole of the pruning is done in the winter and early spring, though this trouble is, in some cases, directly due to a shortage of lime in the soil. In the matter of pruning, however, let me say that the true secret of bush plum culture is to get by careful manipulation and good judgment that even balance between roots and branches which does away with any necessity of severe pruning, because, after everything has been said, the old truth prevails that stone fruit does not appreciate too much knife.

Clean soil, a firm root run, and hoeing on the surface, sums up the cultivation of bush plums in a few words, and over-manuring is an evil. Lime, as I have said, is an essential quantity, and on land that is retentive slow phosphates, like basic slag and bonemeal, are beneficial, and on such soil potash is rarely required, but occasional dressings of soot are beneficial. The best form of applying phosphates to light soil, where lime is present, is in the shape of superphosphate, and, potash being wanted in such mediums, sulphate of potash may be given, but the provision of nitrogen should be entirely governed by the growth that the trees are making.

Bud-picking birds not infrequently play havoc amongst plums in the early spring, but trees of the bush type are easier to protect than standards, owing to their dwarf habit. Syringing with a solution of soap and quassia makes the buds distasteful to the birds, and if soot or dry lime can be dusted over the trees afterwards the remedy is even better. For the reason described above bush plums are more easily kept free of insect pests than is the case with trees of taller habit.

H.

THE KING'S ACRE NURSERIES, LIM., COLLECTION OF HARDY FRUIT AT HEXHAM.

THE PEARL BERRY.

Margyricarpus setosus is the name of a charming little evergreen of creeping growth, which is a general favourite among those who know it. Its neat little plants are very pretty when seen creeping over a stone, with their branches thickly set with shining deep green leaves, which are narrow and pointed. The flowers themselves are small, and not at all conspicuous, and the main charm of the Pearl Berry lies in the little fruits which give it the popular name. These are of a beautiful wax-like texture, and are of a pearly whiteness, looking like nothing so much as a large pearl. They last throughout most of the winter, and are at that season very pretty, the contrast between the pearly fruits and the deep green foliage being extremely fine.

It is by no means a difficult plant to grow, but it is not so absolutely hardy as we would like. Occasional propagation is therefore necessary with the margyricarpus, save in very mild places, so that a few plants can be produced from under glass should the old ones be destroyed by a severe winter. Some winters they stand, but in others the old plants succumb.

It is easy, however, to keep up a stock of young plants, as they can readily be raised from seeds, by sowing the seeds or berries in pots of light soil as soon as ripe, and pricking off the seedlings two or three inches apart when ready to handle. If put in thumb pots they can be transplanted more readily without disturbance, although young plants are not excessively difficult to establish without this precaution. Cuttings of the branches, with a heel, can be easily struck in sandy soil, putting them in pots, and keeping them close and shaded until rooted. Few plants are more readily struck from cuttings than the Pearl Berry.

I prefer a sandy soil and a sunny situation for the margyricarpus, which, although modest in its beauty, is yet a desirable little plant.

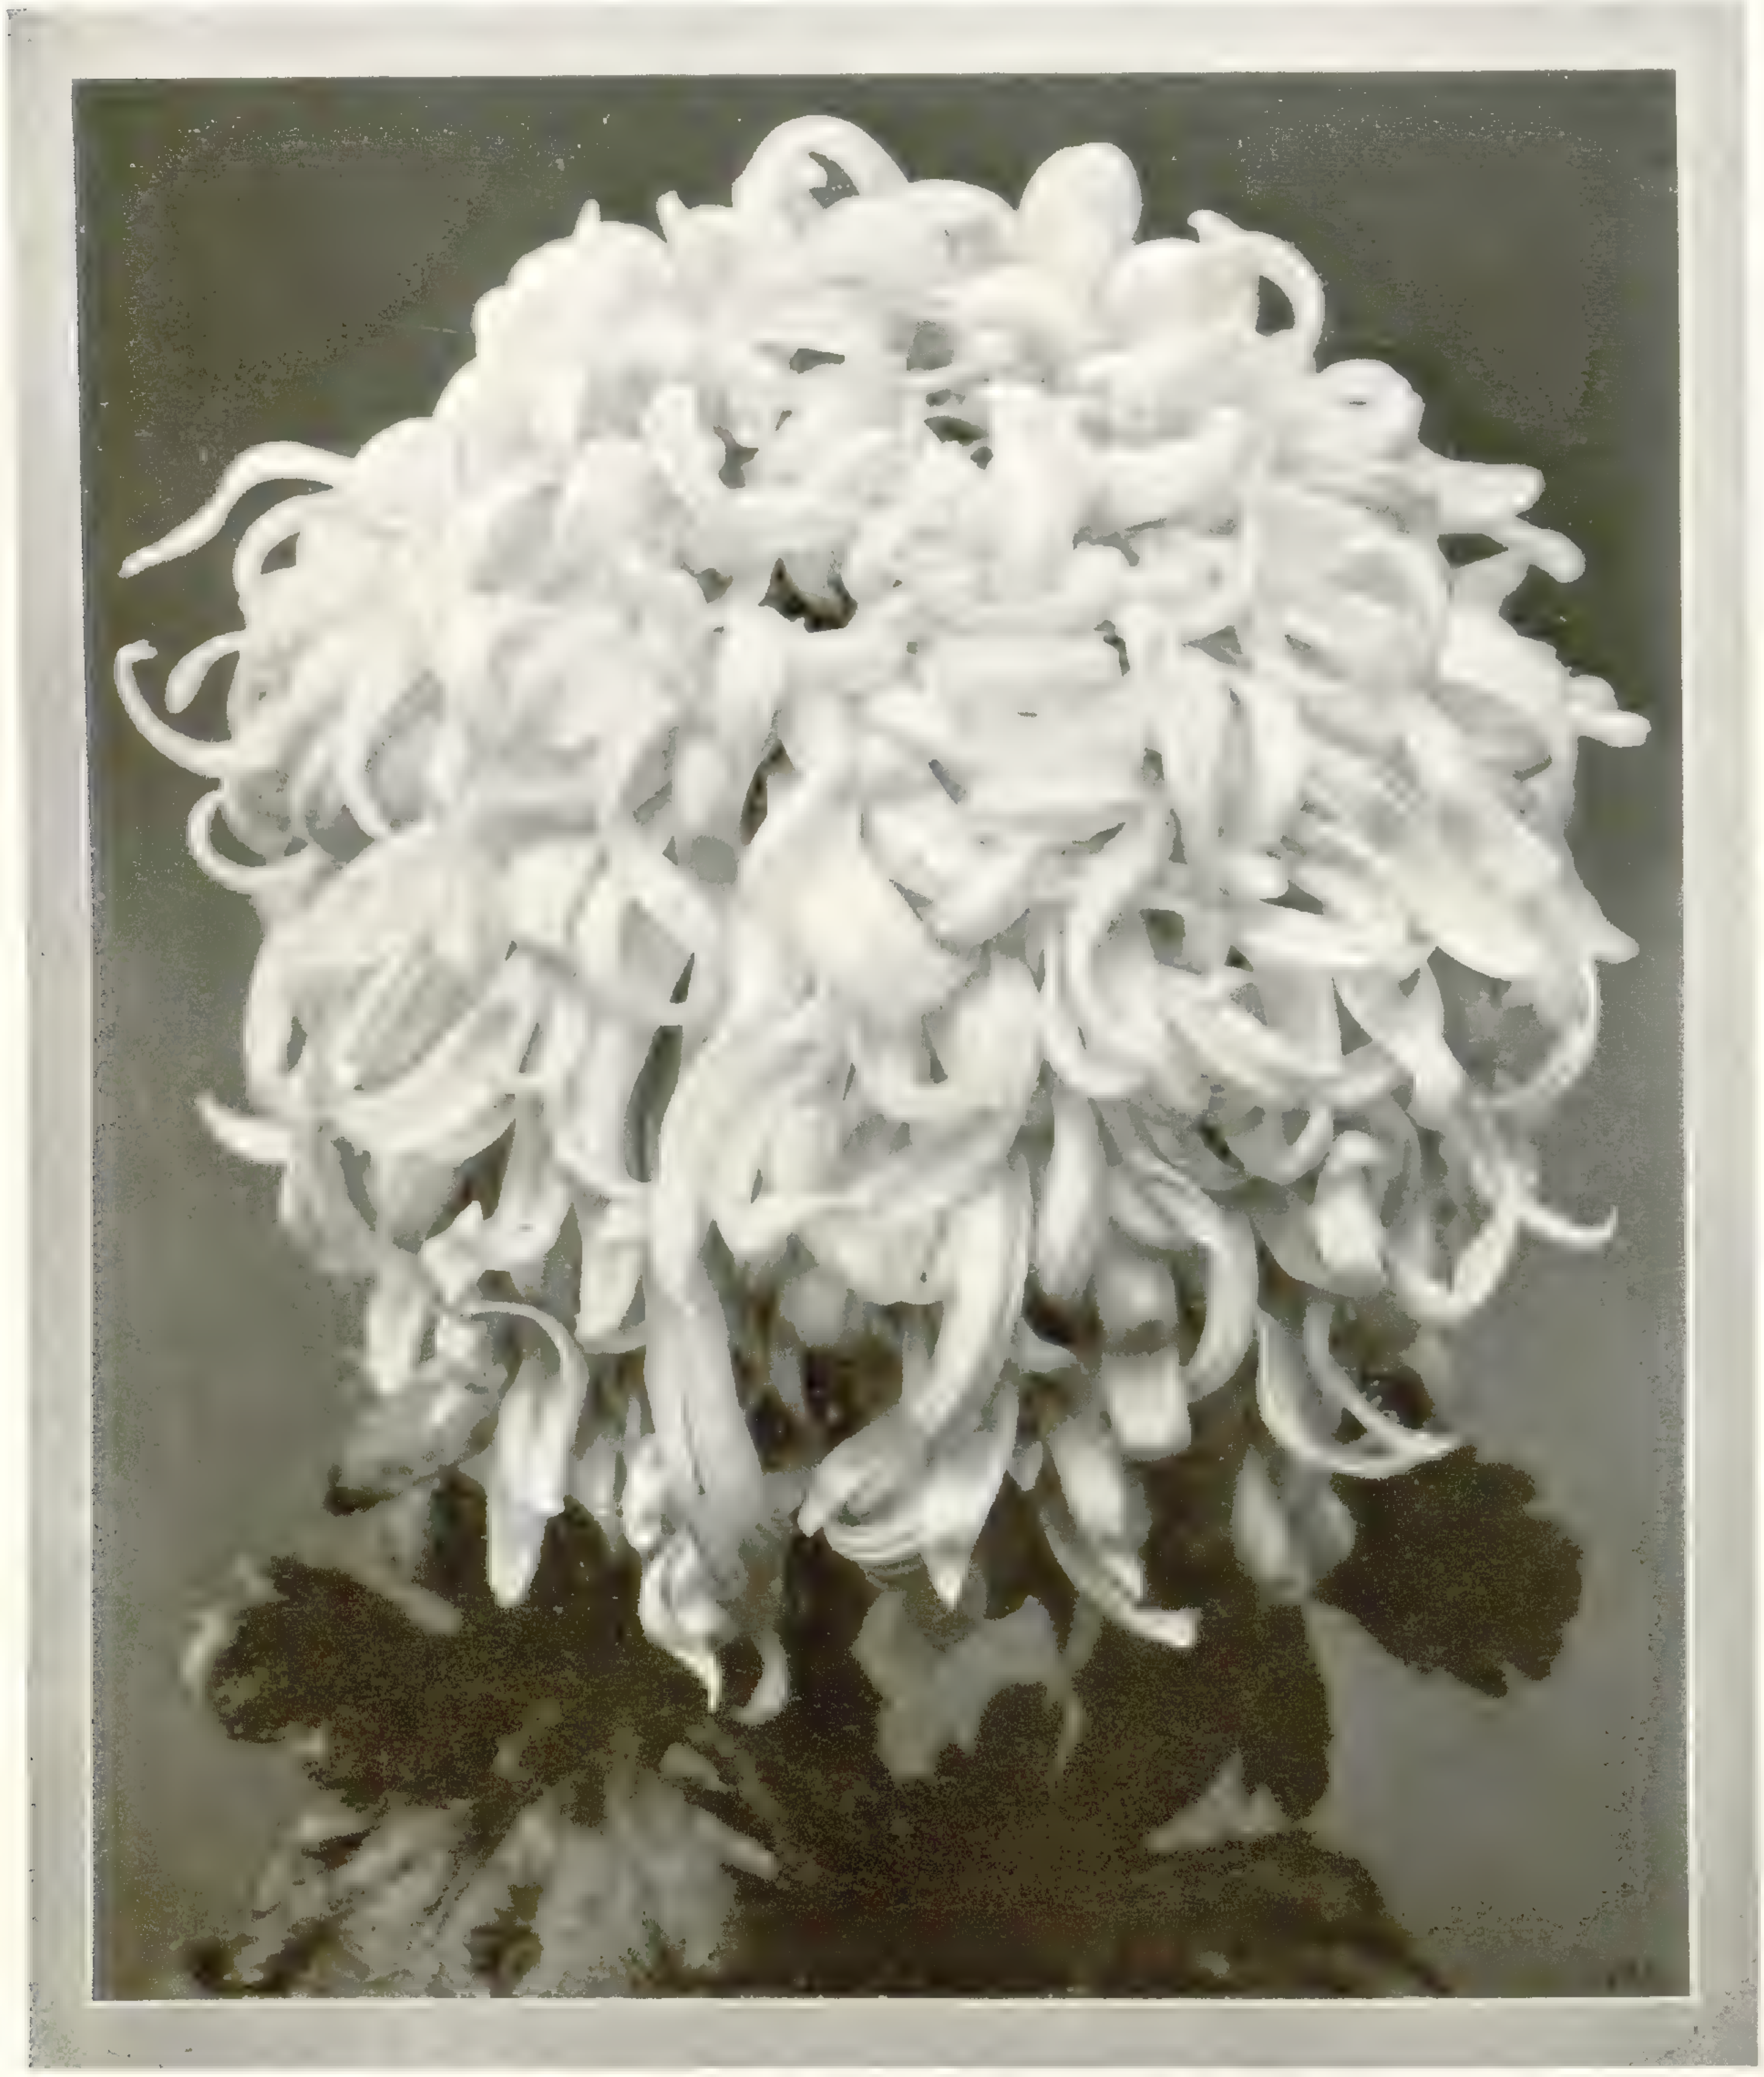
A. S.

GRAPES AND HOW TO GROW THEM. An illustrated guide to propagation, culture, and management in vineries, greenhouses, and in the open air. By J. Landell, F.R.H.S. Price 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London

AMONG THE ALPINE FLOWERS IN OCTOBER.

> " . . . and now the power is felt
> Of melancholy, tenderer in its moods
> Than any joy indulgent summer dealt."
> Allingham.

Few of us look upon this month of October with feelings of ardent joy. It generally brings with it the passing of our favourite flowers for the time, and what pleasures it brings are chastened by the dread that ere long the winds from out the icy north will cut off the remaining treasures of our gardens with but few exceptions. Yet it is folly to dwell too much upon the thoughts of the drear future. Provided we take reasonable "thought for the morrow" in the way of timely precautions for the trying season, where such can be of service, we may dwell more upon the enjoyment of the present, although it is chastened by the more placid note of beauty given us by the flowers of the time.



CHRYSANTHEMUM MARY POULTON.
Flower much reduced, the colour silvery mauve-pink. A.M., R.H.S., October 11. Mr. H. Poulton, The Huntleys Gardens, Tunbridge Wells.

Forewords of Spring.

No longer is the rock garden full of brightness and glowing colours. Flowers there are, but many of these are fragments of those of an earlier season. Some are autumnal blossoms of spring flowers, which often give us blooms to bespeak for the full flourish of the vernal season a thought at the present.

Possibly they give us some cheer by the recollection that, though winter is at hand spring is not far distant, and that these plants, which now afford us but scant bloom will cover themselves with beauty as with a dazzling garment, and will gladden us with their brilliance. Such are some of the alyssums, such as A. rostratum, which gives us many of its small yellow flowers. Such, too, is the little Erysimum pulchellum, the Fairy Hedge Mustard, which, truth to tell, looks prettier in autumn than in spring, although at this time of the year its blooms are few, and do not cover the plant as in the latter season. Now the glossy mounds, only a few inches high, are spangled with little heads of golden flowers, just nestling in the green leaves instead of being lifted a few inches above them, as is the case in the vernal season.

Autumn Tints.

But the golden days of autumn linger with us still, and the mild weather has prolonged the bloom of many of their flowers, so that we are by no means bereft of our favourites. Still others there are whose due season is the present, so that we may yet cull a posy from the rock garden, as well as delight ourselves with the coloration of the autumn leaves of many of these.

The trees may be like "Indian princes" in their glorious tints, but the alpine plants which have put on their autumn garb are like sweet maidens clad in bright garments. We see among them saxifrages, clad in vivid green, never more beautiful than now. We observe flaming scarlets and deep crimsons, russet brown, creamy tints, golden yellows, bronzes, and plum colours as we glance among our plants to see what they present to our eyes. But the glory is still in the flowers in blow, and of some of these we may still speak as a record of a few of our favourites of the time.

Crocuses.

We have yet some few crocuses, and among them none more beautiful than C. iridiflorus, which began in September and has not yet fully run its course. Deep purple, with lilac inner segments shorter than the outer ones, and with white stigmata this flower is lovely indeed. Then we have still the magnificent C. speciosus, with its blue flowers deeply veined with purple, and its variety Aitchisoni, the Afghan representative of the species, and a very beautiful flower. C. pulchellus, too, continues to bestow a few of its pearly blossoms, so beautiful as the sun of the month, now growing fainter, beams upon its little flowers. Other crocuses there are, but these are among the choicest of the time, and are, besides, not so costly as to tax the financial abilities of the owner of the garden in which cost is a consideration.

Colchicums.

We have had to bid farewell for the season to the most of the Colchicums, or Meadow Saffrons, but there are still a few whose blooms we welcome as we pass through the garden. A neat double variety, called C. autumnale roseum plenum, is about the latest of that section with me, but C. giganteum yet affords us its purple blooms. For the autumn garden these flowers are of high value, and we may well appreciate their blossoms at this time.

Erica Maweana,

A very lovely, but rather scarce heath is that named Erica Maweana, whose origin appears to be unknown, but which is conjectured—and probably rightly—to be a hybrid. It is a remarkably pretty and showy heath, with its fine clusters of crimson-purple flowers on the semi-erect branched stems of deep green. It is after the fashion of E. ciliaris and E. Tetralix, and is one of the prettiest hardy heaths for autumn bloom in the alpine garden. It does not appear to be quite so hardy as some others, and last winter my best plant suffered considerably, although it has revived and is now as fine as before. A few others are yet in bloom, and E. hybrida and E. carnea and its variety alba are thickly set with buds for a successional bloom to the early autumnal species.

Other Flowers.

We have still flowers on Potentilla nepalensis, which, trailing over the stones, looks much better than on the level. Tunica saxifraga is yet giving its pretty pinkish elegant flowers. Erodiums, such as macradenum, hybridum, Sibthorpi, and others brighten their haunts with their gay flowers on their finely divided foliage. Some of the alpine pinks have still a few blooms upon their masses of foliage; sedums continue to afford us some flowers, S. spectabile, and its variety atropurpureum helping with their more abundant display. Helianthemum venustum plenum is gay indeed for the season, and two or three other sun roses yet adorn the rockwork. Violas, ever-blooming as some of them appear, give many blossoms; and the curiously pretty Origanum hybridum is yet attractive with its pink flowers from their hop-like heads. With these and other flowers we are passing reluctantly from the time of flowers to the season when these gems are well-nigh absent, and when we live in the remembrance of the past days of pleasure and in the hope of the reawakening of our alpine flowers.

S. Arnott.

DISBUDDING PERPETUAL CARNATIONS.

From the present time, right back as far as the historian can trace, the thinning out of some of the buds produced on the flowering growth of a carnation to assist the remaining buds to develop larger blooms has been practised, and undoubtedly the ancient gardener who discovered this method was a master of his craft.

While the knowledge of this practice is so common, and the operation simple, yet a strict attention to details is, however, vitally important, or the object in view is defeated.

Disbudding, in the case of the perpetual carnation, is a prime necessity, because it requires almost as much effort on the part of the plant to produce three blooms on one stem as it does to produce three blooms on three separate stems. It is not the stem, but the flower, which takes the vitality out of the plant. We can all remember how, a few years ago, when the great beauty of a perfect carnation flower on a long elegant stem was not appreciated to the extent that it is to-day, the practice of removing the crown bud and allowing several of the lateral buds to develop was quite common. Many market growers used to serve their plants this way, and sent quite short-stemmed blooms to market. At the present time such blooms would be almost an unsaleable commodity.

Too often the novice or over-anxious gardener, in his endeavour to procure very large flowers, errs on the severe rather than on the lenient side in disbudding. He removes the lateral buds as soon as they become visible, injuring the main stem and leaves in his over-eagerness. The buds at the base of the stem would perhaps do little harm when so removed, but those at the top, close to the crown bud, should be allowed to become an easy size to handle before removal.

On the other hand, if the lateral buds are allowed to remain until they become almost fully developed more plant tissue must be wasted, and a proportionate amount of energy also, thus defeating the object in view. This does not help, but rather checks the developing of the crown bud into a large perfect specimen.

If disbudding is to be done then it should be treated in a systematic way, the plants being examined each week, and only those buds removed which are of sufficient size to handle. As a rule, the lateral buds towards the base of the stem are fit to remove quite a week before the buds near the crown bud. It is a common practice in commercial establishments in the autumn, when the perpetual carnation naturally makes a short stem, to also remove one or two of the stem growths. This not only gives a longer stem to the flower, but helps to keep the plant's growth short and compact.

Montagu C. Allwood.

"CARNATIONS, PICOTEES, AND PINKS" will [illegible] how to propagate and grow these [illegible] flowers to perfection. The work is freely illustrated with [illegible] of leading varieties, and ex[illegible] [illegible] as to layering, taking cuttings [illegible] blooms, etc. Price 2s. 6d. net, by post, in 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

NOTES FROM KEW.

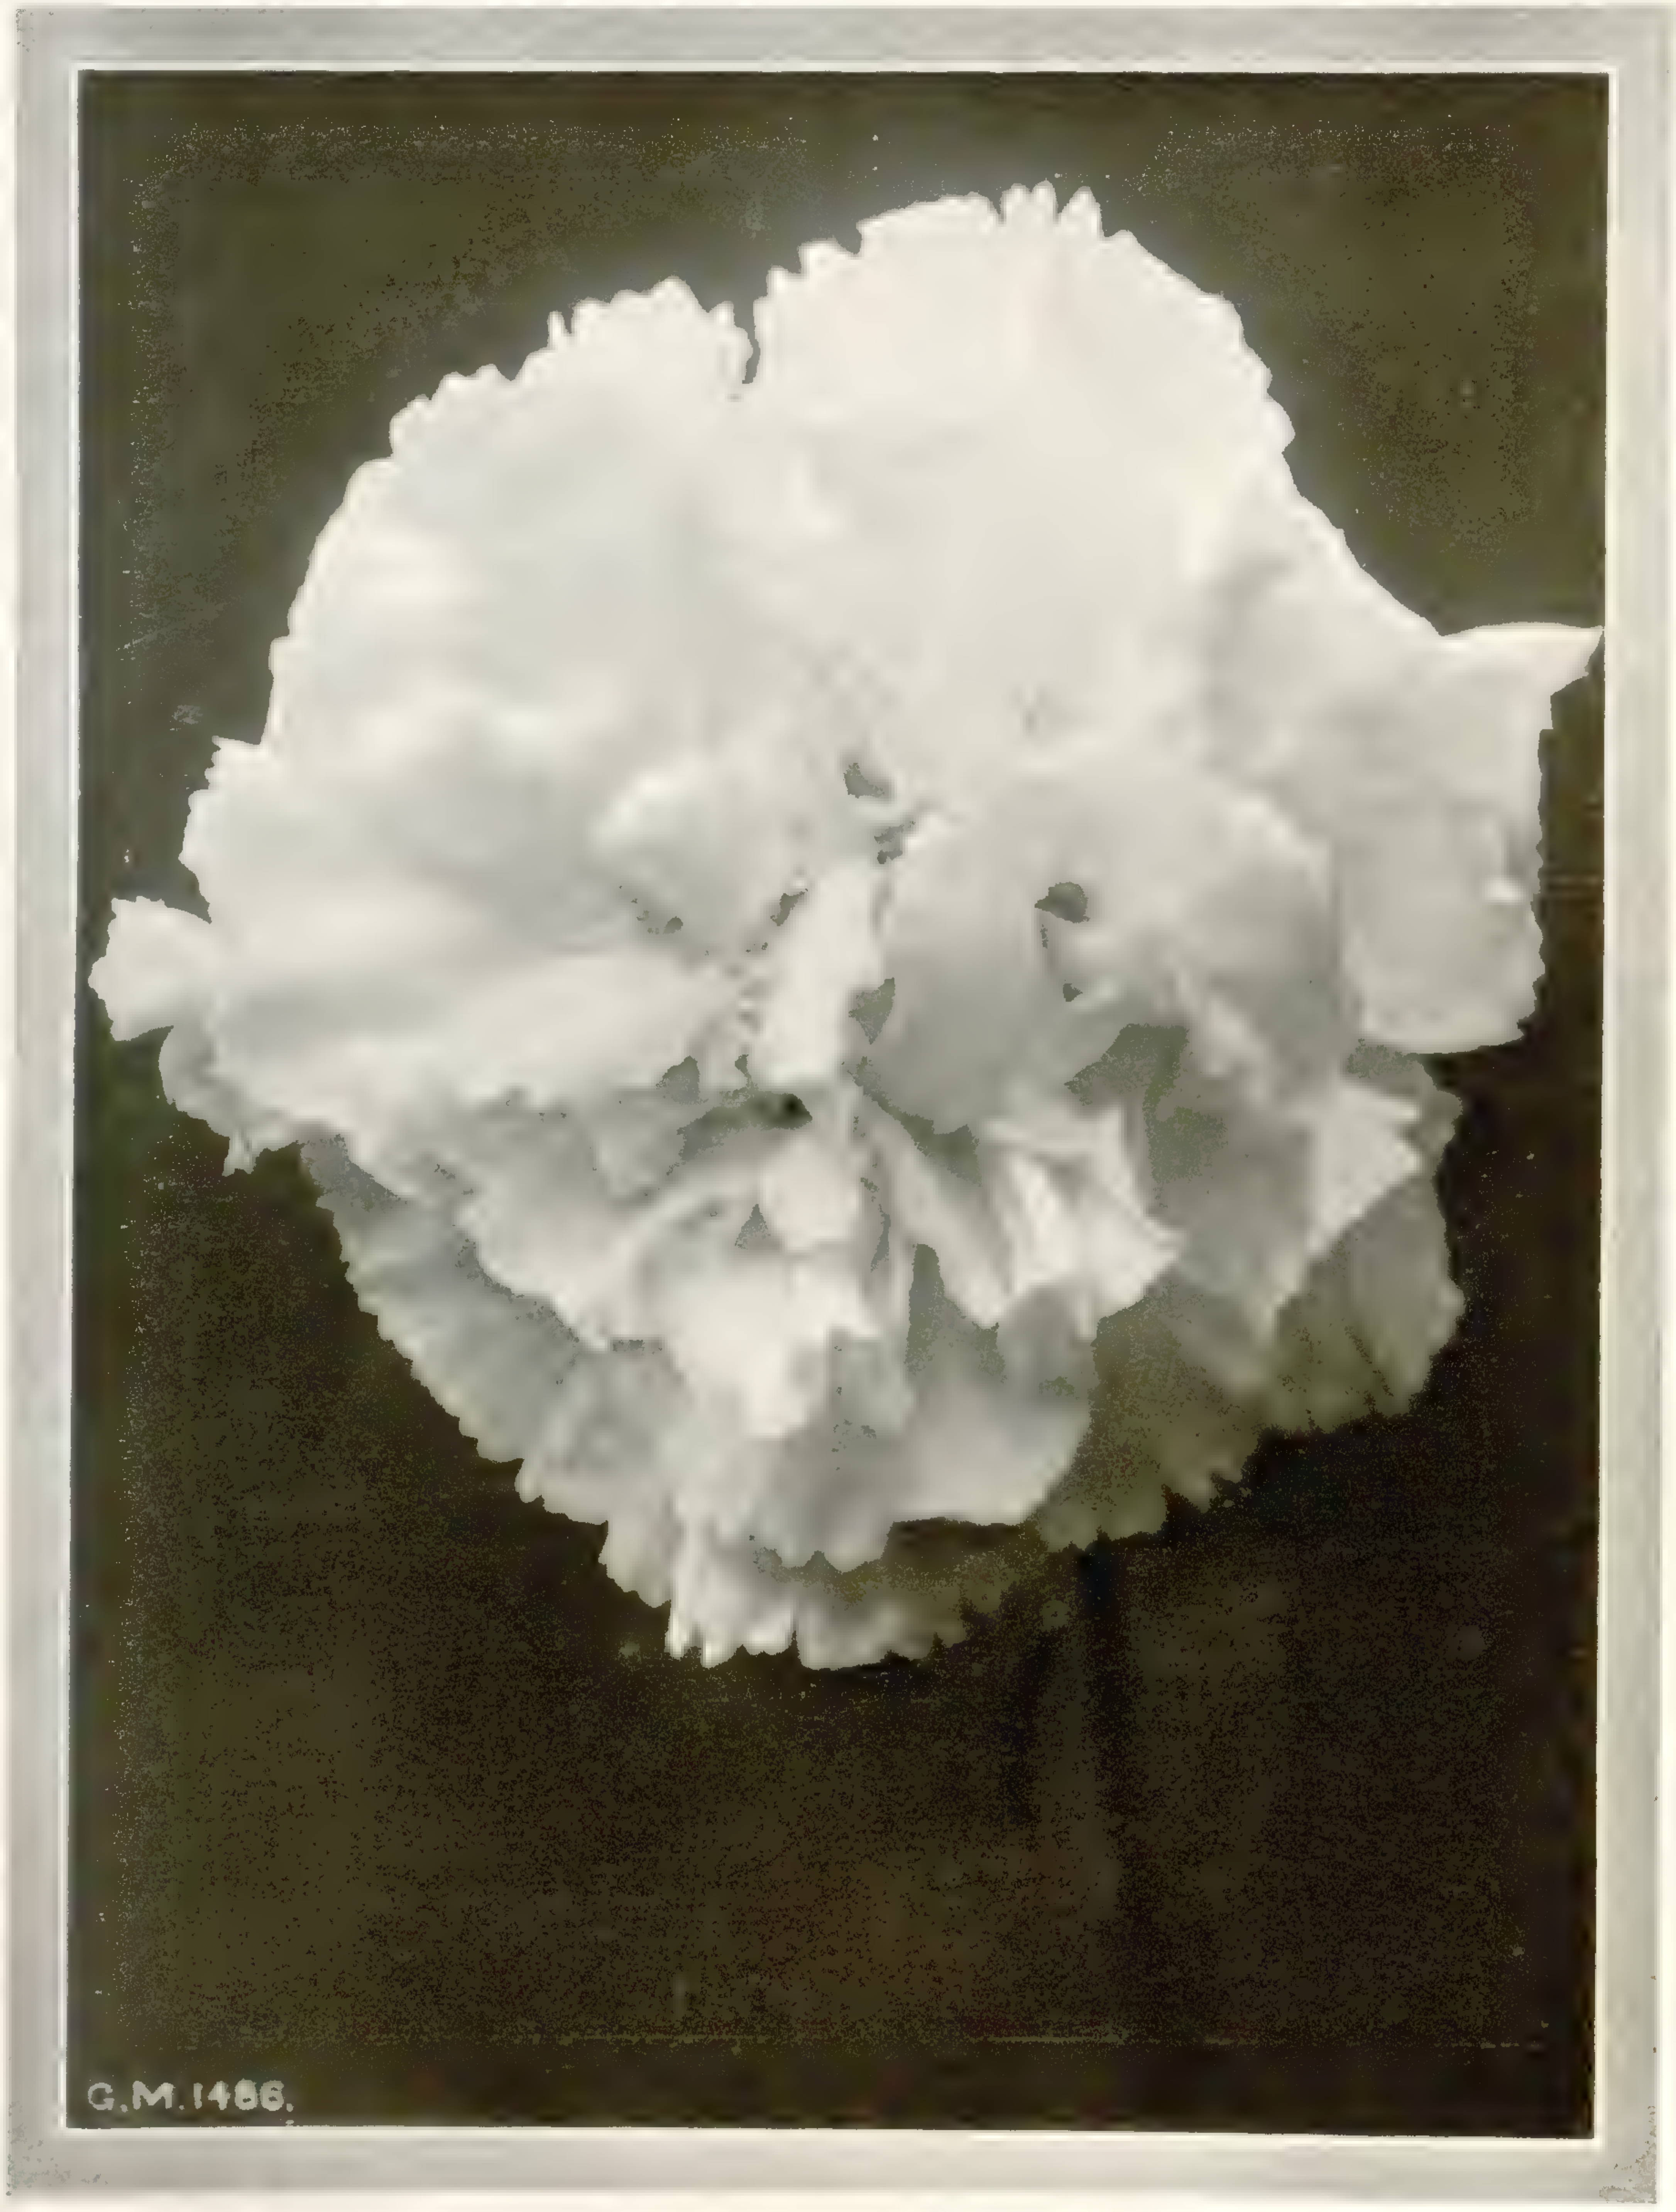
◆

Greenhouse Heaths.

A considerable number of the South African heaths are just now contributing their share to the floral display in the greenhouse. Chief among them are Erica gracilis, represented not only by the ordinary purple-flowered form, but also the variety alba or nivalis, of which notable examples are being brought into Covent Garden Market. The white variety is of a much purer tint than it used to be. Erica caffra, with its myriads of tiny white flowers, is also very much in evidence, as also are Erica colorans, whose pure white flowers are of an uncommon shape; Erica hyemalis, not often seen thus early in the season; Erica melanthera, just beginning to unfold its earliest blossoms; Erica verticillata, a rather spare-growing plant, whose inflated tubular-shaped blossoms, a little more than half-an-inch long, are of a semi-transparent, bright red tint, and borne in distinct whorls; Erica cerinthoides coronata, with crimson-scarlet tubular flowers, produced in a terminal horizontal tier, and Erica conspicua, with lilac-coloured flowers.

Acanthaceous Plants.

The value of the different members of the order Acanthaceæ for flowering at this season is well shown in the intermediate portion of the T range, where a group of brightly coloured examples is brought together. Particularly noteworthy are Dædalacanthus Watti, which used to be known as D. parvus, a smaller-growing plant than the well-known Dædalacanthus (Eranthemum) pulchellus, which it somewhat resembles, but the flowers are of a metallic purple colour; Ruellia amœna, a rather upright-growing plant, about eighteen inches high, whose flowers, borne in great profusion, are of an inflated tubular shape, bright red in colour, and borne nearly throughout the year; Ruellia macrophylla, altogether a larger grower than the preceding, with longer flowers and a more uncommon plant; Ruellia Portellæ, a low-spreading plant, worth growing for its foliage alone, as the leaves, purple beneath, have pretty light markings on the upper surface. The flowers are comparatively large, curved in shape, and deep rose in colour.



CARNATION WHITE HOUSE.
Flowers pure white, clove scented. A.M., R.H.S., Oct. 11. Messrs. W. Wells and Co., Merstham.

Jacobinia chrysostephana is another striking plant, which, introduced 40 years ago, was nearly lost till within the last decade or so, it has become deservedly popular. The flowers, which are disposed in a large terminal crown, are orange-yellow in colour. Justicia (Schaurea) calycotricha, whose merits might be more often recognised, has rounded heads of light yellow flowers. Interspersed with the flowers are long, narrow bracts, which give to a head of bloom an uncommon fluffy appearance. Two very distinct species of Eranthemum are represented, namely Eranthemum albiflorum, with upright spikes of pure white flowers, suggesting those of the lilac, and Eranthemum seticalyx, with small flattened heads of blossoms, which in their marking bear a considerable resemblance to that pretty little South African bulbous plant known as Anomatheca cruenta. Aphelandra tetragona, the oldest and the largest growing of the aphelandras, has its three or four feet stems crowned with large heads of brilliant scarlet flowers. It is also known as Aphelandra cristata. Lastly, on a rafter close by, the pretty pure white Thunbergia fragrans is full of bloom. This climbing plant, which is of moderate vigour, is exceedingly floriferous, and though its merits are fully recognised at Kew, it is not often met with elsewhere.

Gesneras.

A group of hybrid gesneras in the T range serves to show the great variety and beauty both of flowers and foliage that exist among these several hybrid forms. The flowers, borne for the most part in pyramidal-shaped spikes, are of various shades of white, yellow, and red, some of them being very prettily marked. It is a matter for surprise that these gesneras are not more generally grown, as their value for autumn flowering is great. In proof of this one may point to the magnificent display of Gesnera Orange King, made by Adeline, Duchess of Bedford, at the meeting of the Royal Horticultural Society on October 11. The numerous plants shown formed one of the brightest features in the hall, and few exhibits attracted more attention.

Mesembryanthemums.

As a rule these pretty succulents are but little considered as flowering plants for the greenhouse, but a few species are just now so full of bloom and so attractive in the cool portion of the T range as to suggest that they might with advantage be more often grown. Especially noticeable are Mesembryanthemum micans, quite a bushy plant about eighteen inches high, thickly studded with rich purple blossoms; M. aureum, deep orange-yellow; M. roseum, rosy purple; M. lepidum, large white flowers; M. coccineum, scarlet, a pretty and distinct shade; M. violaceum, purple-violet; M. amœnum, nearly a couple of inches across, of a delightful shade of deep rose, a spreading plant; M. blandum, large flowers of a flesh-pink tint, and M. calycinum, satiny white, a freely branched dense-growing kind, very floriferous. Considering that these mesembryanthemums need only the protection of an ordinary greenhouse, and do well if stood outside during the summer, one might expect them to be more often grown than they are.

Lilium nepalense.

After Lilium speciosum is over the lilies that flower naturally are very few. One of the most prominent is Lilium nepalense, which, apart from its autumn-flowering qualities, is quite distinct from any other species. A group of this in the greenhouse is just now very striking. In height the plants vary from four feet to eight or nine feet. This tall habit of growth is in the case of L. nepalense a decided advantage, as the flower is naturally drooping, and the inside is by far the showiest portion. The upper half of the segments is of a yellow or yellowish green tint, and the lower portion a kind of chocolate-purple, thus, as it were, forming a purple centre to the flower. Both in the shades of yellow and purple there is a good deal of individual variation. Large importations of this lily have taken place within the last few years, the bulbs being sent from Burmah, where it grows in association with L. sulphureum, two or three examples of which are also flowering in the greenhouse. Though imported bulbs of L. nepalense flower freely the first season it is a difficult lily to permanently establish.

Salvias.

We have of late years had several varieties of Salvia splendens put into commerce. Two of them are just now very noticeable in the greenhouse, namely, pyramidalis, with particularly fine spikes of bloom, and Pride of Zurich, a dwarf form which may be had in flower early, and on that account it has become very popular for bedding. At Kew a pretty effect is made by associating large plants of Salvia splendens with well-flowered tuberoses, and smaller ones with dwarf specimens of the white variegated-leaved Abutilon Savitzi. Salvia azurea grandiflora, which used to be grown under the specific name of Pitcheri, forms a tall, slender plant, very effective by reason of the pleasing blue colour of its blossoms.

Chrysanthemum carinatum.

This annual chrysanthemum may often be met with flowering in the open border during the summer, and also grown in pots at that season, but as an autumn-flowering plant from late-sown seeds it might, judging by some specimens in the greenhouse, be more often employed than it is. Several forms are represented, but those with the bright coloured ring towards the centre of the flower are the most conspicuous.

Abutilons,

The garden varieties of abutilon are very showy, notably the yellow Golden Fleece, and the white Boule de Neige, but by far the most interesting abutilon in the greenhouse is a well-flowered specimen of the uncommon Abutilon insigne, trained up one of the rafters. This species, a native of Colombia, was at one time nearly lost to cultivation, but from a specimen in the old gardens of the Royal Horticultural Society at Chiswick many plants were distributed. From the other abutilons it differs in the large size and harsh rugose character of its heart-shaped leaves, and particularly in the flowers, which are far more open than those of the garden kinds, and in colour purplish crimson with blackish veins. There is also in cultivation a variegated form in which the leaves are marked in a tessellate fashion with pale yellow.

Solandra grandiflora.

This exceedingly vigorous-growing climber is flowering freely in the succulent house. Full exposure to light and sunshine, together with plenty of room to develop, are very essential matters towards the production of blossoms. The flowers, rather suggestive of those of the datura (a member of the same family), but shorter, are in colour greenish white, with at times a tinge of purple on the outside. It is a striking plant when flowering freely, but there are not many structures suitable for its requirements.

Bougainvilleas.

A form of Bougainvillea glabra, probably Sanderiana, is flowering profusely in the greenhouse. Despite this, and the fact that it may be often seen out of doors during the summer, there are many who will still persist in looking upon all bougainvilleas as stove plants. In the succulent house a specimen of B. glabra Cypheri is also in flower, but not with the same profusion as the other. Judging by appearance one would almost take Cypheri to be a hybrid between B. glabra and B. spectabilis, or speciosa as it is often called. In speaking of the flowering of bougainvilleas it must be borne in mind that it is the floral bracts which subtend the blossoms that form the conspicuous portion of the display, the flowers themselves being comparatively insignificant. K.

MOON DAISIES.

In continuation of my notes in the previous issue, I may say that the cultivation of Moon Daisies is simplicity itself, assuming the soil is ordinarily well cultivated and in pretty good heart, but there is one essential, and that is a sufficiency of moisture, and therefore it is not advisable to plant them in dry places, as in such circumstances they have a weedy appearance, and become untidy early in the summer. In favourable conditions they increase fairly rapidly, though varieties of C. maximum do not spread so as to become a nuisance, as does C. latifolium, which is sometimes grown in mistake. The former have lanceolate leaves, with toothed edges, and are not so tall nor so bushy as the latter. Though moon daisies like a damp soil, they sometimes die out after a year or two in a wet winter, and the young shoots from the crowns are often ravaged by slugs. It is therefore advisable to propagate them occasionally, and this may be done either in the rough-and-ready way of dividing the clumps in the autumn or spring, the latter by preference in wet soils, or by taking off shoots in the spring, with a little piece of root attached if possible, and growing them in a nursery bed during the summer ready to be planted in their flowering positions in the autumn. Good results may be obtained by sowing a packet of seed, when, if sown early enough in the spring, many seedlings will produce a few blooms the first year, and the better varieties can be retained to the exclusion of the others. But, with a view to getting good strong plants for the autumn, it is not advisable to let them flower the first year.

These bright daisy-like flowers serve to lighten up a border like the high lights of a painter's canvas, especially in the twilight of a summer evening, when, to some, the garden always seems to be at its best, and as this is the time when the man who does much of the work of his own garden has most leisure to contemplate and enjoy it, a good case can be made out for including some of these amongst the hardy plants of every garden. Alger Petts.

Tomatoes.—It is a custom to sow seeds at the present time when fruit is required from next April onwards. The seeds should be sown in well-prepared pots of sandy compost, and placed in a temperature of 55 deg. to 60 deg. on a shelf near the roof glass. Water must be very carefully applied, only keeping the resultant seedlings just moist, and, later, putting them into thumb pots, and placing back in the same position for the winter, with successional pottings as required. Plants that are fruiting well and in flower should be stopped, to throw all the energy into the fruits and late flowers: pollinate the latter. Maintain an intermediate temperature.—George Ellwood.

NEW PLANTS, ETC.

CYPRIPEDIUM KING GEORGE V.

This very fine cypripedium is of unrecorded parentage, but many experts ventured the opinion that C. Gaston Bulteel was probably one parent. The dorsal sepal is splendid, broad, flat, and rounded, white, with a green base, and with rosy shading on the lower part of the white area. The petals and lip are green, freely shaded with purplish-brown. F.C.C., R.H.S., October 11. Mr. E. V. Low, Vale Bridge, Haywards Heath.

LÆLIO-CATTLEYA ORTRUDE MAGNIFICA.

An attractive hybrid between Lælia anceps and Cattleya Dowiana aurea. The flowers are large, the sepals and petals being heavily shaded with rose-purple on a creamy ground. Lip broad, wavy, and of rich deep purple colour, veined with dull gold. In habit of growth and in the style of the spike this hybrid showed the influence of L. anceps. A.M., R.H.S., October 11. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

LÆLIO-CATTLEYA GOLDEN ORIOLE SUPERBA.

This is a particularly fine form of the beautiful golden-yellow hybrid derived from Lælio-cattleya Charlesworthi and Cattleya Dowiana aurea. In this form the lip is very finely coloured with crimson, orange, and gold. A.M., R.H.S., October 11. Lieut.-Colonel Sir George Holford, Westonbirt.

CATTLEYA BASIL.

This large and handsome hybrid is from C. Enid and C. Mantini; it has bright rosy-purple sepals and petals, and a crimson-purple lip, marked with old gold. A.M., R.H.S., October 11. Messrs. Charlesworth and Co., Haywards Heath.

CATASETUM FIMBRIATUM AUREUM.

An attractive and fragrant orchid, with greenish sepals and petals, and a large bright yellow area on the fringed lip. A.M., R.H.S., October 11. J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford.

CARNATIONS.

Shasta.—A pure white sweetly scented perpetual variety, with very fringed petals. A.M., R.H.S., October 11. Mr. G. Lange, Hampton.

White House.—A specially fine perpetual variety, pure white, clove scented, of large size, and with first rate non-splitting calyx. A.M., R.H.S., October 11. Messrs. W. Wells and Co., Merstham.

Scarlet Glow.—A very bright and rich scarlet perpetual variety. A.M., R.H.S., October 11. Mr. G. Lange, Hampton.

ASTER PERFECTION.

This is a very charming perennial aster of the ericoides type. It has very graceful growth, and is about 3½ft. high. The small flowers are pure white, and produced in immense numbers on elegant sprays. A.M., R.H.S., October 11. Hon. Vicary Gibbs (gardener, Mr. Edwin Beckett, V.M.H.), Aldenham House, Elstree.

CHRYSANTHEMUMS.

Cranfordia.—An effective early Japanese variety, of good form, and apparently of special value for market and decorative purposes. Colour, deep rich yellow. A.M., R.H.S., October 11. Mr. W. Roots, Holly Cottage, Cranford.

Miss F. Collier.—This is like the former in shape and size, but has pure white flowers. A.M., R.H.S., October 11. Mr. W. Roots.

Mary Poulton.—A very fine new Japanese variety, and of a size that will render it specially useful for exhibition purposes. The colour is silvery mauve-pink. A.M., R.H.S., October 11. Mr. H. Poulton, The Huntleys Gardens, Tunbridge Wells.

SYMPHORICARPUS MOLLIS.

A free-fruiting bushy species, that bears an abundance of white, rounded fruits in dense clusters towards the ends of the branches. It should prove a useful addition. A.M., R.H.S., October 11. Messrs. James Veitch and Sons, Chelsea.

GESNERA ORANGE KING.

This very useful gesnera was figured on p. 127, in our issue of February 12, 1910. It is the result of crossing G. cinnabarina with G. exoniensis. The handsome foliage is attractively mottled, and above the leafage rises a pyramid of brilliant orange-red flowers. The plants exhibited were remarkably well grown. A.M., R.H.S., October 11. Adeline, Duchess of Bedford (gardener, Mr. Dickson), Chenies.

ASTER ERICOIDES PERFECTION.
Flowers pure white. A.M., R.H.S., Oct. 11. Hon. Vicary Gibbs (gardener, Mr. Edwin Beckett), Aldenham House, Elstree.

LIGUSTRUM HENRYI.

In this distinct hardy privet the growths are very erect, and closely set with small ovate and deep green leaves. Possibly of dwarfer habit than most privets. A.M., R.H.S., October 11. Messrs. James Veitch and Sons, Chelsea.

APPLE HOUNSLOW WONDER.

A handsome yellow-skinned apple, flushed with red on the sunny side. It is a culinary variety, of good size, and keeps well until March. The flesh is firm and crisp. The tree is a free cropper and good grower. Dumelow's Seedling is given as one parent. A.M., R.H.S., October 13. Messrs. S. Spooner and Sons, Hounslow.

PEACH SALWEY.

This very handsome late peach has very deep yellow flesh that is very rich and juicy. The skin is of a deep orange-yellow hue, and as the fruits are of good size they are very attractive. Dr. Hogg records that this variety was raised by Colonel Salwey from a peach stone brought from Italy, and was introduced by Mr. Charles Turner, of Slough. A.M., R.H.S., October 13. The Duke of Richmond (gardener, Mr. Brock), Goodwood, Chichester.

SOME GOOD COOKING APPLES.

Stone's or Loddington Seedling is a fine large cooking apple, lemon-yellow, and slightly flushed with red on the sunny side. It is a great and constant bearer, and by no means erratic, as every year it has a crop. It is an excellent variety to grow as a bush. It is a fine fruit for baking and cooks quickly. I would recommend this variety to all growers, and especially to small growers. It is in season from now on to December.

Stirling Castle is also a fine apple, and one which bears regularly. It is large, highly coloured (yellow), a fine cooker, and is in season now. The birds are very partial to this fruit. The variety forms a fine bush, and a good pyramid or standard. We have just harvested a good crop.

Golden Spire is another good bearing variety, and is in season from October to Christmas. It is of medium size, pale yellow, and has a very pleasant acidity. It is very conspicuous when growing, and has borne heavy crops this year. Domino is a large, bluntly-conical fruit, good and early, greenish-yellow, a fine cooker, and therefore most excellent for tarts. It crops well and regularly, and is much better in every way than the old Keswick Codlin. We have had heavy crops this season.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

PLEIONES.—The late autumn and winter-flowering pleiones will now be showing their flower buds, and where the plants are grown several together in the same receptacle, it is generally found that the flower buds break away irregularly, and some of the buds may be distinctly seen before the others show any signs of moving from their bulb sheaths. Under such circumstances it is desirable to afford water with care, for the least excess of root moisture, or very moist atmospheric conditions, will excite the plants to produce their leaves, and frequently this is found to occur at the expense of the flowers. The two species most commonly grown are P. lagenaria and P. maculata; both of these flower about the month of November, and are most attractive when good specimen plants are in evidence. As soon as the flowers are expanded the plants may be removed to a reasonably dry atmosphere, where the flowers will last a considerable time in perfection. As soon as the flowering season has passed the plants should be again removed to an intermediate house temperature, where the foliage soon starts away. Any repotting necessary should be done at the advent of the new growths. We find that well-drained shallow pans suit their requirements best, the compost consisting of equal parts of fibrous peat, turfy loam, chopped sphagnum, and broken leaves, with sufficient sand added to render the compost porous. The pseudo-bulbs, being only of annual duration, should not be placed too far apart, and if mounded to the centre of the receptacle a better opportunity for the display of the flowers is afforded. Water as soon as repotting is completed, and afford every encouragement for the development of growth. A position within reasonable distance of the glass is desirable through the winter months.

EPIDENDRUM VITELLINUM MAJUS.—There is no orchid more deserving of attention where there is a demand for flowering plants at this season of the year than the autumn-flowering variety of this species. The charming orange-scarlet colour and gracefulness of the flower scapes, where the plants are well grown, renders them exceedingly useful for house decoration, as well as for exhibition purposes. There is no plant that I know that can be compared with it for the duration of its flowers. On the plants they last from three to four months in perfection, and as cut flowers they are nearly as durable. Easily grown under the same conditions as Odontoglossum crispum, they should be extensively cultivated where there is a demand for flowering plants in the autumn.

SOPHRONITIS GRANDIFLORA.—The examples of this species will now be producing their flowers from the centre of the expanding leaves. Considerable advantage will be obtained in the substance, size, and colour of the flowers if the plants are removed from the cool house into slightly warmer conditions as soon as the flowers are seen until the flowers are open; they may then be returned in the cool house, where they are more durable.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

HUMEA ELEGANS.—This graceful biennial is, as a rule, a favourite both for conservatory decoration and for use in the flower garden, and care should be always taken to have a good stock of plants. If seeds were sown in the early part of the season the plants should now be strong specimens in six-inch pots. The roots being fairly active all through the winter the plants must not be checked through remaining in a potbound condition, therefore it will be necessary to repot them without delay into eight or nine-inch pots. Use a potting compost consisting of good turfy loam, with leaf-soil added, some sand, and a six-inch potful of soot to every barrowload of soil. Make the soil rather firm. Afford the plants very little water through the winter, and grow in a cool atmosphere.

CAMPANULA PYRAMIDALIS. — Plants that have been growing out of doors during the summer must be now lifted and potted. Good turfy loam should be used in potting, and care should be taken when lifting not to break much soil away from the ball of roots. When potted stand in a cool peach house.

HYDRANGEAS.—Cuttings propagated in heat late in the summer, and potted on at once will by now have become quite established, and should be kept in a cool frame during the winter. Remove the lights on all favourable occasions. Where these are wanted to flower early in the season it is a good plan to place a small batch in heat at intervals. Those growing in small pots, and which are developing flower heads, will require weak liquid manure, and must not be allowed to become dry.

AZALEAS AND RHODODENDRONS.—The plants growing in pots or tubs, and that have been out of doors all the summer, will now have to be placed indoors. Liquid manure should be applied once or twice weekly to plump up the flower buds.

BLINDS AND SHADING.—All shading must now be dispensed with. Blinds should be taken down, dried, and stored in a place free from damp. Such material as summer-cloud, that has been painted on the glass, should be washed off, as the maximum amount of light will be required during the dull days of autumn and winter.—W. Staward, Preston Hall Gardens.

THE FLOWER GARDEN.

CLIMBING PLANTS of almost any description may now be planted with advantage. Many of these, owing to the luxuriant growth they make, quickly exhaust the soil in which they are growing, and unless this is renovated from time to time the plants soon assume a weakly and unhealthy appearance, and are not unfrequently destroyed because of the impression that they are dying and are of no further use. All this might be obviated by a judicious renewal of the soil, which does not mean replanting, or even a serious disturbance of the roots. A few inches of the surface soil should be removed, which need not, if carefully done, damage any of the surface roots: these should be laid bare, and as a substitute for the exhausted soil that has been taken away the bed or borders should be filled up with a mixture of rich turfy loam and well-decayed manure, making the whole fairly firm, and afterwards mulching the surface with a dressing of half-decayed manure. Frequent waterings during the growing season with well-diluted liquid manure will aid in keeping strong-growing climbers in a healthy condition, especially if these are growing on walls. Ivies and climbing roses quickly respond to this simple treatment.

THE SEA BUCKTHORN (Hippophæ rhamnoides) is making a very attractive display this autumn, its orange-red berries giving the plants a very ornamental appearance. The slender growths, with densely packed berries, are furnished with a few willow-like leaves of a pretty silvery hue. This plant is diœcious, that is to say, male and female flowers are produced on different plants, and the failure to secure a crop of berries is due to this fact being not generally known: it is therefore necessary that plants of both sexes should be grown in close proximity to each other, then failure is well nigh impossible. Although considered a sea coast plant, the Sea Buckthorn does remarkably well in some inland districts, and is well worthy of a trial where shrubs of this kind are considered desirable.

DAHLIA TUBERS may be lifted and stored in a frost-proof place for the winter months. These are usually left untouched until the growths are damaged by frost, and it is certain nothing is gained by lifting the roots too quickly, unless the situation or soil should happen to be unusually wet or cold. Cut the stems to within about six inches of the tubers, and place them in a dry airy place for a few days before storing them away. Where convenient the roots may be covered with dry soil or cocoanut-fibre refuse, as this prevents shrivelling, although many persons simply store them without any covering whatever, and, more often than not, they winter safely if frost is kept from them. Where special stock plants have been grown and kept in small pots for next spring's propagation, they may be kept in that condition undisturbed until they are required, a shift on into larger-sized pots being all that is needed to ensure a plentiful supply of cuttings for spring propagation.—W. Hedley Warren, Aston Clinton Gardens.

HARDY FRUITS.

PREPARATIONS FOR PLANTING.—This work must be pushed on without delay, weather permitting. The heavy rains which we have experienced for the past few weeks have been detrimental to carrying out this work in a satisfactory manner, as it is not advisable to attempt digging and trenching where the soil is of a clayey and tenacious character until the surface has become fairly dry and workable. Where it is intended to plant fruit trees in a soil of this character plenty of road scrapings, old potting soil, and burnt garden refuse should be added, in fact, anything that has a tendency to bring the soil into a more open and friable condition, should be worked in as the digging and trenching proceeds. At the same time due consideration should be given to the advisability of adding plenty of old mortar rubbish to all classes of soil where stone fruits have to be grown. Where it is intended to plant standard orchard trees the soil should be well broken up in circular beds about six feet across, and from two to three feet in depth. With regard to the addition of farmyard manure before planting this should be carried out in a similar manner to that advised in the calendar of September 17.

PLANTING.—In most localities this operation will have to be deferred for a few weeks yet, owing to the leaves being still green and healthy upon the trees. Cultivated hardy fruits are mostly deciduous, and should not be planted until the leaves have fallen; where only a few leaves remain upon the tips of the shoots, these can be pruned off before planting operations commence.

STRAWBERRIES.—There is still time to make new plantations, but this work must be finished as soon as possible, or deferred till the early spring months. All leaves upon established plants which show signs of decay should be cut off and burnt. A light dressing of basic slag and fresh slacked lime will be beneficial to the plants if applied now, and the surface soil between the plants lightly dug over with a fork.

GENERAL WORK.—When dealing with trees in the fruit garden proper, the mulching and leaves have to be lightly dug in, trees should be raked off and immediately consigned to the fire heap, but where large plantations have to be dealt with this work is an expensive item, and one that can be seldom undertaken, owing to the expenditure thus incurred. On the other hand, where it is possible to carry out this work it is advisable to do so, otherwise the mulching and leaves have to be lightly dug in, and, consequently, the eggs of many destructive insect pests remain dormant in the soil until next spring, when they hatch out and cause much trouble. Trees which have borne heavy crops of fruit should receive frequent applications of farmyard manure, and provision should always be made for the urine from cow-sheds and the drainings from manure heaps to run into a cesspool for use in the gardens.

THE FRUIT ROOM.—Attend to the airing of the fruit room, keeping an even temperature; remove all specked and decayed fruits, but in so doing be careful not to handle or disturb the sound specimens more than is necessary.—Henry R. Farmer, Cardiff Castle Gardens.

No. 5.

THE ALPHA, King of - - - Sprayers.

Latest Success – GOLD MEDAL, Northern Counties Fruit Congress, Oct. 21.

Awarded 12 Medals and Diplomas.

No other sprayer can be compared with it for efficiency and simplicity; no work, no trouble, never gets out of order, no continuous pumping. One person only required to use any size machine.

Charged with compressed air by means of an ordinary bicycle foot pump.

What the Royal Horticultural Society think of this Sprayer:—

"We consider this to be one of the finest Sprayers on the market."
From R.H.S. Report in Journal, March, 1910.

For use in **ORCHARD, GARDEN, GREENHOUSE, CONSERVATORY.**

Can be used for Lime and Whitewash Spraying, Disinfecting, &c.

The Knapsack, 3½ gallons, awarded First Diploma in open competition, complete with powerful foot pump, 60/0.

MADE IN SIX OTHER SIZES, DIFFERENT PATTERNS.

1 quart, **15/0**; 2 quarts, **16/6**; 3 quarts, **17/6**; 1½ gallons, **47/6**; 3½ gallons special Lime and Whitewash Spraying Machine, **58/6**; 5 gallon Sprayer, suitable for any purpose, **75/0.**

Any Tree-Spraying Solution or Insect-Killer may be used with wonderful effect in these machines.

Full Particulars and Illustrated Price List on application to

BENTLEY'S DAISY KILLER.

(Lawn Sand.)

THE

IDEAL DRESSING FOR IMPOVERISHED LAWNS,

Completely eradicates Daisies, Plantains, Dandelions, Buttercups, Moss, and other Weeds, and at the same time acts as a valuable fertiliser, producing a perfect dense sward of fine-leafed, rich-green grasses.

PRICES:

1 ton, **£19**; 10 cwts., **£9 15s.**; 5 cwt., **£5**; 1 cwt., **21/-**; 56 lbs., **12/-**; Tins, **5/-**, **2/6**, **1/-** each.

BENTLEY'S

Vine Border Compound

Specially Manufactured for making and renovating Vine and Fruit Tree Borders.

A combination of scientifically prepared and graded bones, with certain other high-class fertilisers. This Compound has been supplied regularly for over 30 years to the principal private establishments, and to the leading prize-takers in the United Kingdom.

In two grades { **Coarse,** for new borders.
Fine, for renovating old borders.

PRICES:—

1 ton, **£10 10s.**; 10 cwt., **£5 7s. 6d.**; 5 cwts., **£2 17s 6d.**; 1 cwt., **12/-**; 56 lbs., **6/6.**
Fine grade **1/-** per cwt. extra.

Carriage Paid on 7/6 orders and upwards to any railway station.

EXHIBITIONS AND MEETINGS.

◆

Northern Counties Fruit Congress.

Hexham was, according to Roger North, "formerly the metropolis of a famous shire of that name," but it is now a quiet, pleasant, and interesting town of moderate dimensions, with a fine old abbey church, and surrounded by diversified scenery of much beauty. There can be no question as to Hexham having been of considerable importance in the distant past, or of it now being the most interesting of the towns on the Tyneside above Newcastle; but it is not a town in which one might have expected a congress on fruit culture of the first class to be held. Cumberland, Durham, Northumberland, and Westmoreland, which constitute the four northern counties of England, are not specially adapted to fruit culture, as evidenced by the fact that during the past twenty years the extension of fruit growing has been less in them than in any similar area in England. Moreover, Hexham does not occupy a position in the centre of a fruit growing district. There is much good fruit grown in the gardens around Hexham and in the Tyneside gardens, but the orchards are few and unimportant, and around Hexham the orchards of the Hazel pear, which at one time were a source of considerable profit, are falling into decay, for the venerable trees, many of them more than a hundred years old, are, by reason of their great age, dropping out slowly, but surely, and the youngest of them are rapidly falling away in productiveness. The congress, with its attendant exhibition, was not held for the purpose of demonstrating to the world what the fruit growers in the four counties had accomplished, but rather to call attention to their possibilities in relations to the fruit industry, and to direct attention to methods of procedure by which the most successful results can be obtained. Having so laudable an object, we have much satisfaction in recording the fact that it was a great success.

To the **Rev. J. Bernard Hall, of Dalston,** Cumberland, belongs the credit of having originated the gathering, which may, with perfect accuracy, be described as great, and to him belongs, in a large measure, the success that has been achieved. Imbued with a strong belief in the possibilities of fruit culture in the four counties, Mr. Bernard Hall has, during the past few years, done much excellent work, with a view to stimulate an interest in the matter by giving addresses at the meetings of the principal gardeners' associations; and early in the year he proposed that a fruit congress and show should be held at Hexham, the proposition was at once accepted, and the majority of those interested in fruit growing entered heartily into the work of preparing a scheme, and carrying it out. The scheme may not have been perfect in every detail, and it would have been unreasonable to have expected perfection in a first attempt, but the scheme was such as to evince judgment of the highest order on the part of those responsible for its preparation, and we are unable to call to mind any meeting of a similar character that was so remarkable for the completeness of the arrangements or for the strong sense of satisfaction that prevailed among those taking part in the proceedings, and the interest shown by visitors in the display of fruit, and the papers read. It might have been an advantage to have had a slight reduction in the number of meetings for discussion, and a smaller number of papers, but we are not prepared to express a very definite opinion upon this point, for each of the four meetings held on the first two days was crowded, and the audience gave evidence of a sustained interest throughout the three hours or so over which the proceedings at each meeting extended. The interest that has for some time past been taken in the congress has not been limited to the district round Hexham, or, indeed, to the four northern counties. On the contrary, it has extended over a large area of the United Kingdom, and was attended by many of the leading horticulturists from distant parts of the country. The Royal Horticultural Society sent a deputation, consisting of Mr. George Bunyard, V.M.H., Mr. J. Hudson, V.M.H., and Mr. A. H. Pearson, and contributed a number of medals, which were awarded by the deputation. The Royal Caledonian Horticultural Society was represented by Mr. Massie, one of its vice-presidents, and the Scottish Horticultural Association by Mr. J. Whytock, its president, and among the other horticulturists we noticed were Mr. H. Somers Rivers, Mr. G. B. Berry, Mr. R. H. Pearson, Mr. T. W. Sanders, Mr. Mason, Mr. Miskin, and Mr. George Gordon, V.M.H.

Hexham is fortunate in the possession of a fine block of buildings, and this was utilised to the full for the purpose of the conferences and the exhibition. The block comprises the Corn Exchange, a large hall, elegant in design, and well lighted, which was wholly devoted to the display of fruit; the Town Hall, hardly less spacious, which was in part devoted to exhibits, and in part to the concerts; and the Guardians' Hall, a spacious apartment in which two of the conferences were held. Adjoining is the Wesleyan schoolroom, which was pressed into service for the exhibition of spraying apparatus, insecticides, and orchard heaters. These several buildings not being sufficient for carrying out the programme, were supplemented by the large hall of the Abbey Hotel, which is not far distant, and this was used at the conference at which lectures illustrated by lantern slides were given.

EXHIBITION OF FRUIT.

This, as already intimated, was held in the Corn Exchange and the Town Hall, and as the fruit in competition was supplemented by several important collections from the more southern parts of England, the display was extensive, and highly attractive. Fruit grown in the four northern counties was alone eligible in the forty-eight classes provided in the schedule, a stipulation of some importance, inasmuch as the various contributions afforded visitors an opportunity of forming an opinion as to the possibilities of fruit culture in Cumberland, Durham, Northumberland, and Westmoreland. It was obvious in a careful examination of the exhibits that under a proper system of cultivation there is no difficulty in obtaining apples and pears of large size and high quality, although less highly coloured in the case of some varieties than fruits grown farther south.

The class provided for twelve dishes of hardy fruits, to comprise not less than four kinds and to include six varieties of apples, was a very interesting one, as the competition was open to horticultural societies. There was a very keen contest for the first place between the Hexham and Corbridge Societies, both staging well, and in the result the first-named society was successful in winning the silver cup and the cash prize offered as the premier award. In the first-prize collection we noticed excellent examples of Coe's Golden Drop plum, Marie Louise, Durondeau, and Belle de Bruxelles pears, and Allington Pippin, Lord Derby, King of the Pippins, Warner's King, Lane's Prince Albert, and Ribston Pippin apples. The Corbridge Gardeners' Society was second, staging apples and pears of excellent quality. In the market growers' class for twelve dishes of apples, Mr. J. Millican, Carlisle, was a capital first with finely-developed fruits of Golden Noble, King of Pippins, Peasgood's Nonsuch, Warner's King, Charles Ross, and Lord Derby. Mr. W. Alexander, Hexham, followed closely for second place. The last-named scored in the class for six dishes of apples suitable for commercial culture with Worcester Pearmain, Warner's King, Lord Derby, and Newton Wonder as his best; Mr. J. Millican was a good second. Mr. Alexander was first also in the class for six boxes of hardy fruit graded and packed for market. The fruits consisted wholly of apples, and these were properly graded and in boxes, and moreover were large in size and of the finest possible quality, but they could hardly be described as "packed for market," seeing that they were so loosely put in the boxes as to suggest that they would be badly bruised in the course of a short railway journey. The fruit staged by Mr. Millican for second place was, on the other hand, tightly packed, and could have been sent a long distance by rail without injury. Mr. Henderson, Falloden, had the best box of Worcester Pearmain, and Mr. Alexander the second best, and in both cases the packing had been skilfully done. Mr. Alexander contributed, not for competition, five baskets of apples, and was awarded the Royal Horticultural Society's silver Banksian Medal.

There was a good competition in the important class for eighteen dishes of hardy fruits, to include not more than twelve dishes of one kind, and at the head of the several competitors was Mr. Cocker, gardener to Mrs. Clayton, The Chesters, Hexham, with a remarkably fine collection, consisting of apples and pears. Specially noteworthy for their large size and fine finish were the fruits of James Grieve, Blenheim Pippin, Warner's King, Stirling Castle, Cellini, Peasgood's Nonsuch, Lord Suffield, Worcester Pearmain, Ribston Pippin apples, and Doyenne du Comice, Pitmaston Duchess, Beurre Diel, and Beurre Bachelier pears. Mr. G. Shotton, Prudhoe Hall, Stocksfield, followed closely for second place with highly-finished fruits of the best-known apples and pears, Castle Major and Mère de Menage being of special Merit. Mr. J. Robson, Beacon Grange, Hexham, was third with meritorious fruit.

The prizes offered for six dishes of hardy fruit, comprising not less than four kinds, brought out a spirited contest, and the most successful of the several competitors was Mr. J. M. Robson, Beacon Grange, Hexham, who had an excellent collection in which were fine dishes of Belle de Bruxelles pear and Magnum Bonum and Warner's King apples.

In competition for the prizes for six dishes of dessert fruit, Mr. J. Cocker occupied the first place with a well-ripened melon, good apples and pears, and a fine dish of Coe's Golden Drop plums. The competition was exceptionally strong in the open class for six dishes of cooking apples, the entries being numerous and the fruit of high quality. Mr. J. H. Stewart, Holm Hill, Dilston, Northumberland, was successful in winning the first prize, and in his set were large, finely-finished dishes of Blenheim Pippin, Gloria Mundi, Peasgood's Nonsuch, and Golden Noble. Mr. J. Waugh, Stocksfield, secured the second place with fruits of full size, but somewhat less highly finished. Mr. J. Farquharson, Heyton Gardens, Carlisle, was a close third. In the corresponding class for six dishes of dessert apples, Mr. F. Fixten, Brackenburgh Towers, Carlisle, won with fine fruits of Cox's Orange Pippin, Allington Pippin, Blenheim Pippin, Charles Ross, and Ribston Pippin. Mr. G. Dunn, Whitfield Hall, was a good second with fruit not remarkable for size but splendidly coloured and highly finished, Lady Sudeley being especially noteworthy; Mr. Bewley, Causa Grange, was third with excellent fruit. For six dishes of pears Mr. Dixon, Holeyn Hall, Wylam, was a capital first with finely developed fruits of Beurre Superfin, Pitmaston Duchess, Durondeau and Doyenne du Comice. In the class for three dishes Mr. W. H. Lambert, Howick Hall, Northumberland, was first with Durondeau, Pitmaston Duchess, and Hacon's Incomparable, and Mr. Dixon second. For a single dish of pears Mr. Waugh obtained premier honours with large fruits of Pitmaston Duchess. Mr. Chalmers, Haggerston Castle, Beal, second with the same variety.

There was a good competition in the open classes for single dishes of apples, and Mr. Fixten and Mr. Hedley, who were first and second for James Grieve, staged medium sized fruits of excellent quality. Allington Pippin, for which Messrs. G. Bunyard and Co. offered special prizes, was especially well shown by Mr. J. Waugh. Mr. Farquharson, and Mr. F. Fixten, who were the winners in the order of their names. There were about twenty entries in the class for any other dessert variety, and Mr. F. Fixten succeeded in winning with Blenheim Pippin of high quality; Mr. J. Henderson, Work-on-Tyne, was second. There were about ten entries in the class for a dish of Stirling Castle, and Mr. Shotton won with fruit that represented the variety at its best. Mr. J. Henderson had the best dish of Ecklinville Seedling, and Mr. J. T. Stewart was a close second. In competition for the prizes for Lord Derby, Mr. Shotton scored with fine examples; Bismarck was well shown, and Mr. Waugh was a capital first, the specimens being of full size and splendidly coloured; Mr. J. T. Stewart followed with fruit of high quality and colour. Especially well represented was that fine late apple Lane's Prince Albert, and of quite exceptional excellence was the dish of fruit staged by Mr. Bewley, Causa Grange, Thursby, Carlisle; Mr. J. Hunter, Riding, who was second, also had a fine dish. The best of the several dishes of Newton Wonder, for which the prizes were provided by Messrs. J. R. Pearson and Sons, was contributed by Mr. J. Tait, Tynehow, Carlisle. Bramley's Seedling was strongly represented, and the first and second prize winners were Mr. Weighton, Eslington Park, Alnwick, and Mr. J. Hunter.

For three dishes of dessert apples Mr. D. Mackie, Eshott Hall, Felton, was first, with excellent examples of Ribston Pippin, Cox's Orange Pippin, and Allington Pippin; Mr. J. Waugh, Whellbank, Stocksfield, was a capital second, his Ribston Pippins being particularly good. In the corresponding class for culinary apples, Mr. Waugh was first with a fine set, in which Cox's Pomona, Lord Derby, and Peasgood's Nonsuch were especially well represented. Mr. Waugh also occupied the place of honour in the class for three dishes of orchard-house grown pears, and set up in capital style dishes of Rivers' Magnate, Rivers' Princess, and Doyenne du Comice; Mr. G. Shotton, Prudhoe Hall, Prudhoe, was a close second, with a capital set in which Conference was especially meritorious.

NON-COMPETITIVE.

To the non-competitive class Messrs. G. Bunyard and Co., Maidstone, contributed a large and attractively arranged collection of apples and pears, which was throughout remarkable for the high quality of the fruit. Especially noteworthy were the splendidly developed examples of Cox's Orange Pippin, Wealthy, James Grieve, Lane's Prince Albert, Bramley's Seedling, Blenheim Pippin, and Norfolk Beauty apples; and Conference, Emile d'Heyst, Duchesse d'Angoulême, Marie Benoist, and Doyenne du Comice pears. The King's Acrè Nurseries, Lim., Hereford, exhibited a collection of upwards of one hundred dishes of apples and pears, and the arrangement was bold and tasteful; conspicuous in the collection were fine baskets of Lord Grosvenor, Maltster, Belle Pontoise, Washington, King of the Pippins, Mère de Menage, Worcester Pearmain, James Grieve, Warner's King, and Rival apples, and Durondeau, Beurre Bachelier, Pitmaston Duchess, Doyenne du Comice, and Emile d'Heyst pears. The R.H.S. silver-gilt Knightian medal was awarded to each of the two firms.

Messrs. T. Rivers and Son, Sawbridgeworth, exhibited a large number of dishes of apples and pears from orchard-house trees, and the same number of dishes of the same varieties from trees growing in the open, to show the difference in appearance and size of the fruit produced by the two classes of tree. Unfortunately the position assigned the fruit was rather badly lighted, and the contrast reduced; and, moreover, the two dishes of the same variety were placed rather too far apart. The collection, it need hardly be said, was of much interest, and a magnificent demonstration of the possibilities of the cultivation of hardy fruits under glass. Highly attractive were the fine specimens of King of Tomkin's County, Thomas Rivers, Washington, Cox's Pomona, James Grieve, and Cox's Orange apples, and Conference, Pitmaston, and several other well-known pears. The award of the Hogg silver medal was made to the firm for their fine exhibit.

Other miscellaneous contributions included an attractive collection of fruit and ornamental plants from Messrs. W. Fell and Co., Hexham; a collection of hardy fruits and a table of shrubs from Messrs. J. Robson and Co., Hexham; flowers and fruit in quantity from Messrs. Michie and Co., Alnwick; chrysanthemums from Messrs. E. F. Fairbairn and Sons, Carlisle; fruit, etc., from Messrs. G. Fairbairn and Sons, Carlisle; and flowers, fruits, and vegetables from the Chadwick Memorial School, Carlisle; fruit from Messrs. W. Lawrenson and Co., Newcastle.

Mr. W. B. Little, horticultural instructor for the counties of Cumberland and Westmoreland, exhibited a large collection of finely grown apples from the experimental plots in the two counties, with bottled fruits, cases of injurious insects, specimens of manures used in teaching, and other objects of interest.

R.H.S. MEDALS.

The following is a complete list of the medals awarded by the deputation from the Royal Horticultural Society:

Silver-gilt Knightian.—Messrs. G. Bunyard and Co.; The King's Acre Nurseries, Lim.

Hogg Silver.—Messrs. T. Rivers and Son.

Silver Knightian.—Messrs. A. Michie and Co.; Messrs. Clark Bros. and Co., Carlisle; Messrs. W. Fell and Co.

Silver-gilt Banksian.—Messrs. J. Robson and Co.; Mr. J. Millican.

Silver Banksian.—Messrs. W. Lawrenson and Co.; Chadwick Memorial School; Mr. W. Alexander; Mr. J. Cocker.

Bronze Banksian.—Mr. J. Waugh; Mr. J. H. Stewart; Mr. F. Fixten; Mr. M. Dixon.

THE CONFERENCE MEETINGS.

There were five meetings for the reading of papers and for lectures, and the first of these was held in the Guardians' Hall during the afternoon of the 20th inst. Dr. D. Stewart, chairman of the committee, presided over an audience that filled the hall to its utmost capacity. The Chairman having briefly referred to the importance of such gatherings as a means of stimulating an interest in fruit culture, and disseminating information relating thereto, called upon Mr. G. P. Berry, horticultural instructor to the Edinburgh and East of Scotland College of Agriculture, to address the meeting on "Fruit Storage and the Bottling of Fruit."

Mr. Berry, in his opening remarks, directed attention to the importance of obtaining fruit that is really worthy of being stored, and strongly advised rather severe thinning in seasons of plenty. Not only, he said, was thinning necessary to secure fruit of full size, but it was essential to prevent the tree having its energies so heavily taxed as to prevent the proper development of the flower buds necessary for the production of the following year's crop. Storage was, in his opinion, seldom satisfactory owing to the conditions that obtain in the majority of fruit houses being distinctly unfavourable to the keeping of hardy fruits in the best possible condition over the longest possible period. The elaborate structures that were met with in so many gardens were altogether unsuitable for the keeping of apples. In them the temperature was as a rule far too high, and the degree of atmospheric moisture decidedly too low. A temperature between 38 and 45 degrees was an ideal one, and it was essential to success that there should be a considerable amount of moisture in the atmosphere, but the moisture should not be stagnant. When a special store has to be erected, it should be wholly or partly underground to ensure an equability of temperature. There should be no woodwork because of the flavour of the fruit being impaired by the odour arising from the wood. He advised that the walls and the supports of the shelves should be of concrete, and that the latter should be formed with slabs of Welsh slate. In some places a thin layer of burnt clay spread over the shelves was used for the purpose of preventing the fruit coming into contact with the material with which they have been constructed, and had given good results. Mr. Berry expressed the hope that at no distant date County Councils would establish properly constructed fruit stores for the purpose of demonstrating their value to fruit growers. He then proceeded to deal with the bottling of the various kinds of fruit amenable to that means of preservation, and gave much excellent advice relating thereto.

Mr. W. B. Little followed with an excellent paper on the bottling of fruit and the storage of such kinds as can be kept in good condition for a considerable period in a properly constructed fruit room. He dealt with his subject in considerable detail, and gave much useful information both on bottling soft fruits in summer, and the storage of apples for winter and spring supplies.

The evening meeting on the 20th inst. was held in the Guardians' Hall, and Mr. Alderman Carrick presided over a large audience. The proceedings were commenced by the reading of a highly interesting paper by Mr. H. Somers Rivers on "Stocks for Fruit Trees Historically Considered."

Mr. Rivers said that, although he entered on his task of preparing the paper with some hesitation, he had derived much interest and entertainment from the ancient books it had been necessary to consult. He had found many quaint ideas quaintly expressed, and he had found, also, that many of the worthy writers had freely borrowed from the writings of their predecessors, and had taken many strange statements as matters of fact. Early in the eighteenth century there was a fashion, as in the case of medical works, of going back to the ancient classics for information relating to gardening. Everything was accepted without hesitation; and however wild the statement may have been, it was sufficient that they were under the ægis of antiquity, and therefore credible. Myths of Roman writers were cited in good faith, and all sorts of impossible graft combinations gravely set forth.

For example, Virgil relates that nuts were grafted on the arbutus; apples on nuts and maple bushes, on planes and pears; pears on the ash, etc. Many of the authors were poets, and therefore had poetic licence. Most of these fairy tales are to be found in "The Vineyard" (2nd edition, 1732), which may be consulted by those who wish to have an excellent résumé of them. It is evident that prior to the 16th century fruit culture was in a very primitive state in England. In the "Fruiterer's Secrets," by N. F., 1604, we read, "I thing meete to acquaint thee from whence our great plentie of fruit came. One Richard Harris, of London, borne in Ireland, Fruiterer to King Henry the Eighth (1509—1547), fetched out of France great store of grafts, especially pippins, before which time there was no right pippins in England. He fetched also out of the Lowe Countries cherrie grafts, and pear grafts, of divers sorts." "The Country Man's New Art of Planting and Grafting," by Leonard Mascall, 1652, gives directions "For to make young trees of the Pepins of apples, pears, plums, and services . . . . take of the Pepins or Pomes of the said fruit and the first pressing out of the liquor before the kernels be marred or bruised [and plant them]. When those wild cions shall be great as of the growth of one year, ye must then pluck them up all in the winter following . . . . and make of them a wild orchard. Set your wild trees as far one from the another as ye think meet to grafte. In what part soever ye do set your trees you must cut off the great master root within a foot of the stock, and all other big roots. . . . Then after five or six years' growth, when they be as big as your finger or thereabouts, ye may remove any of them, whereas you will

CORN EXCHANGE, CAMBRIDGE, Nov. 9 and 10.
Open Classes for Chrysanthemums and Vegetables.
For Schedules apply to F. E. FORDHAM, Asst. Secretary, 8, North Terrace, Cambridge.

SCOTTISH HORTICULTURAL ASSOCIATION.
CHRYSANTHEMUM EXHIBITION.
The Association will hold its next GREAT CHRYSANTHEMUM EXHIBITION in the WAVERLEY MARKET, EDINBURGH, on the 16th, 17th, and 18th November, 1910.
Copies of the Prize List, which contains all particulars as to prizes, conditions of competition, etc., may be obtained on application to the Secretary,
A. D. RICHARDSON,
19, Waverley Market, Edinburgh.
ENTRIES CLOSE ON 8th NOVEMBER.

SHEFFIELD CHRYSANTHEMUM SHOW,
CORN EXCHANGE, Nov. 11th and 12th.
£200 IN PRIZES, AND 50 GUINEA SHIELD OFFERED.
Schedules, etc., from
C. COOK.
City Road, Sheffield.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

have them grow and remain. About two or three years after their removal ye shall graffe them." Another paragraph is headed, "Of Negligence and Forgetfulness," and therein the author states that "If peradventure ye forget, and have let small cions two or three years grow about the roots of your stocks, ye may well pluck them up and set them in ranks as the other of the Pepins." This, Mr. Rivers considers, points to the origin of the dwarfing stocks for apples.

Mascall mentions that "if the Pepins be sowed of the Pomes of pears and good apples. . . . we shall find that some of them do love the trees whereof they came. . . If ye will augment trees of themselves, ye must take graffes and so graffe them." In the chapter on the "Setting of trees of nuts" the reader is told that peaches, almonds, and apricots "do love the trees they came of," and presumably were not propagated in any other way than by seed. It is further observed "Sower cherries. . . will grow of stones, but better it shall be to take of the small cions which do come from the roots then plant them." "Great cherries" were to be grafted "on their own seedlings or on trees of sower fruit." The reader is further advised, "Ye must have respect unto the Healine cherry which is graft on the wild Gornire" (Gean), which is another kind of great cherry, and "whether you do prune them or not, it is not natural, for they dure a long time." Plums and damsons were propagated by suckers or "if your plum tree be graft already and have the like fruit that ye desire ye may take your graffes thereof and graffe them on your plum tree." Thus far Mascall is reasonable, but as he proceeds he lapses into extravagant statements.

R. A. Austin in his "Treatise of Fruit Trees," 1653, recommends seedling stocks as being far better than suckers, and mentions different stocks by name. He is evidently under no illusions, for he writes: "The plants you intend to inoculate must be like (as to generall kinds) with the buds that you intend to set on, as apricot buds and other plum buds on plum stocks that are wild stocks: the white plum stock is accounted the best to inoculate apricot buds on, or other choice plums. As for stocks fit for apple graffes, I account crab trees better than sweeter apple trees to graft, because they are usually free from canker, and I conceive will last longer than stocks of sweeter apple trees. The best kind of stocks to graft pear grafts upon are such as come of the seeds or kernels of pears. I know no difference amongst these, but all are good to graft upon, and I utterly dislike these fruits upon white thorn, or upon any kinde of stocks beside pear stocks. The fruits are naught (having a hard and strong core) if grafted upon a thorne tree." Several other quotations were given from this book by Mr. Rivers, and these showed that if the author was not always correct in his views he did not indulge in any that could well be regarded as absurdities. Among other matters Austin recommends the "inoculation" of the Roman nectarine upon the branch of an apricot tree that had been "inoculated" upon a plum stock, and this Mr. Rivers stated was the first mention he had found of double grafting.

Mention was made of the fact that the use of the quince as a stock was referred to by Bacon in his "Natural History, 1658." Bacon writes, "If we graft upon a stock that naturally bears a sower, harsh fruit the fruit of the graft will not be altogether so pleasant as if it were grafted upon a stock that bears naturally sweet and pleasant fruit; and it is that pears grafted upon quince stocks will be more delicate than upon pear stocks. The quince stock gives an excellent taste to it, but these trees upon quinces will never attain to any bigness." William Lawson was briefly cited as having referred in his work entitled, "A new Orchard or Garden," to the grafting of apple and pear trees, and he would appear to have taken a common-sense view of the operation, although he may not have carried it out in accordance with the present-day practice.

The grafting of fruit trees received a full share of attention from John Evelyn, and in his "Pomona," 1678, he states, "We shall find the wilding to be the hardiest and most proper stock for the most delicate fruit. However they do in Herefordshire, both in practice and opinion, limit this rule, and to preserve the gust of any delicate apple rather graft upon a Gennet Moyle than a crab stock, but then, indeed, they conclude the tree lasts not so long. The Gennet-Moyle is commonly propagated by cutting off the branch a little below a bur knot and setting it without any more ceremony."

According to Kock in "Die Deutschen Obstgehobre," 1876, the French Paradise was known in France as far back as the beginning of the 15th century, the first published account of the fruit appearing in Jean de Ruelle's "Di Natura Stirpum," and was considered as one of the most highly-flavoured then grown. This, as Mr. Rivers suggests, is evidently not the apple which is used as the stock so accurately and succinctly described by Parkinson in his "Paradisus Terrestris," 1629, as follows: The Paradise apple is a faire goodly yellow apple, but light and spongy and of a bitterish-sweet taste, not to be commended. John Reid is, Mr. Rivers stated, the first British author with whose works he is acquainted to mention the Paradise stock and its object. In the "Scot's Gardener," 1683, he remarks: "To make dwarfe aples, greff or bud on the Paradise, or any that hath burry knots, Codlings, Redstreaks, etc. Dwarf pears on the quince, but no pear holds on it (that I have tryed) save Red Pear, Achans, and Lonquils, but you may regraft for varieties. Dwarfe Cherries on the morello or on the common Cherrie, or on that Red Gean, which is more dwarfish than the black.

Horticulture in France was earlier developed than in this country, as evidenced by the instructions given in the "Fruiterer's Secrets." The training of fruit trees in various shapes was something of a fine art, and stocks from them received therefore closer attention. "The Compleat Gardener," by the famous De la Quintinye, chief director of all the gardens of Louis XIV. from 1643 to 1715, was made English by John Evelyn in 1693, and no doubt gave a great impetus to fruit growers in this country. He mentions special quince stocks "such as are very sound and produce large leaves and fine shoots, and have a shining blackish back." Apples upon paradise stocks "with this difference only, which seems surprising, between the quince and paradise stocks, that the paradise stocks being anything large are extraordinary good graffed in the cleft, and seldom succeed graffed with a sautcheon (i.e., budded); whereas it is the clean contrary with quince stocks. Apple trees graffed upon the paradise stocks quickly bear fruit and shoot but little wood"; while "those graffed upon apple wildings producing nothing but a vast quantity of wood."

In his "Clergyman's Recreations," 1714, John Lawrence deals with grafting and budding, and refers to "the pear-plum, muscle or Magnum Bonum plum which have been found by long experience to do better and more lasting than any other stocks for peaches and apricots." He did not favour the quince stock, and observes, "many recommend grafting the pear on a quince stock . . . but they are not long lived, do not bear such fair large fruit, nor make such handsome regular trees as those grafted on a pear stock." Batty Langley, on the other hand, evidently had a high estimate of dwarfing stocks, for with reference to apples he says in his "Pomona," 1729, "Apples are grafted on crab stocks raised from the kernels of the crab, as also on stocks raised from the kernels of apples, of which that called the paradise is the best to graft on, to make trees of small growth and produce fruits in great plenty very early."

Other gardening books published during the 18th century contain much relating to grafting and budding, the best kind of stocks, etc.; and from a note in Miller's "Gardener's Dictionary," it would appear that there were in his day more than one kind of paradise stock, and that he had not a very high opinion of dwarfing stocks so far as the apple was concerned.

After passing under review the opinions of many other writers on fruit culture, Mr. Rivers referred to what had been accomplished by his grandfather, the late Thomas Rivers, at Sawbridgeworth, in connection with the introduction and use of the paradise and other dwarfing stocks. This famous pomologist as well known to those who have paid close attention to stocks for fruit trees raised the two paradise stocks which are now generally recognised as the best. One of these is the Nonsuch which was raised at Sawbridgeworth from that old apple the Nonsuch of Queen Bess's time; and the broad-leaved Paradise, which was selected from a large batch of seedlings raised at Sawbridgeworth about the year 1820.

A brisk and interesting discussion followed, in which Mr. A. H. Pearson and other fruit growers took part. He said they had in one of their nurseries apple trees on the Paradise stock that he had known for over forty years; they were trees of considerable size when he first knew them, and were still vigorous.

Mr. Chisholm, horticultural instructor for Northumberland, followed with a good practical paper on the "Best Varieties of Apples and other fruits for Northumberland." He dealt concisely with the conditions that obtain, and the peculiarities of varieties, but it must suffice to state that for heavy soils he recommended Lord Grosvenor, Bismarck, Bramley's Seedling, and Lane's Prince Albert, Allington Pippin, Beauty of Bath, and Gladstone, which also does well on light soils; Worcester Pearmain, Domino, and Early Spire. Lane's Prince Albert, he said, was especially popular in the county, and Bramley's Seedling was found to thrive and bear well in damp situations. The best pears for Northumberland are Doyenne du Comice, Pitmaston Duchess, Williams' Bon Chretien, and Conference.

Mr. W. B. Little next read a paper on the "Best Varieties of Apples for Cumberland and Westmoreland," which was full of information of value to those resident in these two counties. The following apples, it was stated, had given the best results: Lane's Prince Albert, Domino, Bismarck, Golden Spire, Scotch Bridget, Royal Jubilee, Bramley's Seedling, Newton Wonder, Grenadier, Yorkshire Beauty, Worcester Pearmain, Allington Pippin, The Queen, Mr. Gladstone, Early Victoria, and Liddle's Seedling.

Under the heading of "Manners and Customs of Fruit Trees," Mr. George Bunyard dealt with some of the more important points raised by the readers of papers in an address not less remarkable for its interest than for its usefulness.

Mr. J. W. Robson occupied the chair at the afternoon meeting, held in the large hall of the Abbey Hotel, on Friday, the 21st inst., when there were six speakers. The proceedings were commenced with a lantern lecture on "Fruit Pests and their Treatment," by Mr. F. V. Theobald, who is well known as an authority on economic entomology, and especially on the branch that is concerned with insects injurious to plant life. Mr. H. Hogbin followed with an address on "Smudge Fires or Orchard Heating," in which the audience was much interested. Mr. S. T. Parkinson read an interesting paper on "An Enquiry into Damage done to Fruit Trees by Late Frosts," which we hope to refer to at an early date. Mr. R. A. H. Gray, of Newcastle; Mr. F. J. Chittenden; and Mr. Emptage gave the remaining addresses.

The evening meeting, over which Dr. Stewart presided, was opened by the Rev. H. Puretoy Fitzgerald, with a paper on "French Gardening," from which we gathered that the author is of the opinion that a capital of £1,000 per acre is necessary, and that given the necessary skill and untiring energy, those who embark in the undertaking may, at the end of three years, begin to obtain some return for their outlay and labour. Mr. G. W. Avery next followed with a paper on "Bees as Aids to Fruit Culture," which would have been greatly improved had it been reduced by at least one-half its length. The paper dealt with some experiments that had been conducted with a view to determine the aid rendered by bees in the pollination of fruit trees, and conclusive evidence was obtained as to the aid rendered being of immense value. Mr. E. S. Salmon, at the close of the last-named paper, gave a lantern lecture on "Fungus Diseases of Fruit and their Remedies." The fungoid pests dealt with in the course of the lecture included American gooseberry mildew, apple scab or black spot, pear scab, and the brown rot of the apple, and the lecture created much interest. The meeting was brought to a close with a paper by Mr. Cecil H. Hooper on "Small Holdings." The meeting on Saturday morning, over which Mr. W. Alexander presided, was devoted to a discussion of the question of "Co-operation in the Marketing of Produce," and "Packing and Grading."

SPRAYERS, SPRAYING, ETC.

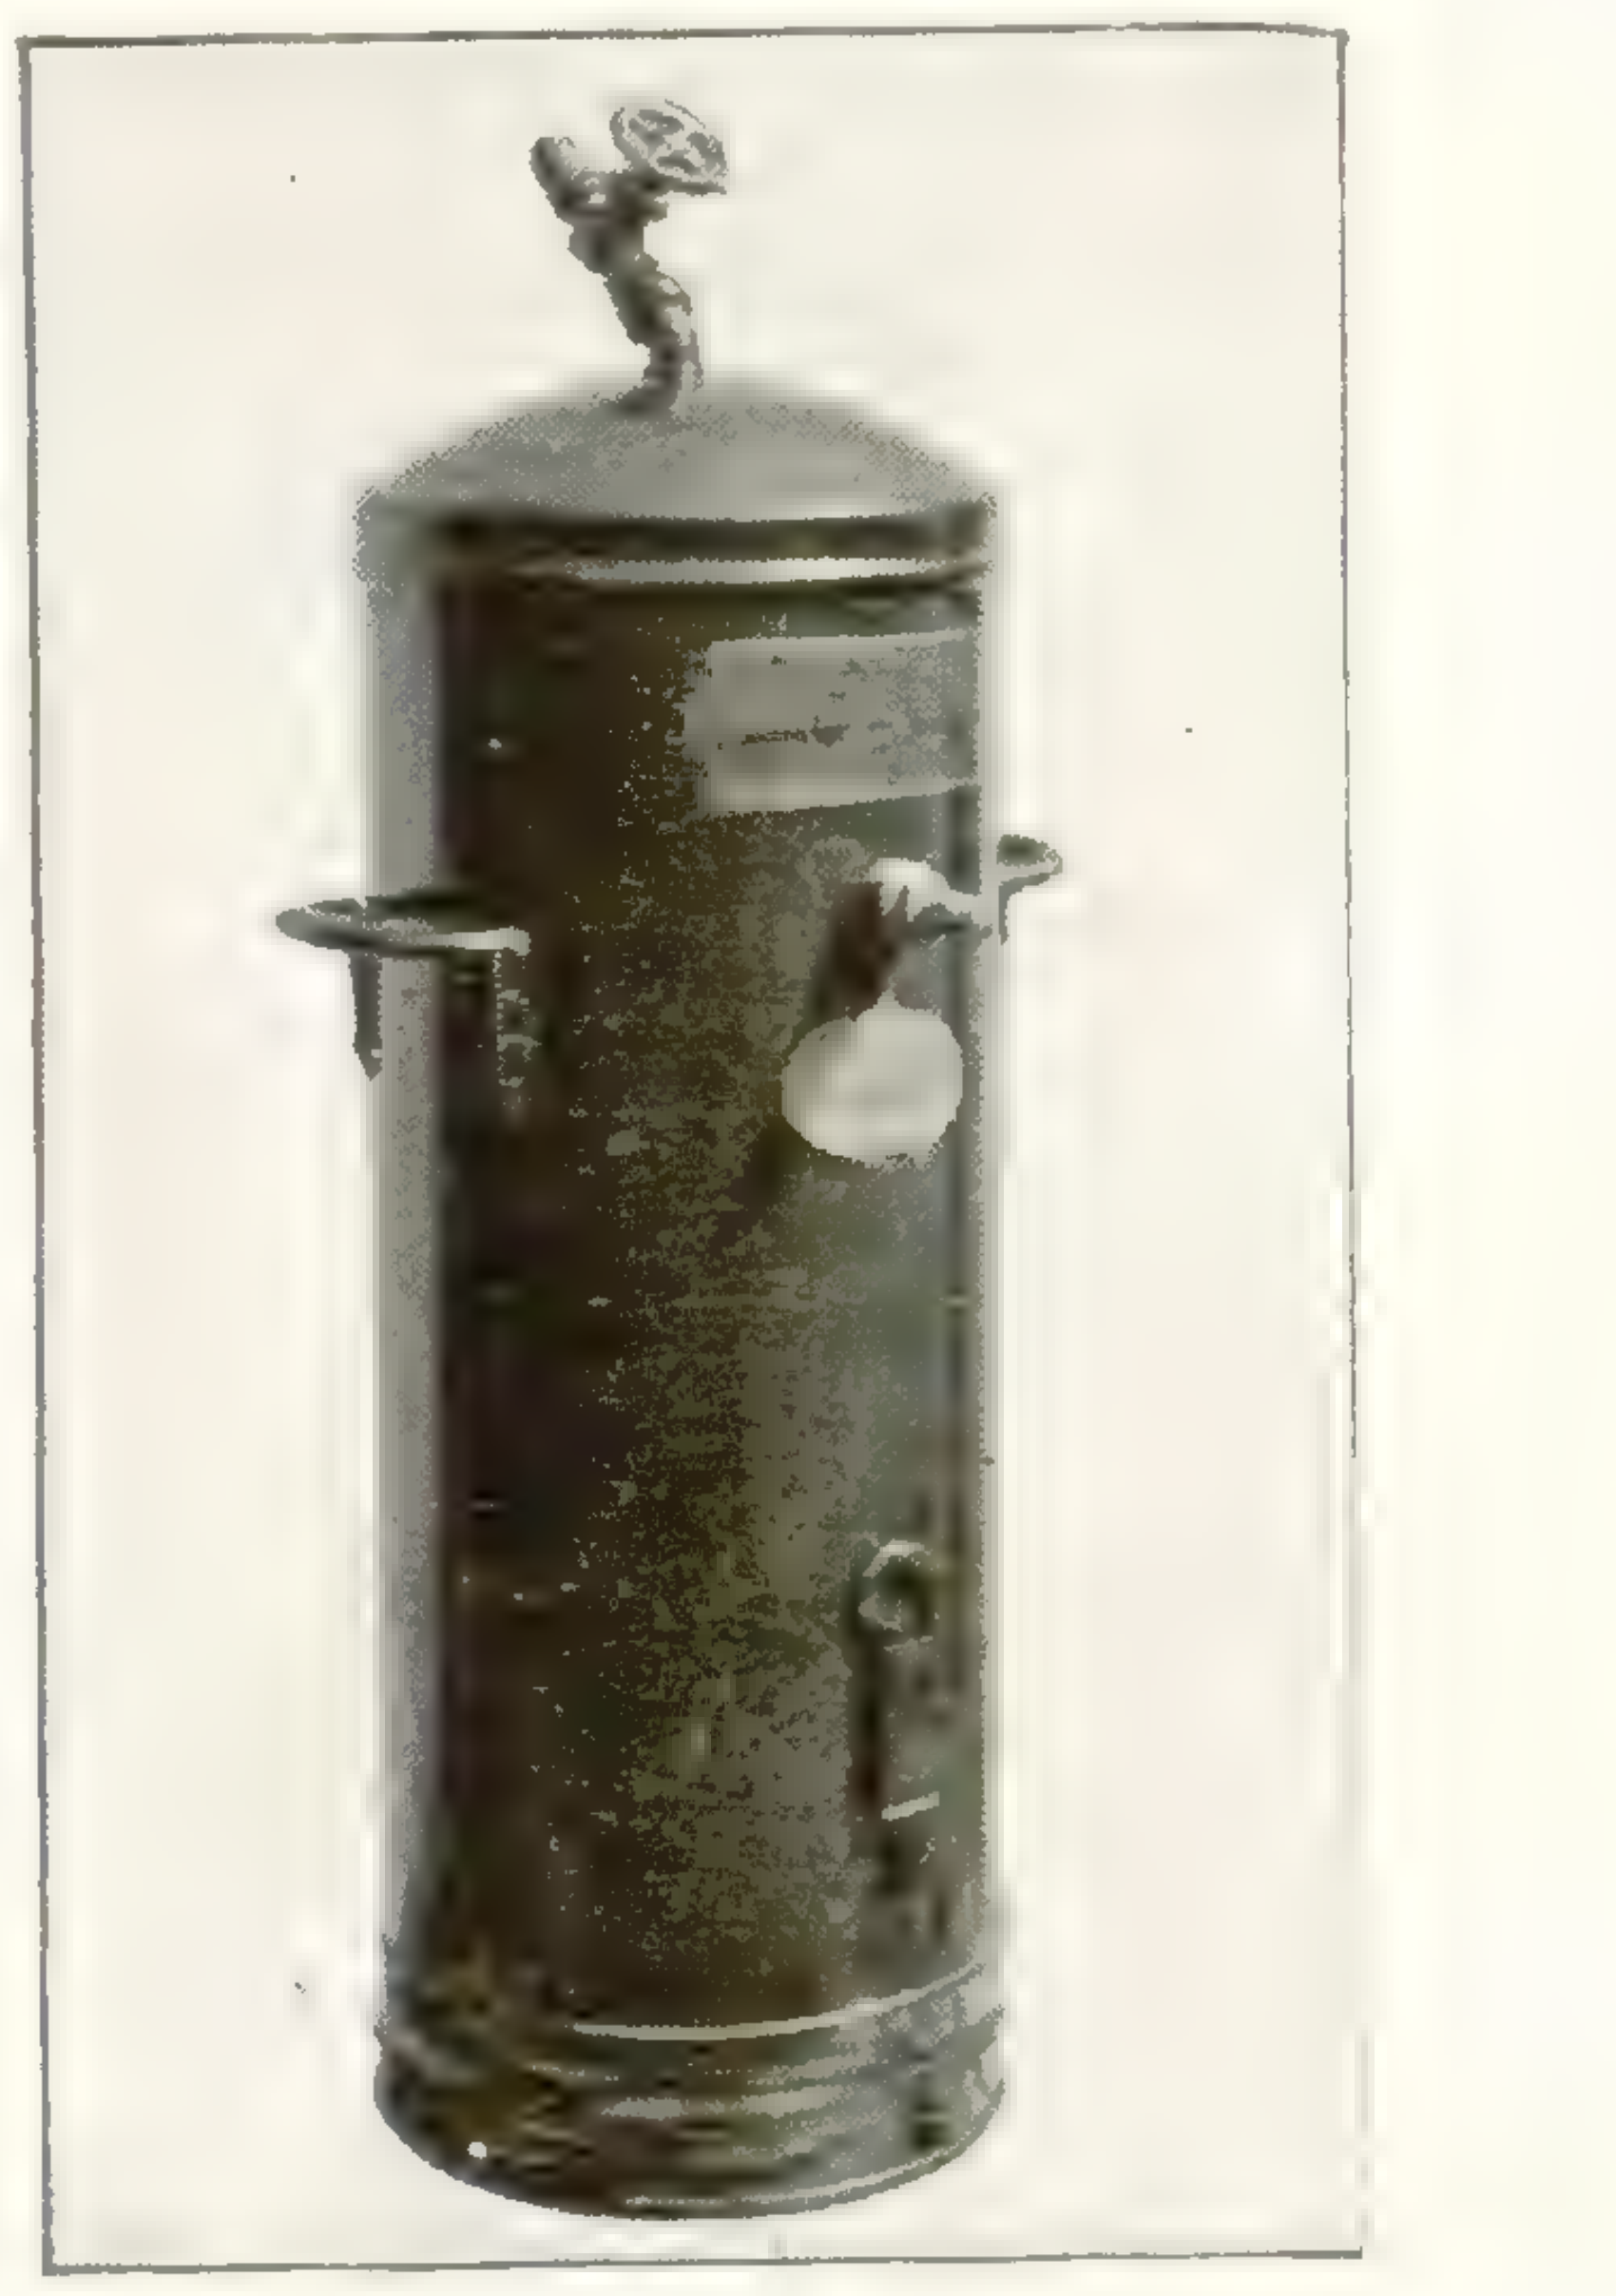
The exhibition of spraying machines, materials for the preparation of spraying mixtures, orchard heaters, etc., was of large extent, and sufficed to fill the Wesleyan School-room, which adjoins the Town Hall, and to attract much attention.

The Alpha Extinguisher, Lim., Ross, Hereford, had on their stand a large number of their spraying machines, ranging from the orchid sprayer with a capacity of one quart to the powerful portable sprayer with a capacity of five gallons. They are all made on the same principle, and they are admirably adapted to the purposes for which they have been designed, the smaller sizes being of much value for the spraying of individual plants under glass, rose trees in the open, etc. while the larger sizes possess a high degree of utility for the spraying of fruit trees and bushes, the lime washing of walls, sheds, etc. They are equally remarkable for their efficiency and simplicity in design, and derive their force from compressed air with which they are charged by means of a foot pump.

The Four Oaks Company, Birmingham, exhibited a range of knapsack and hand-power sprayers, and a large number of their spraying and other syringes, which are widely known and largely used. The hand-power sprayers comprised machines of various sizes on wheels, some being sufficiently powerful to use four nozzles simultaneously, and all are equal to the work for which they are specially made.

Messrs. Cooper, Sons, and Nephew, Berkhamsted, Herts, had on their stand samples of the various preparations for the eradication of insect and fungoid pests, with which the name of the firm is closely identified. They had in addition a number of glass cases in which were displayed the various stages through which various insect pests pass in the course of their life history. Messrs. W. Voss and Co., Millwall, London, exhibited in an attractive manner a large number of different materials that are used in the prevention and eradication of the various enemies that prey upon fruit trees.

The Colorado Heater Company, Hounslow, exhibited a number of the orchard heaters they have introduced for the purpose of preventing injury to the blossom during the flowering season from late frosts, and, indeed, to the young fruits for some time subsequently. Messrs. Burland and Son, Wigan, and Messrs. Crosier, Stephens, and Co., Newcastle, exhibited sprayers of an efficient character.



ALPHA PORTABLE SPRAYER.

On the twenty-first there was a trial and demonstration of knapsack and hand-power sprayers in the tennis court contiguous to the Town Hall, and in this demonstrative test the Four Oaks Company, the Alpha Company, Messrs. R. Burland and Co., and Messrs. Crosier, Stephens, and Co. took part. The first-named firm demonstrated with two or three knapsack sprayers and two of their larger sprayers on wheels, and all the machines did excellent work. The Alpha Company used their knapsack sprayer that has a capacity of 3½ gallons; and Messrs. Burland and Co. used their knapsack sprayer. Messrs. W. Voss and Co. used their sprayer on wheels. The Four Oaks Company also submitted for trial their undentable syringe fitted with sprayer. All the machines were in their several classes carefully tested on systematic lines by the judges, the demonstrations occupying several hours.

The following is the report of the judges:

Class I.—Knapsack Sprayers.—Having inspected the various models of Knapsack sprayers submitted by the Four Oaks Company, Messrs. Burland and Son, and the Alpha Company, on the lines of power, nozzle tests, lime washing, durability, access to parts, and general construction, the judges give their awards as follows: The Alpha Company, gold medal; Four Oaks Company, silver medal; Messrs. Burland and Son, bronze medal. The judges consider that the Knapsack sprayer submitted by the Alpha Company (which is of the pneumatic type), is a considerable advance on previous designs. The construction is simple, reliable, and effective, there being no working parts to get out of order. The Four Oaks Knapsack was found to be a considerable improvement on the older forms of knapsack sprayers, inasmuch as the fittings are external to the reservoir, and therefore not in contact with the liquid. A great improvement was also noted in the fittings of the extension rods, the inlet having been removed from the bottom to the side. The harness and socket for holding the extension rods are also favourably commented on. The Burland knapsack was similar in some respects. The working parts are outside and easily ascessible, a special feature being its adaptability for working with either hand.

Class II.—Hand-power Spraying Machines.—The competition between hand-power spraying machines was keen, and after exhaustive tests, and taking into consideration the mechanism, portability, and cost, the judges came to the following conclusions, viz.: Messrs. Burland and Four Oaks Company, silver medals; Messrs. W. Voss and Co., bronze medal.

Class III.—Spraying Syringes.—The Four Oaks Undentable spraying syringe, with adjustable nozzle, was considered worthy of a gold medal, and such award was accordingly made.

The following awards were made to the exhibitors in this section: The Four Oaks Company, gold medal; Messrs. Burland and Sons, silver gilt medal; Messrs. W. Voss and Company, silver gilt medal, with special reference to their "dry sprayer"; the Alpha Company, silver gilt medal; Colorado Heater Company, silver medal; Mr. M. Herrod, silver medal; Messrs. Crozier, Stephens, and Co., award of merit; Mr. D. Wilson, award of merit; Messrs. Cooper, Son, and Nephews, award of merit as an educational exhibit; Messrs. Morris Little and Son, award of merit.

Royal Horticultural Society's Vegetable Show.

The premier class in the schedule was for twelve kinds, distinct, to be selected from the list given in the schedule. Strange to say, there was but two competitors. The Sutton Challenge Cup was won by Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, who put up a splendid collection, which was almost faultless. The varieties were: Celery, Superb Pink; leek, Prizetaker; cauliflower, Autumn Mammoth; parsnip, Tender and True; onion, Ailsa Craig; beet, Black; turnip, Early Snowball; carrot, New Red Intermediate; potato, Superlative; Brussels sprouts, Dwarf Gem; cucumber, Matchless; turnip, Early Snowball; and tomato, Perfection. Mr. W. Gaiger, gardener to H. T. Tatham, Esq., Kendall Hall, Elstree, was a capital second, though his dishes of tomatoes, turnips, and carrots were weaker. The best kinds were leek, Prizetaker; onion, Ailsa Craig; and beet, Cheltenham Greentop.

In the smaller class for nine kinds, distinct, there were but three exhibits. Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop, securing premier award (the R.H.S. Silver Challenge Cup) with a superb display. The celery was Superb Pink, splendid heads; leeks, Prizetaker; cauliflower, Autumn Mammoth; carrot, New Red Intermediate; beet, Black; onion, Ailsa Craig; pea, Superlative (very fine); potato, Superlative; and tomato, Princess of Wales. Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishops Waltham, was second, having the following as his best efforts: Leek, Prizetaker; onion, Ailsa Craig; potato, Ideal; and beet, Blood Red.

For six kinds, Mr. A. R. Searle, gardener to the Marquis of Northampton, Castle Ashby, Northampton, won well

with a nicely staged exhibit. The following varieties were represented: Celery, Giant White; cauliflower, Autumn Mammoth; potato, King Edward; onions, Ailsa Craig; carrots, Prizewinner (really fine); and tomato, Emperor.

There were but two competitors in the class for twelve dishes of potatoes, distinct, but both were really good. Mr. J. Gibson won first prize for a very level collection. The varieties were Superlative, Ideal, Abundance, White City, Climax, Windsor Castle, King Edward, Sutton's Seedling, Mr. Breese, Satisfaction, Gladiator, and Supreme. Mr. R. Staward, gardener to the Countess Cowper, Panshanger, Hertford, was second, having Purple Eyes, Progress, Industry, Express, and Record as the best examples. Mr. A. G. Gentle, gardener to Mrs. Denison, Little Gaddesden, Berkhamsted, was the only exhibitor for a collection of six varieties, and was awarded first prize for good dishes of The Factor, Goldfinder, Surprise, Sir J. Llewelyn, Royalty, and Windsor Castle.

For six varieties of onions there were again but three competitors, Mr. James Gibson romping home easily for first place with some gigantic bulbs. The varieties were The Sutton Globe, Ailsa Craig, Perfection, Improved Reading, Crimson Globe, and A1 (particularly fine). Mr. G. Ellwood was second with smaller examples, though with superb finish.

The collections of salads attracted much attention, though there were but two entries for nine kinds, the first prize being awarded Mr. E. Beckett for a splendid display, the arrangement leaving nothing to be desired. The dishes were Solid White celery; lettuce, Matchless; endive, Batavian; beet, Blood Red; chicory, Christmas Salad; tomato, A1; cucumber, Delicacy, with mounds of mustard and cress. Mr. W. Gaiger was a good second, his cucumbers, beet, endive, and tomatoes being the best features. For six kinds there were three entries, Mr. J. Gibson scoring well with Green Curled endive, Golden Ball lettuce, Superb Pink celery, Epicure cucumber, Blood Red beet, and Eclipse tomato. Mr. G. Ellwood was second with fine heads of Batavian endive, Favourite beet, and Perfection tomato.

Class nine was for six kinds of minor vegetables, selected from the schedule, but Mr. E. Beckett was the only competitor, and was deservedly awarded the first prize. His dishes were celeriac, very good; Earliest Purple kohl rabi, Long Red capsicum, scorzenera, salsafy, and Stachys tuberifera—a very interesting exhibit.

Mr. James Gibson was placed first for a dish of runner beans with Best of All; Mr. A. R. Searle was second with Webbs' Exhibition; there were four entries. Mr. J. Gibson was first for a dish of French climbing beans, and Mr. R. Staward second. For a dish of dwarf beans Mr. J. Gibson was first with Canadian Wonder, and Mr. A. R. Searle second.

For nine beet, any one type, there were but five exhibits, Mr. A. G. Gentle, gardener to Mrs. Denison, Little Gaddesden, Berkhamsted, winning well with Perfection; Mr. James Gibson second with good examples of Black beet. Mr. E. Beckett was first for a dish of Brussels sprouts, staging Dwarf Gem; Mr. M. Webster, gardener to E. J. Preston, Esq., Kelsey Park, Beckenham, second with a good dish of Solidity.

For three heads of Brussels sprouts Mr. E. Beckett won first place with three fine heads of Dwarf Gem; Mr. M. Webster following with good typical examples; there were four entries. The competition for three cabbages was keen; Mr. H. C. Gardner, gardener to Lord Foley, Ruxley Lodge, Claygate, won well with Sugarloaf, and Mr. Silas Cole was second with Emperor. There were eight entries for three savoys, Mr. J. Gibson winning well with fine examples of Perfection; Mr. M. Webster being second with Early Dwarf Ulm. Mr. E. Beckett led with cauliflowers, staging fine examples of Autumn Mammoth, Mr. J. Gibson being second with the same variety.

Mr. E. Beckett was awarded first prize for six heads of white celery, staging fine sticks of Solid White; Mr. S. Cole was second with Giant White. The same exhibitors won the prizes for six heads of red celery in the same order. There were but four entries for a brace of cucumbers, Mr. E. Beckett winning with Delicacy, and Mr. J. Gibson being second with Epicure—rather an easy competition. For twelve leeks Mr. J. Gibson won well with fine examples of Prizetaker, Mr. R. Staward being second with examples that lacked colour.

Mr. H. C. Gardner was the first-prize winner for three marrows, staging Long Green; Mr. R. Staward was placed second with Large Cream. Mr. A. G. Gentle secured the first prize for mushrooms. For twelve round or globular onions the competition was fairly good, Mr. A. G. Gentle securing first with fine bulbs of Ailsa Craig, and Mr. G. Ellwood second with the same variety. For twelve parsnips Mr. S. Cole gained first place with Webbs' Marrowfat, long, clean roots; Mr. J. Gibson second. Mr. J. Gibson led for twelve long carrots with grand examples of New Red Intermediate; Mr. S. Cole was second. There were five entries for stump-rooted carrots, Mr. E. Beckett winning well with Favourite; Mr. S. Cole second with New Standard.

Mr. J. Gibson was well ahead for a dish of peas, staging clean, handsome pods of Superlative; Mr. E. Beckett was second. For twelve turnips, white fleshed, Mr. J. Gibson won first prize with clean examples of Snowball, Mr. A. G. Gentle being placed second with Jersey Lily. For a dish of parti-coloured varieties, Mr. J. Gibson still further added to his successes by winning first prize with good typical examples of Purple Top, Mr. E. Beckett taking second place with Green Top Stone. Mr. E. Beckett was placed first for a dish of yellow-fleshed turnips, having good examples of Orange Jelly; Mr. A. G. Gentle was second.

There were only three exhibits for white potatoes, Mr. J. Gibson leading with splendid examples of Superlative, and Mr. S. Cole following with New Guardian. The coloured dishes only numbered three, Mr. J. Gibson leading with fine examples of Mr. Breese, and Mr. A. G. Gentle coming second with good tubers of Exhibition Red. Mr. James Gibson secured first prize for three plants of dwarf kale with fine examples, Mr. M. Webster being second. Mr. James Gibson was equally successful with the tall variety, Mr. R. Staward second.

Mr. J. Gibson was most successful for a dish of red tomatoes with fine examples of Princess of Wales; Mr. E. Beckett must have been a desperately close second with his Perfection. The yellow varieties were disappointing, only three dishes being staged, Mr. E. Beckett winning first prize with well-coloured Golden Perfection; and Mr. J. Gibson second. The class for any other vegetable brought out six entries, Mr. J. Gibson securing first prize with some fine globe artichokes, Mr. E. Beckett being second with really fine corn cobs.

National Chrysanthemum Society.

There was a well-attended meeting of the Floral Committee at Essex Hall, on Monday, October 24, and on this occasion there was also a capital display, and a large number of first-rate flowers.

Mr. H. W. Thorpe, Worthing, has a fine thing under the name of Evangeline. Messrs. W. Wells and Co., Merstham, contributed several fine flowers, and Wells' White (provisional name only) was greatly admired. Mr. T. Ward, The Graperies, Bishop's Stortford, sent a fine yellow sport from the single Bronze Pagram, and named it Mrs. Tresham Gilby. Mr. Martin Silsbury, Shanklin, Isle of Wight, sent the brilliant Red Chief, a fine Japanese variety. Mr. G. Mileham was an exhibitor, as also was Mr. Higgs. Messrs. Cragg, Harrison, and Cragg had splendid vases of fine flowers of the golden bronze single variety named Mrs. W. G. Patching, as well as of a very bright form of Bronze Pagram, and a vase of the incurved H. W. Thorpe. Mr. P. Ladds, Swanley Junction, showed a pretty soft yellow sport from Felton's Favourite, named Nora Reilly, and a deep rose-pink single named Joan Edwards. Mr. W. Jinks, Thames Ditton, sent a brilliant Japanese variety named Mrs. George Hartman, and Messrs. Stredwick and Son, St. Leonards, staged Clara Stredwick, a deep amaranth Japanese variety. Mr. Norman Davis submitted the silvery-pink Mary Poulton (see figure in present issue), the stock of which is in the hands of the Framfield expert; Mr. Davis also showed the brilliant crimson Henry Poulton, the bonny Framfield Bronze, a decorative variety, and the creamy-coloured Mrs. A. Herbert.

First-Class Certificate.—To Japanese Chrysanthemum Evangeline, from Mr. H. W. Thorpe, Worthing; to Mrs. G. C. Kelly, a big rosy-crimson incurving Japanese variety, from Messrs. W. Wells and Co.; to Mrs. Tresham Gilby, a yellow sport from Bronze Pagram, from Mr. T. Ward, Bishop's Stortford; to Red Chief, a chestnut-red and buff Japanese variety, from Mr. Martin Silsbury, Shanklin; to Mrs. W. G. Patching, a golden-bronze single variety, from Messrs. Cragg, Harrison, and Cragg, Heston; to Joan Edwards, a rose-pink single variety, from Mr. P. Ladds, Swanley; to Nora Reilly, a yellow sport from Felton's Favourite, from Mr. P. Ladds; to Henry Poulton, a crimson Japanese variety; Mary Poulton, described and figured in this issue, and Framfield Bronze, a decorative variety—all from Mr. Norman Davis, Framfield, Sussex.

Commendation.—To Marie Loomes, Belle Mauve, and Wells' Crimson, from Messrs. W. Wells and Co., Merstham; to Countess of Granard and Mrs. A. Herbert, from Mr. Norman Davis.

International Horticultural Exhibition.

A meeting of the General Committee of the International Horticultural Exhibition of 1912 was held at the Hotel Windsor, Victoria Street, Westminster, on Tuesday, October 25. Mr. J. Gurney Fowler, chairman of the Executive Committee, presided, and those present included Sir Albert Rollit, Dr. Van Rhin (of the Dutch Embassy), Dr. Keeble, Rev. J. H. Pemberton, Rev. A. T. Boscawen, Rev. J. Jacob, and Messrs. H. J. Veitch, V.M.H., A. W. Sutton, V.M.H., A. Dean, V.M.H., Jas. Hudson, V.M.H., F. Sander, V.M.H., E. Molyneux, V.M.H., C. T. Druery, V.M.H., G. Gordon, V.M.H., Edwin Beckett, V.M.H., R. I. Lynch, M.A., V.M.H., G. Monro, V.M.H., Jas. O'Brien, V.M.H., Owen Thomas, V.M.H., George Paul, V.M.H., W. Crump, V.M.H., T. Challis, V.M.H., G. Massee, V.M.H., Joseph Cheal, W. A. Bilney, E. White (hon. secretary), J. Skelton, W. Cuthbertson, J. Green, Spencer Pickering, Peter Veitch, J. Charlesworth, J. Cypher, A. W. Paul, A. Turner, H. Mount, W. Watson, W. J. Bean, C. Foster, C. Jefferies, C. Page, N. F. Barnes, P. Blair, J. Whitton, T. H. Cook, Jas. Gibson, W. Jennings, J. Jacques, W. H. Divers, C. Fielder, W. Fyfe, L. Sutton, R. H. Pearson, W. B. Hemsley, J. Hobday, J. Vert, J. McLeod, W. Poupart, W. W. Pettigrew, C. Harman Payne, W. Swan, T. W. Sanders, G. Waterer, F. Chittenden, A. Hales, E. Laxton, P. R. Barr, G. Schneider, A. W. Hill, Bunyard, jun., Clapham, Farrar, S. Low, D. McDonald, A. Bull, A. S. Rivers, G. J. Ingram, H. J. Wright, Chas. H. Curtis, W. P. Wright, W. P. Thompson, F. W. Harvey, E. G. Quick, P. Anderson Grahame, J. Harrison Dick, E. F. Hawes, C. Engelmann, Baker, J. Strange, R. C. Notcutt, W. Goaring, and C. G. Nix.

Luncheon was served at one o'clock, and immediately at its conclusion the Chairman proceeded to set forth what the Executive Committee had done, provisionally, towards the arrangement for the exhibition. He pointed out that the Executive Committee, with the sanction of the Board of Trade, proposed to at once register themselves as a limited liability company, with a capital of £1,000, so that those immediately responsible would not suffer beyond the amount of their shares (a few pounds), in case of financial loss attending the exhibition. The executive would not receive any dividends, nor would they receive any directors' fees or other special remuneration, and the formation of the company was only for the purpose of putting matters on a business-like footing. The company would be registered in a few days if the present meeting approved of the arrangements.

The Chairman stated that Royal patronage had been graciously bestowed upon the undertaking, and a large number of the nobility of the land had become vice-presidents. Local committees had been formed in almost all the counties of the kingdom for the purpose of furthering the work and awakening interest. An Empire List of Honour had been formed, and on this were to be found the names of those closely associated with horticulture and agriculture in the Colonies. On the Foreign List, all the gentlemen invited had accepted invitations. The Finance Committee had been exceptionally busy, and Sir Jeremiah Colman was the hon. treasurer. The exhibition of 1866 cost £12,500, and there was a profit of £3,500. The forthcoming exhibition would cost a great deal, but he hoped the profits would be at least as good as those of 1866, and such profits, if any, would be devoted to horticultural charitable, or educational or kindred purposes. The Royal Horticultural Society had given £1,000 towards the preliminary expenses, and was prepared to guarantee up to £4,000, in proportion to the amount otherwise guaranteed, and would forego its Temple Show of 1912. It was proposed that guarantors of £100 should have a free pass to the exhibition, and available every day; of £50, one transferable ticket available for the opening or any one day, and so on in proportion. Subscribers to the funds would receive tickets to the value of 20 per cent. above the amount subscribed. It was hoped that the exhibition would be of horticultural, scientific, and educational value. The Schedule Committee, under the chairmanship of Mr. Harry J. Veitch, had had many meetings, and in a fortnight or so the preliminary schedule showing the nature of the exhibits desired, and their size or quantity, would be issued, but there would be no intimation of the prizes to be awarded, as this was a matter for further consideration. At present the Executive body had not decided whether to grant cash awards or only cups, medals, works of art, etc., as prizes, and on that subject desired enlightenment from the General Committee. An opinion had been expressed, said the Chairman, that the exhibition might resolve itself into a glorified Temple Show, but he assured them that the Executive Committee had in view an International Horticultural Exhibition of the highest possible standard. Referring to the Show and Sites Sub-Committee, Mr. Fowler remarked that the grounds attached to the Royal Hospital, Chelsea, had been secured, and 16½ acres were at their disposal, as against the four acres of the 1866 exhibition. It was the largest convenient site available, and was only five minutes' walk from Sloan Square Station. Ample time would be allowed for preparing and removing the exhibition. The sum of £500 would be paid to the hospital authorities, and the date fixed for the exhibition was May 22 to May 30, 1912, a period in the middle of the London season. The Reception and Entertainment Sub-Committee had not yet commenced its duties, but it was hoped by then that the Royal Horticultural Society would place its hall and rooms at the disposal of the committee for entertainments and other meetings. Mr. J. Hassall had been requested to design a suitable poster for the exhibition, and this would be reproduced in various sizes, and quantities would be distributed in the form of stamps. Already about 400,000 slips referring to the exhibition had been distributed by nurserymen and seedsmen in their catalogues. Mr. R. H. Pearson was Press representative, and they

THE GARDENERS' AND POULTRY KEEPERS' GUIDE

And Illustrated Catalogue of Goods Manufactured and Supplied

By WILLIAM COOPER.

640 Pages. 1,000 Illustrations. Bound in Cloth.

The most Complete Work on Gardening and Poultry-Keeping, Dogs, Rabbits, Pigeons, &c., ever written. Business Hours from 9 a.m. to 6 p.m. Saturdays included. Trams from all the Bridges Pass the Door.

had been extremely fortunate in securing Mr. E. White as hon. secretary.

Sir Albert Rollit, in an eloquent and humorous speech, proposed: "That this general meeting approves of the proposals for the International Horticultural Exhibition of 1912, in accordance with the explanations and programme laid down by the chairman, and promises to render all possible support to achieve the end in view." Sir Albert appealed to the patriotism of the members, and pointed out that such a gathering as that proposed tended towards the peace of the world. Mr. P. Anderson Grahame seconded the motion, and suggested the inclusion of one or more foreign members on the Executive, and also an exhibition of insect and fungus pests, showing their life history and the best means of combating them. Mr. J. O'Brien hoped due arrangements would be made for receiving and unpacking exhibits, but thought the display of insects was hardly necessary. Mr. Alex. Dean referred to the subject of guarantees, and further asked if the standing committees of the R.H.S. would be utilised for the purpose of making awards to new plants, flowers, fruits, and vegetables at the exhibition. He suggested special days for gardeners and for traders, and suitable entertainments, and also asked what compensation Fellows of the R.H.S. would receive in the form of tickets, in lieu of the loss of a Temple Show, in 1912. Mr. Fowler said that the Executive would rely very largely upon those present, and members of the committees, with prominent foreign horticulturists for judges at the exhibition.

Dr. Van Rhin, of the Dutch Embassy, urged the formation of national committees for the purpose of securing the co-operation of horticulturists in the various Continental and other countries, and he suggested that the various governments should be approached in connection with such committees. He expressed his pleasure in being invited to take part in the proceedings, and he would do all he could to help. Both Mr. N. F. Barnes and Mr. J. Cheal asked if the schedule to be issued would be a rough draft and open to consideration, both as to classes and prizes, and said that the question of cash prizes could not well be considered until the schedule was received. Mr. Fowler said the schedule would be chiefly for the purpose of indicating the kinds of plants and flowers, etc., to be shown, and so enabling exhibitors to make their plans well in advance. Mr. Farrer and Mr. S. Pickering also spoke, the latter urging an educational sectional exhibition of insect and fungus pests.

The resolution was then put, and carried unanimously, and a vote of thanks to the chairman, moved by Mr. A. W. Sutton and Mr. J. Green, was carried.

FORTHCOMING ENGAGEMENTS.

TUESDAY, November 1.—Scottish Horticultural Association.
Bournemouth Chrysanthemum Show; two days.
Brighton Chrysanthemum Show; two days.
WEDNESDAY, November 2.—Kent County Chrysanthemum Show; two days.
Southend Chrysanthemum Show; two days.

East Cowes Chrysanthemum Society; two days.
Weston-super-Mare Chrysanthemum Society.
British Gardeners' Association, London Branch.
FRIDAY, November 11.—Sheffield Chrysanthemum Society; two days.

ANSWERS TO CORRESPONDENTS.

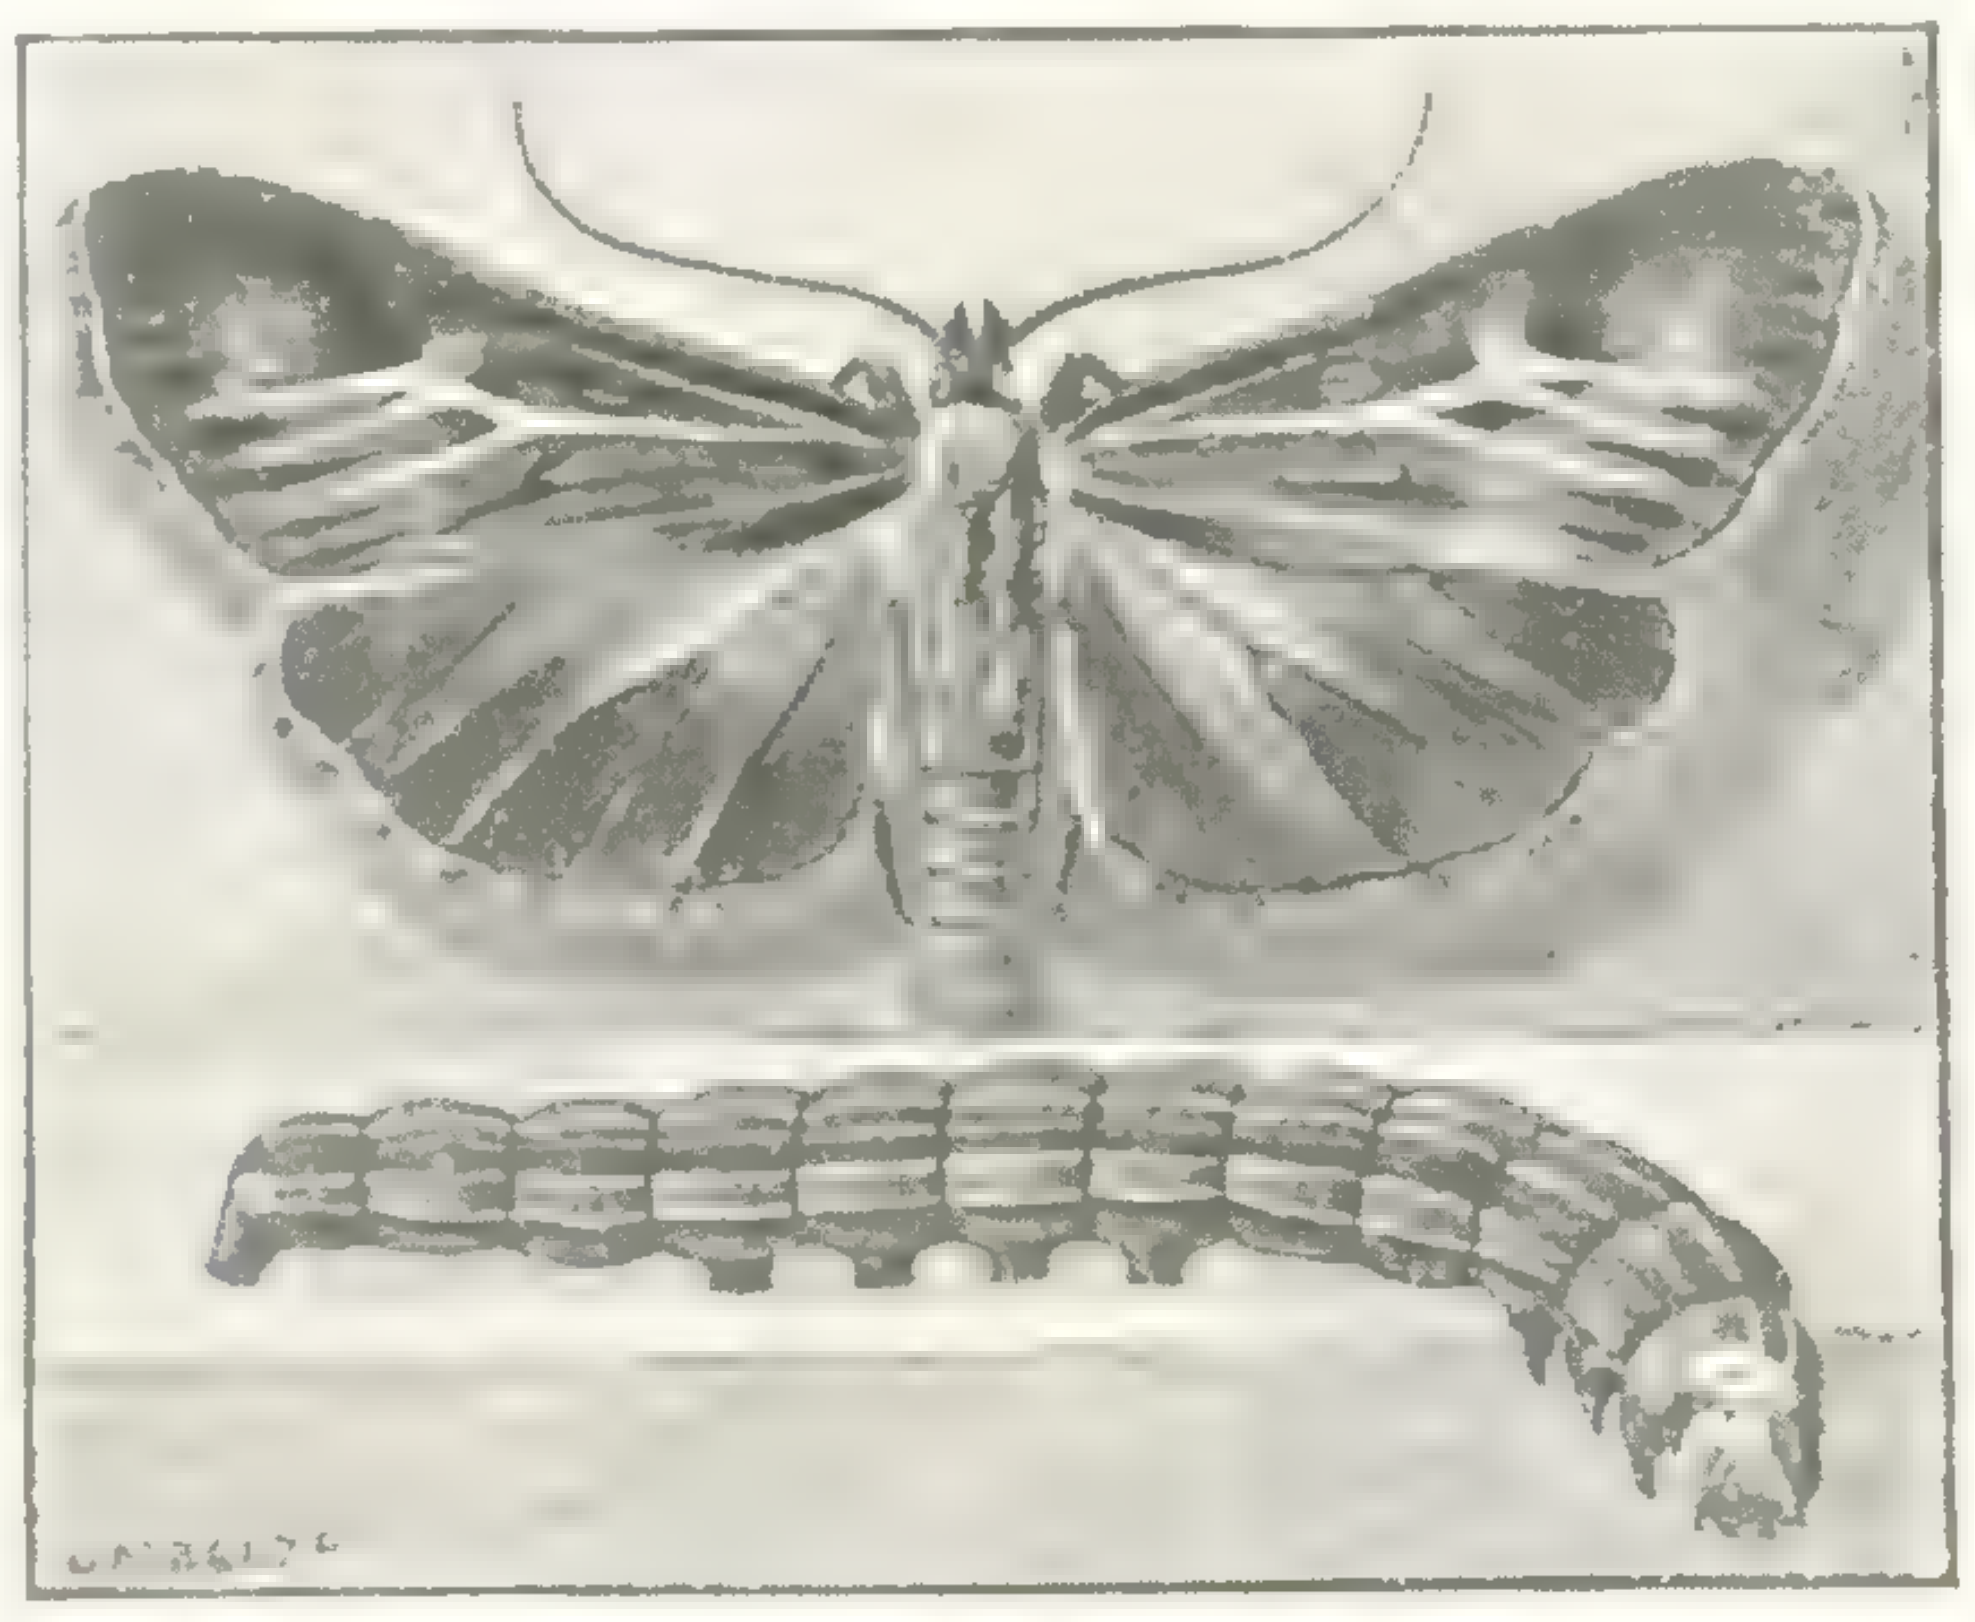
YELLOW DISEASE IN ROSES.—H. H., Wilts: In the absence of specimens we are afraid there is little chance of rendering you real assistance.

CODE OF JUDGING.—A. B., Neyland: You may obtain the "Rules for Judging, with Suggestions to Schedule Makers and Exhibitors," from the Secretary of the Royal Horticultural Society, Vincent Square, Westminster, post free, for 1s. 6d.

GARDEN CACTUS DAHLIAS.—H. T. H., Heytesbury: We hope to discuss this matter before long, but, as new varieties are not distributed until the spring, there is no need for dealing with the subject immediately. Further, we can assist you better this way than in a brief reply.

LOSS OF FLOWERS AND FOLIAGE IN CONSERVATORY.—H. J. B., Norwood: Lack of light will account, in some measure, for the loss of flowers and foliage; if the roof is of thick, ribbed glass, and you have an eucalyptus trained under it, then little light can reach the plants beneath. Have you no means of heating the conservatory, and do any of the living rooms open into the structure?

CATERPILLARS ON LAWN.—G. K. S., Reigate: In all probability the trouble has been caused by the Antler Moth (Charæas graminis), which should, as far as practicable, be kept in check, for, when the caterpillars are present in large numbers they do a great deal of damage to lawns. The moth is brownish, marked with white, and it lays its eggs during July and August on the lower portions of the stems, and on the roots of the grasses. In about three weeks they hatch out and the caterpillars commence their attack on the grasses. They feed at night only, and eat the stems and leaves near the ground level. Passing a heavy roller over lawns that are much infested at night during the autumn might destroy some of the caterpillars; but catching the moths when in flight by some of the devices adopted for capturing moths is, perhaps, the most effectual method of keeping the pest under.



ANTLER MOTH AND CATERPILLAR.

HYDRANGEAS IN TUBS.—T. W. R., Aberdare: Large examples of hydrangeas are particularly effective when placed in suitable positions on terrace and other walks and on the lawn, and they are by no means difficult to produce. The commencement should be made as in the case of the small plants, but, instead of the shoots being reduced to one, the plants should the first year be cut back, and all the shoots be allowed to remain, except, it may be, one or two that are very weakly. The attention necessary subsequent to the first year will be to repot annually, early in the spring, previous to the commencement of the new growth, and to thin out the weakly shoots and slightly shorten those remaining. When they have reached the largest-sized pot or tub in which it is intended to grow them, they can be kept in excellent condition for two or three years with rich top-dressings and liquid manure. When repotting becomes necessary, reduce the ball of soil by about one-third, and return to pots or tubs of the same size. They can be wintered in the greenhouse or in a shed.

NAMES OF PLANTS.

B. K., Matlock.—Abutilon megapotamicum.

S. A., Hertford.—1, Phrynium variegatum; 2, Helenium autumnale.

S. S., Guernsey.—1, Pittosporum Tobira; 2, Fuchsia fulgens; 3, Galax aphylla.

T. W. J., Exeter.—1, Eucalyptus globulus; 2, Punica granatum; 3, Selaginella hæmatodes; 4, S. Mertensi.

L. T. Y., Worcester.—1, Euonymus radicans variegata; 2, Cratægus Lelandi; 3, Laurus nobilis; 4, Cupressus Lawsoniana Allumi; 5, Rivina humilis.

NAMES OF FRUITS.

C. C., Yeovil.—1, Bramley's Seedling; 2, Lord Derby.

L. D., Durham.—1, Newton Wonder; 2, Golden Noble; 3, not recognised.

H. E. W., Horsham.—1, Dumelow's Seedling; 2, Margil; 3, Cox's Pomona; 4, not in character.

K. J. F., Merstham.—1, Ribston Pippin; 2, Ecklinville; 3, Beurre Diel; 4, Catillac; 5, Beurre Bosc.

A. N. W., Kildare.—1, Worcester Pearmain; 2, Lane's Prince Albert; 3, Blenheim Pippin; 4, Smart's Prince Arthur; 5, Belle Dubois; 6, probably London Pippin.

Situations Wanted.

GARDENER (Head); life experience all branches, Inside and Out; Grapes, Peaches, Melons, Stove and Greenhouse Plants, Orchids, Malmaison and Tree Carnations, Landscape and Rock Garden; Vegetables and Hardy Fruit; nearly 8 years as head; age 35; excellent references. F. SMITH, 4, Mellish's Terrace, Morden, Surrey.

GARDENER (Head).—R. ROBERTSON, gardener to the Rt. Hon. Lord Kinnoull, desires engagement with lady or gentleman, where several are kept; 19 years' practical experience in all branches of gardening; age 34; married and well recommended. Address Balhousie Castle Gardens, Perth, N.B.

HEAD GARDENER, The Hall, Harbury, Leamington, highly recommends YOUNG MAN, 18, under good Gardener; 3½ years here; excellent worker; Bothy preferred. F. FIELD, as above.

W. LAMBERT seeks SITUATION as HEAD WORKING GARDENER where several are kept; life experience in growing Grapes, Peaches, Melons, Stove and Greenhouse Plants, Orchids, Carnations, Kitchen and Flower Garden, and Hardy Fruit; good reference; married; one daughter, age 10. W. LAMBERT, The Common, Kenilworth, Warwickshire.

GARDENER (Head Working).—Mr. WATSON can highly recommend C. WALLIS, where two or three are kept; been here 5½ years as Second of five; age 30; married, one child. The Gardens, Bushey Down, Tooting Common.

GARDENER (Head Working), late of Hungerford Park; well up in all branches, Inside and Out; excellent references; 4 years in last place; married; age 41; abstainer. F. EARL, c/o W. Irving, 2, Kent Villa, Stanwell Road, Ashford, Middlesex.

GARDENER (Head Working); life good practical experience in all branches, Inside and Out, Early and Late Forcing; excellent references. H. TURNER, 62, Star Road, Peterborough.

GARDENER (Head Working); 24 years' practical experience in the cultivation of Flowers, Fruit, and Vegetables Inside and Out; good conception in the alteration and improvement of Gardens and Pleasure Grounds; six years' excellent character; married; age 39. SQUELCH, Keston, Hayes S.O., Kent.

GARDENER (Head Working where one or two more are kept, or good Single-handed); experienced Inside and Out; good references, and recommended; age 27; married when suited. W. CROUCHER, 11, North Terrace, Hythe, Kent.

GARDENER (Head Working), age 45; married, no family; experienced in all branches (Inside and Out); excellent testimonials. WM. SMITH, care of Mrs. Clibury, Weather Lane, Astley, Stourport.

GARDENER (Head Working); active, thoroughly experienced in all branches of Gardening; [illegible] years in present situation; 17 previous as head; married; two children, youngest boy 13. J. EGGLETON, The Lodge, Brazier's End, Tring. No circulars.

GARDENER (Head, where three or four are kept); 20 years' practical experience in all branches; 6 years last situation; age 38; can be highly recommended. C. GARNER, Devonshire Cottage, Banstead, Surrey.

GARDENER (Head Working), requires SITUATION; experienced in Vines, Peaches, Melons, Cucumbers, Stove and Greenhouse Plants; Flower and Kitchen Garden, Hardy Fruit, etc.; good references; married, no family. W. S., 16, Warwick Place, Maidstone, Kent.

GARDENER (Head Working), age 33; can be highly recommended, thorough experience in all branches, fruit, flowers, and vegetables; Inside and Out; excellent references. WICKS, The Gardens, Halstead Place, near Sevenoaks.

GARDENER (Head Working), age 38, married, practical, all-round life experience in all branches, desires situation where energetic, trustworthy man is required; has had experience in alterations and remodelling neglected gardens; excellent references. GARDENER, Heathfield, Chislehurst Kent.

GARDENER (Head Working); age 44; life experience; 21 years' excellent references from first-class establishments; thorough knowledge in all branches; leaving own request; no young children, youngest 11. W. BLOOMFIELD, Staplehurst, Kent.

GARDENER (Head Working, where two or more are kept); good all round; can be well recommended; married when suited; age 36. PEARCE, 10, Roxwell Road, Shepherd's Bush.

GENTLEMAN recommends GARDENER (Head of two or three); life experience in all branches; understands formation of new or renovating old gardens; married, one boy 10 years, age 45. PENNELLS, Phœnix Green, Winchfield, Hants.

GARDENER (Single-handed or otherwise), good all-round, under glass; grapes, etc.; married; age 40; one child; good references; suburbs. QUARTERMAIN, 15, Collins Street, Blackheath Village, S.E.

GARDENER (Single-handed), age 25; thoroughly experienced in all branches; last situation seven years; left through death; Milk if preferred; married when suited. GEORGE HUBREN, care of Mr. Bramwell, Crabb's Hill, Hatfield Peverel, Essex.

GARDENER (Single-handed or otherwise); good all-round man in all branches, or handy man on gentleman's estate; good at either; willing to be useful; active and reliable; good character; age 45; married, one child. OSBORNE, 48, Bradshaw Road, Watford.

FOREMAN or SECOND, Inside or Inside and Out; experience in all branches, Fruit and Plant Houses; well recommended from present and previous places; one year and nine months here as Foreman; age 27, married, one child. SHILL, The Gardens, The Lilies, Aylesbury, Bucks.

M. MEREDITH BROWN, Esq., strongly recommends young man as JOURNEYMAN (Second, Inside); 3½ years present place; age 20. F. GEE, Westbrook, Bromham, Chippenham.

MR. LOVETT, Gardener to Sir Harold Harmsworth, Bart., can highly recommend YOUNG MAN as SECOND; good references; all-round experience. Mr. LOVETT, Horsey Hall, Great Yarmouth.

JOURNEYMAN or UNDER-GARDENER, Inside and Out; 2½ years present, 3½ previous; age 22; good references. C. G. STEVENS, 10, Clinton Road, Leatherhead.

JOURNEYMAN (Second, Inside or Inside and Out) seeks SITUATION; age 21; four years' experience; excellent references. DREW, 24, Market Place, King's Lynn, Norfolk.

MR. NEIGHBOUR, Orsett Hall Gardens, Grays, Essex, wishes to highly recommend YOUNG MAN, age 23 as JOURNEYMAN; Inside preferred; 4 years present place, Inside and Out; excellent character.

JOURNEYMAN (Inside and Out); life experience; good reference; age 21. PINK, Chevering Lane, Knockholt, Sevenoaks.

MR. JORDAN, Lofts Hall, Saffron Walden, would be pleased to recommend YOUNG MAN as JOURNEYMAN, Inside and Out; age 23. Apply as above.

MR. T. CORNISH, Mymwood House Gardens, Hatfield, Herts, can highly recommend WILLIAM EBBS as JOURNEYMAN; Inside; 3½ years' experience with me; age 19; 5ft. 10in. in height; bothy preferred.

GENTLEMAN recommends YOUNG MAN, age 22, as second of four or five; Inside and Out; 7 years' experience; good reference. Apply T. ROGERS, Michelmersh, Romsey, Hants.

ESTATE JOINER requires SITUATION; can undertake to keep Property in thorough repair and to collect rents if required; best references. W. E. S., 18, Carrs Hill, Gateshead-on-Tyne.

GARDENER or CARETAKER; married; long personal references. Address, WRIGHT, Gate Lodge, Caenwood Towers, Highgate.

IMPROVER (Inside and Out), age 17; height 5ft. 10in.; well recommended; Bothy preferred. Apply H. HASTINGS, Park Road, Little Packington, Meriden.

IMPROVER, 18 (Inside).—W. BROWN, Stockwood House Gardens, Keynsham, Somerset, recommends Young Man; four years' experience; strong and willing; Bothy preferred.

IMPROVER (Inside and Out).—Young Man seeks EMPLOYMENT in Garden; age 19; five years' good reference. L. TYLER, Great Dalby, near Melton Mowbray.

SITUATION required to look after Pony and Trap, help in Garden, and generally useful; good references; age 21. E. WEBB, Crowsley Park Lodge, Harpsden, Henley-on-Thames.

SHRUBS AND CONIFERS.

An extensive collection of Coniferæ and Deciduous and Evergreen Shrubs, bushy and well rooted plants in all sizes, also an immense stock of Yews, up to 6 feet in height, specially prepared for hedge planting.

STOVE AND GREENHOUSE PLANTS.

An extensive stock of Palms, Climbers and Decorative Plants generally, and also a large quantity of well-grown Autumn and Winter-Flowering plants.

FORCING PLANTS, ETC.

The collection of Plants for Forcing is considered the finest in existence, and a great speciality is made of Azaleas, Deutzias, Lilacs, Wistarias, Guelder Rose, Staphylea, and many other varieties of plants for forcing purposes. Large quantities of Plants and Roots can be supplied in retarded form, such as Lily of the Valley, Liliums, Azalea mollis, etc., for flowering at any season of the year.

ALPINE AND HERBACEOUS PLANTS.

An unique and up-to-date collection, including many GRAND NOVELTIES OFFERED FOR THE FIRST TIME. Nymphæas and other plants for the Aquatic, Bog, and Wild Garden being extensively grown.

HARDY CLIMBERS.

An immense quantity of Ivies, Honeysuckles, Wistaria, Ampelopsis, Clematis, Jasmines, etc., etc., in all sizes up to 10 feet high.

TREES.

A large and varied collection of Hardy Ornamental Trees; also grand stocks of Limes, Planes, Poplars, Elms, Sycamores, Birch, etc., grown singly, specially for Park and Avenue Planting.

CARNATIONS.

The finest stocks of Malmaisons, Tree or Winter-Flowering and Border Varieties, in strong, clean, and healthy plants; also large collection of Pinks, Cloves, etc.

LANDSCAPE GARDENING AND PLANTING.

Plans and Estimates may be had for the Laying-out and Planting of New, or the Renovating of Existing Gardens in any part of the Kingdom.

SEED AND BULB DEPARTMENTS.

Special attention is given to the selection of the finest produce of the Dutch, French, American, and other growers, and being probably the largest importers in this country we are in a position to offer the finest quality Bulbs upon special terms. Every care is taken in the saving and selection of Seeds.

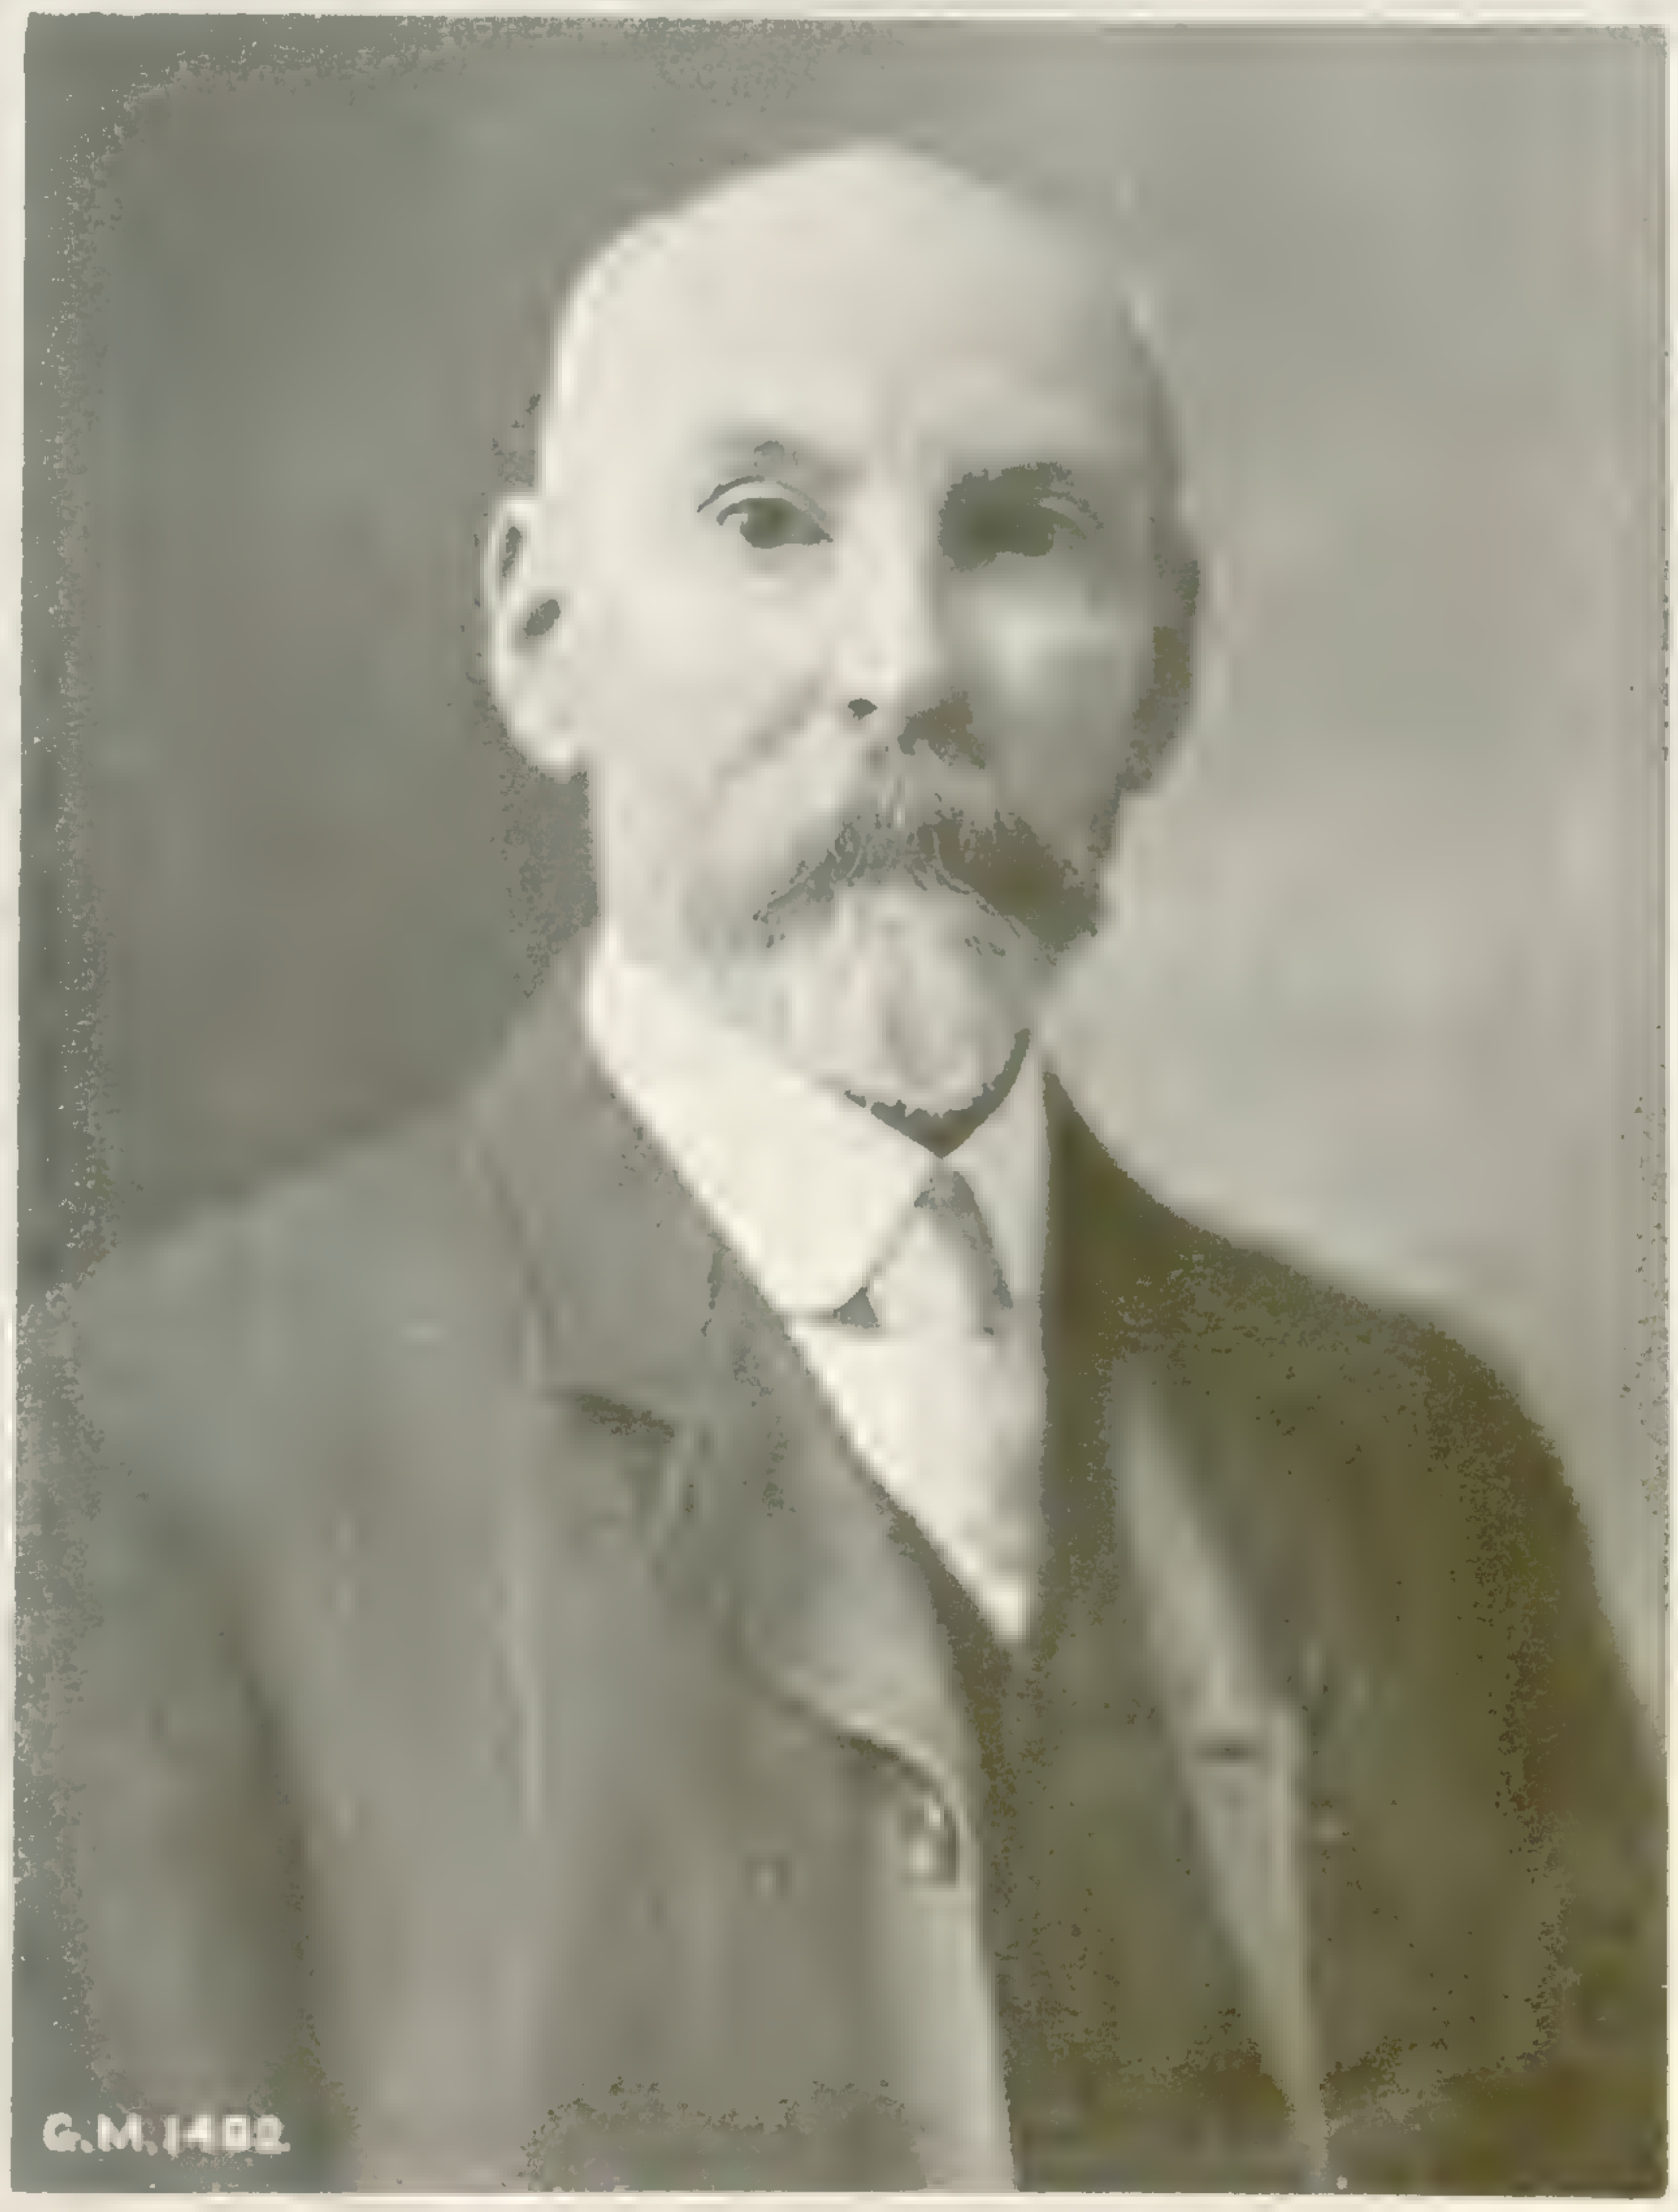
THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

International Horticultural Exhibition, 1912.

The meeting of the General Committee of the International Exhibition, to be held in London in 1912, of which a report appeared in our issue of the 29th ult., was of considerable importance and much interest. It was the first meeting which gave the Executive Committee an opportunity of stating publicly, or what was akin thereto, what had been accomplished during the six months that had elapsed since the meeting was held at which it was decided to hold an exhibition of an international character in the year mentioned. The meeting also afforded an excellent opportunity for obtaining an idea of the interest that is being taken in the proposed exhibition by the general body of horticulturists in the United Kingdom. We certainly regard the meeting as a safe base on which to form an opinion upon the latter point, and the presence of about one hundred and fifty of the leading horticulturists, many of whom had travelled long distances, should be an ample proof that the interest is widespread, and that there is a strong desire to assist in making the exhibition a brilliant success, and in every way worthy of a great country, world renowned for both the practical and scientific aspects of its horticulture. Mr. Gurney Fowler, who is the chairman of the Executive Committee, presided at the meeting in question, and gave a somewhat lengthy, but by no means too long, statement of the steps that had been taken in various directions since the last-named body had been formed. He stated at the commencement of his remarks that at the meeting held in April, when the exhibition was decided upon, a Provisional Committee was appointed to take the preliminary steps, and that this Provisional Committee had a meeting, and invited other gentlemen to assist in forming an Executive Committee. The first matter to receive attention on the last-named committee having been constituted was finance. It was at once recognised that the carrying out of the exhibition on the scale contemplated would necessitate a large expenditure, and it was also recognised that in the event of a loss the members of the Executive Committee would have to bear it. After a full consideration of this all-important question it was decided, as recorded in the report of the meeting which appeared in our issue of the 29th ult., to form a limited liability company. The next step was to form a General Committee, and to prepare a scheme for local committees, and to appoint secretaries of such bodies. A meeting of the latter was held previous to luncheon, as will be seen on reference to the report which appears in another part of this issue. Forty attended, and certain resolutions were passed. The probable cost of the exhibition was dealt with, and the privileges of subscribers and guarantors mentioned by the chairman. The preparation of the schedule, the selection of a site, and some other matters were referred to, and, as far as it went, the statement was satisfactory, but it hardly went far enough. The members of the General Committee were told that it had been said by some of the critics that the exhibition in 1912 would be a glorified Temple Show, and that the Executive Committee intended to hold a real international exhibition. We shall hope, and, indeed, expect, that the exhibition will be of a quite different character to the beautiful shows that have for upwards of twenty years been held in the gardens of the Inner Temple. The fact that the Schedule Committee has been engaged for several months in the preparation of the schedule should be a proof that the show will be of a different character. We have no doubt that cultivators will have such encouragement as will induce them to contribute of their best, and that there will be a large display of such subjects as are available for exhibition in the month of May. We have no apprehension as to the extent of the exhibition or of the quality of the plants, flowers, fruits, and other products; but we should like to know something about the manner in which they are to be displayed. Are they to be arranged in tents, such as have been in use at flower shows held in this country from time well-nigh immemorial? Or will exhibition houses be provided that are large enough for the artistic arrangement of the various objects, and are light and elegant in design, such as those at the international exhibitions at Ghent, Haarlem, Hamburgh, and other of the Continental centres? These are important questions, and unless the second of the two is answered in the affirmative the exhibition will fall short of what it should be. As yet nothing has been said with regard to the educational side of the exhibition, which should be on a considerable scale; or to the holding of a congress for the purpose of discussing matters of importance to horticulturists at home and abroad. It is most desirable that advantage should be taken of the opportunity the exhibition will afford for learning the views of our foreign friends upon the difficulties that have been placed in the way of British horticulturists in sending plants, etc., to a considerable number of European countries. It is advisable that countries should do what is necessary to prevent the introduction of



MR. PETER BLAIR.

insect pests and fungoid diseases, but the regulation should not be so drafted as to practically exclude stock that is perfectly clean, and may not be liable to infection. The formation of the Executive Committee into a limited liability company is not a matter to which objection need be taken, more especially as it places the committee in a better position to deal with those with whom they have to enter into business relations. We attach but little importance to its protective side because we are fully assured that when the full scheme is made public, provided it is commensurate with the character and the importance of the occasion, and an estimate given of the probable cost, the necessary funds will be forthcoming, and the sooner this is done the better. We are, indeed, of the opinion that it would have been an immense advantage had a broad outline of the scheme been published within a reasonable time of the formation of the Executive Committee.

Mr. Peter Blair, whose portrait we have the pleasure of giving in this issue, has so long occupied a prominent position among British horticulturists by reason of his remarkable ability that there is no occasion to make otherwise than the briefest reference to the excellent work he has accomplished. It is now many years since Mr. Blair was appointed to the charge of the Trentham Hall gardens, so long famous for fruits and flowering plants, and those who visited them in the days when the bedding system was in vogue will well remember the success achieved in the arrangement of the various classes of tender plants utilised in the production of summer effects. They will remember also the many valuable object-lessons that were to be obtained in the quarters devoted to fruits, and in the various fruit houses which have long constituted a great feature at Trentham. Mr. Blair has shown his administrative ability in other directions, and nowhere has it been more conspicuous than in the carrying out of the arrangements of the horticultural exhibitions held in conjunction with the shows of the Royal Agricultural Society and the Yorkshire Agricultural Society. The exhibitions held at Liverpool and Leeds during the past summer under Mr. Blair's superintendence were so remarkable for the completeness of the arrangements, as to afford examples that many secretaries of societies may follow with advantage.

Mr. Leonard G. Sutton was unanimously elected president of the Berks and Oxon Chamber of Agriculture for the ensuing year, at the annual general meeting, which was held at Reading on the 29th ult.

Election of Chief Officer of London Parks.—At the meeting of the London County Council, on Tuesday, the election of a Chief Officer of the London parks under the control of that body was proceeded with, and, as we stated in our issue of last week, the General Purposes Committee recommended the appointment of a military officer to the post. There were 145 candidates for the post, and from these sixteen had an interview with a sub-committee of the General Purposes Committee, and from these six were selected to meet the latter body. These were Mr. A. D. Blascheck and Mr. A. M. Caccia, of the Indian Forest Service; Mr. W. H. Morter, superintendent of the Birmingham Parks and Gardens; Mr. J. Weathers, horticultural instructor, Middlesex County Council; Major P. Maud, R.E., of the General Army Staff; and Major C. B. Winter, of the Indian Army. The General Purposes Committee selected Mr. Blascheck, Major Maud, and Major Winter, and recommended that Major Maud be appointed. Mr E. Gray, the chairman of the General Purposes Committee, in bringing up the recommendation, contended that the Council did not want "a Chief Gardener," but the "Head of a department," which was absurd, seeing that in this case administrative ability should be combined with technical knowledge of a high order. Strenuous endeavour was made by several members to have the recommendation referred back, but, on a division, the amendment was lost by 69 to 47. The recommendation was then agreed to, and Major Maud was introduced, and informed of his appointment.

Flowering of Fruit Trees.—At the general meeting of the Royal Horticultural Society on Tuesday next Mr. C. H. Hooper will give a lecture on "The Blossoming of Our Hardy Cultivated Fruits."

Orchids at Manchester.—A most interesting group of orchids was exhibited by Mr. E. Rogers, gardener to O. O. Wrigley, Esq., Bridge Hall, Bury, at the recent meeting of the Manchester and North of England Orchid Society, at the Coal Exchange, Manchester. The group extended to two-thirds the length of the centre tabling, and made a most remarkable display. The most prominent features were the finely grown examples of Vanda cærulea. Not only had these remarkable spikes of flowers, but the colour and substance of the flowers left nothing to be desired, which is the more noteworthy when it is considered that the plants have been grown under the smoky conditions of this particular neighbourhood. These remarks may also be applied to the large quantity of Dendrobium phalænopsis Schroderæ shown, which included a remarkably well-flowered plant of the rare D. p. hololeucum. Clusters of Epidendrum vitellinum, Cypripedium Fairreanum, C. Maudiæ, Odontoglossum grande, etc., were also included. Mr. Rogers was deservedly awarded the society's gold medal for high culture.

The Winter Moth and the destructive effects of its larvæ, was dealt with in an interesting and instructive paper by Mr. A. J. C. Biss, read at the fortnightly meeting of the Bath Gardeners' Debating Society. Mr. Biss described the life history of the moth, and the best means of preventing and checking the ravages of the caterpillars.

R.H.S. Trial of Peas at Wisley.—The Rev. W. Wilks writes: At a meeting of the Council of the Royal Horticultural Society on October 25, a letter was read from one of the leading seed firms, pointing out that it was not quite fair in the trial of peas at Wisley to compare, and to adjudicate on the merits of, varieties sown on different dates; and urging that all peas sent for trial ought to be sown on one and the same day. The Council quite saw the point, but felt, on the other hand, that it would not be quite fair to an admittedly late pea to sow it on the same day as an admittedly early one. After consideration it was decided for 1911, and in future, to ask for one pint (instead of half-pint) of seed peas, and divide it into three parts and make sowings of all varieties on three different dates, suiting early, mid-season, and late peas, as in this way only could the two difficulties mentioned be overcome. It is desired therefore to correct the list of trials which appeared in these columns a fortnight ago, by substituting one pint for half-pint of pea seed required to be sent to Wisley.

Lecturer in Horticulture for Fife.—At a recent meeting of the Education Committee of the Fife County Council Mr. George E. Greenhow, assistant lecturer in horticulture to the Edinburgh and East of Scotland College of Agriculture, was appointed resident lecturer in horticulture for Fifeshire, at a salary of £150, rising to a maximum of £250. Mr. Greenhow is a native of Cumberland, and began his career in the gardens of Hatton-in-the-Forest, Cumberland, the seat of Sir Henry Vane, Bart. After serving for several years as journeyman and foreman in the private gardens at Greystoke Castle and Styford Hall, he was engaged for a year with the Northumberland County Council as gardener at Cockle Park, Morpeth. He had charge of the fruit plots throughout the county, and he had also the supervision of the forestry section.

R.H.S. Awards to Fruits. A special sub-committee of the Fruit Committee of the Royal Horticultural Society visited Wisley on October 13, and recommended Awards of Merit to the following, which were confirmed by the council at its meeting on Tuesday, October 25: Apple, Hounslow Wonder, Messrs. Spooner, Hounslow; peach, Salwey, the Duke of Richmond, Goodwood.

Yorkshire Horticultural Society.—This is the title of the new horticultural society which it was decided to found at a well-attended and enthusiastic meeting held in the Town Hall, Leeds, on Tuesday, October 25, under the presidency of the Lord Mayor. The hope was expressed at the meeting that everyone resident in the northern counties of England would support the society, but as yet the northern counties have not been approached in the matter. It was resolved that the minimum subscription for honorary members be one guinea, and for amateur and professional gardeners five shillings. A strong committee has been formed, and if the enthusiasm shown at the meeting be expressive of the feeling that obtains in Yorkshire with regard to the desirability of forming the society, there is full justification for anticipating that the society will assume large proportions and do splendid work in the advancement of horticulture in the Northern Counties. There is ample room for a strong horticultural society in the North of England, and we trust the new society may achieve a high degree of success. It appears highly desirable that other of the great centres in Yorkshire should co-operate with the horticulturists of Leeds in this important undertaking. The secretary is Mr. P. Clapham, Calverley, Leeds, and Mr. H. J. Clayton, Ulleskelf, is the treasurer.

Dahlia Brentwood Yellow. Concurrently with the opening of the chrysanthemum season we received from Mr. J. T. West, Tower Hill, Brentwood, a box of blooms of his new decorative dahlia Brentwood Yellow, which he introduced to public notice for the first time at the exhibitions held during the past season. Mr. West has sent us a dozen or so growths, and the majority of these bear two well-developed blooms and buds. The blooms are large, full, of fine form judged from the decorative point of view, and borne on stiff, erect stems, of a sufficient length to carry them well above the foliage. The height of the plant ranges from 30in. to 36in., in height, and it is not difficult to imagine the fine effect produced by masses of the rich golden flowers.

NATIONAL CHRYSANTHEMUM SOCIETY'S SHOW.

The exhibition held at the Crystal Palace on November 2, 3, and 4, by the National Chrysanthemum Society, was one of the finest held by this body for many years past. The great building presented a fine sight, the flowers and groups, etc., filling the whole of its immense length with brilliant colouring and rare beauty. Big exhibition blooms were especially fine, and the competition was unusually close, suggesting that "big blooms" are taking a new lease of life. Non-competitive exhibits were superb, and it is doubtful whether at any show hitherto held in November, either in London or the provinces, so many remarkably fine trade displays have been brought together. In every way, attendance included, the show was a great success.

NATIONAL CHRYSANTHEMUM SOCIETY'S SHOW.
Mr. T. Stevenson's First Prize forty-eight Japanese blooms in the Holmes' Memorial Cup Class.

GREAT VASE CLASS.

There were four competitors in the great vase class, and every exhibitor had to stage a dozen vases of three blooms each, the flowers to have not less than six inches of stem rising above the vase. The premier award of £9 was won by Mr. W. Iggulden, Lock's Hill Nurseries, Frome, with a fine set of blooms of F. S. Vallis, Francis Jolliffe, Mrs. R. H. Marsham, Mdme. G. Rivol, Reginald Vallis, Mrs. W. Iggulden, Mdme. P. Radaelli, White Queen, Lady Talbot, Master James, Hon. Mrs. Lopes, and Algernon Davis. Second prize, £6, fell to Mr. T. Waller, gardener to A. C. Hammersley, Esq., Abney House, Bourne End, who had Lady Talbot, Reg. Vallis, and F. S. Vallis in grand form. Mr. W. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, Leatherhead, came third, and Mr. W. Mease, Downside, Leatherhead, was not placed.

HOLMES' CUP CLASSES.

The Holmes' Memorial Cup, offered as first prize for three dozen incurved blooms, distinct, was won by Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, who had a fine set of flowers that included Clara Wells, Romance, Marjorie Shields, Mrs. G. Denyer, Buttercup, H. W. Thorp, Embleme Poitevine, C. H. Curtis, and W. Biddle as especially good. Mr. G. J. Hunt, gardener to Pantia Ralli, Esq., Ashstead Park, Epsom, was a good second; and Mr. T. J. Broom, gardener to Miss Langworthy, Gays House, Holyport, third. This year, after winning the cup annually over a long series of years, Mr. W. Higgs has now retired from this particular competition.

There was a grand competition for the Holmes' Memorial Cup, offered for the best forty-eight Japanese blooms, distinct, no fewer than seven competitors coming forward. Premier place fell to Mr. Thomas Stevenson, gardener to E. Mocatta, Esq., Woburn Place, Addlestone, with a splendid set of even, full-sized, and bright blooms. The varieties were F. S. Vallis, W. Gee, Duchess of Sutherland, Rose Pockett, Master David, Miss A. Nicholl, Valerie Greenham, Chrysanthemiste Montigny, O. H. Broomhead, Willie Rawlins, G. Hemming, Mrs. A. T. Bott, Mrs. R. H. Marsham, W. A. Etherington, Pockett's Surprise, Sir F. Crisp, Algernon Davis, Mrs. C. Beckett, W. Iggulden, Buchan Keeling, Mdme. G. Rivol, J. Peed, Evangeline, Master James, Superbe, Mrs. C. Penford, Lady Francis Ryder, Mdme. Paolo Radaelli, H. Wood, Seedling, Mr. F. Thorne, Mrs. Robt. Holmes, Splendour, Walter Jinks, Mrs. W. Knox, Frank Payne, Shanklin, W. Mease, J. Lock, Marquis of Northampton, Mrs. Norman Davis, Mrs. G. Mileham, Purity, Lady Crisp, J. H. Silsbury, Lady Talbot, Reg. Vallis, and Hon. Mrs. Lopes. Mr. T. Waller, Abney House, Bourne End, a fine second; Mr. G. Hall, gardener to the exors. of the late Lady Ashburton, Melchet Court, Romsey, third; and Mr. C. Moore, gardener to Mrs. G. Clark, Frensham Place, Farnham, fourth.

DISPLAYS.

In a class for a display of chrysanthemums and suitable foliage plants in pots, with cut blooms and foliage as an additional feature, arranged on a floor-space of 200 super. feet, there were some attractive entries. Trade exhibitors were excluded. Mr. W. Howe, gardener to Lady Tate, Park Hill, Streatham Common, was victor, his exhibit being arranged in the form of a circular mound, with a good palm as the crowning piece, and tall crotons at intervals between bold specimens of good Japanese varieties of chrysanthemums, and a number of well-flowered singles to serve as a setting. Crested nephrolepis, adiantums, etc., finished off the group.

Mr. R. B. Leech, gardener to J. C. Eno Esq., Wood Hall, Dulwich, S.E., was second with a rather thin group, in which, however, some very good blooms were included. Third prize went to Mr. P. Wilkinson, gardener to Sir D. F. Gooch, Bart., Hyland's Park, Chelmsford, his group being almost entirely composed of singles, the yellows among which were distinctly good.

Messrs. Butler Brothers, Bexley Heath, won the Dean Memorial Gold Medal, and also a small gold medal, with a group of fifty pot plants of chrysanthemums as grown for market, with marvellously beautiful plants carrying a dozen to twenty flowers, in forty-eight sized pots. Madame Lacroix, Butler, Caprice, Caprice du Printemps, H. W. Thorp, and Source d'Or were all varieties finely represented.

The East Dulwich Horticultural Society won the Challenge Trophy in the Affiliated Societies' Class, with a fine table of Japanese, incurved, and single varieties, of high merit, well arranged with suitable foliage. The Reigate Horticultural Society won second prize.

In a class for a decorative display of various sections of chrysanthemums, tastefully arranged, small blooms being especially asked for, there were two competitors. Sir Albert Rollit, Mr. Robt. Sydenham, and Mr. J. Williams provided the prizes, and Mr. Gooding, Four Elms, Edenbridge, led with a pretty display of small yellow, bronze, and pink flowers in rustic flower stands; Mrs. F. Brewster, Canterbury, a good second.

CUT BLOOMS.

There were four competitors in the class for twelve varieties of incurved blooms, three of each, staged in vases, and the winner was Mr. W. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, Leatherhead. Daisy Southam, Mrs. G. Denyer, and Clara Wells were among his finest blooms. Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, came second; and Mr. C. J. Hunt, gardener to Pantia Ralli, Esq., Ashtead Park, Epsom, third. Mr. T. Stevenson won the special prize offered by Mr. W. J. Godfrey for a vase of Reginald Godfrey.

A silver cup was offered by Sir Albert Rollit, LL.D., D.C.L., as first prize for twenty-four blooms of Japanese varieties, and five strong entries were forthcoming, Mr. T. Stevenson repeating his success by scoring with a capital set. Algernon Davis, F. S. Vallis, and Purity were fine blooms. Mr. A. Smith, gardener to Mdme. Stuart, Convent Gardens, Roehampton, received second award with slightly inferior flowers; Mr. W. Rigby, gardener to Rev. A. E. Cooper Marsden, Borstaldene, Bickley, third. Twelve Japanese blooms made a very big class, quality being well up to standard. Twelve exhibitors pressed each other closely for the coveted positions, and Mr. T. Stevenson was once again successful with a fine dozen, using varieties we have already mentioned in his various stands. Mr. C. Moore made a good second; Mr. G. Mileham, third; and Mr. W. Mease, fourth.

Mr. W. Mease scored in the Ichthemic Guano Company's class for twelve incurved, putting up Mrs. J. Wynne, Buttercup, Mrs. G. Denyer, and other good varieties. He was followed by Mr. G. J. Hunt, Mr. Mileham bringing up the rear. The best six blooms came from Mr. T. J. Broom, gardener to Miss Langworthy, Holyport, Mr. Hunt and Mr. Mileham again following.

The class for a dozen bunches, disbudded blooms, in yellow and bronze varieties, made a bright dash of colour, Mr. R. d'Eyncourt Day, The Nursery, Sutton Scotney, Hants, scoring; Lizzie Adcock and Nagoya were the varieties. In a similar class, from which, however, yellows and bronzes were excluded, Mr. H. W. Page, Broadway Nurseries, Bexley Heath, led with Felton's Favourite, Mrs. Humphries, and others; second prize going to Mr. R. d'Eyncourt Day. Mr. T. J. Brown was awarded first prize for twelve reflexed (large flowered) varieties, being apparently the only exhibitor in the class. For twelve large-flowered anemone type there was but a single entry, and here Mr. A. E. Horton received first prize.

A very attractive display was made by the tables of singles, seven in number, among which the exhibit of Mr. Norman Davis was adjudged winner. The flowers on this stand were distinctly fine, and the arrangement of the blooms with appropriate foliage showed great taste. Mr. T. Stevenson had beautiful blooms on his second-prize table, the losing point being lack of sufficient ornamental foliage. Third prize went to Mr. P. Wilkinson, gardener to Sir D. F. Gooch, Bart., Chelmsford.

Mr. C. Moore scored for a vase of fine blooms of a yellow Japanese variety with magnificent flowers of Hon. Mrs. Lopes; Mr. W. Iggulden second, with the same variety; and Mr. H. J. Hedges third, with Mrs. W. Knox. For a vase of five white Japanese blooms Mr. C. Moore scored with Mrs. A. T. Miller; Mr. W. Newton, gardener to Mrs. McDowel Nathan, Little Heath Wood, Potters Bar, second, with the same variety; and Mr. G. Mileham, Emlyn House, Leatherhead, third; six entries. Mr. Iggulden led for five flowers of any other colour with Madame Paolo Radaelli in good style; Mr. D. H. Fairweather, gardener to R. H. B. Marsham, Esq., Bifrons, Canterbury, second, with Mrs. C. H. Totty; and Mr. G. Mileham third, with Reginald Vallis.

FLORAL DECORATIONS.

There were ten competitors in the class for a table decoration in bronze and yellow chrysanthemums, and here first prize was won by Mr. T. W. Stevens, gardener to H. W. Stone, Esq., Donnington, Laurie Park, Sydenham, with a very pretty and light arrangement of medium-sized flowers; Mrs. A. Robinson, Norhyrst, Park Hill, Carshalton, second; and Miss Varley, St. Albans Road, Kingston, and Mrs. Brewster, St. Peter's, Canterbury, equal thirds. There were nine competitors in the class for a table decoration of other than yellow and bronze flowers, and here Mrs. A. Robinson led with single and double flowers of a deep rose-pink shade, associated with pale croton leaves; Mr. T. W. Stevens, second; and Mrs. Maslin, Ongar Hill Cottage, Addlestone, third, with blush-pink single varieties.

Mrs. Maslin led for a vase of single varieties with a pretty exhibit of Mary Richardson, and creamy-white varieties; Mrs. J. L. Lawrence, Shoreham, near Sevenoaks, second; and Mr. P. Wilkinson, gardener to Sir D. F. Gooch, Hylands Park, Chelmsford, third; eight entries. Mr. F. Fitzwater, Bushey Lodge, Teddington, scored for a pair of bunches of pompon varieties. Mrs. Maslin was placed first for a basket of autumn foliage and berries with a bold arrangement of acer sprays, pernettyas, cotoneasters, clematis fruits, and berberis sprays; Mrs. F. Brewster, second; and Mr. L. Lawrence, third. In the ladies' class Mrs. G. Davies, Crystal Palace Station Road, led with a fine exhibit of bronze and yellow flowers; Miss J. Martin, Warminster Road, Norwood, second; and Mrs. F. Brewster third.

NON-COMPETITIVE.

Mr. Philip Ladds, Swanley Junction, put up a large and finely-arranged group of chrysanthemums, foliage plants, and heaths. The blooms were of fine size and well set up in stands and vases at varying heights. The groundwork was of well-grown bush plants and vases of single varieties, set amid ferns and margined with Erica hyemalis. A few pretty baskets of chrysanthemums gave distinction to the foreground. The whole group served to still further enhance Mr. Ladds' reputation as a market grower of the first class. The new yellow market variety Nora Reilly, a soft yellow sport from Felton's Favourite, was conspicuously beautiful amid a host of fine varieties. A beautiful exhibit was arranged in front of the orchestra by Mr. H. J. Jones, Ryecroft Nursery, Lewisham. It was a fine effort, and once again Mr. Jones' ability as a grower and exhibitor was demonstrated. The fine flowers, chiefly of Japanese varieties, were set up in big stands and vases of one variety, and in a few cases the blooms were a trifle crowded. These vases were arranged over a groundwork of crotons and other foliage plants, in which low bowls of single and decorative varieties were set, while along the front line were a few specimen blooms of new varieties, set in maidenhair ferns.

Mr. H. W. Thorp, Durrington, Worthing, presented a bold bank of cut flowers, staging Japenese, incurved, and decorative varieties, in a setting of maidenhair ferns. The big incurving yellow variety named Mauretania was prominent, but the most striking feature was the new and huge incurved variety named Ethel Thorp, probably the largest incurved variety yet seen; it is of silvery-pink hue, and ought to become very popular. Messrs. H. Cannell and Sons, Swanley, had a background of beech sprays with their brilliant autumn-tinted foliage, and against this they set up a brilliant lot of zonal pelargonium blooms, in fine bunches, and also a collection of single chrysanthemums, these being set up in large triangular bunches. They showed in a marked manner the wonderful range of size, form, and colour now to be obtained in this useful and beautiful section. Among the pelargoniums a few that were of outstanding merit were New York, London, Lucania, Bombay, Naples, crimson, with flowers 3½ inches across; Queen of Italy, Sydney, pink; Frogmore and Venus, white. Messrs. W. Wells and Co., Merstham, put up an enormous exhibit that constituted no mean exhibition in itself; it was 75ft. long, and about 10ft. deep, and consisted of tall stands of decorative and single varieties, vases of the newer big Japanese varieties, and bowls of decorative varieties in the foreground. At either end was a sloping bank of pot plants of single and decorative varieties, while a few Michaelmas daisies and pentstemons were used to lighten up the heavier masses of colour. Among the newer Japanese varieties we noted Marie Loomes, Wells' White—a graceful white seedling, Mrs. R. A. Witty, crimson, and Mrs. G. C. Kelley. Very fine also was the vase of a new scarlet single named Cedy Mason. This was a wonderful exhibit from one firm, but a better finish to the front line would have been a great improvement.

Mr. Norman Davis, Framfield, exhibited a glorious lot of finely-grown Japanese and single chrysanthemums, the former being remarkably well shown in large vases and stands, set in a groundwork of crotons, ferns, and palms. George Hemming, J. Lock, G. F. Bruzard, Henry Poulton, Leviathan, Mrs. W. H. Lewis, and David Ingamells were striking Japanese varieties in this grand display. The position occupied by Mr. Davis was right opposite the orchestra, quite apart from the other big exhibits, and he had one of the finest of the Framfield efforts, both as regards quality and arrangement.

Messrs. J. Peed and Son, West Norwood, staged a huge circular and central exhibit of chrysanthemums, setting up varieties of all sections in a most attractive manner. The same firm filled a large table with a fine collection of apples. Messrs. Austin and Son, South Darenth, showed a collection of apples in market boxes and baskets. Messrs. Cannell and Sons also contributed a splendid collection of brilliantly-coloured and clean apples, their finest dishes being of Newton Wonder, Cox's Orange Pippin, Emperor Alexander, King of the Pippins, Gascoigne's Scarlet, Cox's Pomona, Bismarck, and Allington Pippin.

Messrs. Hobbies, Lim., Dereham, contributed a large collection of pæony-flowered dahlias and late roses, these showing in a marked manner the late and open season. The pompon, miniature cactus, and pæony-flowered dahlias from Messrs. J. Cheal and Sons, Crawley, were a fine feature for early November, the flowers being all so clean and bright. Mr. Spencer Murrin, Whiteladies Road, Bristol, showed floral designs that were rather more novel than beautiful. Mr. W. J. Godfrey, Exmouth, filled a large table with bright chrysanthemums and zonal pelargoniums. Among the former Pockett's Crimson, Laura Hill, and Eva Smith were striking among the big blooms, while among singles Mr. Godfrey had Mrs. F. C. Hunter, Star of Devon, and Countess of Egmont, all three sterling varieties of yellow, crimson, and bronze colouring respectively. Mr. Williams, Oxford Road, Ealing, set up a pretty set of table decorations, and at the top end of the building Mr. Caselton, gardener to the Crystal Palace Company, arranged a very attractive exhibit of Begonia Gloire de Lorraine, ferns, pandanus, and crotons. Mr. F. Brazier, Caterham, had an interesting exhibit of shrubs and Michaelmas daisies. Mr. D. Russell, Brentwood, showed a big group of ornamental shrubs. Messrs. W. Voss and Co., Millwall, contributed a large stand of spraying machines and sundries, and from the Gardeners' Magazine Office, 148-149, Aldersgate Street, came an array of useful horticultural publications.

MEDALS.

Special Gold Medal.—The gold medal offered by Messrs. Clay and Sons for the best non-competitive exhibit was awarded to Mr. Norman Davis, Framfield.

Large Gold.—Mr. Norman Davis, Framfield, for chrysanthemums; Mr. H. J. Jones, Lewisham for chrysanthemums; Messrs. W. Wells and Co., Merstham, for chrysanthemums; Mr. P. Ladds, Swanley Junction, for chrysanthemums; Messrs. H. Cannell and Sons, Swanley, for fruit, pelargoniums, and chrysanthemums; Messrs. J. Peed and Son, West Norwood, for chrysanthemums and fruits.

Silver Gilt.—Messrs. Hobbies, Dereham, for dahlias and roses; Agent-General for British Columbia, for apples; Mr. H. W. Thorpe, Worthing, for chrysanthemums; Mrs. Harriett Scott, for rustic arches, etc.; Mr. G. Caselton, Crystal Palace, for begonias and foliage plants.

Large Silver.—Mr. F. Brazier, Caterham, for shrubs and asters; Mr. D. Russell, Brentwood, for shrubs; Mr. Murrin, for floral designs; Messrs. J. Cheal and Sons, Crawley, for dahlias.

Silver.—Messrs. Austin and Son, Darenth, for fruit; Mr. J. Williams, Ealing, for floral decorations.

THE NERINES.

The nerines are among the showiest of all greenhouse bulbs that flower during the autumn months. They are all natives of South Africa, and one of them—Nerine sarniensis (the Guernsey Lily) is supposed to have been introduced as long ago as 1680.

The species in general cultivation number somewhere about a score, but there are also a great many garden forms. Several raised by Mr. H. J. Elwes, V.M.H., of Colesborne, Cheltenham, have within the last few years been given awards of merit by the Royal Horticultural Society's Floral Committee.

Botanically the nerines are divided into two groups, firstly, those in which the segments of the flower are nearly, if not quite, equidistant from each other, thus forming a regular bloom; and, secondly, those in which most of the segments curve to the upper half, the lower ones in some cases at a little distance suggesting a lip to the flower. To the first group, that is those with regular flowers, belong by far the brightest coloured kinds, most of them having flowers of some shade of scarlet, while in the second group they are mostly of a pink or rose tint.

In the first group the best known and most generally cultivated are—Nerine curvifolia, which is now regarded as the correct name of that so long grown in gardens as Nerine Fothergilli. There is a certain amount of individual variation, and to some of the forms varietal names have been applied. That known as Nerine Fothergilli major is one of the best. The flowers of this are of a brilliant scarlet colour. Nerine corusca is as a rule of a somewhat lighter scarlet than the last, but in a good form it is, I think, even more dazzling. The specific name of corusca is derived from the glittering coruscations which overspread the segments and give them the appearance of being frosted. This feature occurs in many other nerines, but in none to the same extent as in a good form of Nerine corusca.

The popular Nerine sarniensis, with deep rose coloured flowers also belongs to this group. It is largely grown in the Channel Islands, the bulbs being disposed of just as the flower stems make their appearance. In this state they may be readily sent some distance without injury, that is if they are carefully lifted from the beds in which they have been grown, and if potted directly on receipt, placed in the greenhouse, and watered, the flowers will open without check.

Of the second group the best known is Nerine flexuosa, a vigorous-growing kind with particularly crisped segments of a pink colour. There is a variety—N. flexuosa alba, with pure white flowers, and very pretty it is, affording as it does a direct contrast to the many brilliantly coloured forms. N. humilis is one of the dwarfest of all, the flowers being of a deep rose colour sometimes overspread with a slaty tint. One of the latest flowers is Nerine crispa or undulata, a small growing species with narrow grass-like leaves which are well overtopped by the umbels of delicate blossoms. The segments are exceedingly narrow, much undulated, and in colour white flushed with pink. This is one of the latest flowering species, as the blooms are often in good condition till Christmas. The most recent species is Nerine Bowdeni, introduced about half-a-dozen years ago. It was first shown under the name of Nerine excellens tardiflora, and as such it was given an award of merit in October, 1904. A prominent feature of N. Bowdeni is the very large size of the individual blooms, which are in colour deep rose-pink, with a darker line down each segment. Of the various hybrids or garden forms some of the best are unobtainable from the ordinary trade sources, in fact with few exceptions the different kinds are but little grown. The following are all good—amabilis, bright pink segments much undulated; atrorubens, coral red; excellens, bright rose; ingens, very large carmine flowers; Novelty, brilliant carmine red, and Manselli, the latter having flowers of a distinct shade of lilac-rose, and remarkable from the fact that it is exceedingly late in flowering.

CHRYSANTHEMUM HILDA BLICK.
A beautiful new, pure white decorative variety. A.M., R.H.S., October 25. Mr. C. Blick, Hayes, Kent.

As might be expected from plants that are natives of South Africa, they do not at any time require more heat than the temperature of a greenhouse. When the roots are in good condition they may be allowed to remain undisturbed for years, indeed, they will flower better when the bulbs are closely packed together than when they have unrestricted room. Such being the case it is evident that the potting compost must be of a lasting nature, and should consist principally of good fibrous loam lightened by a fair sprinkling of rough silver sand. The yellowish loam of a fairly heavy consistency, such as is so much used, particularly in the home counties, will suit nerines well. If of too heavy a nature a litle leaf mould may with advantage be mixed with it.

In the culture of nerines it is very essential to remember that they make their growth during the autumn, winter, and early spring months, hence after flowering they should be given a good light position in the greenhouse, and be regularly watered. The leaves will, sometime in the spring, turn yellow, which is a sign that the plants are then ready for a season of rest. They must then be fully exposed to the sun and kept quite dry. As at that time they are somewhat unsightly if kept in the greenhouse, the best place for them is in a frame in full sunshine. The lights may be tilted to allow of a free circulation of air, but the rain must be kept from them. Under these conditions they may be allowed to stand till the flower spikes make their appearance, which will be as a rule towards the end of the summer or early in autumn. Then the plants should be taken into the greenhouse and watered, when the flower spikes, and afterwards the leaves, will develop. This applies to the first section, that is the one to which N. Fothergilli and N. corusca belong.

The members of the second group in some cases at least push up their leaves and flower stems at the same time. W. T.

NEW PLANTS, ETC.

CYPRIPEDIUM PRINCESS MARY.

This beautiful cypripedium, figured in our previous issue, has been raised by crossing C. niveum and C. Helen II. The flower is bold and of good shape, pure glistening white, with spottings of deep rose-purple, these markings being most conspicuous on the dorsal sepal and base of the petals. F.C.C., R.H.S., Oct. 25. Messrs. Sander and Sons, St. Albans.

ODONTIODA BRADSHAWIÆ WESTONBIRT VAR.

A magnificent orchid with a fine spike of large rounded flowers that are of good size. The colouring is very beautiful, being bright red, with broad creamy margin round each segment, this in turn being very prettily shaded with bright rose-pink. F.C.C., R.H.S., October 25. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

CALANTHE DENSIFLORA.

An attractive species with long plicate leaves, and stout spikes of yellowish flowers borne in a dense apical cluster. A.M., R.H.S., October 25. Sir Jeremiah Colman, Bart. (gardener, Mr. Collier), Gatton Park, Reigate.

ODONTOGLOSSUM CIRCE.

A very distinct, new, and pretty hybrid between O. Cervantesi and O. Pescatorei. It is of dwarf habit, and shows the characters of O. Cervantesi in a marked manner. The round flowers are white with red-purple markings. A.M., R.H.S., October 25. Messrs. Charlesworth and Co., Haywards Heath.

CYPRIPEDIUM BRITANNIA.

A bold and handsome hybrid of unknown parentage. The broad and rounded dorsal sepal is white, with a large green base and a few lines of purple spots. The lip and petals are light greenish yellow shaded with purple-brown. A.M., R.H.S., October 25. Messrs. Sander and Sons, St. Albans.

CYPRIPEDIUM REGINALD YOUNG.

A fine cypripedium, showing in a marked manner the influence of C. insigne Harefield Hall; the other parent is C. Elmireana var. Hitchinsiæ. The flower is greenish-yellow, with a white apex and heavy spots of purple on the dorsal sepal. A.M., R.H.S., Ocober 25. Mr. H. J. Bromilow, Rann Lea, Rainhill.

CARNATION REGINA.

A handsome perpetual variety, bearing large salmon-pink flowers on long stems. The calyx is entire, and the petals are fringed. A.M., R.H.S., October 25. Mr. C. Engelmann, Saffron Walden.

NEPENTHES NOBILIS.

A very fine nepenthes derived from N. sanguinea and N. Curtisi superba. The pitchers are of large size, some measuring fourteen inches in length. The basal colour is green, but this is gradually obliterated by the crimson shading, which deepens towards the broad, handsome, and burnished rim. The specimen shown carried ten splendid pitchers. A.M., R.H.S., October 25. Messrs. Jas. Veitch and Sons, Chelsea.

ASTER NOVELTY.

A small-flowered variety of the ericoides class; it is very free, and has blush-coloured or pink flowers carried on gracefully pendulous branches. A.M., R.H.S., October 25; Mr. Frank Brazier, Caterham.

CROTON GOLDEN RING LYNWOOD VAR.

This is a very beautiful form of a very popular variety; it has narrower leaves than the type, and these are drooping, and spirally twisted. The colouring is gold, brown, and green. A.M., R.H.S., October 25. Mr. A. E. Bainbridge (gardener, Mr. Thos. Bell), Lynwood, Jesmond Park, Newcastle.

NERINE MANSELL SEEDLING.

A striking variety with large heads of brilliant rosy-cerise flowers, that are as large as those of the finest type of N. Fothergilli. A.M., R.H.S., October 25. Mr. Frank Lilley, Guernsey.

CHRYSANTHEMUMS.

Evangeline. — A beautiful pure white Japanese variety with very elegant drooping florets. F.C.C., N.C.S., October 24. Mr. H. W. Thorpe, Worthing.

Marie Loomes. — A very large but somewhat flat Japanese variety with incurved tips to the florets. The colour is rosy-crimson, with buff reverse. Commendation, N.C.S., October 24. Messrs. W. Wells and Co., Merstham.

Mrs. G. C. Kelley.—A very large incurving Japanese variety, which shows a great deal of the silvery reverse side of the broad florets, but not very much of the rosy amaranth of the upper surface. F.C.C., N.C.S., October 24; A.M., R.H.S., October 25. Messrs. W. Wells and Co.

Wells' Crimson.—A very free flowering and attractive border variety with a profusion of neat chestnut-crimson flowers with gold tipped florets. Commendation, N.C.S., October 24. Messrs. W. Wells and Co.

Belle Mauve.—A beautiful and useful late border variety carrying flowers of good size and form, and of a beautiful lilac-pink shade, with paler centre. Produces fine sprays of flowers. Commendation, N.C.S., October 24. Messrs. W. Wells and Co.

Mrs. Tresham Gilby.—A fine large single variety of rich yellow colouring; a grand sport from Bronze Pagram. F.C.C., N.C.S., October 24; A.M., R.H.S., October 25. Mr. T. Ward, Bishops Stortford.

Red Chief. — A very showy Japanese variety with loosely drooping florets. The colour is chestnut-red, with old gold mottlings and bright buff reverse. F.C.C., N.C.S., October 24. Mr. Martin Silsbury, Shanklin, Isle of Wight.

Mrs. W. G. Patching.—A very large and handsome single variety, with broad, substantial florets. The big blooms are of a rich golden bronze shade that is very attractive. F.C.C., October 24. Messrs. Cragg, Harrison, and Cragg, Heston, Hounslow.

Joan Edwards.—A splendid large single variety with finely rounded blooms of deep and brilliant rose-pink colour. F.C.C., N.C.S., October 24; A.M., R.H.S., October 25. Mr. Phillip Ladds, Swanley Junction.

Nora Reilly.—A splendid addition to the Japanese market varieties, as it is a clear bright primrose-yellow sport from Felton's Favourite. F.C.C., N.C.S., October 24. Mr. P. Ladds.

Mrs. George Hartman.—A large Japanese variety, with narrow and sometimes divided florets, that droop prettily. Colour, deep crimson, with buff reverse. F.C.C., N.C.S., October 24. Mr. W. Jinks.

Mrs. F. C. Stoop.—A graceful and full-sized Japanese variety, reminiscent of the old Belle Paul, but more refined and beautiful. Cream suffused and edged with rose. F.C.C., N.C.S., October 24. Mr. Norman Davis.

Framfield Bronze.—A decorative variety of good substance; the colour is a combination of deep chestnut-red and dull gold, giving a bright bronzy effect. F.C.C., N.C.S., October 24. Mr. Norman Davis, Framfield.

Mary Poulton.—An effective silvery-pink Japanese variety, figured in our issue of October 29, p. 852. F.C.C., N.C.S., October 24. Mr. Norman Davis.

Henry Poulton.—An intense crimson almost blood-red Japanese variety, with buff reverse. A striking variety of rich colour and good size. F.C.C., N.C.S., October 24. Mr. Norman Davis.

Mrs. A. Herbert.—A large and attractive creamy-white Japanese variety with deeper centre. Commendation, N.C.S., October 24. Mr. Norman Davis.

Countess of Granard.—A graceful Japanese variety of good size; yellow with deeper centre. Commendation, N.C.S., October 24. Mr. Norman Davis.

Mrs. Sam Nash.—A charming single variety of free growth and fairly large size. The colour is an exquisite shade of clear pink. Commendation for colour, N.C.S., October 24; A.M., R.H.S., October 25. Messrs. W. Wells and Co.

J. H. Greswolde Williams.—A large and attractive yellow single variety. A.M., R.H.S., October 25. Messrs. W. Wells and Co.

Miss Mary Pope.—A large-flowered single variety with pleasing bright blush-pink flowers, rather deeper in colour at the tips. A.M., R.H.S., October 25. Mr. Frank Brazier, Caterham.

Hilda Blick.—A decorative variety of the utmost grace and refinement. The flowers are of good size, purest white, and carried on stiff stems. A fine acquisition. A.M., R.H.S., October 25. Mr. C. Blick, Hayes, Kent.

SOLDANELLAS IN WINTER.

Few who own the charming little alpine Moonworts, or Soldanellas, will venture to assert that they are free flowerers in our climate, but will agree in stating that they are shy bloomers in our gardens. This is probably due to the absence of the covering of snow which protects them at home, and which is but poorly supplied in this uncertain climate of ours. Whether this be the case or not, it is a fact that the soldanellas generally grow well enough, so far as regards leaves, making neat little plants with thickish orbicular leaves, but, to our regret, yielding us few of their lovely little purple or blue bells. The best of the soldanellas to bloom with us are S. Clusi and one called in gardens S. pyrolæfolia, neither of which names, by the way, are recognised by the "Index Kewensis," but are well enough known in nurseries. They seem to represent forms of S. alpina.

These and the other soldanellas are more satisfactory if they are afforded the slight shelter from winter rains supplied by a sheet of glass elevated some four or six inches above the plants, and fixed in position by a wire or other support.

This evidently induces them to flower more freely, and those who have experimented with this contrivance have generally been well satisfied with the results. It is a simple contrivance, and I have found that from early in October until about the beginning of April will be a sufficient period for supplying this protection. With some other plants a slate held above them in the same manner is as efficient, but not having tested this in the case of soldanellas I dare not venture to give any assurance that this will serve the purpose equally well. Those who have not tried a sheet of glass over the soldanellas will be well advised to do so at once.

S. Arnott.

Queen Pineapples.—The plants intended for fruiting next summer should by the beginning of this month have been brought to a resting state, and from that date until the temperature is raised, with a view to cause them to push fruits, the night temperature should range from 55 to 60 degrees, that for the day being five higher, with a bottom heat of from 75 to 80 degrees. These conditions, accompanied by less atmospheric and root moisture—only enough of each being given to prevent the plants from suffering—will keep the stock through the winter in a healthy state of rest, so that, later on, when excited by higher temperature, they will readily respond, and without fail push their fruits. Young plants raised this autumn from suckers should receive similar treatment, but, owing to the comparatively small size of their pots, they may require closer attention to root moisture.—T. Coomber, The Hendre Gardens.

GOLD MEDAL ROSES

WILLIAM LOWE'S

BEESTON ROSES

ARE THE BEST.

For all Soils and Situations.
Roses for Exhibition.
Roses for Pergolas.
Standard and Bush Roses.
Roses for Garden Decoration.
Pillar Roses. Climbing Roses for Walls.
Old and New and all the Best Roses.

All are magnificent plants, and the best value for money obtainable.

Also a grand lot of

FRUIT TREES, ORNAMENTAL TREES, SHRUBS, etc.

Intending Planters should come and inspect my stock of HOLLIES and EVERGREEN SHRUBS of all descriptions.

30 *Minutes' walk from Beeston Station,*
Send for Catalogue, Post Free on Application.

MAY-FLOWERING TULIPS.

These are usually divided into two great classes, but where one begins and the other ends is, speaking from the amateur's point of view, scarcely clearer than the line of demarcation between the pansy and the viola. One of these great classes is the Cottage group, so called because many, perhaps most, of its members have been gradually collected from old cottage gardens, mainly in this country, where they have been flowering for many years, in some cases for generations, unknown to florists, even if they were interested in them. Some of them are relics of bygone times, when tulips were fashionable flowers, a craze, in fact, the change in garden practice leading to their exclusion from the gardens of the well-to-do, when they found refuge, so to speak, in cottage gardens, in which they are now being sought out by the modern connoisseur. The other great group of May-flowering tulips is known as the Darwin group, the members of which are very strong growing, often two feet or more in height, the blooms having the leaves of the perianth, or petals, very rounded at the top, the prevailing colours being rose, crimson, maroon, and various shades of purple and lilac; yellow, which is such a characteristic colour of the Cottage tulips, either wholly or in part, being represented in very few varieties of the Darwin class. The following notes will deal mainly with the cultivation and uses of the Cottage tulips in all their wonderful variety.

With bulbs generally there is no doubt about the advantages possessed by the owners of a light soil, but these Cottage tulips are perfectly at home in a clay soil, often producing their finest blossoms when the bulbs are six or eight inches deep in a rich old garden soil with a clay basis. When planted in mixed borders in such a soil they need no animal manure, but basic slag applied in the autumn will add to their health and vigour. In a light soil they will be improved by the application of cow manure, dug deeply into the soil before planting, and an annual dressing of superphosphate in the early spring, lightly hoed in or worked in with a small hand-fork. If the ground they occupy is wanted in the summer-time they may be taken up soon after flowering is over and replanted, or heeled in in the kitchen-garden quarters to mature, the flower stems being at the same time cut off. They should be taken up when the leaves are dry and slowly harvested—not laid out in the June sun to bake—and the sooner they are replanted after September the better. Where they are planted permanently in mixed borders, as distinct from annual planting, the clumps should be taken up when it is seen they are getting crowded and the blossoms becoming smaller, deferring the operation, when it can be managed conveniently, till the foliage is turning yellow, and either replanting at once or in the autumn.

Beds of tulips, planted in rows with bare ground between, are, in the writer's opinion, crude in the extreme, like "Rule Britannia with variations" to a musically-educated man, and though we may admire the gorgeous effects of wide stretches of them at Haarlem and elsewhere, in the garden we do not want the bang in the eye which they give us. Such beds are bad in two ways—the rows, and the bareness of the soil between, for in neither direction do we ever see anything like it in nature. There are so many plants that can be used for covering the ground, such as myosotis, double arabis, Limnanthes Douglasi, silene, alyssum, aubrietia, primroses, polyanthuses, London pride, etc., which are not only pretty in themselves, but help to set off the beauty of the tulips, either by harmony or contrast of colour effect, the surfacing plant always being chosen with reference to the colour of the tulip with which the bed is planted. To give the surfacing plants a chance the bulbs must not be planted so closely together as they would be otherwise, or the foliage of the latter will smother them. But better than rows are clumps of six to a dozen with a space of one to two feet between the clumps. This is some little approach to the method of Nature, who does not have bare ground round her bulbs, unless it is covered with a thick carpet of dead leaves. When this system is adopted the relative importance of the groundwork is increased, as well as the scope for varied effect, till we get comparatively tall plants like the shorter doronicums, e.g., D. austriacum and D. caucasicum, amongst the clumps, producing a very gorgeous effect.

After all, the most fitting place for the Cottage tulips is the permanent hardy flower border, where they may stand undisturbed amongst the perennials for several years, forming clumps producing a dozen or more blooms, as they will do in a soil which is not too stiff, the flowers being of varying heights and sizes, owing to the congested state of some of the bulbs, and producing the effect of a natural pyramid of blossom. The most effective use of these tulips I have ever seen is along the border of a nut walk, where there is a three-feet gravel path, and then about two feet of soil each side between the edge of the path and the nut-stubs, these borders being filled with spring flowers of all sorts covering the ground in a semi-natural struggle for existence, little being done save weeding, and amongst all these things are large clumps of golden Cottage Tulips—Golden Crown mostly—giving one the impression that is the way they grow in nature. There is nothing elaborate about it, and anyone with the space at command could produce a similar effect in a couple of years.

CHRYSANTHEMUM MRS. SAM NASH.

A very beautiful new single variety with flowers of an exquisite shade of clear pink. Commendation for Colour, N.C.S., October 24; A.M., R.H.S., October 25. Messrs. W. Wells and Co., Merstham.

Naturalised in grass and wild gardens, too, excellent effects may be obtained, that just described being, in fact, an example. For growing in pots and tubs the tallest varieties should be avoided, but even when growing those which attain no greater height than eighteen inches it is necessary to use large pots to produce a good effect, a forty-eight pot containing three, or even four bulbs, being much too small in proportion to the height of the plants. Twenty-fours are the smallest size which should be used, and eighteens are better, but they take a good many bulbs.

Little need be said about varieties, for they are as varied as people's tastes. Generally speaking those that flower in the first half of May are more satisfactory than those that flower towards the end, as they are not so likely to suffer from unseasonable heat. Those who are partial to Tennyson's

"Deep tulips dashed with fiery dew,"

will like Billietiana, yellow, margined scarlet at the base; Bouton d'Or, deep golden (syn. Golden Beauty); Golden Crown (sometimes erroneously called Golden Eagle), and Royal Crown, scarlet, margined yellow. These flower in the first-half of the month in a normal season and are not too tall.

A great advantage of these tulips is that almost any situation suits them, even a north aspect, where they last in flower longer and retain their colour better than anywhere during one of those untimely bursts of heat we sometimes get in the middle of May. On the other hand, in such a situation the bulbs may deteriorate after a year or two, unless the soil is very favourable.

Alger Petts.

THE DEVELOPMENT OF THE ROCK GARDEN.

Few aspects of the garden are so brimful of interest at all seasons as the rock garden, and certainly little apology is needed for referring to its development.

Those garden lovers who are old enough to remember garden adornment during the sixties and early seventies will recollect the hideous masses of burr-bricks, clinkers, shells, cement work, etc., which, in many cases, had to do duty as rockeries and hardy ferneries. Fortunately such atrocities are rare nowadays, thanks to the prevailing good taste of garden lovers, and the progress made in natural gardening and in the study of high mountain and other plants.

Travel has done much to forward the cult of alpine plants, and the collector has found the need of a suitable home for his collection, thus helping to usher in the reign of the rock garden.

It is not altogether my province to discuss the relative value of various typical gardens, but rather to advance the whole idea of rock gardening. Experience has led me to find in the furnished rock garden a multitude of charming effects, an everchanging colour display, a veritable mine of floral interests.

A natural rock garden is the ideal. A garden where one has rugged broken banks and braes, with outcropping rocks, heavy boulders, and weatherworn gorges and waterways. A bit of pleasant scenery, combining light and shade, rock, water, and woodland effects, which Nature has been at work upon for ages. This is the ideal, the truly natural rock garden, where by the judicious felling of a tree or two, the clearing of certain overrunning bushes, the partial uncovering of nearly hidden rocks, one can find himself in possession of as charming a scenic rock garden as was ever devised by the cleverest constructor. This, however, is not general. As a rule, the rock garden has to be formed by manual labour and thought. In this one is often greatly aided by the site available, for one can often select a position where banks and slopes, hillocks and valleyed depressions, are already in existence. If this is so, and a sufficiency of suitable stone is available, then the task is a pleasant one.

He has the natural "run" of the ground before his eye, suggesting further improvements in the shaping of the ground, by the emphasis of the good points, and making good deficiencies. For instance, a bank abutting a little further than its fellows will suggest the placing of a bold bluff of rocks which will perhaps prove the key of the whole scheme. A low depression between two banks may be extended and turned into a rock-girt valley, or a traversing route for stepping stones, or a mountain streamlet; one could multiply suggestions, but space forbids, so that I must leave the idea with my readers. It is astonishing, too, how a good background helps one. A broken belt of shapely pines, a few well-placed symmetrical forest trees, a dominating oak or beech, or even a coppice of hazel and birch crowning a ridge, will work wonders in creating an effect, restful to the eye, and a finish to a well-arranged foreground. But to lack all these things! Picture, if you will, the difference of making a rock garden where the ground level is flat and uninteresting, where the soil is a stiff unkindly clay, where the rocks are difficult to obtain, and many of them unsuitable, and, worst of all, where there is "no background," nothing except perhaps a hideous fence, a clipped hedge, or a few wildling bushes.

At the present time, when the love of garden beauty is becoming so extended, and so virile a part of English life, it is unnecessary to laud the pleasure of a rock garden, but yet there are associated thoughts which will have their way, and show themselves definitely.

For instance, the question of domination calls persistently. Certain subjects should dominate certain points, being more effective than a misty mass of indescribable subjects. The Japanese have made a fine point of this, excelling by far the average ideas of English planters. It may be a dark-hued pine, a mass of glowing azaleas, a bold grouping of lilies or iris, or a serried wealth of lowlier beauties; there is certainly always something to give the "keynote" at each point of vantage. Even in the rock plants themselves this idea is applicable, and that is why colonies of certain subjects are so favoured.

I have noted spots where the blue of aubrietias and the gold of alyssums have provided the principal note of colour in spring. Saxifrages in starry sheets, alpine phloxes massed with their varied degrees of colouring, the sun-borrowed brilliance of helianthemums, the telling blues of muscaris, lithospermums, and gentians, the rich velvety butterfly grace of Viola gracilis, the snowy pictures created by arabis and iberis, cerastium, and anemones, are but typical features of many rock gardens, yet they are sufficient to impel admiration from all who see them during the flowering season. To the planter I would tender the advice to "plant tellingly." Group your best subjects upon the vantage points. Let them dominate the garden in their respective seasons of beauty. Put the glowing colour of Japanese azaleas, of alpine rhododendrons, of Berberis Thunbergi, against the grim dark outline of the rocks.

Plant not as if you were making an annual display, but rather for the garden beauty of a generation or more. If possible utilise the idea of the twofold planting. Early-flowering bulbous subjects among the later-flowering rock plants. Anemones, scillas, galanthus, etc., among the hardy ferns, dwarf peat-loving subjects amongst the azaleas and rhododendrons, or breadths of ericas among sparsely-set dwarf pines, Azalea pontica, and Daphne mezereum.

When planted and established the rock garden requires constant attention. Some specimens will need thinning, others replanting. Excessive growth of certain plants must be restricted in order to give a chance to weaker-growing subjects. Division and top-dressings, weeding and occasional watering, will, of course, call for attention.

In the selection of plants one must, of course, follow their own desires, as everyone must necessarily have some ideas of their own in the matter of arrangement, and in the planting of various subjects. One rock garden of recent date has by direction of the owner been planted largely with a varied collection of British plants, with the object of naturalising many of our rarer "natives," and as the garden in question combines sunny exposures and shady nooks, pools and bog beds, and high rocky ridges, one may realise the possibilities of a good collection amid such surroundings.

With the increasing love of alpine and rock plants, and a more real appreciation of natural surroundings for plant life, one may be assured that rock gardening art will be carried to a higher degree in the near future than ever before. A sign of the times is the way in which nurserymen and florists are taking advantage of the boom in rock gardening. The boom is good for trade certainly, a good thing for all concerned, but better still is the awakened interest, the kindled enthusiasm, and the appreciation of the garden-loving public for the gems of high mountain floras.

P. S. Hayward.

THE AMERICAN WITCH HAZEL.

Hamamelis virginica, or the American Witch Hazel, is grown in English gardens fairly commonly, but is lost sight of to a great extent except for a few weeks in autumn, when the yellow flowers, with their curiously twisted petals appear, and when the leaves take on their brilliant golden colouring preparatory to falling. There is, however, another use to which it is put that is less familiar to many people, for it is used largely as a stock on which to graft the more showy Chinese and Japanese kinds which brighten up our gardens during January. Plants for this purpose are grown in pots, and grafting is carried on indoors during early spring. Stocks are generally raised from imported seeds, though a considerable number of seeds are sometimes matured in this country.

The people of America have long found another use for the shrub, for they collect the bark from the smaller branches, and from it an astringent extract is obtained, which is used in the preparation of cooling ointments and for other purposes. The leaves formerly had a place in the pharmacopœia, though they appear to be of far less importance than the bark at the present time. Hamamelis virginica requires no special cultivation, and may be expected to grow under similar conditions to the common Guelder Rose; therefore, it might well be planted in positions that are not quite good enough for the showier kinds, such as H. mollis and H. arborea.

Kew. W. Dallimore.

Hippeastrum reticulatum.

The "Dictionary of Gardening" gives the date of the introduction of this Brazilian species of hippeastrum as 1677. It must, therefore, be regarded as the oldest of the hippeastrums, and also one of the most distinct. At the same time its comparative scarcity is no doubt owing to the fact that it is less vigorous in constitution than many of the others, and, flowering as it does at the end of the season, it has not been much employed by the hybridist. This hippeastrum is practically an evergreen, the strap-shaped leaves being of a dark green colour, with an ivory-white midrib. The flowers are of a pretty shade of pink, with darker veinings.—W. T.

THE POTATO CROP IN SCOTLAND.

The fine, dry weather that has been experienced generally over the greater part of Scotland for the past two months, has produced an excellent effect upon horticultural and agricultural matters. In regard to the latter, it enabled the corn harvest, which was comparatively early, notwithstanding the untoward weather conditions at certain periods during the summer, to be cut and garnered without much delay, and this in turn had its action upon the potato crop, which at the present date—October 25—is practically raised and stored, even in the latest districts. The work, too, has been accomplished under very favourable circumstances, the tubers being clean and dry, thus enabling close inspection to be made for any trace of disease.

Being now so near the close of the month, and with every indication of a continuance of dry weather, it may confidently be predicted that in the South-West of Scotland the total rainfall for the month will not reach to one-third the amount that fell in October last year, which, at this station, was upwards of seven inches, and was immediately succeeded by frost of unusual severity for so early in the season. This resulted in large areas under crop having the tubers damaged to such an extent that they became unsaleable, and in some instances were rendered useless for any purpose. In the district referred to the present crop is considered, as raised from the soil, one of the heaviest on record, and prices are correspondingly low, and altogether in favour of the purchaser. This somewhat unsatisfactory state is accentuated by the anxiety of growers to dispose of their stock offhand, owing to the prevalence of disease. The excessive rainfall and accompanying atmospheric dullness in the closing days of July and throughout August was very propitious to the spread of the fungus, and this alone tends to very considerably reduce the value of the bountiful crop.

The potato boom, and the fabulous prices for seed tubers, are both things of the past, and whether the former did any real good is perhaps questionable, but certainly there are numerous varieties at the present day, though none as yet disease proof, that are a great advance in regard to quality and productiveness on those cultivated thirty or more years ago.

The one-time famous Up-to-Date has apparently lost its high reputation as a standard maincrop variety, it having in recent years greatly deteriorated as a heavy cropper, and is now no more immune from disease than are many others. Of some twenty of the best known and most reliable varieties, collected in bulk, that recently came under my notice, not one among them could justly claim any specific advantage as being disease resisting, though with some of them the taint was very slight, yet it existed, and in all probability would develop rapidly, once the tubers were stored or clamped, and covered. As already stated, the crops have been raised under the best possible conditions, and the tubers are free of soil, dry, and bright in appearance; had the reverse of this been the case, the losses through the winter, owing to the spread of the disease and the infection caused thereby, would have been greater than is now probable.

James Day.

Galloway House, Wigtownshire.

APPLES IN 1910.

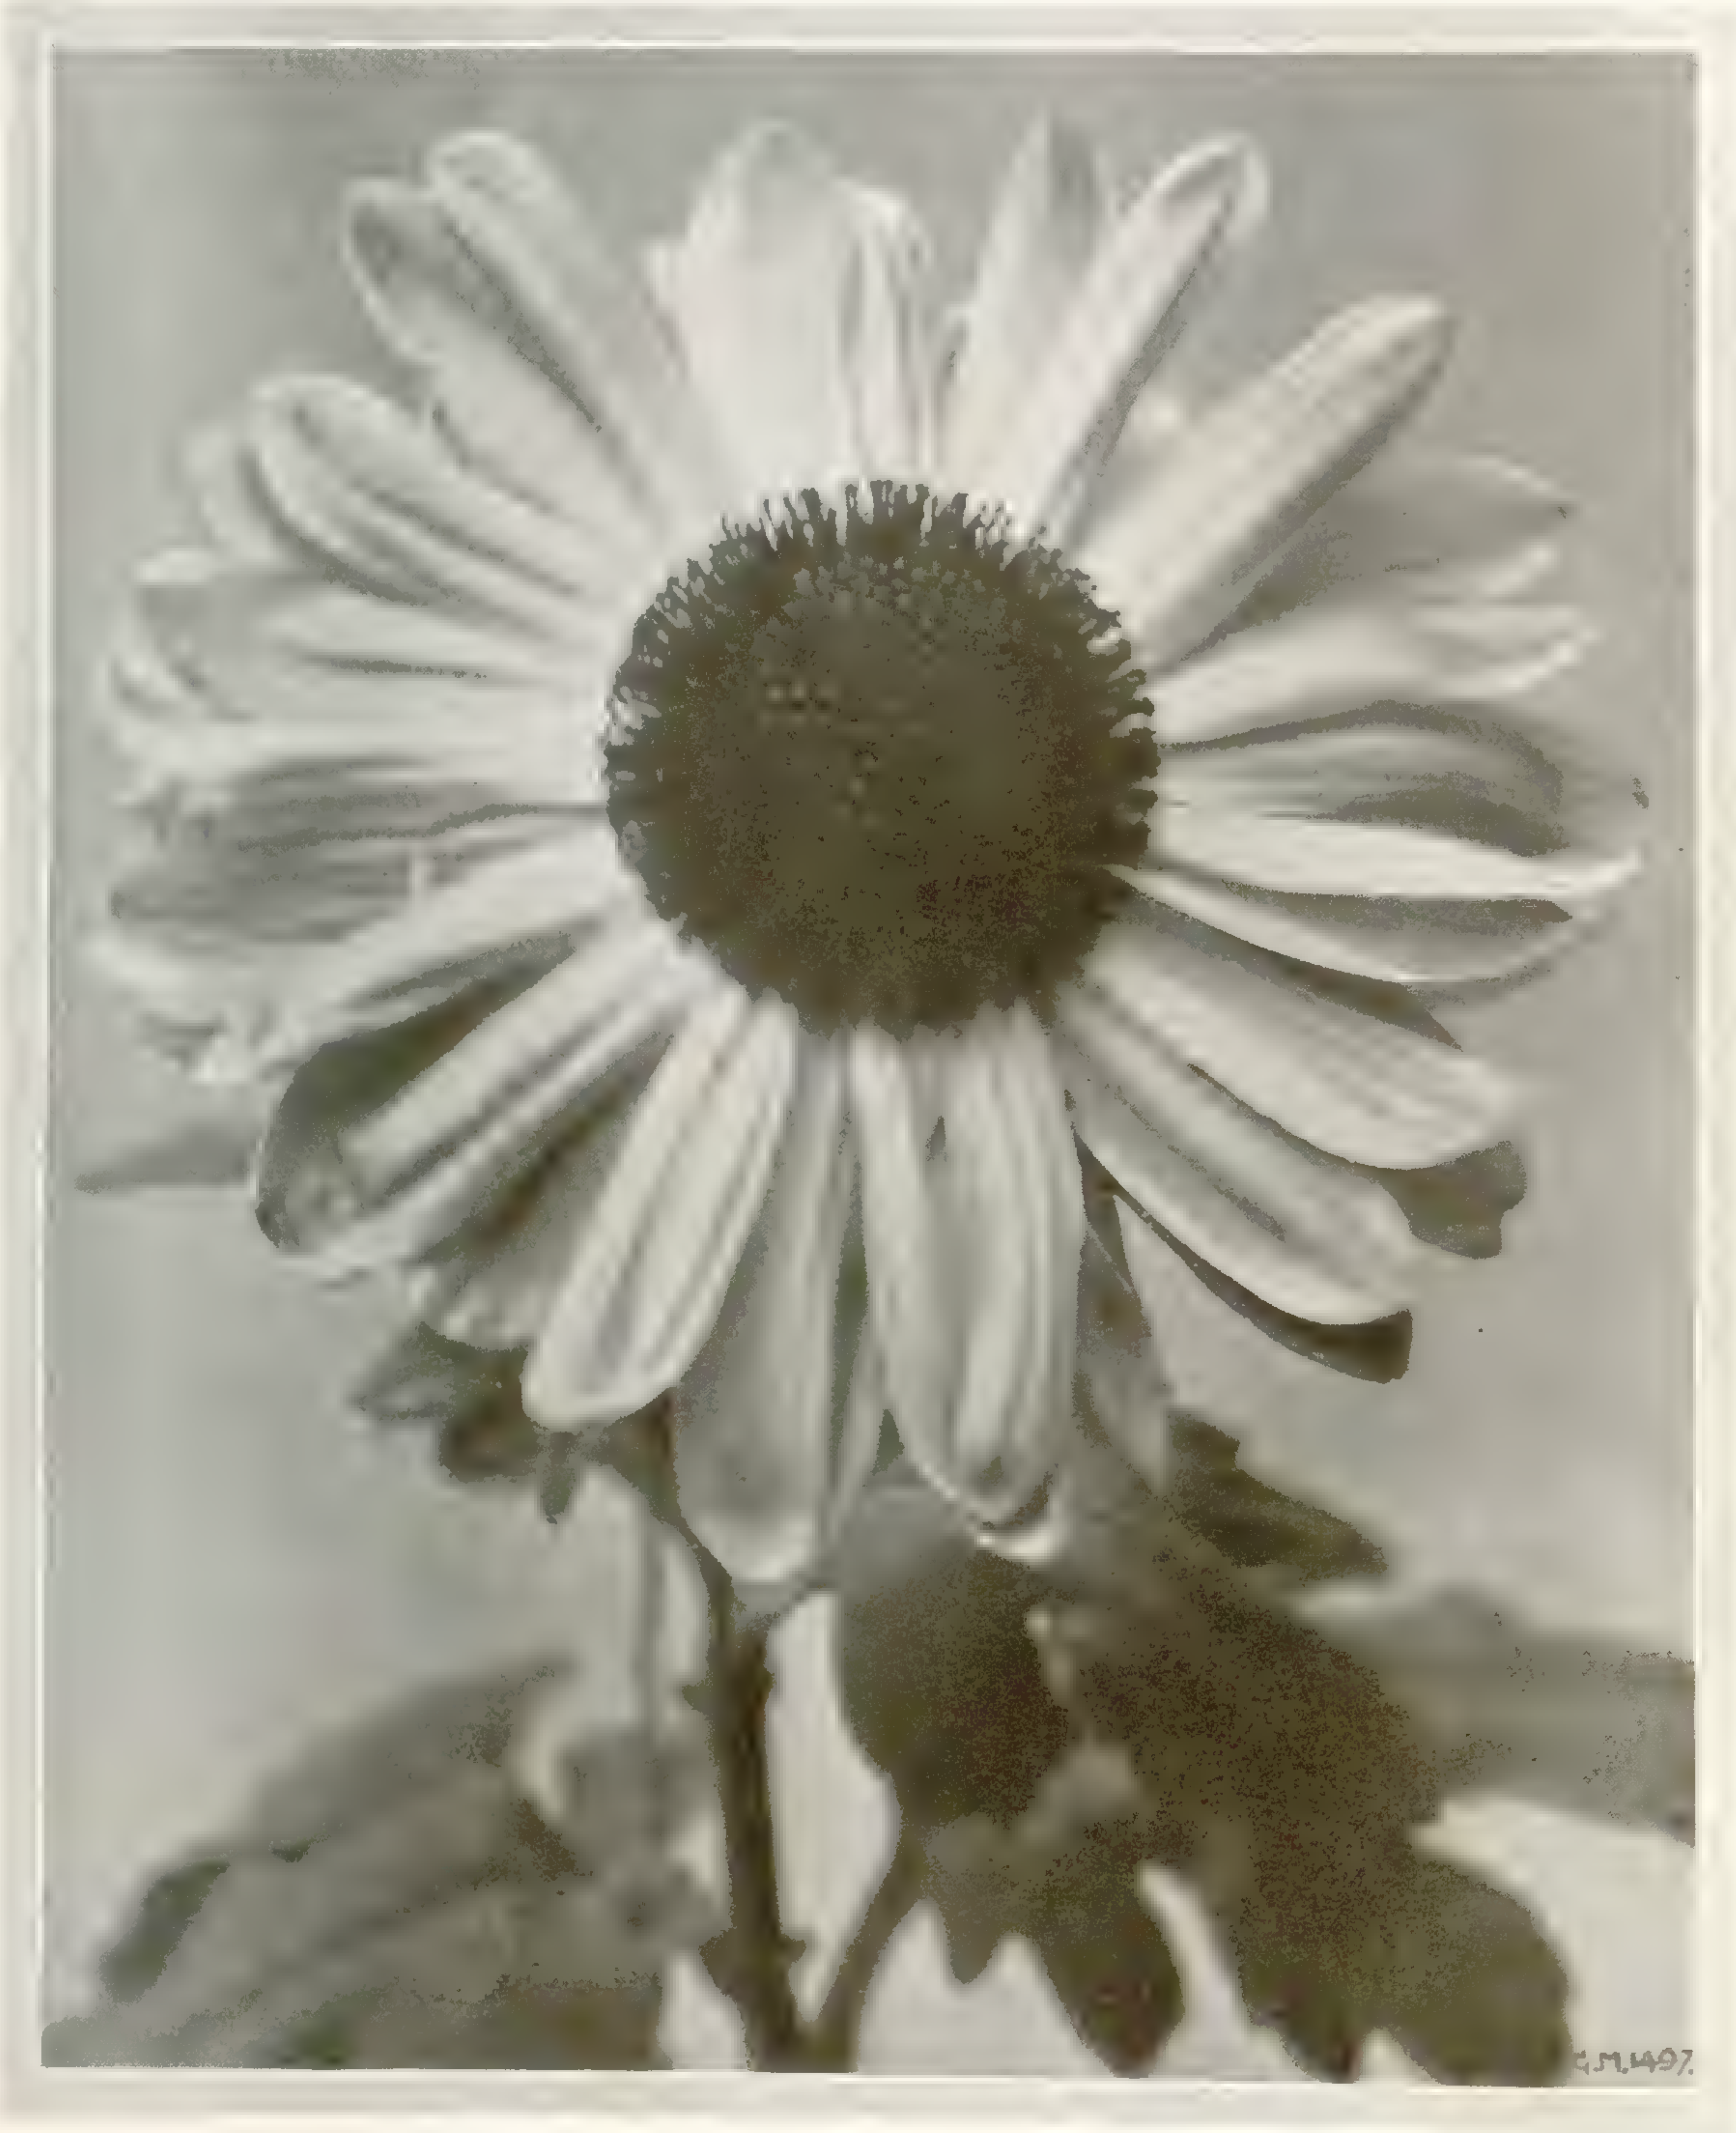
The apple crop of this season while generally light is also remarkable for the variation in the cropping of some varieties, and, although there is a scarcity of apples in most gardens, there are a few in which a fair crop has been gathered in. It is well known to fruit growers that many apples are what may be described as biennial croppers. These, all other things being favourable for a crop, bear a crop every second year. While taking into consideration this peculiarity of some varieties, it is still somewhat puzzling to account for the cropping and non-cropping of many apples this season, the trees of which have been growing side by side. If it is the maturity of the wood or any of the other essentials we are told are so necessary for the production of fruit, how is it that one row of trees is laden with fruit and the next row fruitless? I have seen many instances of that this season.

Again, I have had trees under my notice where one side has cropped well and the other side had scarcely a fruit on, and these much smaller than on the side of the tree which carried a crop. Judging, however, from the appearance of the leaves this may have been caused by cold blasts from the north-east in the early summer or late spring.

Of the several varieties which this season have carried a good crop, Worcester Pearmain appears the most prolific, in fact, it might be called a "Worcester year," and the most fruitful kind of tree this season has been the bush tree. Tom Putt has carried good crops, also Court Pendu Plat, Bramley's Seedling, Lady Henniker, Barnack Beauty, Royal Somerset, Brabant Bellefleur (but it may have been the year for this variety, as I have found it a variable cropper); New Northern Greening, a promising apple, far superior to the old variety in appearance, and Sleeping Beauty, an October cooking apple.

In one garden or orchard which came under my notice, the two varieties which were carrying fruit were Lane's Prince Albert and Bismarck, and these were cropped heavily. Despite the scarcity of apples and pears in many districts this season, there was in most classes a very creditable display at the R.H.S. show of British fruits, and, although we have been bewailing the uncongenial season, there were many dishes that apparently had been basking in the sunshine, perhaps they had forestalled the "Daylight Bill." It is evidence of the skilful cultivator who takes advantage of every ray of sunshine, and all the little details which lead to success, and who shows what may be accomplished in an almost sunless summer.

T. H. Slade.

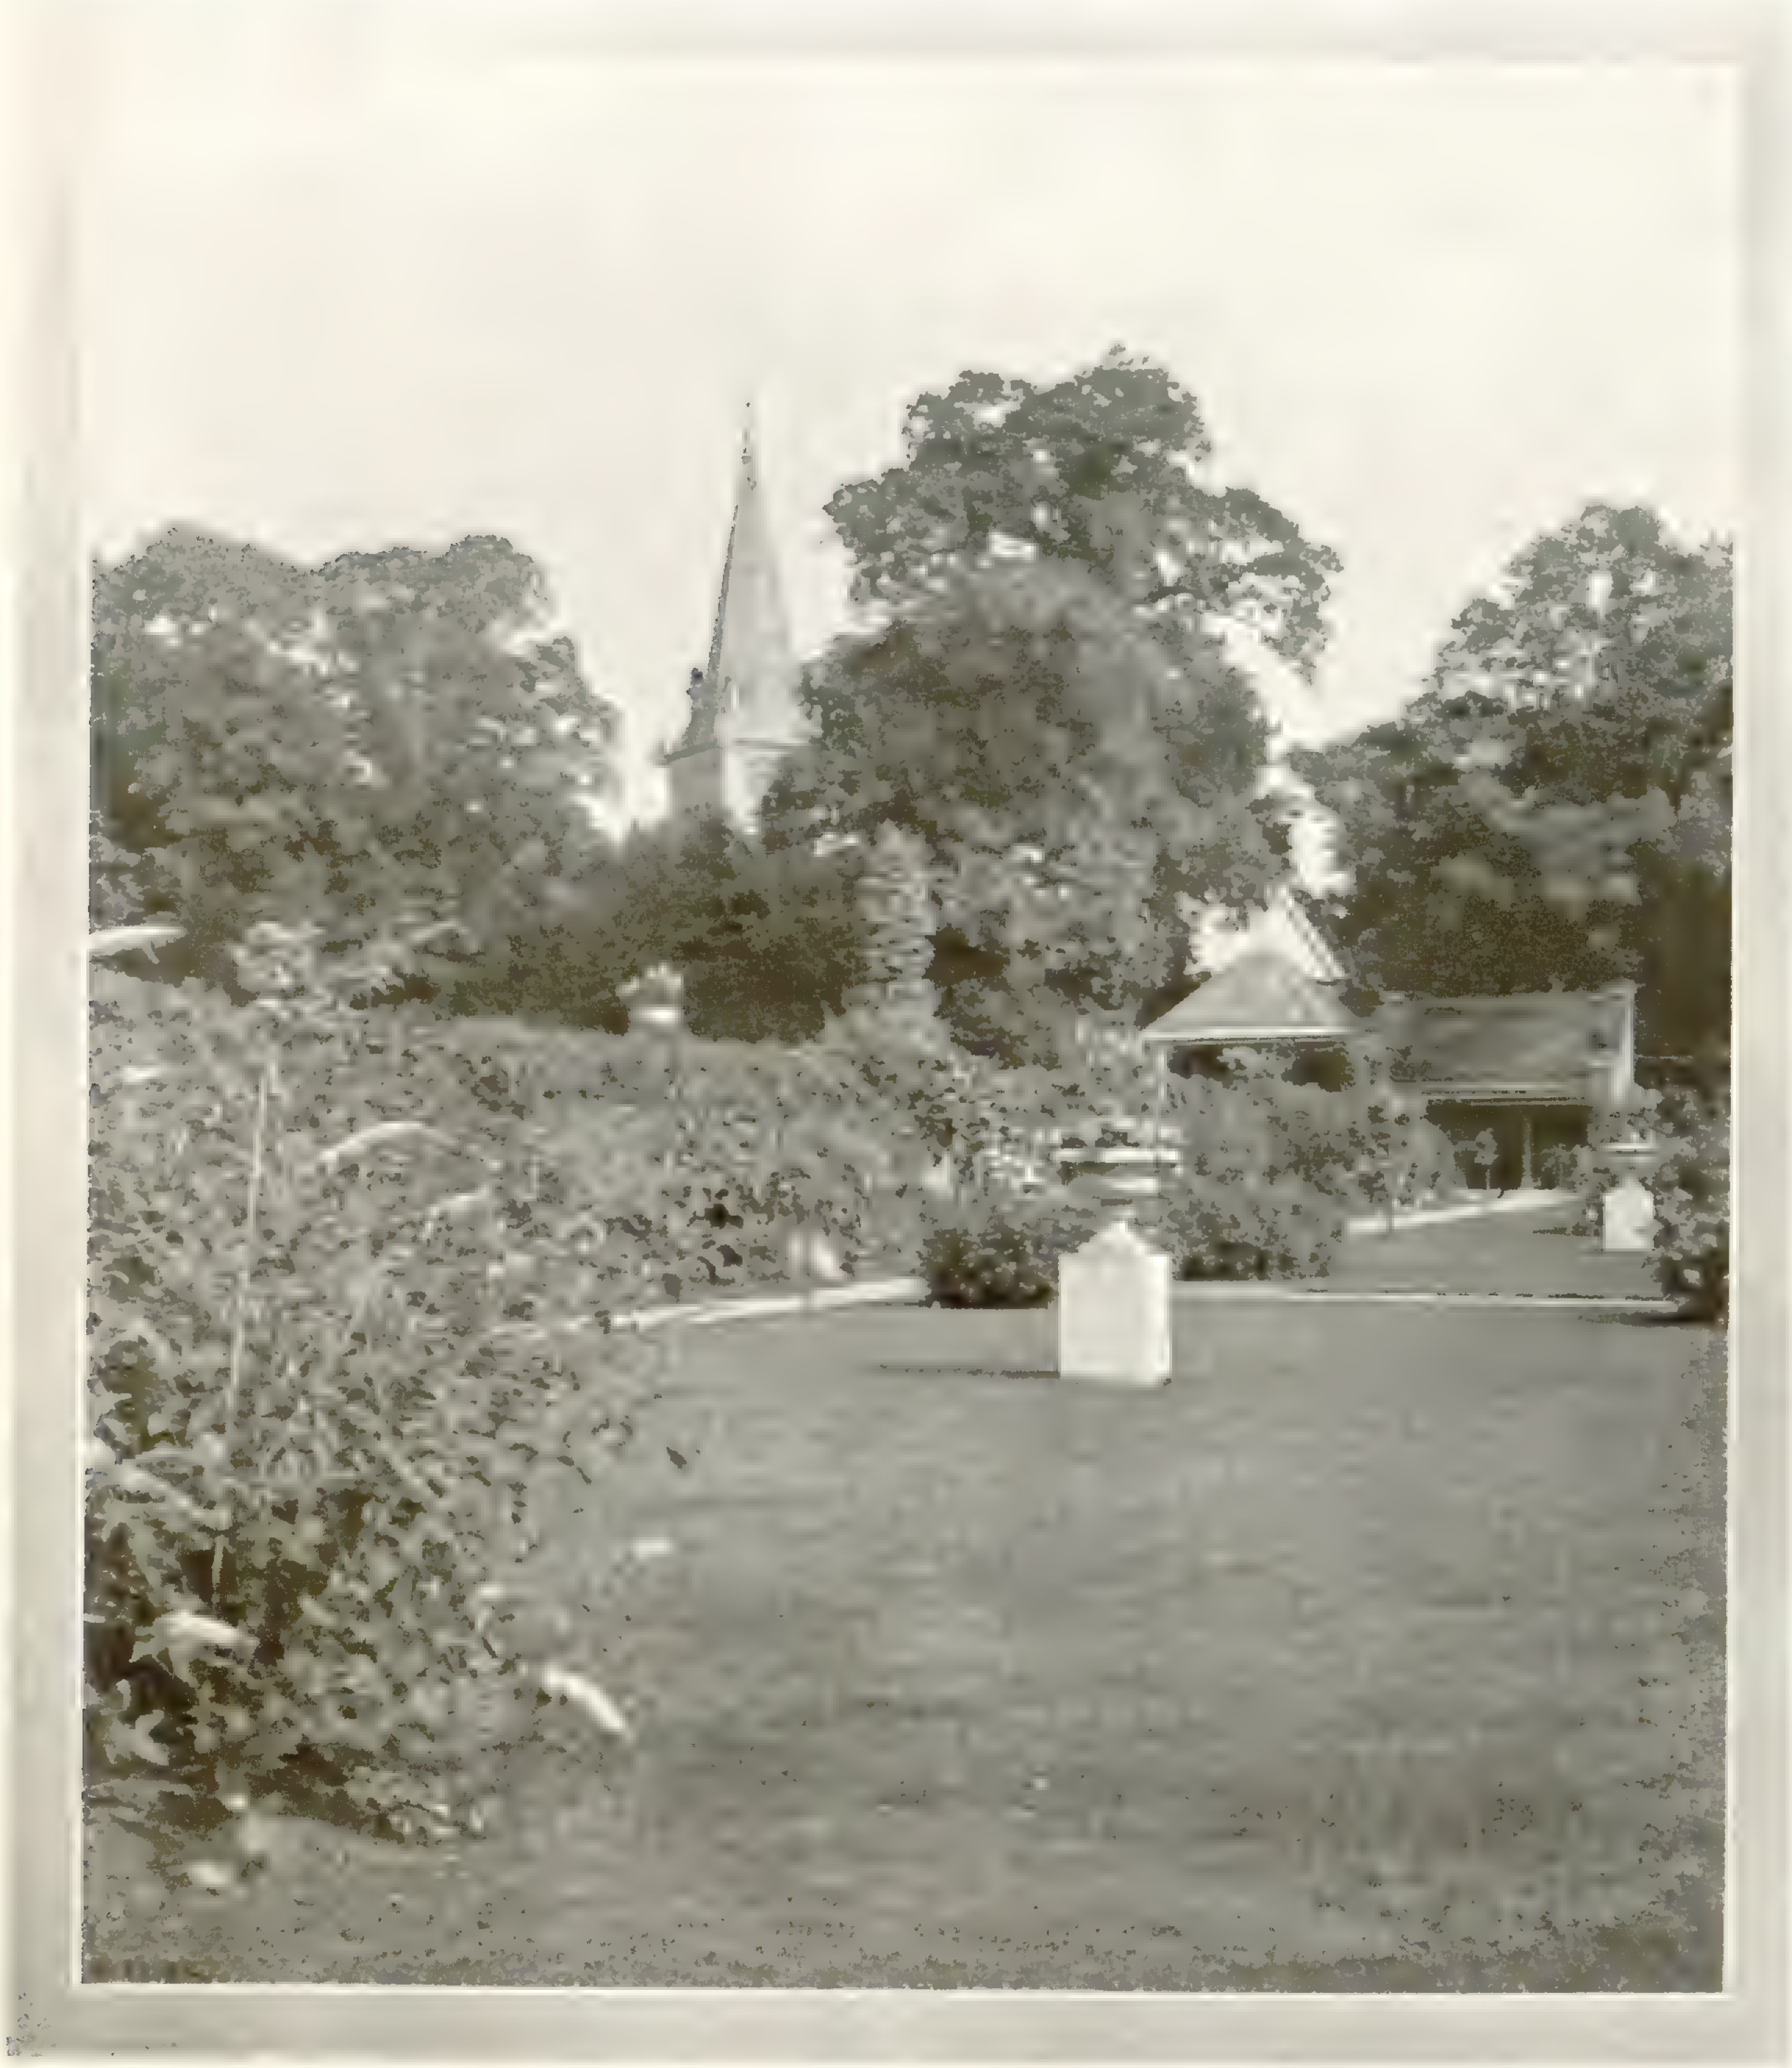


CHRYSANTHEMUM JOAN EDWARDS.

A fine rose-pink single variety of excellent size and form. F.C.C., N.C.S., October 24; A.M., R.H.S., October 25. Mr. Phillip Ladds, Swanley Junction.

GARDEN TEA HOUSES.

Many changes have been made in the garden and its accessories within recent years, and one of the most noteworthy of these has been in relation to the structures provided for the purpose of rest and refreshment. For a long period it was the custom to have in the garden a house of a rustic character, built it may be of reeds and wood, or with branches and boards of oak and lined with match boarding, and very comfortable some of these were. But for a long period it was the practice to build them without doors or windows, and it is surprising that this practice should have continued until a decade or so ago. Buildings of this description had two objections, the occupants were exposed at certain times to cold draughts, and generally the light was not sufficient to enable them to read or do fancy work. In some designs provision was made for openings at the side for the purpose of admitting more light to interior than could enter through the doorway, but these openings admitted air as well as light, and frequently the draught was so keen that if not positively dangerous it was decidedly unpleasant. Of late years the more expensively designed summer houses of a rustic nature have been provided with windows and doors, and where plain glass has been used the light has been ample.



AN ELEGANT GARDEN TEA HOUSE
In the gardens of Elvetham Park, Winchfield.

A rustic structure was almost invariably regarded as essential whether the garden was English or Italian in design; but that was not perhaps so important a matter as may at first sight appear, as a secluded spot was generally selected for the site. It is not at the present time easy to understand why garden architects in bygone days should have shown such remarkable unanimity in selecting sites where the houses could not be seen, and their occupants could see but little, unless it was that they considered every form of structure, excepting the mansion, an eyesore.

Now the structures required for rest and refreshment are regarded as an essential part of the garden, and sites are selected for them where they will have some prominence, and where also those who resort to them for rest or retirement can enjoy the charms of one of the most noteworthy of the beauty spots within the boundaries of the garden. They also show a great diversity in design, but they all agree in being properly lighted and ventilated. The structures of rustic wood work and of reeds have not disappeared from the garden, and no one could wish public taste in relation to them to undergo so great a change as this would imply. A rustic house with thatched roof is herewith illustrated, and is so arranged that tea can be taken inside the building or on the lawn, as may be desired, and both lighting and ventilation are perfect. This structure is in the gardens of The Pleasaunce, Overstrand, the marine residence of Lady Battersea, and it has the further advantage, as will be readily seen, of occupying a site in an extremely beautiful part of these delightful gardens. The other structure illustrated is of a quite different design, and is in the gardens of Elvetham Park, Winchfield, the seat of Lord Calthorpe. As in the case of the thatched summer house at The Pleasaunce, it is admirably adapted to its purpose, and commands a view of a beautiful part of the grounds.

HINTS ON SPRING BEDDING.

As the season is such a late and open one it may not be out of place to note that the employment of spring-flowering plants, such as myosotis, wallflowers, arabis, primrose, polyanthus, etc., in company with bulbous subjects, has been a gradual business, but it is now fully recognised and acted upon. The association brings about vastly more artistic and picturesque effects than when these are arranged independently of each other. Until recent years certain beds and stretches of border were allocated to shrubs of dwarf, compact habit, spring-flowering plants, and bulbous plants respectively, and under these conditions a very considerable expanse of soil was bare and innocent of vegetation or greenery over many months. We may be reminded that such portions were covered with a thick layer of bright and cleanly cocoa-nut fibre refuse, but even this does, or did, little to compensate for the absence of life in the scene. Happily this is all changed, and as far as the decorative portion of the garden is concerned, Mother Earth wears a perpetual, if ever-changing robe.

It is interesting to note that early-flowering deciduous shrubs, or trees in shrub form, now play a part in the decorative scheme, and it may be said they are a decided acquisition. The double cherries contribute a great wealth of florescence, and the same applies to the flowering peaches, double form, and Pyrus malus floribunda. I noted a large bed last spring filled with crimson wallflowers, and between them bushy specimens of double cherry about three feet in height were literally smothered with bloom, while a wide belt of myosotis Royal Blue formed a splendid framework. Very soft and pleasing was a combination of Dicentra spectabilis and Arabis albida flore pleno, the last named acting as a carpet, and being carried to the grass verge.

An irregular-shaped bed with raised mounds of various sizes and shapes planted with hyacinths and tulips in shades of purple, with a dense carpet of Silene pendula compacta, attracted my attention, and I commend this informal fashion to planters generally. Many admirers were found around a bed in one of the London parks, containing Proserpine and white Joost Van Vondel tulips, with a mass of the old typical Myosotis dissitiflora underneath, and what a very fine combination it was! Scarcely less effective, with delicious fragrance added, were deep golden wallflowers with blue and red hyacinths between them. It was very clear that geometrical precision was out of the question when the hyacinths were planted, and they were evidently thrown down in careless fashion and planted where they fell.

Crimson tulips do much to enhance the beauty of light-coloured primroses and polyanthuses, and for associating with those of crimson hue, pure white, or golden yellow tulips are to be recommended. It is difficult to explain why violas are not more exclusively employed as carpet plants, seeing that they bloom profusely in spring, and may be allowed to act in the same capacity in the summer arrangement of bedding plants. Walter H. Aggett.

GRAFTING ROSES.

Grafting is a very important method of increasing any variety of rose, and is much more adopted now than formerly. In the case of many teas and their hybrids, also the polyanthas of dwarf and compact growth, it is not easy to obtain the required number of buds during summer; but the plants frequently produce wood suitable for grafting, and so this method of increase is selected.

I have already referred to two methods of propagation, viz., budding and cuttings, and a few weeks ago an article appeared upon the various stocks for roses and the most practical way of securing the same. It may appear full early to treat on grafting, but as the stocks need attention at once I am induced to send some notes now.

Stocks are many. Both the seedling and cutting briar, and the manetti, may be lifted and potted at once. Personally, I much prefer seedling to cutting briar stocks for grafting, because the former have less pith, and are sounder throughout, resulting in a better union of rose and stock. Do not use a larger pot than will accommodate the roots fairly comfortably, or much space will be taken up in the propagating case. Even if only three parts of the roots are in the potting compost it will answer our purpose. Deep potting does not allow of the graft being worked so closely upon the roots as is desirable, and it is the same here as with the budded stocks, we need to get as close to the crown of roots as possible, so as to avoid future suckers from the stock. As we plunge the potted stock at once there is no distress resulting from the roots not being quite covered with potting soil.

A HANDSOME GARDEN TEA HOUSE WITH THATCHED ROOF
In the Gardens of The Pleasaunce, Overstrand.

Plunge the stocks in a pit or cold frame and shade for a time, to prevent shrivelling. Very soon the roots will commence new growth, and directly this takes place is the best time to graft. If you have no rooted or seedling stocks in a suitable condition pieces of briar root can be used, but they are not so good as a stock. Let there be as much fibre as possible upon the roots, I am aware that many thousands of briar stocks especially seedlings are grafted before being potted, but where a few only are wanted it is certainly preferable to have the roots partially established, and I also find it best for the stock to be a little in advance of the scion or graft.

The graft, or scion, can be of two distinct stages of growth, and I will discuss the ripe or dormant wood first. By far the best grafts are obtained from wood grown under glass or upon a wall. Any wood that has been frosted should be avoided as much as possible, because a considerable quantity of this dies when introduced to artificial heat, and is not so satisfactory as the smaller and riper wood from pot plants. Last season's wood is the best. Let the scion have more than one eye, if practicable, and endeavour to have the bottom eye quite at the lower end of the graft. The short lateral growths of teas and hybrid teas, also the shoulders from which these spring, make excellent grafting wood.

Then we have what may be called a green graft, i.e., wood about half-ripened and carrying healthy and fully-developed foliage.

We will suppose the stocks are ready. Lift, and shake away the plunging material so as to leave the crown of the stock clear. Cut off the top of the stock so as to leave only two or three inches above the crown, letting the cut be slightly slanting rather than level. Upon the longest side or upper part of this cut is the place to fix the graft. By placing it on this side we avoid damp running down between the graft and stock, and a certain amount of moisture is sure to accumulate on the top of the stock while in the propagating case. The amount of wood to be pared away from the stock depends entirely upon the thickness of the scion, but endeavour to have these fit in due proportion.

Cut the scion in a slanting direction, letting the cut be of the same length as that upon the stock, and, as nearly as possible, at the same angle. Always see that the bottom of the graft is well down to the lower part of the cut upon the stock. It is here that the first union generally takes place, and the lower eyes of the graft are often the most important part of the future plant. Tie the whole firmly together. Formerly moss, clay, and grafting wax was used to keep the air from the cuts, but this is seldom made use of nowadays in up-to-date propagating.

Place the grafted stocks in a close propagating case, but if this does not exist a box can be used, covered over with glass to keep the whole close. The box may be plunged in some cocoanut-fibre upon a warm bench, and this will generally answer the purpose. Keep dark until the callus forms; in fact, close and dark conditions, without stale moisture in the atmosphere, is the ideal. Wipe the glass early in the morning, or sometimes twice a day, to remove condensed moisture. Do not water over the graft at any time until the union is quite perfect. If the roots are dry water the soil only. One is sure to find a number of suckers no matter how carefully the work may have been done, and, needless to say, these should be removed at once. As the plants show signs of growth gradually inure them to light and air. One is not likely to get all of them in one stage at first, and selection should be made for removal into less close quarters as they advance in growth. It only remains to pot on, and treat in the ordinary way, but the potting should be deep enough to cover the union of scion and stock.

For green grafting we need the stock a little further advanced in growth. Cut off as usual, but instead of making a cut by paring away a part of the stock, make a clean cut with the point of the knife from the crown to the top of the stock. Cut the scion with a thinner and much slighter base than in the case of a ripe graft, and slip it under the bark, so that the bottom reaches the lower end of the cut made in the stock. Now tie, and treat the same as in the other system. Rosarian.

HARDY FRUITS FOR CUMBERLAND AND WESTMORLAND.

The following instructive paper was contributed to the Northern Counties Fruit Congress by Mr. W. B. Little, F.R.H.S., instructor to Armstrong College and C.C. horticultural instructor:

The Cumberland County Council have had established for some seven or nine years three experimental fruit plots situated in various parts of the county, and they vary from a quarter to one-third of an acre in extent. The Westmorland County Council have one plot, situated at Lyth, near Kendal. At each station about forty varieties of apples have been planted, some of the trees have been duplicated, whilst others have not. The types of trees grown are bush and half-standards. The former are on free and paradise stocks, and the latter on free stocks.

Apples.

At Abbeytown, which is some six miles from the Solway Firth, the undermentioned varieties have given the best results: Lane's Prince Albert, Domino, Bismarck, Golden Spire, Scotch Bridget, Royal Jubilee, Bramley's Seedling, Newton Wonder, Grenadier, Yorkshire Beauty, Worcester Pearmain, Allington Pippin, Mr. Gladstone, and Maltster. The following have borne well for a few years, but the trees are now severely attacked with canker, in fact many have been cut down: Cellini Pippin, King of Pippins, Northern Dumpling, Warner's King, Blenheim Pippin, Ecklinville Seedling, Lord Grosvenor, Stirling Castle, and Lord Suffield. The undermentioned have never given satisfaction: Court Pendu Plat, Lady Henniker, Belle du Pontoise, King of Tomkins County, and New Hawthornden.

At Newton Rigg County Council Farm School, the plot stands very much exposed, and is 560 feet above sea level. The varieties which have given the best results here are included in the list of those doing well at Abbeytown, with the following in addition: The Queen, Early Victoria, and Liddle's Seedling. All that have succumbed to canker at Abbeytown have met the same fate at Newton Rigg, and the undermentioned in addition: Lady Sudeley, Gloria Mundi, Norfolk Beefing, Potts' Seedling, Ringer, Hambling's Seedling, Beauty of Kent, Dumelow's Seedling, Hoary Morning, Lord Derby, Early Red Margaret, Schoolmaster, Cox's Pomona, and James Grieve.

At Brampton, nine miles north of Carlisle, a station was formed in a corner of the allotments. The soil is heavy and cold. The varieties which are doing well at Abbeytown and Newton Rigg are doing well here, and vice versa, with the exception of King of the Pippins, which so far is healthy, and this year carrying a good crop, but whether it will remain so much longer or not is doubtful. I might mention that this was the last-formed plot in Cumberland. The most interesting point in connection with this plot is that up to the present year the trees have borne very little fruit. In weighing this matter over, I noticed that the branches were inclining to the north-east, thus showing that the prevailing wind was from the south-west. On this side no bees are kept within a considerable distance, and I thought it probable that the bees on the north-east side, about half a mile away, when leaving their hives in the early spring, would not rise and fly against the wind. I then decided to seek the aid of Mr. Avery, expert to the Cumberland Beekeepers' Association, and he brought to the plot two hives of bees. Afterwards, observations were kept in various ways, which will, I expect, be dealt with by Mr. Avery in his paper. Briefly, however, the net result was a splendid set of fruit on nearly all the varieties, including pears. I have recently been carrying out an election of the best varieties of fruit trees growing in Cumberland and Westmorland, but I would not say that the results are conclusive, because all the varieties I have previously mentioned are not known to many of the electors.

Pears.

I do not think it worth while devoting much ground to the cultivation of these fruits unless it be in very favoured localities or on walls. There are only a few pears that do really well in the North, and the demand for them is not great unless they are of first-rate quality. Where bush trees are grown on the pear stock frequent root prunings are necessary to induce the formation of fruit spurs. On walls I have noticed the following varieties doing well: Jargonelle, Beurre Diel, William's Bon Chrètien, Marguerite Marillat, Souv. du Congrès, and Easter Beurre.

As bush trees the undermentioned are perhaps the best: Pitmaston Duchess, Doyenne du Comice, Emile d'Heyst, Marie Louise, Fertility, Beurre Giffard, and Hessle.

Pears on the quince stock only flourish in favoured localities.

Plums.

These I consider to be a profitable crop. Great difficulty, however, is often experienced in getting the trees thoroughly established in the ground, as so many flourishing specimens totally collapse, and die in a very short time. Personally, I am inclined to believe, and my observations so far have given me the impression, that trees which suffer this fate have been worked on myrobalan stocks. Whether these on other stocks are liable to perish the same or not I am not prepared to say, but I should like other observers' opinion on the matter. In all our experimental plots this trouble has been met with, and many growers have also complained. I have recently planted some trees which have been worked on mussel stocks, and others, e.g., Abricote de Bounneau on their own roots, so as to note the result. The varieties which succeed best are Rivers' Early Prolific, The Czar, Victoria, Red Magnum Bonum, Greengage (in a few favoured districts), Jefferson, and Pond's Seedling.

In the Lyth and Crook districts of Westmorland very large quantities of damsons are grown by the farmers. The districts named are on the limestone, and this undoubtedly accounts chiefly for their success. In the hedgerows and along the stone walls bordering the fields and roads, trees have been planted at intervals of from 18 to 30 feet, and after becoming established no further care has been meted out to them. The trees thrive and the crops vary according to the season. During 1909 very heavy crops were carried, and the wholesale prices were anything from 8d. to 1s. 6d. a score, e.g., 20lb. During the present year the crops have been good, and high prices, 4s. to 4s. 6d. per score, have been obtained. I am told that some of the farmers will gather during a good season anything from one to three thousand score.

Black Currants.

These I consider to be one of the best paying crops, provided good varieties are grown, and the bushes properly treated. Plenty of young wood should be encouraged by annually cutting out the old. All young bushes should be cut hard back for three years in succession. This treatment will result in the production of fine, healthy bushes. The variety, Carter's Champion I find to give splendid crops of good-sized berries, and also produce abundant young wood. Victoria and Boskoop Giant are also good. By planting black currants amongst the apple trees a shelter is obtained in which they delight. I might here make an observation on the "mite." It is spreading rapidly, and many people are loath to destroy the bushes or attempt any remedy. Under these circumstances I should like to see it scheduled as a notifiable pest.

Gooseberries.

For these berries there will always be a great demand, and as they are admirable fruits for bottling, this means of preserving can be adopted whenever there is a glut of fruit on the market. A too severe system of pruning induces each year the formation of excessive growth. A good plan to adopt with the upright growers is to prune fairly hard until well-shaped bushes are formed; then for one season almost refrain from using the knife, with the exception of thinning out undesirable shoots. This will result in a check to wood formation, and the development of numerous fruit buds. There are many varieties which are succeeding well in the fruit plots and elsewhere, notably: Whinham's Industry, Lancashire Lad, Keepsake, Whitesmith, Leader, and Early Sulphur.

Raspberries.

These, if grown well, will never fail to give good returns, and there is always a good demand for the fruit. Some people with whom I am acquainted make at home a large number of pots of jam annually, and readily find a market at the grocers for them. The variety Superlative has done remarkably well at Newton Rigg, but not so at Brampton and Abbeytown. I have noticed in many gardens that the buds on many canes of this variety remain dormant during spring, the canes eventually dying. A gardener I was speaking to one day told me that his were so badly affected in this respect that he intended to give up growing Superlative. I have not yet arrived at a decision as to the cause of this dying back. It may be the result of frost, but, on the other hand, why canes in some exposed gardens should not suffer is a mystery. Northumberland Fillbasket and Baumforth's Seedling flourish, and do not seem to be troubled the same way.

OUTDOOR PEACHES.

At Aldenham, on a west wall, the outdoor peach crop has been an exceptionally good one this season. Looking at the trees one does not wonder at the result; they receive all they need from a cultural point of view, and in their training, which is the most important point of all, and also adequate protection while in flower. There, too, the ground in front at a reasonable distance from the base is occupied with low-growing subjects yearly, as strawberries, lettuce, pentstemons or anything of a low-growing nature that cannot deprive the trees of sunlight. There are some persons who grow tall herbaceous plants within two feet of the trees, and then lament that peach trees out of doors will not flourish!

Instead of lifting the trees as noted by Mr. Slade (p. 788) to check their exuberant growth, the late Mr. Wildsmith, when at Heckfield, where some of the finest out-of-door peaches were grown, used to deeply trench the border in front of the trees to within three feet of the wall annually, and thus cut off any roots that got beyond that space. The consequence was his trees were always furnished with fibrous roots and never made extra strong growth, but always such as ripened thoroughly, by the aid of thin training, proper watering when required, especially after the fruit was gathered in September, or later, as circumstances needed. This detail quite escapes many gardeners, who never think about the requirements of the trees after the fruit is gathered until they are looking for a crop again!

E. Molyneux.

GREENHOUSE MANAGEMENT.—The Amateur's Greenhouse, the popular book by T. W. Sanders, not only treats of the selection and cultivation of greenhouse plants and flowers, but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the management of the plants and flowers grown in it. The price of this book of 416 pages is 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

THE LADY FERN.

The Lady Fern (Athyrium filix fœmina) undoubtedly ranks as the most beautiful of our native deciduous species, assuming, if we except the Bracken and Osmunda regalis, the largest size, and, without these exceptions, the finest cuttings in its wild state. It is essentially a lover of damp, shady habitats, and is found in its greatest beauty in sheltered glens or woods in the vicinity of water. Under such circumstances we have seen grand bush-like specimens five feet in height, and as much through, the fronds springing from great masses of rootstock consisting of numerous projecting crowns.

It is thoroughly deciduous, the fronds, even under glass, dying quite down late in the autumn, and rising again in April. Incidentally, it may be remarked that though deciduous ferns present a disadvantage in being practically invisible in winter, this is largely compensated for by the fact that when they rise in the spring they are unassociated with possibly shabby, yet green, fronds, which surround the new growths of the evergreen species, and somewhat detract from the beauty of the plant until they die off, and can be safely removed. The dead fronds, too, being removed, do not harbour vermin, as do, too often, the persistent fronds of evergreens: the plant, in short, starts clean of everything.

Even in the wild state the Lady Fern is so liable to minor variation that it is often difficult, in a ditch lined with innumerable specimens, to find two which exactly match each other in habit and cutting. Marked varieties, that is, such as the connoisseur considers worthy of collection, are numerically rare, but, nevertheless, thanks to the perseverance of fern hunters, such a number of these have been accumulated that the Lady Fern ranks, not only among the most variable species in the world, but has been found to assume a number of varietal forms which have no parallels in other species. Like the ladies of the human race, the Lady Fern has been endowed by Nature, not merely with a wonderful charm of her own, but in some occult way has designed fashions for herself in styles, sometimes, it is true, more curious than beautiful, but more often on the chastest and most delicate lines.

As a matter of fact, however, the sexual distinction which the old botanists have established between the Lady Fern and the Male Fern, Athyrium filix fœmina and Lastrea filix mas, due to the greater softness and delicacy of the former, as compared with the coarser foliage of the latter, is entirely imaginary. Both species are alike in bearing spores, which produce young ferns by the union of two parental potencies, and thus each fern is innately bi-sexual.

To deal with the varieties of the Lady Fern exhaustively would need a volume, since the recognised distinct wild finds run into hundreds, while selective culture has given us a large number in addition. Undoubtedly the prettiest forms are those in which the normal delicate division of the fronds into pinnæ and pinnules is carried further by the division of the pinnules into pinnulets, constituting dissected and plumose varieties, and next to these rank such as have produced tassels at the extremities of fronds and subdivisions on very varied lines, flat and fan-shaped, bunched or corymbiferous, merely forked many times, or with the forkings redivided tassel fashion, producing bunches of small tassels. My own find, A. ff. cristatum Kilrushiense, the finest crested form found wild, does this to such an extent that it is quite impossible to count the number of subdivisions in the long pendulous tassels it produces. The finest wild plumosums are the Axminster, Horsfall, Wills, and divaricatum forms. The Horsfall is especially slender, graceful; but the Axminster has excelled all others in its progeny by producing first the more finely cut plumosum elegans Parsons, and then from this, in two generations, the really marvellous crested and uncrested sections of the "superbum" strain, which I was fortunate enough to obtain by selective sowing, and constitutes one of the three most developed sections, not merely in our British ferns, but in the ferns of all the world, since even the wonderful plumose strains of Nephrolepis exaltata have not varied into associated tasselled forms as well.

The Lady Fern known as A. ff. Victoriæ, found in a lane at Drymen, in Scotland, is absolutely unique, and is so far a ne plus ultra in varietal eccentricity, combined with added beauty. In this each side division is in duplicate, the pairs being set on at about right angles, the result being a series of crosses formed with the opposite pairs. These divisions are very slender, and the subdivisions they bear are also twinned on like lines, forming smaller crosses. The frond itself is narrow, and tapers gradually and gracefully. Nature, however, has not been content with this, but has decorated each tip, both of frond and subdivision, with long slender tassels, divided again and again on the lines of A. ff. cristatum Kilrushiense above described, the total result being an extremely beautiful form. Its spores reproduce all the characters truly, with, however, occasional slight modifications as regards small details; and, curiously enough, while the original plant produces fronds about four feet in length, we have never seen one of its offspring exceed two and a-half, even when sown directly from the original find.

In the Frizelliæ section the side divisions are reduced to round knobs; in Pritchardi we find the frond built up of untasselled crosses, somewhat confusedly associated. These forms have been presumably crossed with tasselled forms, since there is quite a number of raised varieties so characterised on varied lines. A. ff. conioides and Verroniæ have the pinnæ shortened and widened on somewhat crispy lines with pretty effect. A. ff. congestum minus is a little gem five or six inches high, and may be obtained plain or crested to various degrees.

Space, however, precludes reference to a tithe of the charming forms of this species, and the writer can only suggest a reference to the trade catalogues, which the renewed popularity of our native ferns has brought into existence, concluding his notes with the remark that the Lady Fern is perfectly hardy, of the easiest possible cultivation, provided it is not allowed to suffer from drought, and, as regards soil, will thrive even in ordinary garden mould, though in pots it is as well to provide it with the proper compost of loam, leaf-mould, and sand.

CHAS. T. DRUERY, V.M.H., F.L.S.

Apple Golden Spire.—For the person with limited space, and who is desirous of having an annual crop of good fruit for cooking, I would strongly recommend Golden Spire apple. It is quite one of the earliest kinds to provide fruit of a cooking size, and, being of upright growth and especially short-jointed, it requires but a minimum of space. At the end of July it is ready, and will keep until the end of October if necessary. A medium-sized fruit, of conical shape, and of the Codlin type.—E. M.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

SEEDLING CYPRIPEDIUMS.—There is generally found a period of growth at which the seedling cypripediums appear to remain practically at a standstill, but it will usually be found that at this particular period the plants produce their roots, and are actively rooting into the potting compost. At such a stage the opportunity is given to attend to repotting. As in the case of other genera, seedling orchids should not be allowed to become root bound in their pots before transferring them to larger ones, or should the compost about the roots be disturbed more than is absolutely necessary; any excessive growth of sphagnum moss and decaying matter about the surface of the compost should be removed, and the plants may be put into suitable sized pots, according to their vigour, and rooting characteristics. We cannot hope to have every plant in the perfect condition we would desire, for every member of the same family does not possess equal vigour, and in the case of all seedling orchids that I have ever had to do with, we find a few that grow away quickly, and appear never to look back, while others struggle for a long time. So with these facts before us, we can only deal with the individual as we consider its necessities demand.

POTS AND COMPOST.—It is always desirable to see that the pots are thoroughly clean for seedling orchids, as this enables the plants to be more readily turned out at the time of repotting, without disturbing the ball of potting compost more than is absolutely necessary. The pots should also have ample clean drainage. The compost we find most suitable is about one part finely chopped turfy loam and two parts good fibrous peat, with some finely chopped sphagnum moss, and sufficient sand and finely broken crocks intermixed to render the whole porous. This compost may be graded according to the size of pot used. In the small sizes naturally the compost will require to be much finer than would be the case to meet the requirements of the more advanced and vigorous plants. Where plants have practically reached the flowering stage, and their pots have become filled with roots, there is generally a great temptation to give them a shift on. It is far better to wait and see what developments are likely to take place. If a plant is potted under such circumstances there is an inducement for it to produce growth, but as we want them to flower as soon as possible it is well to be satisfied on the point of need before repotting is done. Repotted seedlings should be well watered as soon as repotting is completed, thoroughly wetting the compost; after this they should be very carefully attended to until the roots are running freely in the fresh compost.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

BOUVARDIAS.—Batches of plants that have been lifted and treated as advised in a previous calender should by now be nicely established in pots, and on fine days may be given a little air, but do not overdo this, as they may still have a tendency to flag should the sun be bright. With the shortening days reduce the syringing, especially in the afternoon, in fact a damping beneath the pots should be all that is required at this date. Give an occasional fumigation to keep down green-fly and thrips, and provide an even temperature of about 55 degrees at night. The plants cultivated in pots will be of a harder nature, and if not required in bloom may be subjected to 5 degrees lower temperature, but less than this will not do for them.

GARDENIAS. — Some of the older-established plants will, in all probability be swelling up their flower buds, and whether planted out or in pots a little weak liquid manure may benefit them, but at this season it must not be of too forcing a nature. If in pots they should be placed at the warm end of the stove, giving them all the light possible. Be careful with the watering, and if found necessary to use an insecticide to keep the plants clean let it be used fairly weak, as during these short days the plants, if given even the slightest check, are very apt to drop their flower buds. Those that are permanently located in pits must not be neglected at this season; they often require more water at the roots now that more fire heat is necessary for them. Also take care that there is no undue fall in the temperature, as frost and cold winds act very quickly on frames or pits that have only a small cubic area, and good coverings should be at hand to use whenever there is any danger of sharp frosts.

BEGONIA GLOIRE DE LORRAINE.—The early batches of this begonia should now be well in bloom, and to maintain them in good condition over a lengthy period less moisture will be needed, and a few degrees lower temperature may be given them. Later batches must still be kept growing, and if in small pots may be fed pretty liberally. It is a very common fault to find batches of these beautiful flowering plants lacking colour in the flowers, and this is often due to their being opened in too high a temperature and the withholding of liquid manure too soon.

BROWALLIA SPECIOSA is a very useful winter-flowering plant, and may also be relied upon to give a good display for many months during the summer. An ordinary greenhouse temperature will suit it well, but it should be accorded a temperature of from 55 to 60 degrees during the winter months, and, given a light position, it will keep short-jointed, and go on flowering all the winter through. As a plant for the warm conservatory or winter garden it is quite the best of its colour that I know.—T. Stevenson, Woburn Place Gardens.

FRUITS UNDER CLASS.

EARLY-FORCED POT VINES.—In cases where fresh ripe grapes are wanted as early as possible next year, pot vines should already have been placed in the forcing pit, and forcing should now be commenced. Success will depend greatly upon the vines having been properly prepared and the way they are managed during their early stages of growth, and unless these matters have been, and are, skilfully attended to, it will be futile to force vines at this early season. The best means of affording bottom heat is to plunge the pots, with their bases resting upon brick columns, in a carefully prepared bed of tree leaves and stable manure, the temperature of which, until the vines burst their buds, should range between 65 and 70 degrees. With a view to assist the buds to break regularly, secure the rods in a horizontal position, and in doing so see that the rows of buds point sideways rather than one row upwards and the other downwards. When starting the vines keep a night temperature of 50 degrees, with a day rise of 5 degrees from artificial means, and safely encourage their growth by economising the sun's warmth. Promote a moist atmosphere by occasionally damping available surfaces, and spray the vines with tepid water several times daily.

EARLY VINES IN BORDERS.—Where permanently planted vines are depended upon to produce ripe fruit in May the house should now be closed. Directions have been given in former calendars for pruning, and otherwise preparing, vines that were early forced last season, and I have previously remarked that vines with their roots confined to inside borders are more suitable for early forcing than are those having roots in outside borders; but where the roots are outside, the borders should be well clothed with tree leaves mixed with stable litter, which should be protected from rain and snow by glass lights, or any other suitable covering. Inside borders should be tested, and if they require water, enough (after being heated to a temperature of about 85 degrees) to moisten the border through should be given. In other matters the treatment recommended for pot vines should be followed.

EARLY-FORCED FIGS.—To have figs ripe in April pot trees of easily-forced varieties, such as Angelique, Early Violet, St. John's, Pingo de Mel, or Black or White Ischias, that were forced early last season should now be prepared for starting into growth. In the first place, thoroughly cleanse the house and wash the trees with a warm weak solution of soft soap and water, which, if scale is present on the trees, should be strengthened with the addition of an insecticide, and applied in order to remove the scale, with the assistance of a small stiff brush. For the first fortnight or three weeks commence forcing by standing the trees upon a bed placed in a house having a temperature of 50 degrees, and subsequently plunge the pots in a bed of fermenting material after the manner advised in the case of early forced pot vines. Syringe with tepid water in the morning and early in the afternoon, and promote atmospheric moisture by damping their surroundings. As soon as the buds burst increase the atmospheric night temperature by 5 degrees, and that for the day 5 to 10 degrees more, admit a little air on sunny days, and water the trees sufficiently to keep the soil moist. Pay close attention to the plunging material, and thus endeavour to maintain its temperature at about 70 degrees.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

ASPARAGUS.—The growth of this important vegetable will now be quite ripe enough to cut down. This work should be done with a pair of sharp shears, and the cut be made close to the surface of the soil. Following this, remove all weeds and rubbish from the beds, and then lightly prick up the surface with a fork to aerate the crowns and sweeten the soil. Over this a good dressing of burnt garden refuse should be strewn, as well as soot. After a few days of such airing a dressing of decayed farmyard manure should be placed over the bed for the winter rains to wash and carry down to the roots. On light, and, therefore, naturally drained soils this is very advantageous, but wherever the soil is wet and retentive it is the better plan to take out alleys by the sides of the beds to provide for winter drainage.

FORCING ASPARAGUS.—Asparagus is one of the easiest of vegetables to force where there is a good supply of crowns, and nothing is more appreciated than a good dish of this vegetable. It lends itself to easy forcing from November onwards, in either a warm house or pits, or over mild hotbeds. No doubt a house is most suitable at this season. A fair bottom heat is necessary, and a light position fairly near the glass. When beds are ready lift and plant with the least possible delay, as the roots suffer quickly if much exposure is permitted to reach it. A mild bed should consist of leaves and stable manure in equal parts; over this place four or five inches of light fine soil, placing the crowns three inches deep. Give the bed a good watering, and syringe when required.

BROCCOLI.—Certain varieties will be "turning in," and should therefore be examined three times a week to protect them from frost; it is necessary to tie those up that are showing their curds, using leaves from the cut plants, and tying the outer leaves together over them. Even in favoured counties, where the ground is heavy, broccoli suffers much injury in sharp winters, and to prevent this it appears to me that it should be a universal plan to layer the whole batch during the early part of November. This is accomplished by taking out a spit of soil on the northern side of each plant and gradually bending it down towards the north, the soil being placed firmly around and over each stem. Carry this work out carefully, and one will see an improvement in the plants. The partial check thus given will harden them up immensely, and under this treatment 90 per cent. will pass safely through the winter. A few winters back I saw, in a large garden even as far south as this, where the whole crop was ruined because it had not been heeled over.

TOMATOES.—Those raised early in October will require potting into thumb pots, using a sandy compost. Place them on shelves near the glass in a temperature from 55 to 60 degrees, and be very careful not to over-water them at any time during the next three months.

TARRAGON.—To maintain a regular supply a few roots should be placed in the forcing pit at intervals. The bed in the open should be forked over, and all the surface soil taken away, and in its place put a mixture of loam and wood ashes, placing over this a good dressing of cinder ashes to make it comfortable for the winter. Many herbs can now be cut and dried where there is a demand for them. Mint and chives must be placed in heat at intervals, and regular sowings of mustard and cress be kept up.

RUNNER BEANS.—Many fine pods that have ripened will now be ready for removal. It is a good plan to select those that are finely formed, so as to keep up a fine standard for future use. Rigid selection should be the order in all seed saving, choosing perfect forms rather than large and coarse examples.

LEEKS.—Carry out the final blanching as soon as possible before severe weather sets in. Celery should be treated likewise, using some fresh slaked lime as the work proceeds to ward off slugs.—G. Ellwood, Swanmore Park Gardens.

GLADIOLUS BRENCHLEYENSIS.

This variety makes a grand display in the garden during the early autumn days, and should be more extensively grown than at the present time. My main reason for writing this note, however, is to draw attention to the hardiness of the corms. In a low-lying part of a large kitchen garden that I had charge of a number of years since, I had about twelve rows of plants growing two feet apart. In due time the tops faded and were cleared away and I quite forgot to have the corms lifted at a certain time; so I allowed them to remain undisturbed in the ground throughout the winter months. The following year the increase in the number of flower stems was astonishing, and they were of good substance. From that time I left the corms in the soil, and at the end of ten years one could not distinguish the rows as the whole of the plot was occupied by the gladiolus. Then I found it advisable to lift them, trench the ground and replant. The whole of the plot was filled with corms closely packed together, many only just covered with soil; none, however, were ever damaged by frost, and the annual crop of flower spikes was a great one. G. B.

Salvia splendens.—Time was when this bright-coloured salvia was regarded solely as a plant for the embellishment of the greenhouse during the autumn. Now there are dwarfer forms, which flower earlier, the result being that this salvia has become one of the most desirable of subjects for summer bedding. Perhaps the best of all is one known as Pride of Zurich. Where these salvias are bedded out they may be carefully lifted in the autumn and potted. Then, if wintered in the greenhouse, and placed in a little additional heat in spring, they will quickly push out new shoots, which, if taken off and inserted as cuttings, will quickly root, and if potted off singly will form neat little plants by bedding-out time.—W. T.

EXHIBITIONS AND MEETINGS.

◆

Croydon.

The Croydon Chrysanthemum Society held its exhibition on October 27 in the Adult School Hall, Park Lane. There was a pleasing display, but, apart from the two leading cut flower classes, the exhibition flowers were not of a very high order. Singles were good, and plants, fruits, and vegetables were well represented, and the effect, as a whole, was good. None of the flowers were on boards.

CUT FLOWERS.

In the leading class, which is for thirty Japanese blooms, distinct varieties, set up in vases, there were but two competitors, and, therefore, the first prize win on the occasion is not to be counted as one score towards holding the cup outright, as there must be three entries at least if the win is to count as one of the three times necessary (in five years) to secure the fine challenge cup. The prizewinner was Mr. T. Beeson, gardener to J. Newton Mappin, Esq., Headley Park, Epsom, who was first in 1907 and 1908, but he will now only hold the cup for the ensuing year, and must win it in 1911 in a competition of not less than three entries if the cup is to stay at Headley Park for good. He had big bright flowers of Mrs. R. H. B. Marsham, Mrs. Norman Davis, Mrs. A. T. Miller, Miss E. Smith, Madame P. Radaelli, Miss Hilda Rowley, Mrs. G. Mileham, J. Peed, Walter Jinks, Miss Elsie Green, Mrs. C. H. Totty, Hon. Mrs. Lopes, Mrs. R. H. Pearson, Algernon Davis, Bessie Godfrey, George Terry, Pockett's Crimson, Reginald Vallis (premier Japanese bloom), Sir Frank Crisp, Master James, Madame G. Rivol, Rose Pockett, Lady Talbot, Mary Inglis, Splendour, Valerie Greenham, F. S. Vallis, Mrs. [illegible] Thorn, Mrs. W. Knox, and George Mileham. Mr. G. Hall, gardener to the exors. of the late Lady Ashburnham, Melchet Court, Romsey, was a good second.

Mr. Beeson was also first in the class for fifteen Japanese blooms, in three varieties, winning with well-developed specimens of Lady Talbot, Reginald Vallis, and Mrs. A. T. Miller; Mr. Hall second, with Lady Talbot, Thrumpton Pride, and Edith Smith; Mr. C. Lane, gardener to E. H. Coles, Esq., Burntwood, Caterham, third. Mr. G. Hall was to the front for five incurved blooms, in vases, with Romance, W. Biddle (premier incurved), Mrs. C. Crooks, Triomphe de Mont-[illegible], and Romance; Mr T. Beeson second, and Mr. C. Lane third.

In the Borough Class for fifteen Japanese blooms, in vases, three varieties, Mr. G. Edwards, Windmill Cottage, Shirley, led with [illegible] specimens of F. S. Vallis, Mrs. A. T. Miller, and F. S. Vallis; Mr. L. Gooch, gardener to T. Wickham Jones, Esq., Frocester Lodge, South Norwood, second. Mr. Edwards holds the president's cup for the year only.

For ten Japanese blooms, one or more varieties, Mr. E. Croft, gardener to B. F. Smith, Esq., Leigham Court Road, S.W., was an easy winner, and he had fine flowers of Madame G. Rivol and Mrs. A. T. Miller; Mr. G. Edwards, second; and Mr. F. J. Hainge, gardener to H. Hales, Esq., Kenley, third. In the local class for five Japanese blooms Mr. T. Finch, gardener to G. H. Fisher, Esq., Godstone Road, was a good first among five competitors; Mr. G. W. Bentley, gardener to L. French, Esq., West View, Wallington, second; and Mr. A. J. Hart, gardener to Mrs. Thrale, Coombe Road, Croydon, third. Mr. E. Croft scored for five incurved blooms, and was followed by Mr. G. Lewry, gardener to Mrs. Williams and Miss [illegible], Duppas Hill Terrace; and Mr. G. Edwards.

Mr. E. H. Mills, gardener to Frank Lloyd, Esq., Coombe House, Croydon, was a splendid first for three vases of singles, with very [illegible] arrangements of fine flowers, set up with suitable foliage; Mr. C. H. Hunt, Stroud Road, Woodside, second; and Mr. Tyrrell, gardener to A. E. Crook, Esq., Selborne Road, third.

In the amateur section the chief prizes for cut flowers fell to Mr. H. E. Marden, Sunnyside, Godstone Road; Mr. W. Philpot, 57, Church Road; Mr C. R. Clark, 23, Neville Road; Mr. G. W. Beard, Sunny Bank, South Norwood; Mr. F. A. Beadle, Neward Road, Croydon; and Mr. C. H. Hunt, Stroud Road.

GROUPS AND PLANTS.

Groups were not a great success; for chrysanthemums only Mr. W. Tyrrell, gardener to A. E. Crook, Esq., Selborne Road, was first prize winner, with fair-sized flowers; Mr. A. Dyer, gardener to E. Wood, Esq., Church Road, Upper Norwood, second. For a group of miscellaneous plants Mr. G. Lewry was easily first with an arrangement of begonias, salvias, cyclamens, Cypripedium insigne, and Cattleya labiata; Mr. F. W. Hart second, and Mr. F. J. Hainge, third.

Mr. Finch, gardener to G. H. Fisher, Esq., Godstone Road, led for three plants of single-flowering varieties with tall specimens of May Richardson; Mr. A. Dyer second, and Mr. F. J. Hainge third. Mr. Mills was a comfortable first for half-a-dozen winter-flowering begonias, with freely-flowered flattish pyramids of B. Gloire de Lorraine; Mr. T. Beeson second; and Mr. F. W. Hart, gardener to Sydney Smith, Esq., Werndee Hall, South Norwood, third. Mr. Lintott secured the chief award for nine table plants with very clean and elegant specimens; Mr. C. Lane, Burntwood, Caterham, second. Mr. Finch was first, and Mr. A. J. Hart second for six table plants.

FRUIT AND VEGETABLES.

There were four competitors in the class for a pair of bunches of grapes, and here, as usual, Mr. Lintott came first, winning with finely finished specimens of Alicante; Mr. T. Beeson second, with the same variety; and Mr. B. T. Kingsley third. In the open class for nine dishes of apples Mr. W. Paulley, gardener to Dr. Jackson, Thornton Heath, scored with Lord Derby, Golden Noble, Peasgood's Nonsuch, Wellington, Gascoigne's Scarlet, Warner's King, Charles Ross, Ribston Pippin, and Wealthy; Mr. W. Lintott, gardener to Sir Walpole Greenwell, Bart., Marden Park, second; and Mr. B. T. Kingsley, Holmwood Park Gardens, third.

Mr. Lintott was first also for six dishes of pears, with Pitmaston Duchess, Beurre Diel, Conference, Beurre Bachelier, Doyenne du Comice, and Marie Louise; Mr. Paulley second. In the local classes for apples and pears Mr. Paulley; Mr. O. Jeal, gardener to N. Waterall, Esq., Waddon Lodge, Croydon; Mr. Johnson, gardener to Mrs. A. Crawley, Bramley Oaks, Croydon; and Mr. G. Lewry were the most successful competitors.

Mr. Lintott scored for a collection of nine kinds of vegetables with a very fair set of cauliflowers, celery, tomatoes, potatoes,

AN EFFECTIVELY ARRANGED VASE OF SINGLE CHRYSANTHEMUMS.
One of the three vases for which Mr. G. Miles was awarded the First Prize at the Croydon Show.

parsnips, peas (Gladstone), onions, runner beans, and carrots; Mr. B. T. Kingsley, Holmwood Park Gardens, second; and Mr. H. J. Hainge, gardener to H. Hales, Esq., Elmwood, Kenley, third; there was a fine competition. Mr. T. Finch, gardener to G. H. Fisher, Esq., Downsview, Purley, was first prize winner in another class for six kinds of vegetables, and Mr. H. Stone, Kenley, was first in yet another class for a collection, while in the potato classes, where there were some splendid tubers, Mr. F. Oxtoby, gardener to J. J. Reid, Esq., Coombe Road, was first, and Mr. Jeal second. Mr. A. Dennis, Godstone Road, Kenley, had the best nine onions, and Mr. F. J. Davis, Bynes Road, South Croydon, led for leeks.

MISCELLANEOUS.

Messrs. J. Peed and Son, West Norwood, put up a very bright group of chrysanthemums of various types and varieties. Messrs. W. Wells and Co., Merstham, showed chrysanthemums largely, and included their new Mrs. Luxford, Mary Loomes, and Mrs. Kelley. Mr. Thomas Butcher, 35, George Street, decorated the platform and set up some attractive floral designs. Messrs. E. W. and S. Rogers, 280, London Road, contributed a collection of vegetables, and Mr. G. T. Allan, Coombe Cliffe, Croydon, staged a small group of cattleyas, cypripediums, and begonias.

Croydon Gardeners' Society.

There was a big attendance at the Sunflower Temperance Hotel, George Street, recently, when Mr. Jos. Cheal, F.R.H.S., Crawley, who is well known in horticultural circles as a successful landscape gardener and observant traveller, gave a lecture on "Old Gardens of Italy," illustrated by lantern slides made from views he took when touring in Italy a few years ago. The Italian love of gardening, he said, dated from an early period, and with horticulture the Italians combine a style of architecture perhaps somewhat heavy in appearance, but nevertheless making up grand pictures which are copied in our own isles by enthusiasts of this style. The climate being so clear and genial allows the cultivation of tropical plants and these luxuriate in the open, and the lecturer remarked that in walking through some of the gardens the perfumes from the flowers are almost overpowering. Statuary, urns, and stone vases abound freely in making up the gardens, and in the latter the orange and lemon trees grow in splendour, with a profusion of fruit hanging on their branches. Lakes, cascades, and fountains are brought into use to beautify the scenes and afford cool retreats in the hottest weather. Stone pergolas are much used, and are clad with roses, vines, and other flowering and fruiting climbers, which are a feast to the eye and the palate. Lengthy terraces with parterres form a conspicuous part of the gardens, and oftentimes the terraces leading from the villas to the gardens below are long tessellated slopes which are laid in beautiful mosaic instead of being formed into steps. The Vatican gardens are a source of admiration. The whole parterre is divided into compartments, with straight walks bounded by box edging and rows of orange and lemon trees in Roman pots. Successive Popes have tried to immortalise their names by designing their Papal arms in neatly trimmed box. Italian cypresses growing to a good height and narrow in their structure lend gracefulness to the surroundings, and are much cultivated. Another feature of note, observed by the lecturer, was the geometrical designs in some of the gardens, laid out with different coloured granites, these taking the place of bedding plants, and bounded by box closely clipped.

Evidently from the pictures shown and the descriptions given by Mr. Cheal the amount spent in laying out the various gardens was fabulous. In one instance alone a barren rock had been laid out in almost inconceivable style, making it a picture never to be effaced from one's mind when once seen.

The views taken by Mr. Cheal were so clear, and his word descriptions of the landscapes and scenic beauty so good, that, as one member very aptly put it when proposing the society's best thanks to him, it was almost sharing the journey with Mr. Cheal without the expense and trouble.

Some good exhibits were staged by the members, and proved very interesting. Mr. W. Paulley brought a good dish of apples, Cellini Pippin; Mr. O. Jeal, a dish each of Bramley's Seedling and Cox's Orange Pippin apples and Pitmaston Duchess pears; Mr. A. C. Whipps, two vases of pompon dahlias, a dish of peaches, "Salway"; and Mr. M. Tyrrell, fifteen vases of the newer kinds of cactus dahlias. A vote of thanks to the exhibitors terminated a very enjoyable evening.

Bournemouth Gardeners' Association.

On October 18 a social evening, given in aid of the Royal Gardeners' Orphan Fund, proved a very great success. Every year at this season an entertainment is given in aid of this very deserving institution, which does so much to allay the anxieties of gardeners' widows left with young children unprovided for.

Mr. G. Barge, Summerfield Gardens, Bournemouth, is the secretary for Bournemouth and district. J. H. Ralph Smythe, Esq., J.P., is the worthy president of the Bournemouth and District Gardeners' Association, and he took the chair at the concert here referred to. During the interval the chairman made some very appropriate references to the Royal Gardeners' Orphan Fund, explaining how the fund was managed and the money used in deserving cases, and warmly appealed for help. A collection was then taken, and the sum collected amounted to £2 16s.

The weather during the day and evening was most unpropitious, and, no doubt, was the cause of some persons not coming to the concert. Taking this into consideration, the sum collected was a very handsome one. At the close of the meeting all the ladies and gentlemen who kindly assisted in the rendering of the programme were warmly thanked for their services.

Birmingham Gardeners' Association.

The autumn session for 1910 was inaugurated at the Athletic Institute, the vice-chairman, Mr. C. H. Herbert, presiding over a good attendance. The subject for the evening was an address by Mr. Walter E. Collinge, M.Sc., F.L.S., entitled "Economic Biology and Horticulture."

In his prefatory remarks Mr. Collinge expressed the great pleasure he had experienced during his former connection with the association as its president.

The subjoined is a summary of Mr. Collinge's lucid observations on the subject in question, viz., "The Biology of the Soil: A New Era in Agriculture." After dealing with the recent demands of horticulture, plant breeding, and variation, animal and plant parasites, the essayist drew attention to the recent developments in soil biology. The subject was by no means new, excepting in this country, owing to our being considerably behind the times. Recently, however, some valuable investigations had been made at Rothamsted on soil fertility and soil bacteriology. In the past we had spoken of the soil as a chemical laboratory, but it was something more, it was a medium teeming with bacteria, fungi, and minute animal life, the interrelations of which are, as yet, only very imperfectly understood. In the case of the Rothamsted work it had been shown that various unicellular animals were inimical to the multiplication of nitrate-forming bacteria. Only so long as these were kept in check could the bacteria increase and act upon the nitrogenous compounds, converting them into ammonia, thus increasing the fertility of the soil. Apart from being detrimental to the increase of bacteria, Mr. Collinge pointed out that there were protozoa in the soil; which were distinctly injurious to growing crops, and a better knowledge of these minute forms of animal life would undoubtedly open a new era for all cultivators of the soil.

But who is ready to do for agriculture and horticulture what Sir Patrick Mansen and Professor Ronald Ross have done for tropical medicine? At the present moment our Universities are not doing this work, and have neither the men nor means to carry it out. The Rothamsted Experiment Station is the only place he knew of where really valuable work is being done. From childhood we have been taught that the man who can make two blades of grass grow where previously there was only one is a benefactor to the human race. How generously we treated such benefactors would not bear telling. In the Midland counties, at the present moment, apart from elementary agricultural teaching, practically nothing was being done for agricultural research. Here, in the heart of agricultural England, it was impossible to find a man or men sufficiently generous to bring work and prosperity to thousands.

The lecturer concluded by drawing attention to the progressive activity taking place in all branches of human endeavour, and if that knowledge which the successful agriculturist demands is not forthcoming, we shall risk the prosperity and wealth of our country.

The lecture was followed by an expression of much appreciation, in which several of the members took part.

Reading Gardeners' Association.

At the meeting held on Monday, October 17, the chairman, Mr. T. Judd, presided over what must have been almost a record attendance. The minutes of the last meeting were read and confirmed, and two new members elected.

The Chairman drew attention to a large poster announcing the exhibition to be held in the Town Hall on Wednesday, November 23, and informed members that tickets were now at their disposal. Mr. Drew's lectures to young gardeners were announced to commence at the college on Friday, and a large number of members gave in their names.

The lecturer for the evening was Mr. F. Townsend, head gardener to the vice-president, Hillside, Reading, and the subject "Annuals Suitable for Growing in Pots, and Half-hardy Annuals for Beds and Borders." The paper was illustrated by a very fine collection of lantern slides, many of them beautifully coloured, which the lecturer had prepared in conjunction with Mr. H. G. Cox, and the display of these splendid pictures greatly added to the enjoyment of the large audience. As is well known, Mr. Townsend is "facile princeps" in the cultivation of annuals, and his remarks and advice were received with profound attention. Dealing, at the outset, with annuals grown in pots, Mr. Townsend reminded his audience of the beautiful Firefly and other clarkias, which many of them no doubt saw at the last Temple Show, and enumerated and displayed on the screen many other delightful subjects which might be treated in an equally successful manner.

Next, referring to half-hardy annuals raised under glass for summer bedding, he said that nearly all those present had seen in the gardens at Hillside what could be done in this direction, and could form their own opinion as to their beauty and usefulness. In conclusion Mr. Townsend gave ample instructions as to sowing, the compost to be used, and the after treatment of annuals, and in the discussion which followed the paper Mr. Townsend was able to give questioners the benefit of his wide experience as a cultivator of these delightful flowers.

The lecturer also gave evidence of his versatility as a gardener by staging an exhibit of beautifully grown apples and pears, which were much admired. Mr. G. Carter, gardener to S. Griffiths, Esq., exhibited an uncommon bulb in bloom, Eucomis punctata.

BRADFORD CHRYSANTHEMUM EXHIBITION in ST. GEORGE'S HALL, on FRIDAY and SATURDAY, November 11th and 12th.
£50 FOR BLOOMS ON BOARDS.
Besides other good classes for open competition.
Schedules, with entry forms, post free from
H. SPENCER,
Hony. Secy.
Horton Park,
Bradford.

BROMLEY AND DISTRICT CHRYSANTHEMUM SOCIETY.
THE 29th ANNUAL EXHIBITION
Will be held in the
DRILL HALL, BROMLEY,
On WEDNESDAY and THURSDAY, Nov. 9th and 10th, 1910.
Entries close November 5th.
R. S. PATTERSON, Hon. Sec.,
The Gardens,
Bromley Palace, Kent.

BUXTON AND DISTRICT CHRYSANTHEMUM SHOW,
WEDNESDAY, November 16th, 1910.
For Schedule and List of Prizes, address—
S. SHUFFLEBOTHAM, Secretary, 12, Eagle Parade, Buxton.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

Brighton.

The nineteenth annual exhibition of chrysanthemums, etc., held by the Brighton and Sussex Horticultural Society, took place on November 1 and 2 in The Dome and Corn Exchange. There was a marked improvement in the cut flower sections from Japanese varieties to single ones, but there was a great falling off in the group classes. Plants were better than usual, fruits were good, but the collections of vegetables were not up to Brighton high-water mark. The new secretary, Mr. A. J. Gaston, fulfilled his duties admirably, and the committee, as usual, took their share in the work of the show; while the president, Mr. Alderman Jeremiah Colman, J.P., takes, as ever, a very close and keen interest in the society's work, and once again, at the close of the tedious work of arranging and judging the show, he entertained the officers, committee, pressmen, and local celebrities at luncheon, and on this occasion the Mayor and Mayor-elect of Brighton, the Mayor-elect of Hove, and the two members of Parliament for the district were present at this function.

GROUPS.

Chrysanthemum groups, which were once such a splendid feature at the Brighton shows, showed an enormous falling off this year. In the class for a group arranged in a circle 11ft. in diameter, there was only one exhibit, and this was from Mr. A. J. Jones, gardener to Mr. Alderman E. M. Marx, Hanover House, Hanover Crescent, Brighton, who had some good blooms, but had not arranged his plants to advantage, nor had he been at any trouble to provide dwarf plants to hide the boxes on which the plants were raised. The dry moss strewn around the pots in the front effect was by no means pretty, and served only to accentuate the failing already referred to. A second prize only was awarded.

For a circular group of chrysanthemums, arranged in a circle 8ft. 6in. in diameter, ferns and foliage plants allowed, there was again but one exhibitor, who had a very crowded centre, but had finished off the circumference with maidenhair ferns and nephrolepis. Japanese, single, and incurved varieties were used in this exhibit, which was staged by Mr. G. Chandler, gardener to S. C. Witting, Esq., Hollingbury Copse, Patcham, who, however, was only awarded a second prize.

Mr. G. Tunnell secured the first prize for a group of chrysanthemums arranged on a semicircle 10ft. by 5ft. This was in the amateurs' section, and the win was a good one. In a smaller amateurs' class, Mr. E. [illegible], Whippingham Road, Brighton, was to the front with Mr. Arthur Franks, Roe[illegible] Road, Brighton, second. There were [illegible] tables of chrysanthemums and foliage plants, and the prettiest of these was the one arranged by Mr. George Chandler, which secured the first prize: yellow decorative and single bronze chrysanthemums were pleasingly associated with ferns and grasses; Mr. F. Simmonds second; and Mr. W. Hill third.

PLANTS.

Bush plants were arranged in front of the orchestra in the dome, and premier award for a dozen pompon specimens was won by Mr. G. Lambert, 17, Bognor Road, Chichester, with freely-flowered examples of Bob, Mr. Astie, Sœur Melanie, etc.; second prize fell to Mr. G. H. Bennett, gardener to P. Bayer, Esq., Hatch Beauchamp, Withdean, Brighton. First prize for half a dozen bush plants was won by Mr. G. Lambert with good specimens of Lady Hanham, Sir E. Clement, W. Duckham, Miss A. Byron, Lady Conyer, and Mrs. A. H. Lees; Mr. Bennett was second, and Mr. A. Sayers, gardener to S. Copestake, Esq., Adelaide Crescent, Hove, third.

Mr. Lambert scored for two pompons, with Mr. Reuben Moore, 28, New Road, Lewes, second, and Mr. G. H. Bennett third. Mr. Bennett was a capital first for six bush plants of single varieties; his Mary Richardson, Mary Anderson, and F. W. Smith were very fine, but Mr. Bennett had not labelled any of his plants; Mr. S. Watkins, gardener to C. A. Wood, Esq., Maidencombe, Harrington Road, Preston, second; and Mr. Eastwood, gardener to Dr. Bryant, Tongdean, Dyke Road Avenue, third.

Mr. W. Hill, gardener to G. W. Ryder, Esq., Broadhill, Keymer, was the only exhibitor of a collection of orchids, and gained first prize with a pretty table of Calanthe Veitchi, Odontoglossum grande, Cattleya labiata, pleiones, and cypripediums. Mr. J. E. Hickson was a capital first for a dozen begonias, and he showed a fine form of Gloire de Lorraine, well grown and freely-flowered; Mr. A. Bish, gardener to Miss E. Fitz Hugh, North Acres, Stread, Hassocks, second; and Mr. F. Simmonds, gardener to Sidney Howard, Esq., Moulscombe Place, Brighton, third. Mr. Brackley was first for six begonias.

Mr. J. Harris scored for a dozen table plants with a pleasing set of crotons, aralias, and pandanus. Mr. W. Lintott, gardener to Sir Walpole Greenwell, Bart., Marden Park, Caterham, was easily first for six table plants, with Mr. C. Earl, gardener to O. E. Avigdor Goldsmid, Esq., Somerhill, Tonbridge, second. For single primulas, a dozen plants, Mr. F. Simmonds led the way with a good set; Mr. Eastwood second, and Mr. C. Moppett, gardener to A. Carey, Esq., Downside, Roedean, Brighton, third. Mr. H. Murrell, gardener to Mrs. Darby, Knowls Tooth, Hurstpierpoint, led for solanums, but we have seen these better represented at Brighton.

First prize for a table decoration of chrysanthemums was won by Mrs. Cooper, 26, The Warren, Broadwater, with a pretty design in rose-pink single flowers; Mr. H. J. Brill, Southdown Avenue, Brighton, second with yellow Source d'Or; and Miss S. Cheesman, Islingwood Road, Brighton, third with yellow and bronze Source d'Or flowers.

CUT FLOWERS.

The leading class for cut flowers was one for thirty-six Japanese blooms in not less than two dozen varieties. The chief award was a silver bowl, presented by Mr. Jeremiah Colman, and £3, and this was won by Mr. M. Sargent, gardener to G. L. Wigg, Esq., Rockshaw, Merstham, with bright, clean, fair-sized examples of Lady Talbot, Jumbo, W. Mease, J. Lock, A. T. Miller, C. H. Totty, Beecham Keeling, Master James, Mrs. Thorn, Leslie Morrison, Master David, Reginald Vallis, Mrs. C. Penford, Lady Crisp, Superb, Elsie Miller, Mr. R. B. Marsham, Rose Pockett, J. Peed, Mdme. Rivol, Sir Frank Crisp, Mary Inglis, and Mrs. R. H. Pearson. There were eight competitors, and the class was a difficult one to judge. Second prize fell to Mr. J. Harris gardener to Colonel Henty, Avisford, Arundel; third to Messrs. James Stredwick and Son, Silverhill, St. Leonards; and fourth to Mr. J. E. Hickson, gardener to Rev. F. S. Slater, Newick Park, Lewes.

The silver medal and 40s. offered as first prize for twenty-five Japanese blooms, arranged in vases, was won by Messrs. James Stredwick and Son, St. Leonards, their best blooms being Francis Joliffe, Olympic, Mdme. Rivol, and Master James; Mr. J. E. Hickson came second, and Mr. G. Best, gardener to H. S. Johnson, Esq., Seldenville, Worthing, third. Mr. Sargent was the only exhibitor of a dozen blooms of incurved varieties, and he was awarded first prize; his best flowers were Edwin Thorp, W. Biddle, Daisy Southam, Clara Wells, and Frank Tristram. Mr. Harris beat Mr. Best for six incurved blooms, and both showed fairly well. For six incurved blooms of one variety Mr. A. H. Geall, gardener to Miss Smith, Mirimachi, Withdean, led with good flowers of Buttercup; Mr. J. C. Reeves, gardener to Captain H. Acton Blake, Puck's Croft, Rusper, second with H. W. Thorp, and Mr. A. Sayers third with Emperor. For six Japanese, distinct, Mr. W. J. Finch, gardener to F. A. White, Esq., J.P., Oakleigh, East Grinstead, was first with H. Poulton, Mrs. A. T. Miller, Reg. Vallis, Lady Talbot, Sir Frank Crisp, and Mrs. R. C. Felton; Mr. W. Humphrey, gardener to F. W. Franks, Esq., Loampits, Tonbridge, second; and Mr. M. Sargent, third; seven entries. Mr. M. Sargent led for six Japanese blooms of one variety, with Lady Talbot in fine condition; Mr. A. H. Geall, second with F. S. Vallis, very bright; Mr. G. Best, third.

There was a splendid competition in the class for three vases of single varieties, no fewer than a dozen competitors coming forward; premier award fell to Mr. T. Brackley, gardener to Mrs. Brigden, Oaklands, Hassocks, for a beautiful lot of Pagram and other large varieties; Mr. T. Eastwood, second; Mr. G. Funnell, third; and Mr. W. G. Pelley, Ada Vale, Chesswood Road, Worthing, fourth.

In the single-handed gardeners' class Mr. J. C. Reeves led for a dozen Japanese blooms, in vases, followed by Mr. A. E. Clarke, gardener to Dr. Rouse, Worthing. Mr. Brackley scored for six blooms, with Mr. J. C. Reeves second. In the amateurs' division Mr. E. Farrell, Mr. E. J. Brooker, Sillwood House, Southwick; Mr. C. Fox, Richmond Lodge, Eridge Road, Tunbridge Wells; and Mr. A. Jeal, Montreal Road, Brighton; were the leading prizewinners for cut flowers.

FRUITS AND VEGETABLES.

Mr. C. Earl scored for three bunches of white grapes with Muscat of Alexandria, followed in order by Mr. A. H. Geall and Mr. W. Lintott. The latter led for black grapes with Alicante, followed by Mr. A. H. Geall and Mr. C. Earl. Mr. A. H. Parsons, Malling Street, Lewes, led for four dishes of culinary apples in a close competition, with Warner's King, Hollandbury, Peasgood's Nonsuch, and The Queen; Mr. T. A. Sandalls, gardener to G. Mason, Esq., Rottingdean, second. Mr. Sandalls scored for four dishes of dessert varieties with Cox's Orange Pippin, Blenheim Pippin, Baumann's Reinette, and Ribston Pippin; Mr. J. E. Hickson second, and Mr. W. Humphrey third. Mr. Hickson scored for two dishes of stewing pears. Mr. W. H. White had the best dish of dessert pears, Pitmaston Duchess in fine form. For four dishes of dessert pears Mr. W. F. Finch led with Doyenne du Comice, Pitmaston Duchess, Beurre Diel, and Durondeau; Mr. J. E. Hickson second. Mr. W. Cornish, Grovelands, Burgess Hill, had the best single dish of culinary apples, and showed Peasgood's Nonsuch finely; Mr. J. Harris second with the same variety.

In the open class for a collection of eight kinds of vegetables, Mr. W. J. Finch, Oakleigh, East Grinstead, secured the first prize; Prizetaker leeks, Michaelmas White broccoli, and Sulham Prize celery were the best sets staged. Mr. W. Manton, gardener to Mrs. Mashiter, The Grange, Hurstpierpoint, a good second, and Mr. T. Brackley third. Mr. J. Durrant, Pakyn's Lane, Hurstpierpoint, led in the class for a collection of vegetables, prizes provided by Messrs. Tilley Brothers. In another class Messrs. J. Davis and Sons gave the prizes, and here Mr. W. J. Finch was to the front.

Mr. Earl scored for tomatoes, and Mr. W. J. Finch was a capital first for four dishes of potatoes, winning with King Edward VII., White City, Superlative, and Duchess of Conrwall; Mr. H. Murrell second; and Mr. C. Short, Chestham Park, Henfield, third. Mr. Finch scored for six onions with a very heavy set of Ailsa Craig; Mr. A. H. Parsons, Lewes, second; eleven entries. In another class for onions Mr. H. Norman was first among eight competitors.

NON-COMPETITIVE.

Unusually attractive for the time of year was the big exhibit of pæony-flowered dahlias from Messrs. Bakers, Wolverhampton; the big blooms and brilliant colouring of the varieties were very striking, and attracted a great deal of attention. Mr. Jas. H. Hill, Burgess Hill, Sussex, contributed a small group of varieties of Cattleya labiata, Odontoglossum grande, and cypripediums. Mr. F. Woollard, Lewes Road, Brighton, staged a collection of apples, together with chrysanthemums and branches of autumn-tinted foliage. Messrs. J. Cheal and Sons, Crawley, put up a charming lot of single and miniature cactus dahlias, as well as a collection of well-grown and highly-coloured apples.

Messrs. Balchin and Sons, Brighton, put up a delightful exhibit of brilliant crotons and dracænas, flanked with beautifully-grown pot plants of decorative chrysanthemums, and backed by tall palms and dracænas. The margin of the exhibit consisted of Begonia Gloire de Lorraine and rosy-pink varieties of Primula obconica.

Messrs. Toogood and Sons, Southampton, put up a fine collection of vegetables, the whole of their specimens being tastefully set on new lawn grass, grown in boxes for the purpose. Onions, sprouts, cauliflowers, turnips, and Globe artichokes were the leading features. Messrs. W. Wells and Co., Merstham, sent new Japanese and single chrysanthemums. Messrs. G. Bunyard and Co., Maidstone, put up a very fine display of apples and pears, and Mr. Coleman, The Vineries, Burgess Hill, sent fruiting vines and grapes; while Messrs. Tilley Brothers, 133, London Road, staged bulbs, flower pots, and sundries.

Broughty Ferry Horticultural Association.

The ordinary monthly meeting was held under the presidency of Mr. James Bethel, on the evening of the 18th ult. Mr. George Masson, Ayestree Gardens, was the essayist, and his subject was "Notes on a Few Greenhouse Flowering Shrubs." The essayist deplored the disrepute into which this class of plants had fallen in late years, and, as a sequel, young gardeners were not acquainted with their habits and requirements. Mr. Masson took up five genera, viz., azalea, erica, genista, habrothamnus, and luculia. These were described, and cultural details enlarged upon; the best and most accommodating species and varieties were mentioned, and the general remarks made applicable to a wider range of greenhouse flowering shrubs

A good discussion followed, when many of the members eulogised the essay, and referred to it as "of high practical worth and a first-class literary production."

The exhibits consisted of thirty-six varieties of sweet peas, and twelve varieties of single outdoor chrysanthemums, from Mr. William Grant, Fernhall Gardens. The president showed a miscellaneous collection of blooms from greenhouse shrubs to illustrate the subject for the evening. A competition for six onions and six leeks brought forward six competitors, and the judge, Mr. James Kinnear, Fernbrae Gardens, Dundee, had no little difficulty in placing the awards: 1st, Mr. John Campbell, Forbes Court Gardens; 2nd, Mr. William Moir, Chellwood, Monifieth; 3rd, Mr. James Bethel, The Grange Gardens, Monifieth.

Herefordshire Fruit Society.

This society held its nineteenth annual show on October 26 and 27 in the Shire Hall, Hereford, where apples and pears in particular were staged of remarkably good quality, and the many classes devoted to them were well filled; in fact there was no falling off in the quantity and quality of these fruits from that staged in the best of previous years, though, owing to the trying character of the season, it was generally feared there would be. To give anything approaching a full description of the produce staged in the 123 classes provided would take much more space than can be spared, and our remarks must therefore be confined to leading features.

In the class for fifty dishes of apples, arranged with foliage decorations, on 70 square feet, there were five lots staged, the leading one coming from the King's Acre Nurseries, Lim., Hereford, who had a fine display of clean, bright, and large fruits of choice varieties, arranged with excellent taste; notable varieties were Newton Wonder, Lane's Prince Albert, Coronation, Lawrie's Cornish Giant, King Edward VII., Hector McDonald, Tyler's Kernel, James Grieve, Werder's Golden Reinette, Rival, Allington Pippin, Cox's Orange Pippin, and Lord Hindlip; the second prize was taken by Mr. Caddick, of Caradoc, Ross, with a collection but slightly inferior to the leading one, his weak points being found among his front dishes. Mr. W. Jones, gardener to Mrs. Hill, Moreton Court, was placed third. For thirty dishes, the class attracted only one exhibitor, viz., Mr. Taylor, gardener to J. Riley, Esq., who staged a good assortment of leading varieties, including amongst his best, Ross Nonpareil, Christmas Pearmain, King of the Pippins, Worcester Pearmain, James Grieve, Newton Wonder, Emperor Alexander, Blenheim Pippin, Beauty of Kent, and Annie Elizabeth. Seven exhibitors staged eight dishes of dessert apples, and in this class Mr. Kelly, gardener to Messrs. Getting and Newton, Glewstone Court, Ross, was first with good clean fruits of American Mother, Blenheim Pippin, Ribston Pippin, Cox's Orange Pippin, Wealthy, Charles Ross, Worcester Pearmain, and Washington; Mrs. Bashill, Bridge Sallars, second, with an almost equal production; Mr. J. Sykes, gardener to Colonel Henry, third. For a dozen varieties of culinary apples. Mr. Kelly again took the lead, and staged fine examples of Emperor Alexander, Newton Wonder, Lord Derby, Lane's Prince Albert, Warner's King, Peasgood's, Bismarck, Scarlet Custard, and Stirling Castle; Mr. C. Thomas, gardener to Captain W. S. C. Cox, and the Rev. G. H. Devonport, followed closely in the order named.

Single dish classes were confined to twenty-four varieties of apples. Beginning with Cox's Orange Pippin apple, Mr. Webb, Glewstone, Ross, was first; for Blenheim Pippin, Mr. Caddick led; Mr. C. Thomas was first for King of the Pippins; and Mr. Kelly first with Ribston Pippin; for Warner's King Mr. Thomas was to the front; Mr. Thomas was first for Bramley's Seedling; and also for Lane's Prince Albert; and for Dumelow's Seedling Mr. A. G. Burney led; for Gascoigne's Seedling Mr. Caddick led, as he also did for Peasgood's Nonsuch and Newton Wonder; Mr. J. Ridley was first for Annie Elizabeth, and Mr. Caddick for Lord Derby; Colonel Henry was first for Allington Pippin, and Mr. R. M. Whiting first with Encore for any new variety. For any other mid-season kitchen variety Mr. Morland Hall led with Stirling Castle, and for any other late variety Mr. Thomas was first with Bismarck; for any other mid-season dessert variety Mr. Burney was first with Charles Ross, and for any other late dessert kind Mr. Whiting was first with King of Tomkins County.

Special classes included one for eight dishes of kitchen apples and four of dessert varieties; here Mr. C. W. Powell led with a fine collection; Mr. J. Bott second amongst four exhibitors. In a class for six recently introduced apples, Mr. Powell was the only exhibitor, and had Charles Ross, Rival, James Grieve, King Edward VII., Coronation, and Lord Hindlip. Six kinds of dessert and twelve of kitchen apples brought out five competitors, Mr. Thomas being first with good fruits of leading varieties; Mr. Kelly second; and Mr. A. Perry, Palmer's Court, third. For eight dishes of culinary apples Mr. Thomas was again placed first and Mr. Kelly second. In a class for eight dishes of dessert varieties, Mr. Kelly took the lead, staging nice fruits of Margil, Adams' Pearmain, Rival, Ribston Pippin, Worcester Pearmain, Cox's Orange Pippin, Lady Sudeley, and Wealthy; Mr. A. S. Burney second.

For the best dish of dessert apples Mr. Thomas scored with one of Cox's Orange Pippin, and he also won with Lane's Prince Albert for the best dish of culinary apples. Mr. Wooton, Byford, had the best dish of pears, Doyenne du Comice, and with a fine bunch of Muscat of Alexandria the Rev. C. H. Devonport scored for the best bunch of grapes.

There were five exhibits for twelve varieties of pears, and the Rev. G. H. Devonport, Foxley, was placed first, having meritorious dishes of Doyenne du Comice, Pitmaston Duchess, Beurre Diel, Easter Beurre, Nouvelle Fulvie, Beurre Rance, Marie Louise, Durondeau, Duchess d'Angoulême, Emile d'Heyst, and Le Lectier; Mr. Parrott, gardener to A. W. Foster, Esq., Brockhampton Court, second. For eight dishes, Mr. C. Liddle, gardener to Sir J. Cotterell, Garnous, led with fine fruits of Easter Beurre, Pitmaston Duchess, Doyenne du Comice, Durondeau, Nouvelle Fulvie, Josephine de Malines, Marie Louise, and Beurre Superfin; Mr. Whiting, Credenhill, second.

The best dish of Marie Louise and of Doyenne du Comice came from the Rev. G. H. Devonport; of Pitmaston Duchess, from Mr. Parrott; and for any other dessert kind, Mr. J. Morgan led with Beurre Diel; and for any stewing kind, the Hon. Mrs. R. Wilmot was first with Catillac.

For a decorative group of fruit, fresh or preserved, arranged on fifty square feet, there were three exhibits staged, the King's Acre Nurseries, Lim., taking chief honours with a splendid stand, having a background of fruit trees in pots, with a frontage of a collection of apples, pears, etc., arranged in boxes, and dishes, flanked with groups of bottled fruit; Mr. Caddick followed, having a fine collection of apples, ornamented with decorative plants as his chief subjects; Messrs. Pewtress Bros., Tillington Nurseries, third, with a similar stand.

Only one class was provided for a collection of miscellaneous fruits, but five collections were staged, Mr. Liddle taking the lead with Gros Maroc and Muscat of Alexandria grapes, Doyenne du Comice pears, James Grieve apples, Emerald melon, and Coe's Golden Drop plums; Mr. Sykes second with an almost identical collection; and Mr. W. E. Hyde, Norwood Hall, third.

The best Muscat of Alexandria grapes came from the Rev. G. H. Devonport, who had fairly good examples. Gros Colmar made a good class, Mr. Liddle and Mr. Sykes being placed first and second in the order named, with capital bunches. Mr. Liddle again took the lead for any other black variety with splendid examples of Mrs. Pince, followed by Mrs. Woodhouse with Alicante.

Many classes were provided for cider and perry fruits, and for cottagers as well as for agricultural roots, grain, hops, etc. Vegetables were good, and for these Messrs. Sutton and Sons, Reading; Messrs. Webb and Son, Stourbridge: the King's Acre Nurseries, Lim.; and Mr. Wilson, Commercial Street, Hereford, offered prizes, the exhibits making an interesting addition to the show.

The classes devoted to chrysanthemums were for cut blooms arranged in vases, the chief prize winners being Mr. Parrott, gardener to A. W. Foster, Esq., Brockhampton Court, Ross; C. J. Holford, Esq., and T. W. G. Williams, Esq.

Non-competitive exhibits were not numerous. Messrs. Young and Co., Cheltenham, had a fine stand of leading varieties of carnations; The King's Acre Nurseries, Lim., set up a large collection of apples, pears, floral designs, etc.; and Mr. J. Wilson, Hereford, sent bouquets, wreaths, fruit, and lily of the valley.

International Horticultural Exhibition, 1912.

On Tuesday, October 25, a meeting of secretaries as representing counties in England and Scotland, Ireland, and Wales was held in the Hotel Windsor, Victoria Street, Westminster, to consider certain details regarding the projected International Exhibition for 1912. Mr. Gurney Fowler, chairman of the Executive Committee, presided, and the attendance numbered between 40 and 50 representative officials.

Opening the proceedings, the Chairman thanked the representatives for attending in such large numbers, and said that the business before them was to consider the resolutions passed by the Executive Committee at a meeting held on Tuesday, June 14, and to make recommendations thereon. These resolutions were

NATIONAL CHRYSANTHEMUM SOCIETY'S SHOW.
Mr. W. Iggulden's First Prize twelve vases of Japanese blooms in the Great Vase Class.

(1) The country be divided into Territorial District Committees, making individual counties into separate districts where their importance justifies it.

(2) Presidents and hon. secretaries be appointed. The hon. secretaries to be consulted as to the appointment of local committees proposed to consist of about ten members. The list of names on the local committees to be submitted to the Executive Committee for approval, and names to be added by the Executive where desirable.

(3) The duties which local committees shall be invited to undertake shall be clearly defined, viz., getting exhibitors, guarantors, and subscribers, and making known in their respective districts that an international exhibition will be held in London in 1912; also that local committees shall be invited to make recommendations to suit local conditions.

(4) That every president and secretary of a local committee should have a ticket for the opening two-guinea day; that members and local committees should have one ticket each.

(5) That the local hon. secretaries should be invited to London to meet the Executive Committee to consider and discuss a common course of action. The third-class railway fares to be paid if requested.

(6) That Scotland, Ireland, and Wales should have a committee each to organise their respective countries.

(7) That members of the general committee be appointed members of the local committees of their respective districts. At a later meeting, it was resolved that each hon. secretary should be styled the local representative of the Executive Committee.

The earnest wish of the Executive Committee, the Chairman said, was to carry the provinces with them, and make this exhibition an exhibition for the whole of the United Kingdom, and in which everyone connected with horticulture might personally feel interested. On the question of making the exhibition known, he mentioned that posters were being prepared to be exhibited at local shows, and local secretaries were to be asked to have paragraphs and similar announcements inserted from time to time in newspapers circulating in their respective districts. Then the question of the tickets of admission was one on which the Executive desired the opinion of the local secretaries. As far as the disbursements were concerned, the Exhibition Committee would be willing to pay all proper disbursements of the local secretaries and certain other items authorised at headquarters.

A desultory conversation followed the programme laid down by the chairman. Ultimately, Mr. Molyneux proposed that there should be a committee for each county, and with regard to the chairman or president of each particular committee, that the name proposed should be submitted to the Executive before appointment.

Mr. Hudson seconded, and this was carried unanimously.

The Chairman said that it had been suggested that the chairman and secretary should send a list of names to be formed as a local committee, not necessarily ten, which was a tentative number; and with reference to Scotland, that that country be divided into two districts.

Mr. Whitton said it had been suggested that in Scotland a public meeting should be held in Glasgow, at which the chairman of this meeting or some other representative should attend, and that would incite very considerable interest in the exhibition.

The Chairman thought this a valuable suggestion, and one that should be acted upon.

The Chairman intimated that the opinions expressed would be submitted to and considered by the Executive Committee, The meeting then adjourned.

Bristol District Gardeners' Association.

The first meeting of the winter session was held on October 13, at St. John's Parish Rooms, when Mr. Hayball presided over a large attendance. Mr. Townsend, representative of the Reading Society, gave an interesting paper on "Annuals." A large number of slides were used by way of illustration, and the lantern was efficiently manipulated by Mr. Hunking, ably assisted by Mr. Cox, also of Reading. Annuals for pots, and half-hardy annuals for borders, were the two headings under which Mr. Townsend dealt with annuals, and he included in the former myosotis, mignonette, rehmannia, schizanthus, clarkia, godetia, larkspur, Gypsophila elegans, celsia, rhodanthe, nemesia, and salvia. These, he said, if grown under cool conditions, make good subjects for pots. For borders the lecturer recommended as annuals, or to be grown as annuals, hollyhocks, marguerite carnations, dianthus, verbena, antirrhinums, pentstemons, petunias, cosmos, anchusa, arctotis, statice, salpiglossis, and scabious. These, if sown early in the year, would make a good display in the borders.

The members greatly appreciated the lecture and slides, and hearty votes of thanks were given to Messrs. Townsend and Cox, and to Mr. Hunking.

For three bunches of early chrysanthemums Messrs. Springham and Woodward won as placed, and the same two members were awarded four points each, the former for a dish of green peas, the latter for orchids.

A largely attended meeting was held on October 27, at St. John's Parish Rooms, Dr. Shingleton Smith in the chair. The indoor and outdoor culture of sweet peas was dealt with in papers read by Messrs. Garnish and Harford. Mr. Garnish opened with a short paper upon indoor culture for market. In his practice the seeds are placed in saucers for a few days and kept moist till germinated, when they are sown in trays. The young plants are transferred to pots when two inches high, one plant being put in each. The borders in the house are dug two spits deep, and animal manure, bonemeal, and soot added. When the plants are ready they are put out in rows three feet apart across the house. Strings are used in place of sticks for support. Several applications of nitrate of soda are made and watered in. Mr. Garnish said this liberal treatment made them grow so luxuriantly that they had to be taken down and layered, but the result was quite satisfactory. Mr. Harford followed with the system he has adopted for outdoor culture of sweet peas. This system includes a good open position, sheltered from west winds, thorough trenching, not too much manure, planting out from pots firmly, and thinning to three strong growths. For a collection of vegetables, Mr. Binfield was first, Mr. Springham second, Mr. Young third. A certificate was awarded to Mr. Garnish for several vases of chrysanthemums. Mr. Woodward was given four points for a dish of apples Charles Ross.

Beckenham Horticultural Society.

On Friday, the 28th ult., Mr. M. E. Mills, of Coombe House Gardens, Croydon, lectured to a good audience (which included several ladies) on "Some Pretty Gardens and Flowers," illustrated with lantern slides. Councillor W. J. Norris occupied the chair. Some views of Kew Gardens, both glasshouses and the rockery, were first shown and briefly dealt with by the lecturer. These were followed by some views of the Royal Horticultural Society's Gardens at Wisley. The water lily ponds shown were surrounded by trees and shrubs, and to the falling and decaying leaves of these in the water the lecturer attributed the vigour of the water lilies. Then followed views of some small gardens in the neighbourhood of Croydon, all noted for some special feature, either of landscape or culture, one especially for forced strawberry culture; but as the lecturer failed to have the "secrets" of success in this particular instance confided to him, it did not transpire how the very remarkable crops mentioned were produced. Lastly, some beautiful slides from the gardens of Coombe House were shown. The very fine Cedrus Libania, of which there are several; the rockery and its occupants were well treated on, and afforded much pleasure. A question was put to Mr. Mills respecting Begonia Lloydi raised by him, and as to its culture. It wants growing in full sunshine, no shade, and can be raised easily from cuttings. A good discussion followed. Mr. Francis Hooper, an architect, of Beckenham, spoke at some length, and urged for a greater individuality in gardens. Hearty thanks were accorded both lecturer and chairman. Mr. Abrahams exhibited tomatoes.

Blackheath Horticultural Society.

A meeting was held on October 28 at the Church Street Schools, Lee, when a lecture was given by Mr. T. W. Sanders, F.R.H.S., on "Diseases and Enemies of Plants." The meeting was well attended, and the audience was amply rewarded by the lecture on this interesting subject. The diseases and enemies dealt with by the lecturer were very numerous and varied. One thing in particular he wished to impress on his hearers, and that was the necessity for using a soil fumigant to kill the larvæ of many of the plant parasites. This, he said, would prevent their development in the spring, and was a much better way than letting the larvæ pass through their several stages and produce more enemies of their kind to work havoc amongst the trees and plants. Several methods of making insecticides and fungicides were described. A hearty vote of thanks was accorded Mr. Sanders for his able lecture. The next lecture will be given by Mr. W. P. Bound, F.R.H.S., on November 25, and the subject will be "Present Day Orchid Culture."

ANSWERS TO CORRESPONDENTS.

CARNATIONS.—J. B., Haywards Heath: We are glad to hear from you, and to know that the articles have been so useful. You will have seen that others have appeared recently, and we hope these will prove equally useful to yourself and friends.

DISEASED VIOLAS.—W. H. E., Sheffield: The specimens sent were totally insufficient for a proper investigation. It would appear that the trouble is due to the biting action of some mite or larger insect, possibly earwigs, and the irritation thus set up has resulted in the swollen and compressed tips of growth. Red spider was present, and this would also affect growth, but is, in your case, a contributory cause rather than the real cause of the trouble. See that the plants do not lack moisture; top-dress them with a light mixture of leaf-soil and manure, and dust the points of growth with tobacco powder.

HORTICULTURAL STUDY.—A. R., Middlesborough: A few books that would be of special value to you in connection with the points raised include "The Chemistry of the Garden," Macmillan and Co., 1s.; "Pictorial Practical Gardening," Cassell and Co., 1s.; "The School Garden," Blackie and Co., 1s.; "Primer of Horticulture," Macmillan and Co., 1s.; "The Soil," John Murray, 3s. 6d.

APPLES AT COVENT GARDEN.—J. G., Suffolk: You could make purchases through a commission agent, but the price you would have to pay would be the current rate per bushel or half-sieve, plus the agent's commission and the carriage of the fruit to your house from the market. It is very probable that you would be able to purchase locally at a cheaper rate, or at a market near at hand; at least, this is a matter you should consider, as the cost of carriage from London is considerable. If you wish to purchase at Covent Garden, write to the Market Superintendent, Covent Garden, W.C., who will give you names of agents who buy and sell on commission.

THE NEW WINTER WASH.—G. C. W., Lincoln: The new winter wash for fruit trees, to which we have previously referred, is an improvemnt upon the old one, and is the result of experiments made by Mr. Spencer A. Pickering, director of the Woburn Experimental Fruit Farm. The formula is as follows: Iron sulphate, $\frac{1}{2}$lb.; lime, $\frac{1}{4}$lb.; caustic soda, 2lb.; paraffin (solar distillate), 5 pints; and water to make 10 gallons. In order to prepare the wash the iron sulphate should be dissolved in about nine gallons of water. The lime should then be slaked in a little water and be well stirred, a little more water being added to make a "milk." The "milk" of lime should next be run into the iron sulphate solution through a piece of sacking or a fine sieve to remove grit or coarse particles. The paraffin should then be added and the mixture churned thoroughly. Just before using, the caustic soda, in the powdered form, should be added to complete the "wash." This wash, which has both a cleansing property and an insecticidal value, is recommended for application while the trees are dormant, and certainly before the buds have burst. Perhaps the greatest advantage would result from such a wash if applied about the beginning of February.

LAWN BEDS FOR ROSES.—W. W. B., Towcester: Many kinds of roses are admirably suited for beds on lawns, but the size and form of the bed should be adapted to space and environment, and also to the kind or style of roses to be used. The beds should not be over large, or fanciful in design, the latter being objectionable because of the difficulty in using the mowing machine on their margin. As a rule, circular and oblong beds are preferable, and, as indicating the most suitable dimensions, it may be mentioned that circular beds, ranging from four to five feet, and oblongs from three and a-half to four feet wide, and from four to six feet long are the most convenient. As a deeply-stirred and liberally enriched soil gives the best results in the culture of roses in beds, as elsewhere, a thorough preparation of the beds is necessary. This will consist in dressing them with sufficient manure from an old hotbed, the farmyard, or stable, to form a layer of six to eight inches in thickness, and then breaking up the soil to a depth of thirty inches or three feet, and well incorporating the manure with the soil throughout its whole depth. If the good soil is too shallow to admit of the deep stirring here suggested, the top spit should be thrown out, and twelve or eighteen inches of the subsoil be removed and taken to some other part of the garden. Then replace with the manure and good loam or soil from the surface of the kitchen garden. Old soil in which chrysanthemums or strawberries have been grown will be most useful in the preparation of rose beds, as also will decayed vegetable refuse, which may be used in liberal proportions. The beds should be prepared, when practicable, a few weeks before planting, so that the soil may become somewhat consolidated. The planting may be successfully carried out from the end of October until the beginning of March, provided the weather is open, and the soil is neither frozen nor too wet to be worked without being converted into a more or less pasty condition.

INSECTS ON THORNS.—H. S., Barnsley: The tips of growth were infested with thrips and red spider, themselves evidence of dry conditions in atmosphere and soil. Gather up and burn the fallen leaves, prune the trees lightly during the winter, mulch the roots freely with half-decayed manure, and, next year, see that the roots do not lack moisture. Next spring spray the tree occasionally with a weak nicotine solution, and repeat the operation during the summer if it appears necessary.

RICHARDIA LITTLE GEM.—"W. T." writes: Some few weeks ago there was an Editorial note in the Gardeners' Magazine asking the best way to flower this richardia. I have not seen that any correspondent has given the result of his experience, hence my note. I am somewhat diffident in giving my experience, as I have not grown the variety now for several years, but when I did so it used to flower freely. When attention was first directed towards it we were led to expect pots full of its pretty litle flowers, as it produces offsets so freely. In practice, however, flowers were not to be obtained in this way, and, after several experiments I found it was necessary to take off all the suckers in order to obtain a satisfactory display of bloom. After that I grew my plants singly in four-inch pots, taking care when potting that every offset, however tiny, was removed. Grown in this way the plants were very useful for dropping into small vases, or for the edging of groups, while larger specimens could be made up if desired. It may interest your correspondent to know that the golden rule is to keep the plant clear of offsets, at least it used to be. As my experience is not a recent one, I had hoped that someone more up-to-date would have answered the query.

NAMES OF PLANTS.

S. G., Chesham.—The specimens were very poor ones; No. 2 is probably Begonia fuchsioides.

B. H., Bexley.—1, Cotoneaster frigida; 2, Diplopappus chrysophylla; 3, Stachys lanata; 4, Rhus cotinus.

P. L. E., Manchester.—1, Justicia calycotricha; 2, Grevillea robusta; 3, Saxifraga Fortunei; 4, Berberis Darwini.

M. S., Leicester.—1, Pelargonium quercifolium; 2, P. capitata; 3, Cypripedium Actæus; 4, C. insigne, a good variety.

L. B., Towcester.—1, Diosma ericoides; 2, Lespedezia bicolor; 3, Helenium pumilum magnificum; 4, Cymbidium eburneum.

T. H. I., Byfleet.—1, Cattleya Loddigesi; 2, not recognised; 3, Epidendrum variegatum; 4, very shrivelled, probably Læli Perrini; 5, Cypripedium barbatum. The aster is evidently A. diffusus.

GARDEN FOES.

By T. W. Sanders, F.L.S. Price 2s. 6d. net; by post 2s. 10d. (W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London, E.C.).

Many books have previously appeared on the insect pests and fungoid diseases, but none has attempted to cover such a wide field as the one now before us. In its 336 pages all pests and all diseases of any serious importance have been fully described, and the remedies, where known, given for their destruction or their prevention.

The fruit grower, for example, will find valuable information on the enemies and diseases of fruit; the vegetable grower similar data about vegetable crops; the flower gardener full details about plant pests; the greenhouse owner everything regarding the foes that are capable of injuring indoor plants; the forester the chief pests and diseases that attack trees; indeed, every pest from the tiniest mite and microscopic eelworm to the marauding cat, the mischievous bird, or the burrowing mole, has received attention.

Then, full attention has also been paid to the subjects of insecticides and fungicides. All the leading formulæ are given, together with descriptions of the chief proprietary articles, their uses, and the time for their application. The methods of spraying are fully described, as also are the different types of spraying apparatus. The fumigation of glass houses by means of nicotine compounds and cyanide is likewise amply dealt with, and full information supplied in a way which may be easily understood by those who lack experience in such matters, and desire guidance as to how and when to fumigate in the proper manner.

Not the least interesting feature of the volume is the chapter devoted to a description of the various insect, animal, and bird friends met with in gardens, which it is essential gardeners should be able to distinguish from the many foes described in the earlier chapters.

The volume is profusely illustrated, and is in every way a reliable guide for amateur and professional gardeners who desire information about the pests and diseases of fruit, garden, and other crops.

FORTHCOMING ENGAGEMENTS.

TUESDAY, November 8.—Birmingham Chrysanthemum Show; three days.
Royal Horticultural Society; committees meet at 12 o'clock; lecture at 3 p.m. on "Observations on the Blossoming of Hardy Cultivated Fruits," by Mr. Cecil H. Hooper; Scientific Committee at 4 o'clock.
Ulster Chrysanthemum Show; two days.
Southampton Chrysanthemum Show; two days.
Oxford Chrysanthemum Show.
WEDNESDAY, November 9.—Northampton Chrysanthemum Show; two days.
Bath Gardeners' Chrysanthemum Show; two days.
Liverpool Chrysanthemum Show; two days.
Cambridge Chrysanthemum Show; two days.
THURSDAY, November 10.—Wandsworth Chrysanthemum Society; two days.
East Cowes Chrysanthemum Society; two days.
Weston-super-Mare Chrysanthemum Society.
British Gardeners' Association, London Branch.
FRIDAY, November 11.—Sheffield Chrysanthemum Society; two days.

HAVE YOU A GARDEN?
If so Don't Risk Catching Cold when you can avoid doing so by wearing our celebrated "G" BRAND GRAINED CLOGS Lined with Fine White Felt Only **4/6** Postage Paid.
Any size, Men's or Women's, all ready for posting off.
Our No. 688 in List.
Note.—All sizes are as ordinary Boots. If you forget your size draw a pencil round your stocking foot and send to us. **THE GARDEN BOOT WAREHOUSE, 6, Wellington Street, GLASGOW.**

Situations Wanted—*continued.*

SEED TRADE.—Young Man requires SITUATION as Counter Hand or General Assistant; 12 years' experience; excellent references. C., 42, Market Hill, Maldon, Essex.

SITUATION required to look after Pony and Trap, help in Garden, and generally useful; good references; age 21. E. WEBB, Crowsley Park Lodge, Harpsden, Henley-on-Thames.

YOUNG MAN, age 21, seeks SITUATION in large garden (Inside or Out), Kitchen Garden or Pleasure Grounds; 8 years' general experience; excellent references; Bothy preferred. Write GARDENER, c/o Wardley's Stationery, Mill Street, Guernsey.

YOUNG MAN seeks SITUATION Inside as bulb forcer, bedding grower; also knowledge of ferns; 9 years' experience; good refs. Apply REGINALD, c/o Mrs. Chaffey, Challis House, Langport, Somerset.

YOUNG MAN (22) seeks SITUATION to help in Kitchen Garden and Pleasure Grounds; strong and willing; good references. Apply, H. WEEKES, Merther Lane, Probus, Cornwall.

YOUNG MAN, experienced in Ferns, Bedding Plants, Tomatoes, Soft-wood, Climbers, Shrubs in Pots Wreaths, etc.; can manage glass of small Nursery.—BARTLETT, 3, Eastcote Road, Harrow.

YOUNG MAN, age 21, seeks SITUATION in good garden; 6 years' experience; excellent references; can be highly recommended by Mr. A. COLLINS, Stud House Gardens, Hampton Court, as a good and willing worker; in or near London preferred. G. CHANDLER, 58, Westland Terrace, Queen's Road, Alton, Hants.

Employment THE GARDENERS' MAGAZINE Register.

The charge for an Advertisement INCLUDES A FREE ENTRY ON THE REGISTER. Immediate Notice must be given when an engagement is secured.

A List of Gardeners on the Register will be supplied to employers only upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

Situations Wanted.

HEAD GARDENER, The Hall, Harbury, Leamington, highly recommends YOUNG MAN, 18, under good Gardener; 3½ years here; excellent worker; Bothy preferred. F. FIELD, as above.

GARDENER (Head).—The Rt. Hon. the EARL OF KINNOULL highly recommends R. ROBERTSON to any Lady or Gentleman where several are kept; 19 years' experience in growing Grapes, Figs, Peaches, Melons, Orchids, Stove and Greenhouse Plants, Vegetables, Hardy Flowers and Fruits; age 34; married, and life abstainer. Address Balhousie Castle Gardens, Perth, N.B.

MR. E. R. BEVAN highly recommends his late HEAD GARDENER; 13 years in his service; life experience in all branches; most capable and trustworthy; 39; married, one child. H. KING, Rempstone, Corfe Castle.

GARDENER (Head Working).—Mr. WATSON can highly recommend C. WALLIS, where two or three are kept; been here 5½ years as Second of five; age 30; married, one child. The Gardens, Bushey Down, Tooting Common.

GARDENER (Head Working), late of Hungerford Park; well up in all branches, Inside and Out; excellent references; 4 years in last place; married; age 41; abstainer. F. EARL, c/o W. Irving, 2, Kent Villa, Stanwell Road, Ashford, Middlesex.

GARDENER (Head Working); life good practical experience in all branches, Inside and Out; Early and Late Forcing; excellent references. H. TURNER, 62, Star Road, Peterborough.

GARDENER (Head Working); 24 years' practical experience in the cultivation of Flowers, Fruit, and Vegetables Inside and Out; good [illegible] in the alteration and improvement of Gardens and Pleasure Grounds; six years' excellent character; married; age 39. SQUELCH, Keston, Hayes S.O., Kent.

GARDENER (Head Working where one or two more are kept, or good Single-handed); experienced Inside and Out; good references, and recommended; age 27; married when suited. W. CROUCHER, 11, North Terrace, Hythe, Kent.

GARDENER (Head Working), age 45; married, no family; experienced in all branches (Inside and Out); excellent testimonials. WM. SMITH, care of Mrs. Clibury, Weather Lane, Astley, Stourport.

GARDENER (Head Working); active, thoroughly experienced in all branches of Gardening; 3¼ years in present situation; 17 previous as [illegible]; married, two children, youngest boy 13. [illegible]GGLETON, The Lodge, Brazier's End, Tring. (No circulars.)

GARDENER (Head Working), requires SITUATION; experienced in Vines, Peaches, [illegible] Cucumbers, Stove and Greenhouse Plants; [illegible] Kitchen Garden, Hardy Fruit, etc.; good references; married, no family. W. S., 16, Warwick Place, Maidstone, Kent.

GARDENER (Head Working), age 33; can be highly recommended; thorough experience in all branches, fruit, flowers, and vegetables; Inside and Out; excellent references. WICKS, The Gardens, Halstead Place, near Sevenoaks.

GARDENER (Head Working) requires SITUATION; experienced Vines, Peaches, Melons, Fruit, Flowers, Vegetables; 5 years' good character; married. C. N., Clarence Cottage, Broadbridge Heath, Horsham.

GARDENER (Head Working), age 38, married, practical, all-round life experience in all branches, desires situation where energetic, trustworthy man is required; has had experience in alterations and remodelling neglected gardens; excellent references. GARDENER, Heathfield, Chielehurst Kent.

GARDENER (Head Working where one or more are kept); thoroughly experienced in all branches, Inside and Out; age 36; married; good references. EVANS, Dinmore Hill Leominster.

GARDENER (Head Working); age 44; life experience; 21 years' excellent references from first-class establishments; thorough knowledge in all branches; leaving own request; no young children, youngest 14. W. BLOOMFIELD, Staplehurst, Kent.

GARDENER (Head Working, where one or more are kept, or good Single-handed); experienced Inside and Out; good references: abstainer; married; age 29. W. S., Office of this Paper.

GARDENER (Head Working, where two or more are kept); good all round; can be well recommended; married when suited; age 36. PEARCE, 10, Roxwell Road, Shepherd's Bush.

WANTED, SITUATION as HEAD WORKING GARDENER, where two or more are kept; lifelong experience in all branches, inside and out; also landscape work; Churchman; abstainer; excellent references; married: one child; North of England preferred; age 30. Apply GARDENER, care of Hy. Wardhaugh, Shotley Bridge, Durham.

New Late-Fruiting Raspberry,

DANN'S MONARCH.

AWARD OF MERIT at the Eastbourne Horticultural Society's Show, Nov. 2nd, 1910.

This is without doubt the finest Autumn Fruiting Raspberry ever sent out, being a dessert berry of splendid flavour and very large, almost as large as the strawberry. It is an enormous cropper and very hardy. It commences to ripen in August and continues in fruit, if the weather is mild, until December in the open. 115lbs. of fine berries were picked from my canes the last week in October this year.

Well-rooted Planting Canes, 15/- per doz.; £5 per 100
Free on rail. Cash with order.

FROM **A. E. DANN,**
Fruit Grower,
Oaklands, HAILSHAM, Sussex.

Please mention "Gardeners' Magazine" when ordering.

CHRISTMAS ROSES, Helleborus Niger; strong clumps; full of bud. 9s.-12s. doz.—ELLISON, 57, West Bromwich.

AMERICAN TREE CARNATIONS, extra strong, in 5in. pots, in bud, bloom all winter, 2s. doz.; car. pd. ELLISON, 57, West Bromwich.

NATURALISATION BULBS.—Iris, Snowdrops, 6s.; Bluebells, Tulips, Narcissus, Scillas. 10s. 1,000. Car. pd.—ELLISON, 57, West Bromwich.

TULIPS, RAINBOW MIXTURE, 1s. 6d. 100; 13s. 1,000; 10 each, 20 named varieties, 5s. Car. pd. Ctg. free.—ELLISON, 57, West Bromwich.

HYACINTHS.—30 best named varieties, all different, correctly named, 5s. 36-page Catalogue free.—ELLISON, 57, West Bromwich.

CHESTER NURSERIES.

Over 500 Acres in extent.

LARGEST STOCKS OF

Forest and **Ornamental Trees, Evergreen,** and Deciduous Flowering **Shrubs, Covert,** and **Hedge Plants, Rhododendrons, Hollies, Yews,** and **Aucubas.**

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

The Origin of Soils.

This is a fascinating subject, and one we bring at intervals and in various ways before our readers, especially for the benefit of young gardeners and students of horticulture. Practically all good cultivatable soils may be regarded as consisting mainly of the débris of rocks, which have been reduced to small dimensions by the action of water, frost, and mutual attrition induced during the conveyance of larger masses from high levels to lower ones. During this process this débris becomes mingled with that of dead vegetation, and in this way an admixture is obtained which is generally admirably fitted for new plant life, containing as it does both earthy salts and humus in a form easily penetrable by roots. It is to this class that the soils termed alluvial all belong, and these are universally recognised as the most fertile. They are found distributed as dead beds along the courses of rivers, particularly where these have ceased their primary tumultuous and more precipitous transit through the gorges and ravines in the hills and mountain ranges which constitute their birthplace, and have reached the plains which they have contributed to form. Water in rapid transit permits of little deposition; on the contrary, it is the active wearing agency, not merely of the rocks over which it passes, but of those which environ it; hence in periods of storm and spate it becomes laden with the detritus it thus forms; but no sooner does it reach more level conditions than settlement occurs, and, as at such times its normal banks are overflowed, and the adjacent land submerged by a comparatively motionless flood, the effluent water leaves nearly all its solid contents behind, and an additional layer of alluvium is thus deposited. It is in this way that vast alluvial plains are formed in many parts of the world, and smaller ones everywhere fill up the spaces between the actual stream and its more or less distant confining walls. On such plains the river's course is usually a very devious one, and is constantly changing, since at every curve the flood is washing away the bank against which it impinges and depositing fresh material where the current is slackened. Thus, in course of time under natural conditions, the stream not merely adds layer after layer of sediment to the plain wherever submerged, but actually traverses the entire area like a slow-moving serpent. Non-alluvial soil we find formed in abundance in mountain regions by the simple weathering down of even the hardest rocks, the materials of which are mingled, as with alluvium proper, with the débris of the local vegetation, which in the case of many plants, forms in itself a disintegrating factor, the roots penetrating fissures, and eventually enlarging them with almost as irresistible a force as frost itself as such roots increase in size. Such soil is usually very open, consisting mainly of the rock itself in larger or smaller dimensions. Even here, however, alluvium proper starts its course towards the fertile plains below, and we have only to glance at a mountain side to see how it is seamed with glens and gullies which eventually are bound to bring this raw material within the clutch of their streams, and so convey it downward. Even our densest clays, too dense and tenacious to encourage plant growth until opened up and rendered friable by artificial admixtures, are of similar origin, but differently deposited. Given a deep lake, whose waters are devoid of obvious currents, though ever on the move, as the numerous streams which feed it find an outlet at, may be, a far distant end, all the finely triturated rock these streams bring down is gradually deposited age after age at the bottom as a dense clay, which, as we see beneath our feet in London, may eventually accumulate until the lake depression is entirely filled up and a city, mainly built of the clay in question, occupies its site. Another class of soil is different entirely, being exclusively vegetable, such as peat deposits, produced by the long-continued growth of bog plants age after age, which are not so fertile as alluvial soils, owing to the lack of mineral matter essential for most vegetation. In the brown coal formations of Germany we may see such deposits hundreds of feet thick and of enormous extent, and practically not a soil proper at all. Peat, in fact, generally, though we have classed it as a soil, and though many plants have been evolved to fit it, is mainly valuable as a contribution of humus to other soils proper which may require it.

MR. J. T. WEST.

Mr. J. T. West has for more than a quarter of a century occupied a commanding position as a cultivator and raiser of dahlias, but his interest in these flowers might, we have no doubt, be traced back a further ten years or so. The exact date on which Mr. West began to grow dahlias, or, indeed, that on which the first of his seedlings flowered, may not be a matter of special importance; but it is of interest to know that he was one of the original members of the National Dahlia Society, and that he has, from the second year in its history, been a member of committee; and a valuable member of that body he has proved. Mr. West has decided ideas with regard to the lines that should be followed for the purpose of giving encouragement to growers and raisers, and he has the courage of his opinions, which is an excellent quality in those engaged in public work. Mr. West possesses a remarkable breadth of view in connection with dahlias, and has raised many fine varieties in each of the several sections. For some years he devoted unremitting attention to show dahlias and raised varieties of such exceptional excellence as to give rise to the idea that he was essentially a "show" fancier. Nothing could well have been farther from the fact, for he has raised many beautiful pompons and a goodly number of cactus varieties of high merit; and he has entered on the improvement of the pæony-flowered varieties with so much zest that he has added a considerable number of beautiful forms to the list. Not the least noteworthy of his successes has been the decorative variety Brentwood Yellow, to which we recently referred. That Mr. West's abilities are highly appreciated by his neighbours, as well as by those of his friends who are specially interested in the cult of the dahlia, is proved to demonstration by the fact that he is a member of the Brentwood District Council and the Billericay Board of Guardians, positions that he has occupied for some years past.

Arbor Day at Eynsford.—There were great doings at Eynsford on Saturday, November 5, when Sir J. Alexander Cockburn, late Premier of South Australia, was crowned "King of Arbor" in the presence of a brilliant company. Tree-planting was carried out near the station, and the initial letters of the names of the trees planted made up the quotation: "Who keeps one end in view makes all things serve." There was a fine show of chrysanthemums and fruits in the Drill Hall, and among notable visitors were Mr. and Mrs. Henniker Heaton; while the veteran Mr. Henry Cannell, V.M.H., was present, and Mr. E. D. Till was, as usual, the moving spirit of the whole of the proceedings.

New Rose Trials at Bagatelle.—We are informed by M. Forestier that trials of new roses will be conducted at Bagatelle during the years 1911 and 1912, and he asks us to inform the raisers of roses in the United Kingdom that he will be pleased to include in the trials any of their productions they may wish to send. Not less than five plants of each variety should be sent. They should, if possible, be in pots, and they must reach the Rosery at Bagatelle before April 15, 1911. It is necessary they should be accompanied by particulars of their origin, parentage, etc. The roses will be planted in the open beds at Bagatelle, and remain undisturbed until the month of October of the second year, to enable the members of the jury to study their growth and flower production during the two years. The packages must be addressed as follows: "Monsieur le Conservateur des Promenades, Roseraie de Bagatelle, Bois de Boulogne, par Neuilly-sur-Seine, en gare de Neuilly, Port Maillot, France."

October in the North.—It is seldom, indeed, we are vouchsafed so fine an October in the North, writes our Aberdeen correspondent, as has been experienced this year. It is the month in which we, as a rule, have most rain, August coming close upon it. But this year August has been much the wetter of the two. The rainfall for October this year is a little over 2in., whereas the average for the month for the last 40 years is about 3½in. The first fortnight of the month was remarkably fine and sunny, but a change came over the scene on the 19th, the wind setting in from the north, while dense masses of globular-headed clouds—what our meteorologists term "cumuli"—turned up along the northern and north-eastern horizon. These clouds are invariably the precursors of some days of rough weather, and the 20th was squally, cold, and rainy. But we have had no very severe gale this October; the only occasions when the wind was at all strong were on the 20th and on the 31st, when we had a good breeze from south and south-west. In short, the atmosphere was quieter than it usually is during this month, having been generally under the influence of an anticyclone or region of high pressure. As is generally the experience of the month, temperature has been rather variable, with no snow or severe frost on the seaboard. In the uplands, however, some snow fell. The sky has been often cloudy, but there has been more sunshine than is usually the case in October. A most remarkable fall in the barometer occurred on the 31st, amounting to about an inch and a quarter, under the influence of the strong breeze from the south-west. At the beginning of the month the stubble land was too hard and dry for the plough, but since then it has come into capital order, and a large breadth of it has been turned over. The turnip crop is doing splendidly. The turnip, with its large green blades, is a thirsty plant in the autumn, but the cool, cloudy, and rather drizzly climate of this district suits it admirably. Here mildew, so common farther south, is rarely felt, which makes the turnip crop of the north the finest that can be produced. It is a wet summer that plays the mischief with the turnip crop, by starting the dreaded yet curious finger-and-toe disease. The potato crop is also turning out uncommonly well, and the fine weather experienced for lifting and pitting should be conducive to good returns to the growers. The absence of severe drought and of strong continuous sunshine keeps our pasture generally green, so that, with our grass in summer and turnips and straw in winter, the husbandman has at his command food for his stock all the year round.

An Interesting Fodder Plant. Dr. A. Voelcker recently showed the basal part of a plant used in Mexico as food for cattle, before the Royal Horticultural Society. The portion shown consisted of the over-lapping basal portions of the leaves, their upper parts having been removed, and the axis from which they sprung. The mass measured about 12 inches in diameter and about 10 inches deep. The leaves are exceedingly glossy and hard. The mass is broken up with a chopper and fed to cattle, which devour it greedily. It contains about 2 per cent. of cane sugar. It is apparently from a species of Hechtia and belongs to the Bromeliaceæ.

Christmas Bank Holiday.—His Majesty the King has appointed "Tuesday, the twenty-seventh day of December next, as a special day to be observed as a Bank Holiday throughout England and Wales and Ireland."

"**The Botanical Journal,**" the new official organ of the Royal Botanic Society, has made its appearance, and, judging from the first part, it should prove an interesting addition to periodic scientific literature, and prove of service in giving publicity to the operations of the society. The number opens with an article dealing with the Royal Botanic Society, and in this is given a sketch of the history of the society during the seventy-one years that have elapsed since it was granted a Royal Charter, and the formation of the gardens commenced. There are also contributions relating to the Victoria regia, the flora of Victoria, the making of lawns, and the Melbourne Botanic Gardens. There is an article on "Artificial Fertilisers versus Manure," which is not easy to understand. In the first paragraph the writer states that "there exist agriculturists (so-called) who have no belief in the value of artificial fertilisers. They maintain that stable manure was good enough for their fathers and their fathers' fathers, and so it must be good enough for them." This may be true of thirty or forty years ago, but the agriculturist who does not use artificial fertilisers is somewhat of a rarity at the present time. Then, farther on, the writer observes: "It is not generally remembered that plants feed on the soluble constituents of the soil and added manure only." It is quite true that plants derive their food from the soluble constituents of the soil and manure incorporated therewith, but the author is careful to differentiate between artificial fertilisers and manure, and as he states that the latter is dear at a gift, the passage is difficult to understand. The journal is illustrated with four reproductions in colours, two of which are from photographs taken by Mr. E. T. Butler, with his new camera, by means of which three negatives can be obtained.

Accident to Mr. E. H. Wilson.—We regret to learn that the famous plant collector, Mr. E. H. Wilson, who is on an expedition to Western China, has met with a serious accident. Mr. Wilson, while returning from Sung P'an, was overtaken by a landslip, and struck by a boulder, which resulted in a broken leg. The accident occurred some three days' journey from Chentu, where medical assistance was obtained. We have much satisfaction in stating that, according to the most recent report, Mr. Wilson is making satisfactory progress towards recovery from his unfortunate accident.

Extension of Wimbledon Common.—A recommendation to contribute £5,000 towards the acquisition of certain lands at Kingston Vale for the purpose of extending Wimbledon Common, and thereby increasing its value and that of Richmond Park as a great open space, was made at the meeting of the Surrey County Council, held on Tuesday, November 8, but it was defeated by 38 votes to 28.

Gardeners' Royal Benevolent Institution.—We are requested to state that the offices of this institution have been removed to 92, Victoria Street, Westminster, S.W.

Fruit Growers' Conference at Wye.—A meeting of the governors of the South-Eastern Agricultural College, Wye, was held on Monday at Caxton House, Westminster, with Lord Ashcombe in the chair. The principal, Mr. M. J. R. Dunstan, reported that there were 130 students in residence, and that immediate additional accommodation was required, and it was decided to erect temporary buildings for lecture rooms, etc. He also reported that a fruit-growers' conference, in conjunction with the National Fruit Growers' Federation, had been arranged to be held at the college on Friday, December 2, for which invitations would shortly be issued and a programme published. The governors resolved to apply to the Treasury for a development grant in aid of the investigations and teaching work carried on by the college.

Agave americana in Bloom at the Zoo. At present a huge specimen of Agave americana is flowering in the Reptile House at the gardens of the Zoological Society, Regent's Park. These giant succulents always attract attention when flowering, though those in charge do not look so pleasantly upon the incident as do the public, because the plant dies after flowering, and thus a fine decorative specimen is lost.

New Park for Kilburn.—The Hampstead Borough Council has unanimously decided to offer £10,000 towards the purchase of land on the Grange Estate, Kilburn, for the purpose of a public park, but this offer was made on the understanding that Hampstead should contribute £4,000.

BIRMINGHAM CHRYSANTHEMUM SHOW.

Those who have of late entertained fear that the chrysanthemum, as an exhibition flower, is on the wane, received a pleasant surprise at the most important show in the Midlands, which was held on November 8, 9, and 10. Bingley Hall on this occasion presented as bright and cheerful an aspect as in the best days of the reign of the Autumn Queen, and the show may well be voted an advance upon those of the past few years. There was, of course, a marked difference in the general character of the display from those of past years, because, in addition to an abundance of big specimen blooms, there were the smaller decorative and single types that add so much to the artistic effect. Perpetual carnations were another modern introduction, and still further variety and interest were added by the fruit, vegetables, shrubs, and miscellaneous exhibits.

CUT BLOOMS.

A class that proved to be one of exceptional interest was that for six vases, each containing three blooms of Japanese, all distinct varieties. Five competitors were forthcoming, and not often have better and cleaner flowers been staged. Mr. E. J. Brooks, gardener to Lieut.-Colonel Beech, Brandon, Coventry, took the lead, staging glorious blooms of Purity, Mdme. G. Rivol, Valerie Greenham, Hon. Mrs. Loftus, C. H. Broomhead, Bessie G. Payne, F. S. Vallis, Master James, Lady Crisp, Marquise de Venosta, Alg. Davis, Mdme. P. Ralli, Mrs. C. Penford, Wm. Mease, Reg. Vallis, Lady Talbot, John Peed, and President Viger. Mr. W. Iggulden, Lock's Hill Nurseries, Frome, was a good second, although in a few varieties his flowers were not up to the great size of the winner's. Mr. J. R. Tooley, gardener to Hugh Andrews, Esq., Toddington, Winchcombe, third; Mr. G. W. Drake, Cardiff, fourth.

Another class in similar style, but for four vases in four varieties, mustered eight entries, among which Mr. E. J. Brooks again led. The blooms of F. S. Vallis in this exhibit were simply wonderful, but every vase was a picture. Second prize went to Mr. W. H. Westbury, gardener to J. W. Wheatley, Esq., Berkswell Hall, Coventry, with another beautiful set. Mr. J. Deacon, gardener to Right Hon. Joseph Chamberlain, M.P., Highbury, came third; Mr. H. S. Foster, gardener to F. E. Muntz, Esq., Umberslade, and Mr. Silas Cole, gardener to Earl Spencer, Althorp Park, Northampton, were awarded equal fourth. For one vase of three blooms, any pink variety, eight competitors entered, Mr. E. J. Brooks scoring with Reg. Vallis, Mr. Silas Cole following with Mdme. Paolo Radaelli; Mr. J. R. Tooley, third with Reg. Vallis. Six entries made up the class for three of any crimson variety, and here Mr. W. Iggulden scored with Master David, Mr. H. S. Foster coming second with the same variety, and Mr. Tooley third with Master James. The whites brought eight entries, Mr. E. J. Brooks again proving invincible with his wonderful flowers of Purity; Mr. Deacon and Mr. G. W. Drake second and third respectively. Mr. W. H. Westbury and Mr. E. J. Brooks fought hard for honour in the yellow class, both staging marvellous blooms of F. S. Vallis. The cards were placed in the order named, with Mr. J. R. Tooley as runner-up.

One of the prettiest classes was for a dozen Japanese blooms, shown on a table in separate vases, with suitable plants and foliage as setting. There were seven good entries, and in each case crotons, ferns, and grasses were well used. The competitors ran each other extremely close, and really there was little to choose. Mr. Deacon was eventually accounted winner, and Mr. H. S. Foster second, the balancing point being the decoration. Mr. J. R. Tooley was a good third, and Mr. A. W. Young, gardener to Mr. Richard Peyton, Edgbaston, fourth. For twelve blooms, distinct, arranged in four vases, Mr. Rayner Bullock, gardener to T. W. Piggott, Esq., The Leons, Park Hill, Moseley, scored, showing Buttercup, Mdme. Ferlat, Louise Giles, and others of fine quality; Mr. T. W. Davis, gardener to H. F. Keep, Esq., The Grange, Edgbaston, second; and Mr. J. Deacon, third. Seven entries for two vases in two varieties made a good class, Mr. Rayner Bullock scoring with Mrs. G. Denyer and Buttercup; Mr. James Shuter, Smallheath, took second place; and Mr. T. W. Davis third. Mr. Jas. Udale offered prizes in a special class for a dozen incurved, grown within four miles of the centre of Birmingham, and entries were strong. Mr. G. W. Drake led, with Mr. Deacon and Mr. Wm. Teal as second and third.

Two vases, distinct varieties (Birmingham district), had eight entries, Mr. J. Deacon again taking premier position with Mr. A. W. Young and Mr. Rayner Bullock as followers. In a similar class for incurved, Mr. G. Bolt, Ward End, scored; Mr. Charles Judge, Hobmoor Road, Smallheath, being second; and Mr. Mark Chalfield, gardener to Jas. Archdale, Esq., The Yews, Harborne, third. Mr. Mark Chalfield led in the class for two vases Japanese, confined to employers of not more than two regular gardeners, and in the amateurs' class, where employers of a permanent gardener were excluded, the prizes went to Mr. W. J. Wakefield, Northwood Road, Harborne; Mr. Jas. Shuter, Smallheath; and Mr. E. Darby, Aldridge.

Quite a distinct feature of the show was provided by the perpetual carnations, of which there were three splendid collections. Mr. W. H. Lancashire, Victoria Vineries, Guernsey, was awarded first prize, his flowers having been artistically arranged in quite a new style by Mr. R. F. Felton, who, as everybody knows, is a pastmaster in the art of floral decoration. Mr. C. F. Waters, Balcombe, Sussex, was a capital second, and staged some blooms of superb quality. Mr. S. Mortimer, Farnham, came third.

PLANTS.

Two competitors staged six specimen plants of Japanese chrysanthemums; Mr. Alfred Cryer, gardener to J. Arthur Kenrick, Esq., Berrow Court, Edgbaston, scored. He had shapeley, dwarf, and well-flowered plants of Mrs. W. Knox, Chas. Davis, Vivian Morel, J. H. Silsbury, Mrs. J. Ritson, and Mrs. J. Hadaway. Second prize went to Mr. O. Brazier, gardener to E. Martineau, Esq., Edgbaston. For six plants, excluding Japanese, Mr. Brasier led with some very nice incurved, Mr. A. Cryer being second. Mr. Brasier also led for three Japanese, and was again followed by Mr. A. Cryer, the same exhibitors maintaining this order for three singles, which was reversed in the single specimen classes for both Japanese and incurved.

Two entries for groups of pot-grown chrysanthemums, arranged for effect, with foliage plants, on a space 20ft. by 12ft., made not a large, but a most interesting and attractive class. The interest was enhanced by the fact that the two exhibitors staged in totally

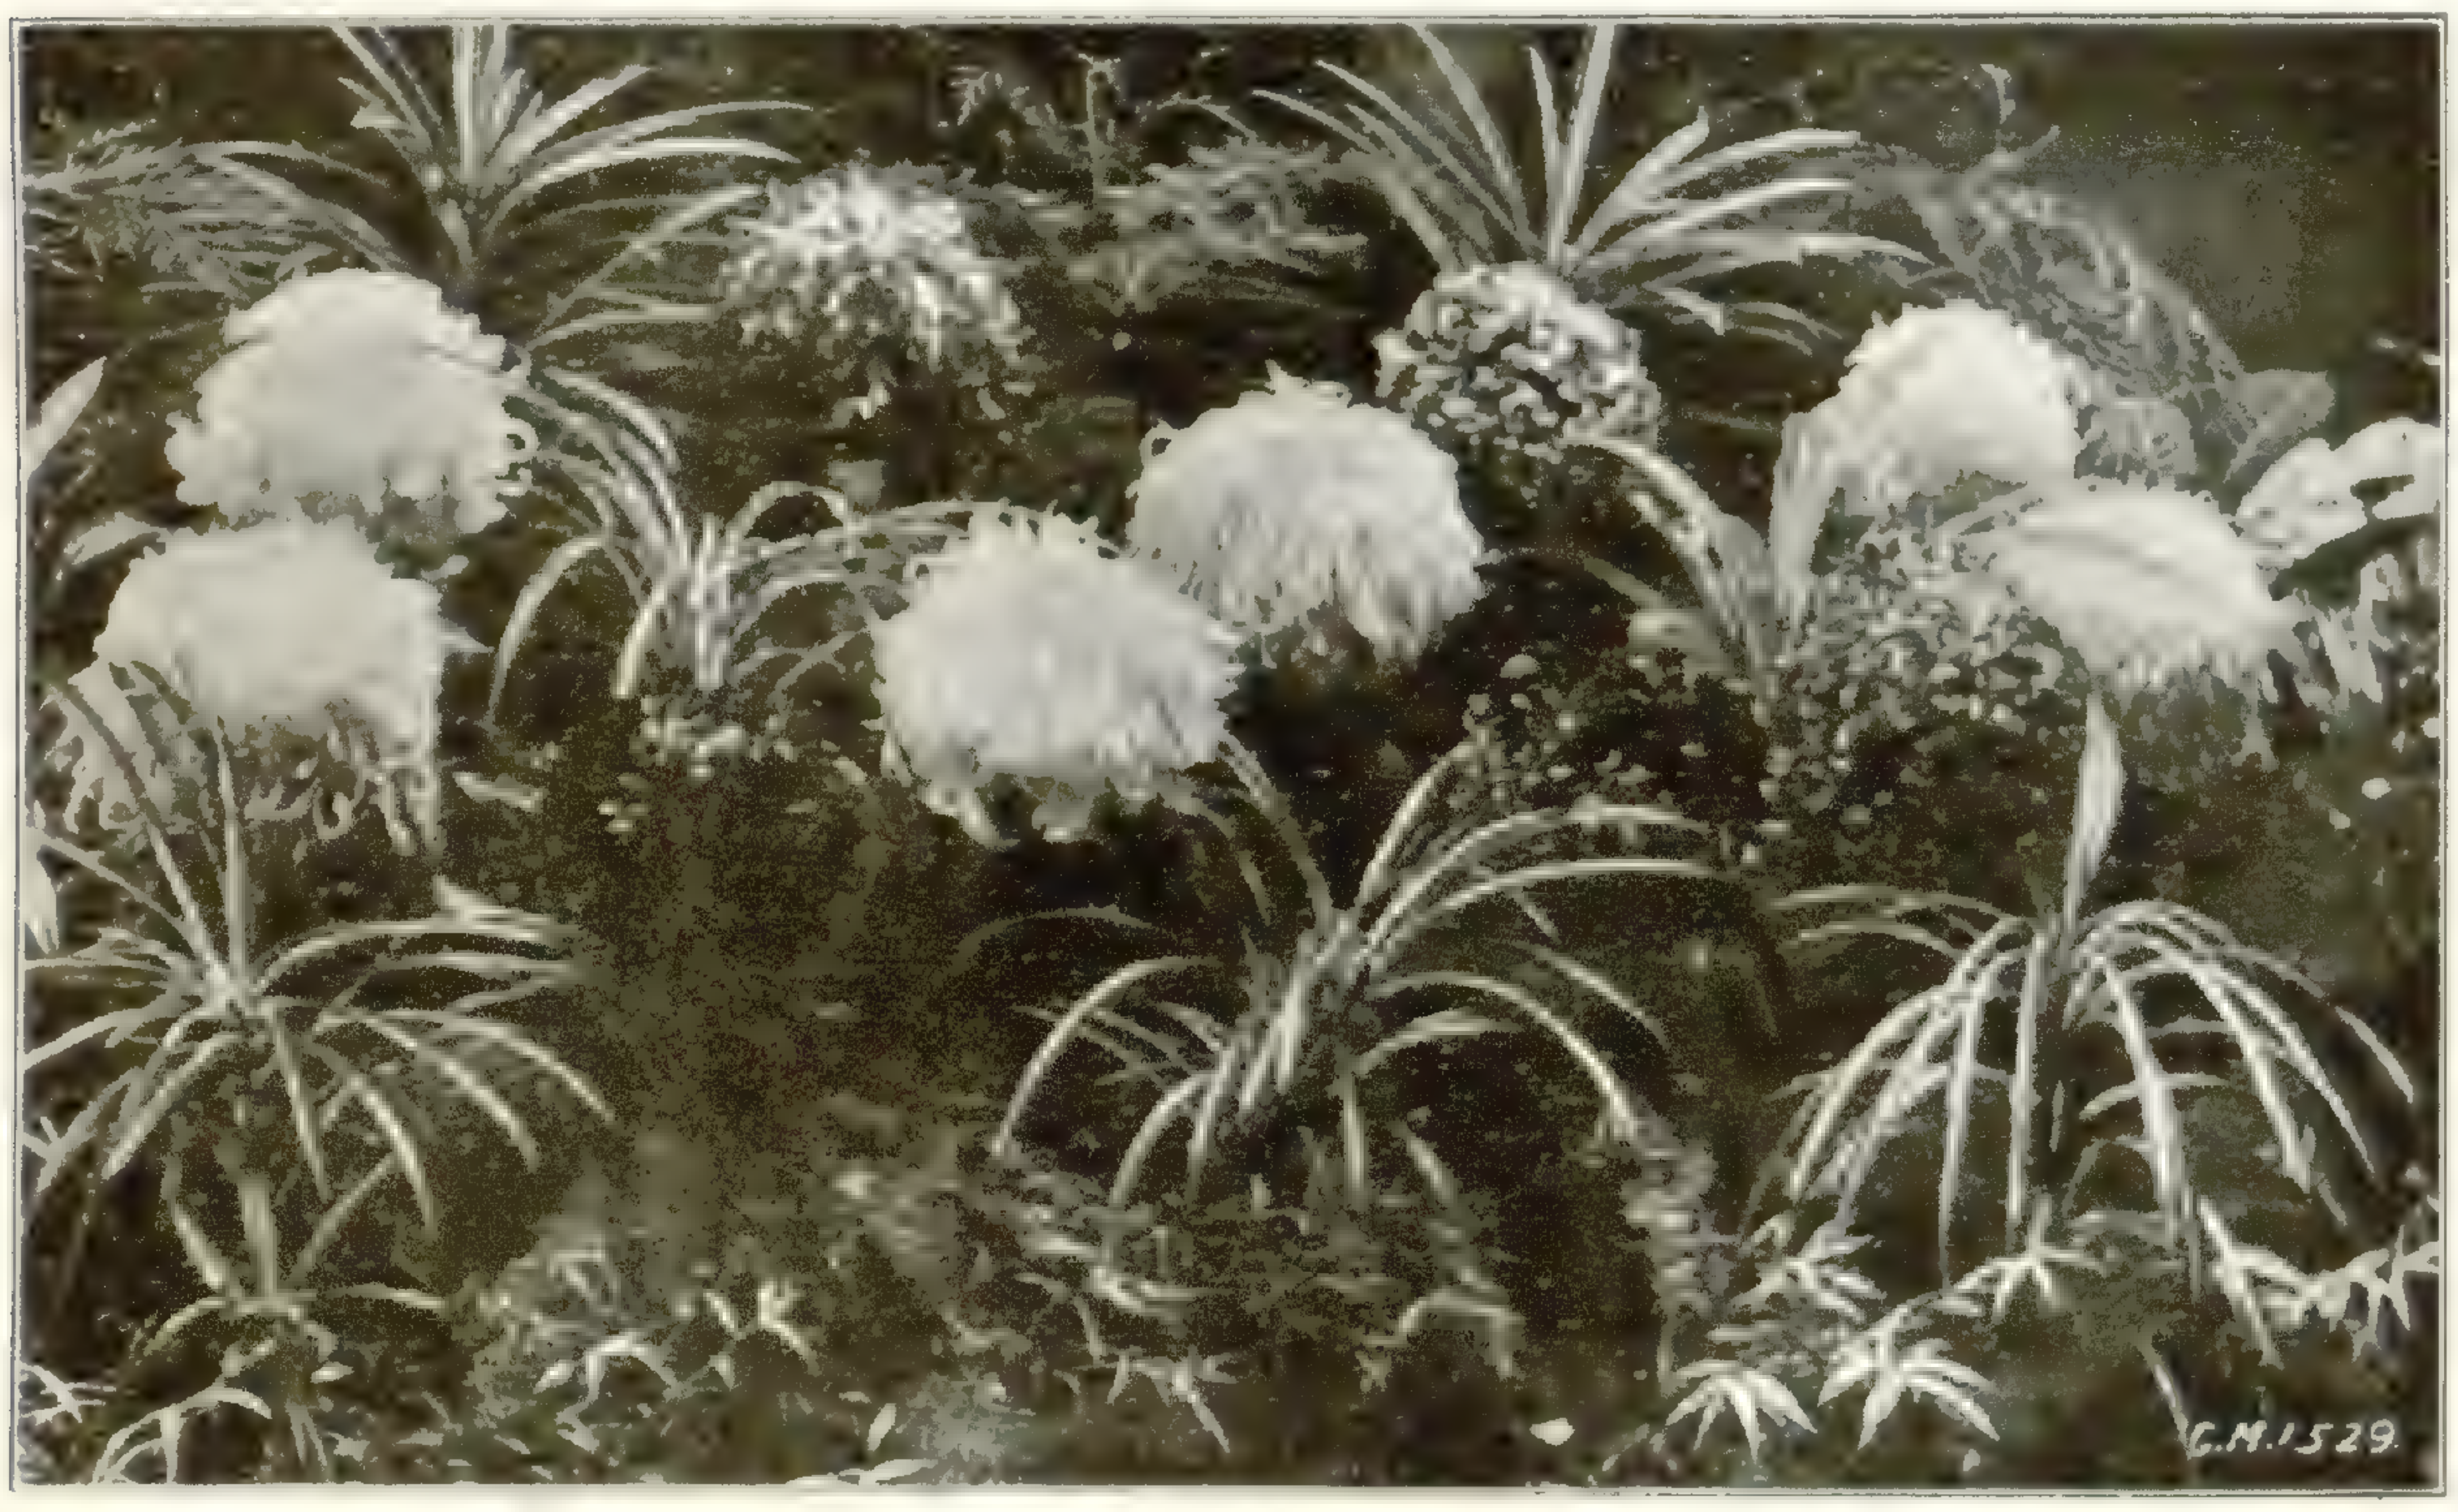
A TASTEFULLY ARRANGED BASKET OF CHRYSANTHEMUMS.

Exhibited at Birmingham Chrysanthemum Show by Messrs. Gunn and Sons, Olton, Warwickshire.

different character, Mr. Alfred Cryer, gardener to J. Arthur Kenrick, Esq., Edgbaston, practically confining himself to large-flowered Japanese, whilst Mr. J. V. Macdonald, gardener to Sir George H. Kenrick, Whetstone, Edgbaston, showed all decorative and single varieties. Each group was remarkably fine, both in point of quality and tasteful arrangement. The prizes were awarded in the order in which the exhibitors' names are mentioned. In a smaller group class, 14ft. by 10ft., there were three entries. Mr. G. Corbett, gardener to Hume C. Pinsent, Esq., Lord Wood, Harborne, winning first, and Mr. R. Bullock second. In a decorative group class Mr. C. H. Herbert, Hazelwood Nurseries, Acock's Green, scored with a tasteful arrangement of naturally-grown singles and small-flowered types. Mr. A. Cryer was second in this class, his group falling away somewhat in the foreground.

FRUIT.

Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, had things his own way in the class for a collection of British-grown fruit, staging grand grapes, pears, apples, melons, pines, strawberries, and figs. Three tables of British-grown hardy fruits contained some really splendid dishes, the winner being Mr. G. R. Morris, gardener to Mr. Hearne, Hanbury, Droitwich. Pitmaston Duchess, Conseiller de la Cour, Beurre Diel, and other pears were accompanied by perfectly-grown apples of the leading sorts. The Caradoc Fruit Plantation, Ross, Herefordshire, were a very close second, their apples being of remarkably good colour for the season. Caradoc Scarlet was a very handsome scarlet culinary apple of good keeping quality. A few walnuts and pears accompanied the apples, which, however, were the great feature. Messrs. Pewtress Bros., Tillington, Hereford, were third. For six bunches of grapes, there were four competitors, the winner being Mr. J. R. Tooley, who put up Muscat and Black Alicante in good style. Mr. J. Jones, gardener to Mrs. F. Need, York House, Malvern, had the same varieties on his second prize stand, as also had the third prizewinner, Mr. J. H. Goodacre.



FIRST PRIZE COLLECTION OF TWELVE JAPANESE CHRYSANTHEMUMS.
Arranged with plants and foliage, at Birmingham, by Mr. J. Deacon, gardener to the Rt. Hon. Joseph Chamberlain, M.P., Highbury, Birmingham.

VEGETABLES.

These are always an important feature of this show, Messrs. R. Sydenham, Lim., Messrs. Sutton, Webb, Dickson and Robinson, and other seed firms, offering liberal prizes for exhibits of the produce of their seeds. Messrs. Sydenham's classes extended to twenty-six and the total number of entries exceeded 200, about double the previous record. The principal winners were Mr. T. Jones, Ruabon; Mr. J. White, Bampton; Mr. W. Folkes, Ampthill; and Mr. Edward Deakin, Mr. A. Cryer, and Mr. Whitbread, the latter three in the local classes being particularly successful.

In Messrs. Sutton's class for a collection Mr. Edward Beckett was victor over three other competitors, each of his nine dishes being about as good as one could wish to see. Mrs. Davis, Ruabon, was second with smaller, but choice dishes, Mr. George Neal, Bampton, Oxon, being third. Mr. Beckett also scored for nine onions, and in several other classes.

In Messrs. Webb's collections, eight in number, the fortunate winner was Mr. John Hudson, Leicester. He had a splendid lot of stuff. Mr. Silas Cole, gardener to Earl Spencer, was a very good second, and Mr. F. Barrett third.

Mr. T. Jones was very successful in Messrs. Dickson and Robinson's classes, scoring for onions, leeks, tomatoes, and carrots.

NON-COMPETITIVE EXHIBITS.

The trade always patronise Birmingham in a whole-hearted manner, bringing of their best, and staging in capital style. This year's non-competitive section, far from being an exception to the rule, was, if anything, even finer than usual, most of the best-known exhibitors putting in an appearance, and creating a display of floral beauty and high-class fruit and vegetables that was a delight to the eye, and an education to all who were privileged to inspect it. One of the first exhibits to attract attention on entering the hall was an extensive and remarkable collection of rare, or little-known vegetables, staged in a most artistic manner by Messrs. Sutton and Sons, Reading.

Beautiful, in a totally different manner, were the immense, but perfectly-formed chrysanthemums, staged in great profusion by that well-known specialist Mr. W. J. Godfrey, of Exmouth, who never comes from home without something really choice. The Japanese and incurved flowers were well supported by a variety of useful and decorative singles, among which the golden flowers of Reginald Godfrey were conspicuous. Messrs. Gunn and Sons, Olton, Warwickshire, arranged a very artistic rockery, upon which a number of choice alpines, dwarf phloxes, and other floral subjects were interspersed with dwarf shrubs. The same firm had a very elaborate exhibit of choice floral designs.

A collection of well-grown conifers came from Messrs. Bakers, Wolverhampton, and very choice they were. Cryptomeria elegans, Abies Hookeriana, Osmanthus illicifolia, and a number of fine cupressus were included in the group. Another excellent exhibit was that from Messrs. John Waterer and Sons, Lim., Bagshot, whose chief feature was some remarkably good standard hollies. Mr. H. N. Ellison, West Bromwich, brought a lovely lot of crested nephrolepis, adiantums, Polypodium glaucum crispum, and other ferns. Mr. Ellison also showed some particularly fine hybrid gerberas, which embraced a wonderful range of most delightful colours; these were the latest developments of M. R. Adnet, who has become famous for his successful efforts with this plant.

The circular stage erected for Messrs. E. Webb and Sons, Wordsley, Stourbridge, was tastefully furnished with a splendid lot of tomatoes, onions, potatoes, and, in fact, a comprehensive collection of vegetables. Celosias, and Begonia Gloire de Lorraine formed a bright centrepiece, and tall stands at intervals, some filled with chrysanthemums and others with melons, added beauty to the display. The Government of British Columbia sent a big exhibit of apples packed in boxes, the fruit being particularly even in grade, and of brilliant colour. An exhibit of fruit that was of great extent and superb quality, was staged by the King's Acre Nurseries, Lim., Hereford.

A capital exhibit of vegetables came from Messrs. Yates and Sons, Birmingham. Giant leeks, onions, pumpkins, and potatoes were staged in great quantity. Messrs. W. H. Simpson and Sons, Birmingham, were also exhibitors of good types of vegetables, and a very prettily-arranged collection came from Messrs. Toogood and Sons, Southampton. A new open air tomato of first-rate quality was shown by Messrs. Robert Sydenham, Lim., Birmingham. It was "Holmes' Early Open Air," and in shape, evenness, and quality was equal to the best of indoor varieties. Messrs. Young and Co., Hatherley, Cheltenham, put up a good group of perpetual-flowering carnations, representing the best varieties in well-formed blooms. About sixty dishes of good potatoes, and about as many dishes of miscellaneous vegetables were put up by Messrs. Thomson and Co., High Street, Birmingham. A very beautiful exhibit of cut chrysanthemums was staged by Messrs. Clibrans, Altrincham. Big blooms of Hon. Mrs. Lopes, J. W. Molyneux, W. Mease, and other fine Japanese, were intermixed with decorative singles of dainty form and colours. Messrs. W. Wells and Co., Merstham, Surrey, brought a choice lot of chrysanthemums, and also some lovely flowers of their new carnation "White House." A big group of conifers and shrubs of decorative character, was put up by Messrs. Hewitt and Co., Solihull.

Flower pots scarcely appeal to one's imagination as subjects for an artistic exhibit, but Messrs. R. Sankey and Son, Lim., Bulwell, Notts, succeeded in making their stand very attractive. Flower pots and bulb bowls, in great diversity of size and shape, were arranged with ferns, grasses, etc., to act as a set-off. Some of the small pedestal pots, and fancy bowls were distinctly pleasing, and are fashioned with an eye to utility as well as appearance. All manner of garden sundries were exhibited by Messrs. Wm. Wood and Son, Lim., Wood Green, N., and Mr. G. H. Richards, Borough, London, made a good display of XL All specialities.

MEDALS AND AWARDS.

Large Gold. — Messrs. Gunn and Sons, Olton; Messrs. John Waterer and Son, Lim., Bagshot; King's Acre Nurseries, Lim., Hereford; Messrs. Webb and Sons, Wordsley; Messrs. Sutton and Sons, Reading; Messrs. Yates and Sons, Birmingham; Messrs. Thomson and Co., Birmingham.

Small Gold.—Messrs. Clibrans, Manchester; Mr. H. Woolman, Shirley; Mr. W. J. Godfrey, Exmouth; the Government of British Columbia; Messrs. Toogood and Sons, Southampton; Mr. Powell, Hereford; and Messrs. Bakers, Wolverhampton.

Silver-Gilt.—Messrs. Hewitt and Co., Solihull; Mr. H. N. Ellison, West Bromwich; Messrs. Young and Co., Hatherley, Cheltenham; and Messrs. W. Wells and Co., Lim., Merstham.

Silver.—Messrs. W. H. Simpson and Son, Birmingham; and Messrs. Pewtress Bros., Hereford.

ACACIAS.

The hardiest and easiest cultivated of greenhouse plants, the various species of acacia take a foremost place in the conservatory and greenhouse. They enjoy a greater measure of popularity than one might be led to suspect, for the " mimosa " of Covent Garden is none other than the flowering sprays of Acacia dealbata of gardens. In its season the flowering sprays are plentiful in the flower markets, so that it is practically familiar to the majority of English people. The species are of immense value to gardeners, yielding unlimited quantities of first-class material for cutting, while the majority lend themselves to pot culture, forming elegant and shapely specimens, which are doubly effective in that they retain their beauty for many weeks, and are valuable for indoor decoration. Not all of them bloom at the same time, but rather form a natural succession, while by gentle forwarding in heat, or retarding under the coolest conditions, a much longer period of flowering is secured.

Their cultivation presents no difficulty inasmuch as their propagation is readily carried out either by seed or cuttings; the former is best sown as soon as ripe, and the subsequent seedlings potted on until they attain flowering size, which, in the majority of instances, is at a comparatively early stage. Cuttings of the half-ripened shoots root readily under handlights, or on a mild bottom heat in a propagator, a high temperature being at all times inimical to success with acacias.

The best results obtained with acacias are under conditions where the plants secure unlimited root room; this is particularly apparent where the genial climate of certain Continental districts favour their development to a marked degree, so much so that they constitute an integral and characteristic feature in the landscape, and so almost appear as if indigenous. In a lesser degree, and possibly more restricted in variety, those favoured counties in the South-West of England offer many opportunities for the culture of acacias in the open, particularly when ample shelter can be provided. It may occasionally happen that some severe winters may prove fatal to them, but with a stock of young plants in reserve such losses may readily be made good, and as they are rapid growers, they very speedily become reinvested with the old charm. In northern latitudes the acacias are best suited for greenhouse and conservatory, and where the facilities are present they prove most valuable when planted out, as it then supplies the best material for cutting, as the removal of large branches from the trees when in full flower only anticipates by a few days the pruning that is generally practised whenever the flowers fade. The following possess much merit.

Acacia dealbata, sometimes called the "Silver Wattle," from the characteristic grey-white colour of the underleaves; the flowers are yellow, disposed in broad, spreading racemes along the branches; the leaves are compound, with many pairs of linear, pubescent leaflets.

A. cultriformis has intense grey leaves, which terminate in a curious hooked point; the flowers are orange-yellow, ball-like, and are disposed in racemes.

A. Drummondi is a particularly good and well known species, having pinnate leaves; the flowers are pale lemon, borne in cylindrical spikes.

A. verticillata produces solitary pale yellow flowers, oblong in form; the leaves are like fine needles, and are borne in whorls; it is one of the best and most distinct.

A. trinervis has narrow leaves some four inches in length, and conspicuous, solitary, deep lemon-coloured flowers, some one and a-half inches long.

A. Barkeriana produces miniature ball-like sulphur-yellow flowers; the young shoots are bright purple; the mature leaves are narrow and willow-like.

A. retinodes (floribunda) is a species having long linear lanceolate leaves; the flowers are in branching racemes, each branch having from fifteen to twenty flowers.

A. Baileyana has intense grey leaves resembling A. dealbata; the flowers are in globular heads, the racemes being erect.

A. Riceana produces its globular yellow flowers on long slender branches; the flower panicles are wide-spreading, making it a most effective subject when trained from the roof; the flowers are cream-white, while the leaves are small and needle-like.

A. lophantha is probably best known as a summer bedding subject; the foliage is extremely graceful, the flowers being greenish-yellow.

A. pubescens is a free-flowering species, with elegant compound leaves; the globular yellow flowers are disposed in racemes along the axillary peduncles.

A. affinis, A. armata, A. hastulata (cordata of gardens), and A. grandis are species in commerce, and more or less common to gardens. Cordata is very desirable, if only for the distinct character of the leaves, and grandis is one of the most desirable in flower.

T. S.

APPLE MILLER'S RED VICTORIA.

This apple has been before the public for a considerable time now, and for a number of years past it has been exhibited annually before the Royal Horticultural Society. It is a handsome apple, of good size and shape, most brilliantly coloured with rich crimson. It appears to be a free cropper and regular bearer and should certainly prove a most useful market variety by reason of its attractive form and colouring. Mr. G. W. Miller, of Clarkson's Nursery, Wisbech, who has shown this apple so frequently, and is distributing it, has great faith in the variety. He has exhibited it in bulk each autumn, and on September 13 last the Fruit and Vegetable Committee of the Royal Horticultural Society granted a First Class Certificate in its favour. Miller's Red Victoria is a culinary apple that comes into use early in the autumn. Its colouring is more than skin deep, as in most of the specimens the vivid crimson enters the flesh, staining it conspicuously.

APPLE MILLER'S RED VICTORIA.
A brilliant crimson culinary apple. F.C.C., R.H.S., September 13. Mr. G. W. Miller, Clarkson's Nursery, Wisbech.

Aster Climax.—One more season has proved this variety to be quite the finest of the large-flowered type of Michaelmas daisies belonging to the Novi Belgi section. Given an Award of Merit by the R.H.S. in 1908, it has since verified the award. Of vigorous growth, it reaches six feet in height, has extra large leaves, throws up shoots freely, and gives abundance of blossoms which are fully two inches in diameter, quite meriting its name. The colour cannot fail to please, being an attractive clear light blue, and it is quite the best in the section that Mr. Beckett, or anyone else, has raised.—E. M.

NOTES FROM KEW.

◆

Chrysanthemums.

As might be expected at this season, chrysanthemums contribute largely to the embellishment of the greenhouse, the different sections being well represented. The major portion are grown in a natural bush form, and disbudding has been comparatively little carried out. A few plants have been treated for the production of large blooms, sufficient, in fact, to show their capabilities in that respect, but most of them are carrying masses of effective flowers on bushes of proportionate height. In the Temperate House an exceedingly pretty effect is produced by groups disposed here and there among the foliage plants which occupy the greater part of that structure. Each group consists of one variety grown in the shape of good-sized bushes, most of which carry a number of finely developed flowers. In this way chrysanthemums are certainly seen at their very best as decorative plants. The varieties mainly consist of Japanese kinds that lend themselves to such a mode of treatment, particularly noticeable among them being Source d'Or, rich orange, and its crimson sport; Lady Selborne, white; Lady Hanham, cerise and gold; Niveus, white; Tokio, perhaps the nearest approach to a scarlet; Viviand Morel, pink; Market Red, rich velvety red; Ball of Gold, yellow, large flowers; Charles Davis, yellowish-bronze; Miss Byron, white, large; J. E. Lager, a beautiful golden yellow flower; Nelly Pockett, white; and N. Boddie, rosy-purple. Beside these garden forms of chrysanthemum there are some effective little bushes of the typical tiny-flowered Chrysanthemum sinense, and a form thereof with yellow flowers about three inches across. Chrysanthemum nipponicum is also very noticeable. The foliage suggests that of C. maximum, and the plants are about eighteen inches high. The flowers, three inches in diameter, have a large central disc of a greenish tint, while the florets are white. Though less showy than some of the others this at once arrests attention by reason of its uncommon appearance.

Mutisia Clematis.

This climbing member of the Composite family is just now flowering freely in the cool portion of the Temperate House. It is trained to wires carried from one of the pillars supporting the structure to another at a considerable height from the ground, so that the slender shoots hang down for a considerable distance, and thus form a living fringe. This fringe is studded with numerous blossoms of a strictly pendulous character, while there is also a large number of unopened buds. The flowers are about three inches in length, the greater part consisting of large bracts, while the petals which spread out horizontally, or nearly so, are of a kind of reddish-scarlet tint. They hang suspended by very long stalks, and are thus particularly noticeable. The leaves are pinnate, each terminating in branching tendrils, while the leaflets are downy on the undersides. Apart from the blossom, the general appearance of the plant suggests a member of the pea family. My first acquaintance with this mutisia was at Pendell Court, about 20 years ago, the plant then flowering freely under the care of Mr. Ross. It is a native of the elevated regions of New Grenada, Ecuador, and Peru, and is said to have been introduced in 1859, but it has always been a rare plant. A second species now seldom met with is Mutisia decurrens, with large orange-yellow flowers. This was introduced by Richard Pearce when travelling in Peru, and first flowered in this country in 1861.

Luculia gratissima.

A specimen of this about 12ft. high, planted out in one of the beds of the Temperate House, is absolutely laden with its hydrangea-like heads of fragrant blossoms. They are of a delightful shade of rose-pink, a colour pleasing to all. This native of the temperate Himalayas was introduced nearly 90 years ago, but even now well-flowered examples are by no means frequent.

Cestrum Smithi.

This is a garden variety of cestrum or habrothamnus, as it is more generally termed. It was distributed by the late Mr. William Bull, of Chelsea, about a dozen years ago, at which time there was a considerable demand for it. From the better-known Cestrum elegans and fasiculatus it differs in the flowers being pink, and also in the fact that it flowers freely in quite a small state as may be seen in the Temperate House. In the same structure the orange coloured Cestrum aurantiacum shows its value for clothing large pillars, though the blossoms are now somewhat past their best.

Ruellia macrantha.

When my last notes on acanthaceous plants in general were taken at Kew this Ruellia was not then represented by flowering examples. Now, in the intermediate portion of the T range, it is in full bloom. This Ruellia is pretty well known in gardens, therefore it will suffice to say that the funnel-shaped flowers are the largest in the genus. They are from three to four inches long, and nearly as much across the expanded mouth, the colour being a deep rose, with a suspicion of purple, and veined in the throat with a deeper tint.

Clerodendron squamatum.

In the early part of August this clerodendron, which in its scarlet flowers and general aspect bears a considerable resemblance to the better-known C. fallax was in full flower. These flowers were in turn succeeded by berries, which, being now ripe, arrest attention by reason of their peculiar colouring. Borne in roundish heads they are green at first, but change to an almost indescribable tint, perhaps a kind of peacock blue with a metallic suffusion being as near the mark as possible.

Nepenthes.

When one remembers as I do the time when the collection of nepenthes consisted of a few by no means flourishing examples in the tropical fernery, the difference now is most marked. The present Nepenthes House, in which the plants are grown in suspended baskets over an undergrowth of tropical vegetation, has proved a decided success, and a fine collection is there represented by characteristic specimens. As an instance of the up-to-date character of the collection, it may be mentioned that Nepenthes nobilis, a hybrid between N. sanguinea and N. Curtisi superba, which was given an award of merit by the Royal Horticultural Society as recently as October 25, is included, while noteworthy examples are to be seen of Nepenthes bicalcarata remarkable for its two curious spurs which project downwards from the base of the lip; Nepenthes ventricosa, whose pitchers are curiously contracted in the middle; and Nepenthes Sir W. T. Thiselton-Dyer, with very large pitchers freely blotched with brownish-crimson on a green ground.

Diospyros Kaki.

A specimen of the Japanese date plum, which has been for some years planted out in the Succulent House, where it fruits annually, is this season bearing an unusual crop of its bright golden yellow, orange-like fruits, and in this stage it forms a highly-ornamental feature. There is, I should say, about a hundred fruits on this one particular plant.

Aralia Sieboldi syn. Fatsia japonica.

As this fine foliage plant is in a small state so much used for indoor decoration, there is a widespread idea that it is tender, which is by no means the case; indeed, it can be safely included among hardy shrubs. In the collection of shrubby araliads there are several freely-branched examples in perfect leafage. Every branch is terminated by a panicle made up of globular-shaped heads of whitish flowers. In this condition they are very ornamental, for which reason this aralia is at the present time entitled to rank among the most attractive of flowering shrubs. At Battersea Park, it is also in good condition. The close resemblance between the arrangement of the heads of flower of this aralia and those of the ivy (both members of the same order) is very interesting.

Cotoneaster rotundifolia.

A great number of cotoneasters have been introduced within recent years, but it is questionable if any will, from an ornamental standpoint, prove to be the equal of this. In the collection of cotoneasters a group of this species is absolutely laden with bright-coloured berries. It forms a freely-branched, spreading shrub of four feet high or thereabouts, whose branches are clothed with small dark green roundish leaves, most of which are retained throughout the winter unless the weather is particularly severe. The berries, which are about the size of small peas, are of a bright scarlet colour. A form of C. buxifolia, with crimson fruits, may sometimes be seen doing duty for C. rotundifolia, but it is far less effective than C. rotundifolia itself.

K.

MICHOMELES FOLGNERI.

This interesting Chinese tree is one of a large number of showy subjects which have recently been distributed by the Messrs. Veitch, of Chelsea, who received it through Mr. E. H. Wilson, when collecting for the firm in Western China a few years ago. It is closely allied to Pyrus, and has somewhat the appearance of a light-habited member of the genus. In general appearance it is of peculiarly graceful outline, for the secondary branches are of a somewhat pendulous character, while the main stem is sturdy. The leaves are from 4 to 6 inches long, and about 1 inch wide, more or less acuminate at both ends. The margins are serrate, and somewhat revolute, while the under-surface is of a lovely silver colour; the upper surface being green.

It has the appearance of being a useful autumn tree, for the leaves of young specimens turn scarlet and bronze. The flowers are white and borne freely in flattened heads in May, whilst during autumn the small, oblong, orange-scarlet fruits ripen. From what can be seen of it up to the present, it is likely to grow quite as well as, and give no more trouble than, any of the ornamental crabs, while its habit is superior to that of many of the species. One item in its favour is the first-rate manner in which the majority of the plants from the same part of China have taken to British conditions, for a great many of them, though introduced but a few years ago, have already formed large specimens, and are growing as well as our common British shrubs.

BY APPOINTMENT. BY APPOINTMENT.

CHEAP OFFER TO CLEAR.

We beg to inform our numerous clients that we have secured a large tract of land adjoining one of our principal Nurseries, and that it is our intention to clear the Stocks off some of our outlying branch Nurseries at a sacrifice.

Everything has been grown with our usual care, and offered in Lots, subject to being unsold; we guarantee the numbers and quality of each Lot offered.

Particulars of above, together with our General Catalogue, will be sent on application.

JAMES SMITH & SONS (Nurserymen to H.M. THE KING), **DARLEY DALE NURSERIES, near MATLOCK.**

Inspection cordially invited. Visitors met by appointment at Darley Dale or Matlock Stations.

NARCISSUS AND DAFFODILS, 5/-, 7/6, 10/- per 1,000
TULIPS ... ... 10/-, 15/-, 20/- per 1,000

Many other varieties to offer; also all kinds of Herbaceous plants. Any of the above, half quantities at half price.

FRUIT TREES.—Apples, Pears, and Plums, all fruiting trees, **9/-** per dozen. Gooseberries, Currants (black, red, white), **3/-** per dozen. Loganberries and Raspberry-Strawberry, **5d.** each. Raspberry Canes, **3/-, 4/-** per 100. Strawberry Plants, **1/-** per 100.

All kinds of Flower & Garden Seeds, also ***POTATOES.*** *Send for List,*

J. W. CROSS, Old Grammar School, **WISBECH,**

A SPECIALITY FOR MORE THAN 50 YEARS.

POT VINES

Strong well-ripened Canes, clean and healthy, for planting and fruiting. Descriptive List FREE.
ALSO FIGS AND PEACHES.

J. R. PEARSON & SONS, LOWDHAM, Notts.

NEW ROSE

CRIMSON RED DOROTHY PERKINS

"Excelsa"

(Award of Merit, R.H.S.)

Planters of Roses should not omit this fine variety this season. Price 3/9 each, 42/- doz.

We have also good plants of **"Juliet," "Duchess of Wellington,"** and other fine sorts.

STUART LOW & CO.,
Fruit and Rose Growers,
BUSH HILL PARK, MIDDLESEX.

HERBACEOUS BORDERS

Original Schemes designed by our Border Expert. Choice mixed Borders. Colour Schemes. Borders flowering through the Season from Spring until Winter. Borders to flower over a given period. Existing Borders renovated or remodelled. Advice freely given. Terms strictly moderate. Plans and Estimates submitted.

ROCK GARDENS

Estimates given for Constructing Rockeries, Furnishing Plants. All kinds of Natural stone supplied to any Station. Clients interviewed in all parts of the Kingdom by appointment. No enquiry too large or too small to gain our prompt attention.

ROSES, FRUIT TREES

Roses—Hybrid Perpetual, Hybrid Teas, Standards, Dwarfs, Climbers, Ramblers in choicest variety.
Fruit Trees—Standards, Pyramids, Dwarf Trained up-to-date sorts. All clean, well grown and sturdy.
Hardy Evergreen Trees and Shrubs, Climbers and other Plants for Greenhouse, etc.
Delphiniums, choice varieties, **6/-** to **18/-** doz.
Phloxes, superb colours, **6/-** to **9/-** doz.
Pæonies, grand selection, from **10/6** doz.
Tree and Border Carnations, great variety, from **5/-** doz.

WARE'S NURSERIES, FELTHAM

Catalogue free, upon application Address "B."

CARNATIONS, PINKS, AURICULAS, DAFFODILS

(4 Gold Medals R.H.S.)

12 choicest Carnations and Picotees for borders, **6s.** to **12s.** per doz.; **12s.** to **21s.** per doz. pairs. Choicest Malmaisons, **7s. 6d.** per doz. Pinks, the sweetest and best, **5s.** per doz.; 1 doz. pairs, **9s.** Best named Alpine Auriculas, from **9s.** per doz. Edged Auriculas, from **21s.** per doz. All established in pots for safe removal.

Auricula, Polyanthus, and Pink Seed, **1s. 6d.** to **2s. 6d.** per packet.

Illustrated Catalogue Free.

SUMMER FLOWER SHOWS OF 1910.

The summer of 1910 has passed, and another flower show season has come to an end. Some folk complain that we had precious little summer; but, at any rate, we have had plenty of shows, and what has impressed me most is that in spite of all the bad weather we have heard so much about, the shows have been well up to the average in point of quantity and quality of exhibits, and we have read from time to time of certain shows being the best ever held by this or that society. The logical conclusion is that either there has been a lot of unnecessary grumbling, or that exhibitors have devised ways and means of defying the fury of storms and making up for a lack of sunlight and warmth by some artificial means. Well, I have seen and endured enough of the weather up and down the country to venture the opinion that my latter suggestion comes near the truth; and indeed it has needed but half an eye to see that a great deal of the products exhibited this year has been treated to something more than slight protection from heavy rain. There can be no objection against a grower taking steps to preserve choice flowers or produce from damage by wind or rain, for we do not go to a flower show to see weather-beaten exhibits that bespeak a lack of care and attention. I do, however, strongly object to the practice, all too frequent, of forcing under totally unnatural conditions subjects that should be grown and shown as hardy plants. How often do we see in classes provided for hardy flowers various things staged that could not possibly be had in bloom in the open at the time of the show! It is about time judges ceased to give prizes to such exhibits. Some exhibitors will quibble as to whether a certain thing is truly herbaceous, and yet will stage things that have been literally forced into bloom. There is a good deal of truth in remarks we have heard about sweet peas developing into exotics instead of hardy annuals. What then shall we say of dahlias and phloxes exhibited at the Temple Show in May?

Of course, I am here treading on tender ground, for the commercial exhibitor will maintain that he must show what will pay him. Well, I am criticising, and no doubt the Editor will afford space for our good friends "The Trade" to take up the pen in self-defence. But I must have just another fling. It seems to me that some nurserymen are of the opinion that there is only one point that counts for merit, and that is the extent of an exhibit. If they can measure their space by the thousand feet, and fill it, they are proud of the achievement; but woe betide the judge who dares to deem the display worthy of anything less than a large gold medal! If things progress much further in this direction a few firms will soon require tents entirely to themselves. I am not thinking of a certain firm which, at Holland Park, did actually monopolise a whole tent for a remarkably fine display of delphiniums, for there was great merit and novelty in that exhibit; but what I am driving at is that there is a tendency nowadays to put bulk before quality, and that is wrong.

I do not intend in this article to deal with the big London shows. That would necessitate much more space than I dare hope the Editor would give me, so I will get away into the country. I have met a good many old friends and some new ones at the various shows. Some I used to meet have, alas, attended their last show, and are sadly missed. Some who were in the fray at the beginning of this season have not lived to see its end, and for them, too, we mourn. There is some gratification in the fact that new exhibitors are entering the arena, and we have met some this year who have acquitted themselves well. I suppose I may say the provincial summer shows opened with York Gala, and it was a good opening. This society seems to have taken on a new lease of life since it passed its half-century, and this year's show was every bit as good as the jubilee show of 1908. The class for a rock and water garden has taken on well, and was a fine feature this year. The one weak point in that class is the background. Nobody seems able to make a pleasing background on the space allowed, and it would be a good move if the exhibits could be built with a double front and arranged right across the centre of the tent. Wolverhampton followed the lead of York, and had a fine series of rockwork exhibits. Other provincial societies would do well to copy. To my mind Wolverhampton sets a pattern to the country for organisation and perfect arrangement. With a set of the finest marquees in the country, and a band of business-like workers, this show is the one that I should say comes nearest to Shrewsbury which, as everybody knows, is our grandest provincial show. Roses are always good at Wolverhampton, and, in spite of a wet time, the growers came up strong again this year. I am not going to say much about the grumbles against judges, which, of course, were to be heard; but there did seem a good deal of surprise over the placing of the cards in one or two of the vegetable classes. I think the time cannot be far distant when societies will have to appoint specialist judges for each section of the show, and when one man, or one party of judges will judge in one section only.

Shrewsbury this year was as grand as ever, and the weather was capital. The big fruit classes were again a sight to see, the groups of plants were excellent, and, indeed, have been good throughout the season. Our old friends the Cyphers have had a remarkable run, beating all comers, I believe, every time out. The new group class at Shrewsbury, which admitted cut flowers, was good, but I confess it did not turn out exactly as I anticipated. I thought it would be a group in which hardy plants predominated, but it was the reverse. Hardy cut flowers were strong again, but, for goodness sake, let us see no more of the densely packed, flat-surfaced banks, which are about as heavy and inartistic as exhibits of hardy flowers could possibly be. Surely the merit of a collection of beautiful things does not rest in the number of blooms that can be crammed into a given space!

Just a word in the ear of those who exhibit floral designs. When exhibiting a "basket of flowers for the hand," would it not be as well to keep within a size and weight that a lady could reasonably be expected to carry? Some of the baskets were so large that one would have to hold them at arm's length to avoid crushing the flowers, and were of a weight that would make one glad to enlist the services of a porter. I want to see ornamental trees and shrubs a feature at Shrewsbury. Fruit trees in pots are well shown now, and, with ornamental trees and shrubs added, there will be little room for any fault-finding here. One of the most unfortunate shows in point of weather was Hanley. It rained, and rained, and kept on raining, and, of course, the attendance was wretched. I was very sorry, for if anyone wants to meet a secretary who is a real good fellow, and a committee who will do anything they possibly can to make exhibitors and visitors happy, they will be satisfied at Hanley. Dundee is another show that suffered terribly from boisterous weather, but it was a good show. Hawick held their diamond jubilee show this year, and from all appearances the society is still hale and hearty. Edinburgh was very good, and quite a lot of Southerners put in an appearance. It would be a big thing to say that grapes had never been finer here, but I'll warrant a good many shows would be proud to have half such a show of grapes. I missed the big banks of hardy flowers at Edinburgh, and the little mounds on round tables seem to me a poor substitute. Glasgow had a nice show, but until they can get some more convenient place than the St. Andrew's Halls the society will always be severely handicapped. On the other hand, Carlisle has about the finest building for a flower show to be met with. The Market Hall is roomy, well lighted and ventilated, and was well filled with exhibits. Amateurs and allotment holders are particularly strong here, and, judging by the enthusiasm of the school children who visited the show, and were treated to an instructive lecture by Mr. W. B. Little, County Council Instructor in Horticulture, there is another generation of keen gardeners coming along.

There is every prospect that the horticultural shows held in conjunction with agricultural shows will ere long rank among the foremost events of the summer season. Mr. Peter Blair ably managed a remarkably fine exhibition in connection with "The Royal" Show at Liverpool, and he had a good display for a first venture at Leeds, under the Yorkshire Agricultural Society. The trade like these shows, and if the committees will only extend their schedules of competitive classes they will come right to the front. Another young show, which, if I am not mistaken, will soon leave a good many older ones behind, is Leamington. It was but their second show, and they mustered six big tents well filled with really good exhibits. Five twenty-five guinea cups drew exhibitors from all parts, and made one of the best shows of the season. One little dig I must have at the powers that be. They were terribly late in getting through with the judging, and at Northampton they were very late. A little smarter in getting the tents cleared and the cards up next time, please. Cardiff and Leicester are still flourishing. At the latter Mr. Frank Bouskell, an amateur, staged a non-competitive group of hardy flowers in a very natural manner on the ground. This is a step in the right direction, and I hope a good many societies will soon add such a class to their schedules. Sandy is still to be reckoned as one of the best shows confined to one day, but this year Taunton abandoned its second day, and reverted to its original one-day show. The display was very fine, especially strong in vegetables, but it seems a pity that such a capital lot of exhibits should be got together for just about six hours. Cardiff improves year by year in size and quality, and its arrangements are A1. A nice little show was held at Birmingham, and it is said the City Council are interesting themselves in it with a view to developing a big show that shall place Birmingham in the running with Wolverhampton, Hanley, Leicester, and other big municipal exhibitions. It is high time Birmingham should bestir herself, for it is a reproach that no good summer show is held in Birmingham. Why, even its own suburb of Handsworth beats it. The show at Handsworth was very good, but I hear some cantankerous folk round about have been spreading the wet blanket over the whole affair with carping criticism, and complaints that it is more of a fair than a show. Well, truth to tell, I don't myself care to see roundabouts and peep-shows at a horticultural exhibition; but no doubt if the committee can obtain necessary funds without these counter-attractions they will revise their methods; so let those who complain put their hands in their pockets and supply the cash to run the show on more approved lines. There are a good many shows I have not mentioned, but—enough.

L. I. Atris.

Pear Durondeau.—Cordons of this variety bear splendid fruits. I planted some cordon trees near brick buttresses supporting a very high wall, and trained them up the face of the brickwork so that both the wood and the fruits borne on it had the full benefit of wind and sunshine. The trees were planted in very hard ground, they did not make gross growth, but ripened their wood and buds thoroughly, and rarely failed to bear good average crops of fruit, while other trees, trained on walls in the recesses, did sometimes fail. I am quite sure that there is ample space on walls in many gardens for the accommodation of cordon fruit trees that has been, and is now, wasted.—Geo. Garner.

COMMERCIAL METHODS AND PRIVATE WAYS.

One cannot help thinking that in these days a good many private gardeners are in a similar position to that occupied by the venerable Mr. Pickwick, when he was likened to a shuttlecock by Sam Weller, of immortal fame. In other words they are targets for a host of people to shoot at, and their work is held up for comparison in a manner that is not always complimentary to themselves. I do not say that gardeners are altogether above criticism; in a good many cases they are not, and the blame is probably due to the slipshod method of making gardeners, by which men answer to the name, but have no right to, and by some means or other obtain situations for which they are not qualified. But after allowing all this, there is still a tendency on the part of both employers and others to criticise gardeners unfairly, to expect too much from them and withhold a good deal of the credit which is justly theirs.

A FINE LYCASTE SKINNERI, CARRYING THIRTY FLOWERS.

British horticulture is made up of two sections, commercial and private, both of which have advanced in recent years, but the former by leaps and bounds. There is no getting away from the fact that the commercial gardener is master of his business, and in nurseries and market gardens plants of every description are grown as well as it is possible to do it. It is not unusual for employers to see splendidly grown stuff in a nursery, and compare it with similar material in their own gardens, and, as a rule, it is the private gardener who suffers by the comparison, because dissatisfied employers are not so ready to see the different conditions under which the gardener and the nurserymen work. One is used to hearing the expressions of admiration that are made, by ladies in particular, at say, the Temple Show, at which nursery specialists exhibit their very best productions; and sometimes you also hear the question "Why doesn't our gardener grow them like this?" Probably the gardener could tell you the reason, which would be that he has not the proper conveniences and facilities, but if he urges these facts too much they are not infrequently taken as excuses for incompetence.

While giving every credit to the nurseryman and market grower for their skill as cultivators, let us remember that they have the machinery to work with. In the glasshouses that are used for commercial horticulture there is nothing in the way of elaborate design, and no attempt at outside adornment. On the other hand they are often run up cheaply, and at the lowest possible cost, but they are properly heated and ventilated, and in every way adapted for the class of plants that is grown inside them. In short, the commercial glasshouse is a money-making concern, and if it is unadapted for the purpose for which it is intended, it is swept away, whereas hundreds of old greenhouses in private gardens, that never were adapted for modern requirements, are sacred institutions, prized like heirlooms, and the gardener has no alternative but to do the best he can with them. Again, the commercial grower in producing a batch of plants devotes a house to them, and every specimen is grown under the same correct conditions, whereas the same class of plants in the private establishment are, through force of necessity, housed along with half-a-dozen other subjects, each one of which requires different treatment.

In criticising many of the old-fashioned conservatories, and other glass structures, it must be remembered that a number of them were built to fit in certain places, and were intended to house plants rather than grow them, for those were the days of big palms, oranges, camellias, trained azaleas, and other specimen plants; besides which the exterior of glasshouses was part of the ornamentation of the garden. The above particular period in plant culture has passed away, but the unfortunate gardener in many places still finds himself with the old time structures, lofty, draughty, badly ventilated, and inadequately heated, and in them he is supposed to grow the class of plants that is required to-day. The marvel of it is that many succeed as well as they do.

Fashion is largely the ruling spirit now as to what shall be grown in the way of plants, and at the present time it is the correct thing to have carnations. No word can be urged against this, even if one desired such a thing, but all the leading carnation growers have houses for them. This is not the case, however, in all the places where carnations are grown, and it is not unusual for a lady or gentleman who sees a fine lot of carnations at some other establishment, or at a show, to buy a number of plants to form a collection of their own. But do these good people always consider whether they have the proper convenience for growing carnations? Alas, no, and the gardener anxious to do his best, makes room for them amongst the other plants in one of his antiquated structures, and then, poor fellow, if he fails, as he inevitably must, to grow carnations as good as everybody else, he runs the risk of being considered incompetent. "Why can't we have them?" is the petulant question of unreasonable employers when tradesmen exhibit their wares grown to the pink of perfection; but they know all the time why they can't have them, if they would only admit it, and listen to the explanation of the gardener.

Commercial methods have opened up many fresh ideas in the way of gardening which were unknown to the old school of practitioners, and, still chained and bound down to the appliances of other days, the private gardener stands at a disadvantage. Take grape growing for instance. The orthodox garden vinery is a house leaning against a wall, and not infrequently fitted up with a stage inside on which to grow plants as well. In not a few cases the vines are as old as the houses, and they are a mixture of varieties that were never intended to be grown together. Perhaps the gardener would like to alter things, and he may be allowed to do it, but, on the other hand, he may not, for both vines and vinery are institutions, and he will be told that they have served very well for so long, and it is he that is at fault, not the conditions. What does the market man do who sets out to grow grapes? He wants no lean-to house against a wall, but erects a light airy span-roofed structure with as little heavy timber as possible to obstruct the light, and planting vines on both sides he soon gets the house filled with grapes. He crops heavily and grows good grapes, but has no need to look far into the future, for he has no use for old vines, and instead of lifting and adopting those methods of renovation which are well-known to private gardeners he promptly clears out the vines that are unsatisfactory, and plants young canes.

The widely published reports on the experiments in fruit culture at Woburn go to show that the best crops are obtained where the pruning knife is withheld, or only lightly used, and the figures simply substantiate what the market grower has known for some time, that in order to get the best returns from his trees he must not cut them back, but let them grow more naturally. Too often, I think, the private gardener is held up as being the champion of severe pruning, and his critics go out of their way to show that he is wrong, ridiculing at the same time the closely cut and artificial-looking trees in the private garden. This is all very well so far as it goes, but the critics of the private gardener should remember that the latter is not a hard pruner from inclination or choice, but simply because he has to do it. By right of custom pyramids, bush trees, and espaliers are planted in kitchen gardens, but it is on the understanding that they must only occupy so much space, because the kitchen garden has to supply the establishment with vegetables as well. What is the gardener to do if he does not prune hard? If he could have his way he would certainly grow his fruit in a plantation after the manner of the market man, and keep his kitchen garden for vegetables; but there, he cannot have his way, so he does the best under the circumstances. He prunes hard because he has no choice in the matter, but he brings common sense and judgment to bear, for he adopts methods of summer pruning and root pruning which the market man has no need to trouble about, and as the result of his methods he fills the shelves in his fruit room.

But one could go on enumerating the instances in which the private gardener has to work under conditions which are peculiar to his vocation, but not always favourable for securing the best results, and it is obviously unfair to make comparisons between private and commercial horticulture that are unfavourable to the gardener. H.

LYCASTE SKINNERI.

Lycaste Skinneri is an orchid that has long been in collections, and one that has shown itself very tractable under cultivation. Those who have an ordinary greenhouse may grow this and some other cool orchids, and find a vast amount of pleasure in so doing. There is nothing new to be written about the treatment of Lycaste Skinneri beyond what has been stated in these columns from time to time. An amateur who has never handled an orchid may well take up Lycaste Skinneri and the cool cypripediums, and, with reasonable care, hope to be successful with them. The accompanying illustration shows a specimen of Skinner's lycaste carrying thirty of its fine, substantial, and long-lasting flowers. This was grown by Mr. W. Mosson, 9, Hermitage Villas, Child's Hill, London, N.W., who cultivates it with a miscellaneous collection of plants in a cool greenhouse, and secures a wealth of bloom annually.

BULBS.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "BULBS AND THEIR CULTIVATION," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

CLOTHING BARE SPACES UNDER TREES.

The planting of bare spaces under the wide-spreading branches of specimen trees in such manner as to produce a carpet hardly less attractive than green, velvety turf is by no means free from difficulty, but this is not so great that it cannot be surmounted. There are plants of lowly growth that will thrive in positions where the supplies of food and water are scanty and where the amount of light is reduced to a minimum, but they are few in number. The lists of plants usually given as suitable for growing under the shade of trees are of but little service to the inexperienced, for they appear to have been prepared not so much for clothing the bare spaces immediately around large trees occupying prominent positions in the pleasure grounds, as the planting of shady yet open areas in woods and plantations contiguous to the garden. We find in these lists such things as pontic rhododendrons, Berberis aquifolium, the common holly, and the common laurel, which will grow freely enough in comparatively open spaces in the plantation or woodland, but are quite unsuitable for planting around large evergreen oaks, conifers that have lost their lower branches, and other trees that might be mentioned. We, of course, find plants in the published lists that will thrive in such positions, but as they are not specially distinguished, those who require help are greatly perplexed when they turn to them for guidance, and, as often as not, make an unsuitable selection. It is reasonable to assume this is the case from the many failures that have been met with.

A CHARMING ARRANGEMENT OF ROCK PLANTS.
Under a venerable cedar in the Woodside Gardens, Chenies.

In the planting of bare spaces that are within the influence of the roots and branches of specimen trees, the endeavour should be to make a carpet rather than form a shrubbery. Probably there is nothing to surpass certain of the green-leaved ivies for this purpose. The common ivy will soon make a good carpet, but the leaves are a little too sombre in tone. The Irish ivy is vigorous in growth, and the colour of the leaves is bright and pleasing. It is, indeed, so well adapted for the carpeting of large areas that were it not for the existence of an ivy known as Emerald Green one would be justified in saying that nothing better could be desired. The last-named is free in growth, and has leaves that are hardly so large as those of the Irish ivy, but are of a more vivid green. Both for clothing bare spaces and walls it has no superior. Ivies appreciate proper attention, and during the earlier stages they should have the assistance necessary to enable them to become established quickly. The soil around the trees will have long since become exhausted, and the first step should be to spread a good layer of well-rotted manure over the surface, and fork it in to a depth of five or six inches provided the roots will allow. In all cases the dressing of manure should be applied and worked in with a fork. The distance at which the plants should be put must be determined by their size, and the best advice that can be given is to put them far enough apart to thinly cover the surface.

The St. John's Worts are also most useful for the purpose, and the best of them is perhaps Hypericum calycinum. This attains a height of ten or twelve inches, is dense and uniform in growth, and produces rather large yellow flowers with some freedom for a considerable period during the summer months. Not less valuable are the periwinkles, and the best of those with green leaves is Vinca major, which has its attractions enhanced by pleasing blue flowers. V. minor is also of much merit for carpeting purposes, and, as in the case of the larger-growing species, bears blue flowers. There is also a form with white flowers, and one with double blue flowers. The green-leaved forms are the best for spaces around trees with wide-spreading branches, but for planting around trees of erect growth the variegated form of V. major is of special value. It soon forms a dense mass, and its rich golden variegation is highly effective. Both the St. John's Worts and the periwinkles should have the soil prepared for them in much the same manner as advised for the ivies.

At Woodside, Chenies, the residence of Adeline Duchess of Bedford, a quite distinct method of clothing bare spaces has been adopted. Closely adjoining the rock garden, which forms so delightful a feature, is an ancient Cedar of Lebanon, with branches that extend over a wide area. Around the trunk of this venerable tree a low rockery was formed and planted with such hardy subjects as are known to thrive in comparatively shady positions, and not to require very large supplies of water. The accompanying illustration shows the arrangement so clearly that there is no occasion to describe it in detail. The photograph was taken early in the spring, and affords proof that the plants blooming at that season produce flowers in plenty.

G.

ILEX PERNYI.

This interesting holly, which has recently been distributed by the Messrs. Veitch, of Chelsea, is a Chinese species, bearing the name of the French missionary, Paul Perny, who was attached to the French mission in Kuichou from 1850 to 1860. Like several of his brother missionaries he had a great love for natural history, and he added considerably to the European knowledge of the flora of Western China by his collections. He is said to have been the first botanical and zoological explorer of the province of Kuichou, and his first entrance into the province was made in the disguise of a Chinese beggar. Among shrubby plants, one of his discoveries was the holly under notice, and this was described upwards of twenty years ago by M. Franchet, from dried specimens. Seeds were sent home, in the first instance, by Mr. E. H. Wilson, when collecting for Messrs. Veitch, and plants from two to three feet high may now be obtained.

Mature examples are said to attain a height of 12 or 15 feet under ordinary conditions, but when placed under very favourable circumstances specimens 30 feet high have been noted by Dr. Henry. The leaves are deep green, glossy, and thick in texture, and have usually five or seven spines on the margins. In many respects they resemble those of I. cornuta, but are smaller; those of typical examples being from 1 to 1½ inches long. The fruits are small and red, and they appear in axillary clusters. Bushes are well furnished with branches, and grow into a good shape with a little attention to pruning. It appears to thrive under conditions which suit the common holly, and this, together with its ornamental character and distinct appearance, ought to make it a popular garden evergreen. Some variation is noticeable amongst seedling plants, a certain number having leaves much larger than those of the type. One or two of the most distinct will no doubt receive varietal names.

CHRYSANTHEMUMS.—For full instructions on the Culture of Early-flowering Chrysanthemums in beds or borders for garden or greenhouse decoration, read the Second Edition of CHRYSANTHEMUMS FOR GARDEN AND GREENHOUSE, by D. B. Crane, price 2s. 6d. net; or by post, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

GENERAL REMARKS.—With the return of November the work in the orchid houses will be more or less confined to the cleaning of the plants, and placing those that have matured their growth under suitable conditions. The resting of plants in Nature is a very different thing to that of resting them under artificial conditions. In my early experience of growing orchids it was thought that what took place under natural conditions must, of necessity, be copied as closely as possible in their cultivation under glass. Collectors would give the information that not a drop of rain fell for so many months, that the plants must be kept absolutely dry for the periods named, etc. I never remembered one of them to have mentioned the heavy dews, which would have soaked them to the skin in a few minutes had they attempted to start their journeys before sunrise, such dews being characteristic of all tropical climates where vegetation freely abounds. Yet the instructions given, or sent home with the plants, were accepted with simple faith, and rigidly practised, although the shrivelling of the pseudo-bulbs and the small growths usually produced should have set growers thinking. Perhaps this may be more marked in the treatment given to the raising and cultivation of seedlings, than in the treatment of the imported plants. It was thought that a resting season was essential to the cultivation of seedlings, and as the result small progress was made, and many years elapsed before it was considered possible for cattleyas and some other kinds to reach a flowering state. The more rational treatment within recent years must have convinced the most ardent believer in the antiquated methods that there is a vast difference between artificial and natural conditions. If we consider that, after all, orchids are only plants, and if treated as such, and not as a something that needs to be grown in glass cases, we soon find that no particular structures are necessary to meet their requirements, and that they are far more easily grown than some other classes. Certainly, less labour is necessary, and practically all the most desirable kinds in cultivation may be procured for a moderate outlay. Although I have wandered from the beaten path of cultural matters in this note, I trust it may be seen clearly that even at a resting season it is essential to retain the growths and pseudo-bulbs in a normal state, if we are to produce future satisfactory conditions in our plants.—H, J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

TREE CARNATIONS.—The cuttings that were rooted early in the spring have grown into strong plants, and are now on the point of flowering. They require a temperature of 55 degrees at night, with a rise of five degrees or more during the day, according to the conditions out of doors. The plants from which the early supplies of blooms will be obtained must not be coddled at this stage of their growth. Advantage must be taken of every favourable opportunity to ventilate the structure in which they are growing. On dull days a little fire heat is necessary to dispel the superfluous moisture, and to render the air buoyant, and on these occasions the leeward ventilators should be opened to ensure that there is a free circulation of air amongst the plants. Timely attention must be paid to disbudding. Occasional supplies of weak liquid manure should be given to all the forward plants.

PRIMULA OBCONICA.—The plants that are on the point of flowering must be given a good position in a light house in which a temperature ranging from 45 degrees to 50 degrees is maintained. They should be given some stimulant to assist them to produce a succession of flowers. A late batch should be shifted into larger pots, and grown on, pinching all flowers off for some time hence.

CHRYSANTHEMUMS. — Large blooms will now be rapidly developing, and liquid manure should be applied regularly. Maintain a free circulation of air by the liberal use of top and bottom ventilators; a little fire heat will benefit the plants by drying up superfluous moisture. Plants that have passed out of flower may be cut back to within a foot of the base, and placed in a house where plenty of sunlight is available, and watered with care.

LILIUM SPECIOSUM.—Examples of this lily that are now passing out of flower should be kept rather on the dry side, and when all the foliage has fallen the stems may be cut down to the level of the soil. Then place the pots containing the bulbs in a perfectly cool and dry place where they can remain until early in the spring, when it will be necessary to shake them from the old soil, and repot. In some gardens the ordinary soil or loam is not suitable for this lily, and, in such cases, where there is plenty of leaf-mould at command, this may be used instead, with some fine sand mixed with it. Other lilies that are passing out of flower may be treated in the same way.

CYCLAMEN.—Plants raised from seed sown as advised in a previous calender will now be ready for pricking off into small thumb pots, or boxes, filled with rich soil. Early batches will now be requiring attention as to feeding. Sheep or cow manure is an ideal stimulant for use during the development of the flowers,

SCHIZANTHUSES.—Plants intended for spring flowering will now require a shift into larger pots. On no account coddle them, but grow on a shelf near the glass with a cool temperature. The potting compost should be made rather sandy, as schizanthuses grow freely in porous soil.

RICHARDIAS that are intended for early flowering should be given a position in a low-roofed structure, with plenty of light, and an atmospheric temperature of 60 degrees. Those which have been kept in pots during the summer months are more suitable for early flowering than are those which have been recently lifted from trenches. These latter may, for the present, be kept in unheated frames or pits from which frost is excluded; when the soil about them has become filled with their roots give copious supplies of liquid manure.

BULBS, such as tulips and hyacinths, that were potted early and placed in ashes should be examined, and if the growth be long enough remove to frames or a suitable house, where a low temperature is maintained. A good soaking of water when they are taken from the ashes will benefit them.—W. Staward, Preston Hall Gardens.

THE FLOWER GARDEN.

PELARGONIUMS and similar bedding plants, now placed in their winter quarters, must be kept on the dry side as to the supply of moisture at the roots, and the atmosphere as dry and buoyant as possible, otherwise losses will occur. With specially constructed houses there is no difficulty in wintering the plants well. More often than not one has to make use of fruit houses, vineries, etc., in which case the trees permanently occupying the houses must be the chief study, consequently such subjects as bedding plants have to take their chance, but, with a certain amount of care and judgment in watering, these generally come through the winter fairly well. Lobelia cardinalis, Salvia patens, and such-like plants, unlike dahlias, usually winter best in pits or frames, where plenty of light can be given them Extreme frost only need be kept from the roots, for if given cool treatment these subjects will retain their robustness, and start freely into growth with the return of spring weather. Whereas if heat is given during the dull days of winter they start prematurely into growth, and are often ruined by the time the bedding-out season comes round again. All tender bedding plants must, of course, receive more careful treatment, and if placed on the shelves near the glass in a warm or intermediate house, will come through the winter season well, if sparingly watered.

CALCEOLARIAS, PENTSTEMONS, VERBENAS, VIOLAS, and suchlike hardier plants, should be freely exposed during warm or fine days, and the plants occasionally looked over, removing all damp or decaying leaves, and flower stems.

PLANTING the flower beds and borders with spring-flowering plants and bulbs will, in most instances, have been completed. If by any chance such work has been delayed it should be completed as quickly as possible, for at this season of the year the weather is very uncertain, and frost may set in at any moment.

OUTDOOR CHRYSANTHEMUMS that have ceased flowering may now be cut down, and the roots lifted and placed indoors for the production of cuttings and plants for next season's supply. Care should be exercised in seeing that these are carefully labelled true to name, or confusion will result later on.

JAPANESE MAPLES have made a bold show of colour this autumn, and the present is a good time to make note of these and other autumn foliage plants, if additions are considered desirable for another season. These trees are of slow growth, and the dwarfer kinds may be very suitably used as permanent subjects for beds in the pleasure grounds and gardens. With us they survive the severest winter unprotected, which is more than can be said of many so-called hardy subjects.

PLANTING, ETC.—During open weather the transplanting of trees and shrubs may be continued, and although this kind of work may be proceeded with for some time to come during open weather, results always show in favour of autumn planting. During unfavourable weather other work, such as draining, road making or mending, trimming verges, hedges, etc., might be undertaken, and where gravel is obtainable on the estate such quantities as may be required later on should be dug and graded ready for use. Standard roses in exposed situations should be securely staked and tied, for, with the advent of rough winds these may be blown about and suffer damage, especially if the trees have made excessive growths; in most instances these may be shortened back at once, in order to minimise the risk.—W. Hedley Warren, Aston Clinton Gardens.

HARDY FRUITS.

PLANTING.—Where the preparation of the soil is completed for planting fruit trees this operation should be taken in hand immediately the leaves have fallen, provided the soil is in a good condition. Before commencing to plant the distance apart for each individual tree or bush should be determined upon, taking out good-sized holes with the spade, allowing sufficient room to lay out the roots in a proper manner. If the trees have been sent from a nursery a long distance away, and the roots have become dry, they should be plunged into a tank of water, and allowed to remain there for a few hours prior to planting. The roots should then be carefully examined, and all that are bruised or broken should be cut off with a sharp knife. Care must be exercised not to plant too deep, but, at the same time, it should be borne in mind that apples upon the paradise stock, and pears upon the quince stock, should be planted deep enough so that the union is from two to three inches below the surface of the soil. Spread out the roots, and work the soil well among them with the hands, afterwards, when the filling operation is finished, the whole should be made firm, and a good mulching of strawy litter spread over the surface as far as the roots extend. If the trees are planted in exposed positions they should be staked and carefully tied. We have found it a good plan, when planting standard trees, to drive strong stakes into the ground before planting; this not only determines the exact position of the trees, but the tree can be planted to the stakes, and, consequently, no roots are damaged by supports being driven into the soil after planting is finished.

DISTANCE TO PLANT.—Usually fruit trees grown in the open quarters in the fruit garden proper partake of the two forms of either bush or pyramid trained. Apples upon the paradise stock, and pears upon the quince stock, should be planted as permanent trees from ten to twelve feet apart; if, on the other hand, they are worked upon the free stock, a distance of from twelve to eighteen feet should be given. Plums and cherries should be given a distance of twelve feet apart. Gooseberries and currants should be planted from six to eight feet apart each way. Raspberries should be planted in rows five feet apart and two feet from plant to plant; loganberries and blackberries, if grown in rows to wires, should be given a distance of twelve feet apart, and six feet from row to row. Standard-grown trees of apples, pears, cherries, plums, and damsons should be planted from thirty to thirty-five feet apart each way.

WALL TREES.—Where horizontal or fan-trained trees of peaches, nectarines, apricots, plums, cherries, and pears are to be planted to walls, a distance of from eighteen to twenty feet should be allowed. Figs should be planted from twelve to fifteen feet apart. Gooseberries and other fruit trees trained double upright cordon or gridiron form should be given from four to six feet apart, but where the single trained cordon trees are to be planted, from eighteen inches to two feet apart will be ample. When planting wall trees the same care must be exercised as that recommended for the planting of trees in the open quarters, and the base of the trees must be kept at least six inches away from the wall, or otherwise, when growing they will press against it.—Henry R. Farmer, Cardiff Castle Gardens.

PRATIA ANGULATA.
